superego In Freudian psychoanalytic theory, one of the three aspects of the human personality, along with the id and the ego. The last of the three elements to develop, the superego is the ethical component of the personality, providing the moral standards by which the ego operates. The superego is formed during the first five years of life in response to parental punishment and approval; children internalize their parents' moral standards as well as those of the surrounding society, and the developing superego serves to control aggressive or other socially unacceptable impulses. Violation of the superego's standards gives rise to feelings of guilt or anxiety.

superfluidity Unusual property of liquid helium cooled below –455.75 °F (–270.97 °C). At such low temperatures, helium exhibits an enormous rise in heat conductivity and rapid flow through capillaries or over the rim of its container. To explain such behaviour, the substance is described in terms of a "two-fluid" mixture model consisting of normal helium and superfluid helium. In normal helium the atoms are in excited states (see excitation), whereas in superfluid helium they are in their ground state. As the temperature is lowered below –455.75 °F, more of the helium becomes superfluid. It is assumed that the superfluid component can move through the container without friction, thereby explaining the unusual behaviour.

Superfund U.S. government fund intended to pay for the cleanup of hazardous-waste dump sites and spills. The 1980 act creating it called for financing by a combination of general revenues and taxes on polluting industries. The Environmental Protection Agency was directed to create a list of the most dangerous sites; it would then compel the polluter to pay for the cleanup or would pay for the cleanup itself through the Superfund and sue for reimbursement. By the 1990s the Superfund had received billions of dollars, and work had begun on many sites. In response to widespread charges of waste, mismanagement, and inefficiency, the Superfund streamlined its procedures, and by the beginning of the 21st century cleanups at more than 750 sites had been completed. In the early 21st century, various proposals were introduced to alter the financing of the Superfund. See also Love Canal.

supergiant star Star of very great natural luminosity and relatively enormous size, typically several magnitudes brighter and several times larger than a giant star. Like other classes of stars, they are distinguished in practice by examination of certain lines in their spectra (see spectroscopy). A supergiant may have a diameter several hundred times that of the Sun and a luminosity nearly a million times as great. Supergiants live probably only a few million years, an extremely short life for a star.

Superior, Lake Lake, U.S. and Canada. The largest of the five Great Lakes, Superior is the world's largest freshwater lake. It is 383 mi (616 km) long and 160 mi (258 km) at its widest, with an area of 31,800 sq mi (82,362 sq km) and depths reaching 1,330 ft (405 m). Lake Superior is known for its picturesque coastline and its numerous shipwrecks; its islands include Isle Royale. The head of the Great Lakes–Saint Lawrence Seaway system, it is connected to Lake Huron at its southeastern end via the Sault Ste. Marie locks. Ships transport grain, flour, and iron ore during the eight-month navigation season. The French Jesuit missionary Claude-Jean Allouez charted the lake in 1667. The region came under British control (1763–83) and remained in British hands until 1817, when the American Fur Co. took over south of the Canadian border.

supermarket Large retail store operated on a self-service basis, selling groceries, produce, meat, bakery and dairy products, and sometimes nonfood goods. Supermarkets were first established in the U.S. during the 1930s as no-frills retail stores offering low prices. In the 1940s and '50s they became the major food marketing channel in the U.S.; the 1950s also saw them spread through much of Europe. Their growth is part of a trend in developed countries toward reducing cost and simplifying marketing. In the 1960s supermarkets began appearing in developing countries in the Middle East, Asia, and Latin America, where they appealed to individuals who had the necessary buying power and food storage facilities.

supernova Any of a class of violently exploding stars whose luminosity after eruption suddenly increases many millions of times above its normal level. Like novas, supernovas undergo a tremendous, rapid brightening lasting a few weeks, followed by a slow dimming, and show blue-shifted emission lines on spectroscopy, which implies that hot gases are blown outward. Unlike a nova, a supernova explosion is a catastrophic event for a star, leading to its collapse into a neutron star or black hole. Amounts of its matter equal to the mass of several Suns may be blasted into space with such energy that the exploding star outshines its entire home galaxy. Only seven supernovas are known to have been recorded before the 17th century, the most famous in AD 1054; its remnants are visible today as the Crab Nebula. The closest and most studied supernova in modern times is SN 1987A, which appeared in 1987 in the Large Magellanic Cloud. Supernova explosions release not only tremendous amounts of radio energy and X-rays but also cosmic rays; in addition, they create and fling into interstellar space many of the heavier elements found in the universe, including those forming Earth's solar system.

supervenience \ˌsü-pər-ˈvēn-yəns\ In philosophy, the asymmetrical relation of ontological dependence that holds between two generically different sets of properties (e.g., mental and physical properties) if and only if every change in an object's properties belonging to the first set—the supervening properties—entails and is due to a change in properties belonging to the second set (the base properties). Supervenience has often been appealed to by philosophers who want to uphold physicalism while rejecting the identity theory: Though it may be impossible to identify mental properties with physical properties in a one-to-one fashion, mental properties may still supervene on, and thus be grounded in, physical properties. Thus, no two things that are physically alike can be mentally (or psychologically) different, and a being's mental properties will be determined by its physical ones.

supply and demand Relationship between the quantity of a commodity that producers have available for sale and the quantity that consumers are willing and able to buy. Demand depends on the price of the commodity, the prices of related commodities, and consumers' incomes and tastes. Supply depends not only on the price obtainable for the commodity but also on the prices of similar products, the techniques of production, and the availability and costs of inputs. The function of the market

© 2006 Encyclopædia Britannica, Inc.

is to equalize demand and supply through the price mechanism. If buyers want to purchase more of a commodity than is available on the market, they will tend to bid the price up. If more of a commodity is available than buyers care to purchase, suppliers will bid prices down. Thus, there is a tendency toward an equilibrium price at which the quantity demanded equals the quantity supplied. The measure of the responsiveness of supply and demand to changes in price is their elasticity.

supply-side economics Theory that focuses on influencing the supply of labour and goods, using tax cuts and benefit cuts as incentives to work and produce goods. It was expounded by the U.S. economist Arthur Laffer (b. 1940) and implemented by Pres. Ronald Reagan in the 1980s. Supporters point to the economic growth of the 1980s as proof of its efficacy; detractors point to the massive federal deficits and speculation that accompanied that growth.

suprarenal gland See adrenal gland

Supremacy, Act of (1534) English act of Parliament that recognized Henry VIII as the "Supreme Head of the Church of England." The act also required an oath of loyalty from English subjects that recognized his marriage to Anne Boleyn. It was repealed in 1555 under Mary I, but in 1559 Parliament adopted a new Act of Supremacy during the reign of Elizabeth I.

Suprematism First movement of pure geometrical abstraction in art, introduced in Russia c. 1913. Originated by Kazimir Malevich and disseminated by El Lissitzky and the Bauhaus school, it had far-reaching influence on Western art and design. Malevich aimed to convey the "supremacy of feeling in art," which he believed could be expressed through the simplest of visual forms. He exhibited the first Suprematist compositions in 1915, the year he issued the Suprematist manifesto. The purest embodiment of Suprematist ideals can be seen in his *White on White* series (1917–18).

Supreme Court of the United States Final court of appeal in the U.S. judicial system and final interpreter of the Constitution of the United States. The Supreme Court was created by the Constitutional Convention of 1787 as the head of a federal court system, though it was not formally established until Congress passed the Judiciary Act in 1789. It was granted authority to act in cases arising under the Constitution, laws, or treaties of the U.S.; in controversies to which the U.S. is a party; in controversies between states or between citizens of different states; in cases of admiralty and maritime jurisdiction; and in cases affecting ambassadors or other ministers or consuls. Its size, which is set by Congress, varied between 6 and 10 members before being set at 9 in 1869. Justices are appointed by the president but must be confirmed by the Senate. The court has exercised the power of judicial review since 1803, when it first declared part of a law unconstitutional in *Marbury v. Madison*, though the power is not explicitly granted to it by the Constitution. Though the court can sometimes serve as a trial court through its original jurisdiction, relatively few cases reach the court in this manner; most cases arise by appeal or by certiorari. Among the most important doctrinal sources used by the Supreme Court have been the commerce, due-process, and equal-protection clauses of the Constitution. It also has often ruled on controversies involving civil liberties (see civil liberty), including freedom of speech and the right of privacy. Much of its work consists of clarifying, refining, and testing the Constitution's philosophic ideals and translating them into working principles.

Supremes U.S. pop-soul vocal trio. The original Supremes—Diana Ross (byname of Diane Earle; b. 1944), Mary Wilson (b. 1944), and Florence Ballard (1943–76)—began recording for Motown (as The Primettes) on graduating from high school in Detroit, Mich. Their long string of Motown hits in the mid-1960s, many written by Brian and Eddie Holland and Lamont Dozier, began with "Where Did Our Love Go?" and included "Baby Love" and "Stop! In the Name of Love." In 1966 Ballard was replaced with Cindy Birdsong (b. 1939). Ross left the Supremes in 1969, and Wilson left in 1977. Ballard died in relative poverty of cardiac arrest. Ross's highly successful solo career included film roles (notably in *Lady Sings the Blues*, 1972) and a free 1983 Central Park concert that drew an audience of record-setting size.

Sur See Tyre

Surabaya \ˌsůr-ə-'bī-ə\ Seaport city (pop., 1995 est.: 2,701,000), northeastern coast of Java, Indonesia. It is Indonesia's second-largest city and has been eastern Java's chief trading center since the 14th century. The Dutch gained control in the 18th century and built their main East Indies naval base there. Occupied by the Japanese in World War II, it suffered heavy damage; it was damaged again during Indonesia's war for independence (1945–49). It is the site of Indonesia's main naval base and a naval college, and of Airlangga University (1954).

sūrah *or* **sura** Any chapter of the Qur'ān. According to Muslim belief, each of the 114 *sūrah*s, which vary in length from several lines (known as *āyah*s) to several pages, encompasses one or more divine revelations of Muhammad. All but three lines are in the form of a direct address from God. The tone of each varies but is generally moralistic, demanding obedience to a transcendent but compassionate God. Except for the opening *sūrah*, known as *fātiḥah* (the "opening"), they are arranged in descending order of length and numbered serially. They carry conventional names (e.g., Cow, Spider, Blood Clot) deriving from some image contained in them that is not necessarily indicative of their meaning or theme.

Surat \'sůr-ət, sə-'rat\ City (pop., 2001: 2,433,835), southeastern Gujarat state, west-central India. It is near the mouth of the Tapti River and the Gulf of Khambhat (Cambay). A major seaport from the 16th century, it was conquered by the Mughals in 1573 and was twice sacked by the Marathas in the 17th century. It became a centre for textile manufacturing and shipbuilding. The British established their first factory (trading post) in India there c. 1612, marking the beginning of the British imperial presence in India. The city declined in the 18th century but prospered again with the opening of India's railways. Surat's cottons, silks, brocades, and objects of gold and silver are still famous.

surface In geometry, a two-dimensional collection of points (flat surface), a three-dimensional collection of points whose cross section is a curve (curved surface), or the boundary of any three-dimensional solid. In general, a surface is a continuous boundary dividing a three-dimensional space into two regions. For example, the surface of a sphere separates the interior from the exterior; a horizontal plane separates the half-plane above it from the half-plane below. Surfaces are often called by the names of the regions they enclose, but a surface is essentially two-dimensional and has an area, while the region it encloses is three-dimensional and has a volume. The attributes of surfaces, and in particular the idea of curvature, are investigated in differential geometry.

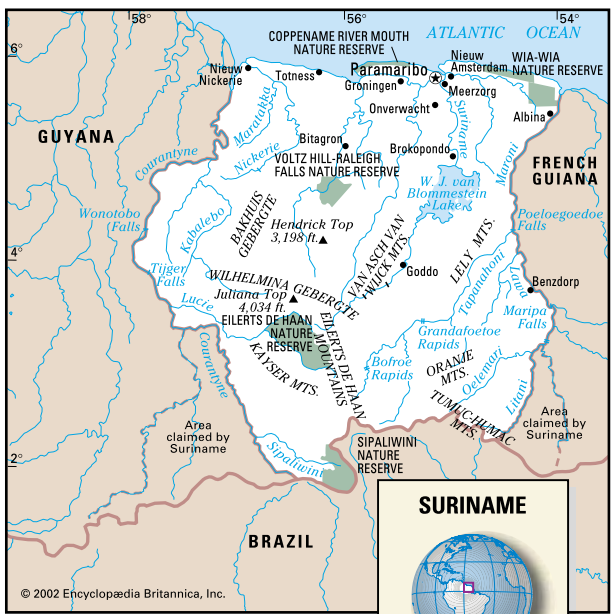
surface Outermost layer of a material or substance. Because the particles (atoms or molecules) on the surface have nearest neighbours beside and below but not above, the physical and chemical properties of a surface differ from those of the bulk material; surface chemistry is thus a branch of physical chemistry. The growth of crystals, the actions of catalysts and detergents, and the phenomena of adsorption, surface tension, and capillarity are aspects of behaviour at surfaces. The appearance of the surface, whether achieved with electroplating, paint, oxidation-reduction, bleaching (see bleach), or another means, is aesthetically important.

surface integral In calculus, the integral of a function of several variables calculated over a surface. For functions of a single variable, definite integrals are calculated over intervals on the x-axis and result in areas. For functions of two variables, the simplest double integrals are calculated over rectangular regions and result in volumes. More generally, an integral calculated over a plane or curved surface results in a surface integral representing a volume, though it also has many nongeometric applications.

surface tension Property of a liquid surface that causes it to act like a stretched elastic membrane (see elasticity). Its strength depends on the forces of attraction among the particles of the liquid itself and with the particles of the gas, solid, or liquid with which it comes in contact. Surface tension allows certain insects to stand on the surface of water and can support a razor blade placed horizontally on the liquid's surface, even though the blade may be denser than the liquid and unable to float. Surface tension results in spherical drops of liquid, as the liquid tends to minimize its surface area.

surfing Sport of riding breaking waves toward the shore, especially with a surfboard. The sport originated prehistorically in the South Seas. In 1777 and 1778 Capt. James Cook first reported seeing surfers in Tahiti and on Oahu. In 1821 surfing was banned by missionaries who thought it immoral. It was revived in the 1920s by the Hawaiian swimmer Duke Kahanamoku (1890–1968). Today surfing is enjoyed on beaches with breakers throughout the world, and several international championships are held. The goal is to maneuver on the unbroken face of the wave, preferably as far back toward the curl ("tube") as possible. In addition to surfboards, surfers can use belly-boards, kneeboards, or kayaks, or they can bodysurf using no board at all.

© 2006 Encyclopædia Britannica, Inc.



surgeonfish *or* **tang** Any of about 75 species (family Acanthuridae) of thin, deep-bodied, tropical marine fishes that are small-scaled, with a single dorsal fin and one or more distinctive, sharp spines on either side of the tail base. The spines resemble a surgeon's scalpel and may be either fixed or hinged at the rear so that they can be opened outward and directed forward. Surgeonfishes are mostly algae eaters and usually do not exceed 20 in. (50 cm) long. The yellow surgeon, or yellow tang (*Zebrasoma flavescens*), is an Indo-Pacific species, and the blue tang (*Acanthurus coeruleus*) is found in the Atlantic and Caribbean.

Surgeonfish (*Acanthurus leucosternon*)
JANE BURTON—BRUCE COLEMAN LTD.

surgery Branch of medicine concerned with treatment by physical means rather than drugs. In addition to operations requiring access to the inside of the body (open surgery), it includes manipulation from outside the body (e.g., setting of a broken bone, skin grafts). Modern surgery began in the mid-19th century with use of ANESTHETICS and ANTISEPTICS. Other important advances have included DIAGNOSTIC IMAGING, BLOOD TYPING, intubation to support breathing, intravenous administration of fluids and drugs, heart-lung machines (see ARTIFICIAL HEART), ENDOSCOPY, and devices that monitor body functions. Specialized instruments used in surgery include scalpels to cut tissue, forceps to hold blood vessels closed or grasp and manipulate structures, clamps to immobilize or crush tissues, gauze sponges to absorb fluids and keep an area dry, retractors to hold incisions open, and curved needles to suture them closed. Pre- and postoperative care is crucial to the success of surgery. See also MICROSURGERY, OPEN-HEART SURGERY, ORTHOPEDICS, PLASTIC SURGERY, TRANSPLANT.

Suriname \ˌsu̇-rə-ˈnä-mə\ *officially* **Republic of Suriname** *formerly* **Dutch Guiana** Country, northern coast of South America. Area: 63,251 sq mi (163,820 sq km). Population (2005 est.): 493,000. Capital: PARAMARIBO. The population includes South Asians, Creoles, Javanese, and smaller groups of people of African, Chinese, American Indian, and Dutch descent. Languages: Dutch (official), English, Sranan (a creole language), Javanese, Sarnami (derived from Hindi and Urdu). Religions: Christianity (Roman Catholic, Protestant, other Christians), Hinduism, Islam, traditional beliefs. Currency: Suriname dollar. Suriname has a low, narrow coastal plain, inland savannas, a forested plateau region, and mountain ranges. A number of major rivers, including the COURANTYNE, MARONI, and SURINAME, cross the country to empty into the Atlantic. Bauxite mining, aluminum production, and agriculture are the largest sectors of the economy. Exports include rice, bananas, sugarcane, oranges, and shrimp. Suriname is a republic with one legislative house; its head of state and government is the president. It was inhabited by various South American Indian peoples prior to European settlement. Spanish explorers claimed Suriname in 1593, but the Dutch began to settle there in 1602, followed by the English in 1651. It was ceded to the Dutch in 1667, and in 1682 the Dutch West India Company introduced coffee and sugarcane plantations and African slaves to cultivate them. Slavery was abolished in 1863, and indentured servants were brought from China, Java, and India to work the plantations, adding to the ethnic mix of the population. Except for brief interludes of British rule (1799–1802, 1804–15), Suriname remained a Dutch colony. It gained internal autonomy in 1954 and independence in 1975. A military coup in 1980 ended civilian control until the electorate approved a new constitution in 1987. Military control resumed after a coup in 1990. Elections were held in 1992, and civilian democratic government returned.

Suriname River River, central and eastern Suriname. Rising in the highlands and flowing toward the northeast for some 300 mi (480 km), it empties into the Atlantic Ocean just north of PARAMARIBO. It was dammed at Afobaka to create W. J. van Blommestein Lake, the largest lake in Suriname.

Surma River \'sůr-mə\ River, northeastern India and eastern Bangladesh. It rises in northern MANIPUR state, India, where it is called the Barak River, and flows west into Bangladesh. There it passes through a rich tea-growing valley and eventually enters an old channel of the BRAHMAPUTRA and becomes the MEGHNA RIVER, before entering the GANGES. It is 560 mi (900 km) long.

Surrealism Movement in the visual arts and literature that flourished in Europe between World Wars I and II. Surrealism grew principally out of the earlier DADA movement, which before World War I produced works of anti-art that deliberately defied reason; Surrealism developed in reaction against the "rationalism" that had led to World War I. The movement was founded in 1924 by ANDRÉ BRETON as a means of joining dream and fantasy to everyday reality to form "an absolute reality, a surreality." Drawing on the theories of SIGMUND FREUD, he concluded that the unconscious was the wellspring of the imagination. Breton was a poet, but Surrealism's major achievements were in painting. Some artists practiced organic, emblematic, or absolute Surrealism, expressing the unconscious through suggestive yet indefinite biomorphic images (e.g., JEAN ARP, MAX ERNST, ANDRÉ MASSON, JOAN MIRÓ). Others created realistically painted images, removed from their context and reassembled within a paradoxical or shocking framework (SALVADOR DALÍ, RENÉ MAGRITTE). With its emphasis on content and free form, Surrealism provided a major alternative to the contemporary, highly formalistic CUBIST movement and was largely responsible for perpetuating in modern painting the traditional emphasis on content.

Surrey Administrative county (pop., 2001: 1,059,015) and historic county, southern England. Surrey is located southwest of LONDON. Sheep raising was an important medieval activity for the county, and by the 16th century a cloth trade was also growing. Its forested hills were a source of timber for charcoal, construction, and shipbuilding. Transport of these products, originally dependent on rivers, was facilitated in 1801 when the Surrey Iron Railway was established as the first public railway. During the 19th century the world's densest network of suburban railways developed in northern Surrey. Suburban growth continued after World War II, proceeding under planning restraints. The county seat is Guildford.

Surrey, Henry Howard, earl of (b. 1517, Hunsdon, Hertfordshire, Eng.?—d. Jan. 13, 1547, London) English poet. Because of his aristocratic birth and connections, Surrey was involved in the jockeying for place that accompanied HENRY VIII's policies. After returning to England in 1546 from a campaign abroad, he was accused of treason by his rivals. After his sister admitted he was still a Roman Catholic, he was executed at age 30. Most of his poetry was published 10 years later. With THOMAS WYAT, he introduced into England the styles and metres of the Italian humanist poets, laying the foundation of a great age in English poetry. He translated two books of VIRGIL's *Aeneid*, marking the first use in English of BLANK VERSE and was the first to develop the SONNET form used by WILLIAM SHAKESPEARE.

© 2006 Encyclopædia Britannica, Inc.

surrogate motherhood Practice in which a woman (the surrogate mother) bears a child for a couple unable to produce children, usually because the wife is infertile or unable to carry a pregnancy to term. The surrogate is impregnated either through ARTIFICIAL INSEMINATION (usually with the sperm of the husband) or through the implantation of an embryo produced by in vitro fertilization. The surrogate traditionally gives up all parental rights, though this has been subject to legal challenge.

Surtees, Robert Smith (b. May 17, 1803, The Riding, Northumberland, Eng.—d. March 16, 1864, Brighton, Sussex) English novelist. Passionately addicted to riding to hounds from his youth, Surtees devoted nearly all his writings to horses and riding. In 1831 he launched *New Sporting Magazine*. His famous comic character Mr. Jorrocks, a blunt Cockney grocer entirely given over to fox hunting, appeared in *Jorrocks's Jaunts and Jollities* (1838), *Handley Cross* (1843), and *Hillingdon Hall* (1845). Among his other novels, which also portray the boredom, ill manners, discomfort, and coarse food of English provincial life, are *Hawbuck Grange* (1847) and *Mr. Facey Romford's Hounds* (1865).

Surtsey \'sərt-sē\ Volcanic island off southern Iceland. It emerged from the ocean in a fiery eruption in November 1963. Over four years its volcanic core built up an island 1 sq mi (2.5 sq km) in area, with elevations over 560 ft (170 m). Named for the fire god of Icelandic mythology, it is now a nature reserve and the site of a joint Icelandic-U.S. biological research program.

surveying Method of making relatively large-scale, accurate measurements of the earth's surfaces. Its principal modern uses are in the fields of transportation, building, land use, and communications. Surveying is divided into the categories of plane surveying (mapping small areas) and geodetic surveying (mapping large areas of the globe). The Romans are said to have used the plane table, which consists of a drawing board mounted on a tripod or other support and a straightedge along which lines are drawn. It was the first device capable of recording or establishing angles. With the publication of logarithmic tables in 1620, portable angle-measuring instruments, called topographic instruments, or theodolites, came into use; they included pivoted arms for sighting and could be used for measuring both horizontal and vertical angles. Two revolutionary 20th-century innovations were photogrammetry (mapping from aerial photographs) and electronic distance measurement, including the use of the laser.

Surveyor Any of a series of seven unmanned U.S. space probes sent to make soft landings on the MOON in 1966–68. Surveyor 2 crashed on the Moon, and radio contact with Surveyor 4 was lost minutes before landing, but the rest sent back thousands of photographs; some were equipped to sample and test lunar soil. Surveyor 6 made the first liftoff from an extraterrestrial body; Surveyor 7 landed in the lunar highlands and returned data showing that the landscape and soil there differ from those of lower areas. See also LUNA; PIONEER; RANGER.

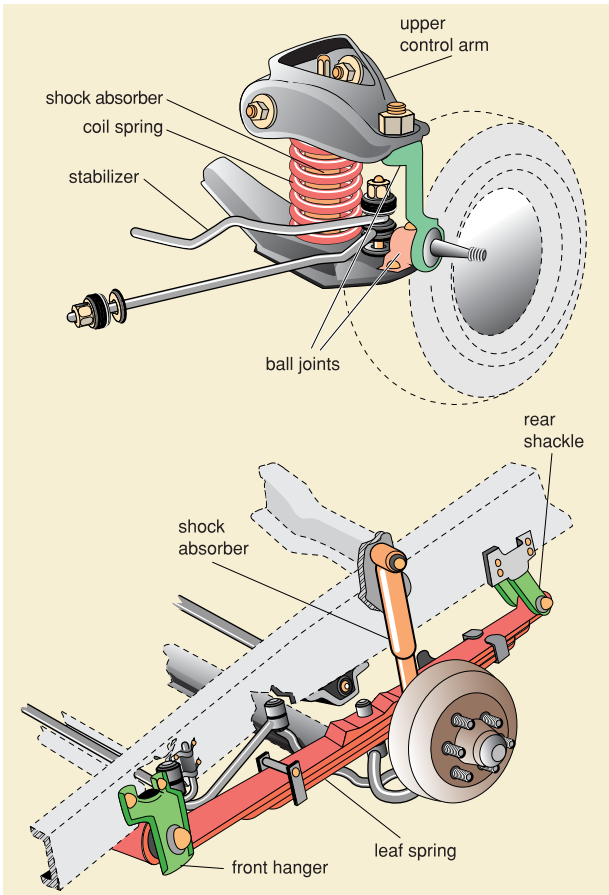
Surya, stone image from Deo-Barunarak, Bihar, India, 9th century AD.
PRAMOD CHANDRA

Surya In HINDUISM, the sun and the sun god. Though once ranking with the major Hindu deities, he is now primarily worshiped only as one of the five important deities of the SMARTA sect and as the supreme deity by the small Savra sect. Nevertheless, he is still invoked by all orthodox Hindus in daily prayer, and his temples are found throughout India. He is the father of MANU, YAMA, and several other gods. The PURANAS record that the weapons of the gods were forged from pieces trimmed from Surya.

Suryavarman \ˌsůr-yə-'vär-mən\ **II** (d. c. 1150) Khmer (Cambodian) king under whom ANGKOR WAT was built. Suryavarman established sole rule over Cambodia in c. 1113, reuniting the country after 50 years of unrest. He expanded his country to include much of what is now Thailand, portions of Vietnam, and part of the Malay Peninsula. He promulgated VAISHNAVISM (a form of Hinduism), rather than the Buddhism of his predecessors, as the official religion. Construction of Angkor Wat, the world's largest religious structure, began under Suryavarman, and he figures prominently in its decorations. He died during a campaign against the kingdom of CHAMPA; the Chams eventually ravaged Angkor.

Susanna Figure in an apocryphal book of the Bible. The History of Susanna, set in Babylon during the Jewish exile, tells of a woman falsely accused of adultery by two elders who had earlier tried to seduce her. She is saved from death by DANIEL's intervention. The tale is one of a cycle of traditions added to the book of Daniel when it was translated into Greek. The scene in which the elders spy on her at her bath was a popular subject for Renaissance artists.

Suslov \'süs-ˌlȯf**, Mikhail (Andreyevich)** (b. Nov. 21, 1902, Shakhovskoye, Russia—d. Jan. 25, 1982, Moscow, Russia, U.S.S.R.) Soviet ideologue. He joined the Communist Party in 1921 and was sent to Moscow for his education, after which he taught economics. In the 1930s he helped supervise the Stalinist purges in the Urals and Ukraine. Later a leading official in the Caucasus, he supervised the deportation of ethnic minorities in World War II. He was appointed to the Politburo in 1952, and from 1955 he held a pivotal position in the ruling clique. A political conservative, he helped NIKITA KHRUSHCHEV quell a conspiracy in the Politburo in 1957, but he organized the bloodless coup in 1964 that ousted Khrushchev and substituted LEONID BREZHNEV. Thereafter, he concentrated on relations between the Soviet Communist Party and other communist parties around the world.



suspension, automobile Elastic members designed to cushion the impact of road irregularities on a portion of an automotive vehicle. The members link the vehicle's tires with its suspended portion, and usually consist of springs and shock absorbers. Spring elements used for automobile suspension members include (in increasing order of ability to store elastic energy per unit of weight) leaf springs, coil springs, torsion bars, rubber-in-shear devices, and air springs. The springs absorb the energy of impacts of the tires along the road surface, and the shocks damp or dissipate that energy, using hydraulics, so that the suspended portion of the vehicle does not keep bouncing. See illustration on following page.

Susquehanna \ˌsəs-kwə-'ha-nə\ **River** River, central New York, Pennsylvania, and Maryland, U.S. One of the longest rivers in the eastern U.S., it is about 444 mi (715 km) long. It rises in Otsego Lake, central New York, and winds through the APPALACHIAN MOUNTAINS before flowing into northern CHESAPEAKE BAY. Though it was never an important waterway because of obstructions, including rapids, its valley was at one time a significant land route to the OHIO RIVER system and was later a coal-mining region.

Susskind \'səs-ˌkīnd**, David (Howard)** (b. Dec. 19, 1920, New York, N.Y., U.S.—d. Feb. 22, 1987, New York City) U.S. television producer and host. After being educated at the University of Wisconsin and Harvard University, he worked as a publicist before forming the agency Talent Associates in 1952. He produced numerous television programs, including *Circle Theater* (1955–63) and *Dupont Show of the Month* (1957–64), but he became best known as host of the talk shows *Open End* (1958–67) and *The David Susskind Show* (1967–86), for which he won many Emmy Awards. *Open End* began at 11:00 PM and ran until the program's participants grew too tired to continue. Noted for his provocative discussions of controversial issues such as race relations, organized crime, and the Vietnam War, he also interviewed international leaders, notably NIKITA KHRUSHCHEV (1960).

Sutherland, Graham (Vivian) (b. Aug. 24, 1903, London, Eng.—d. Feb. 17, 1980, London) British painter. After studying art in London, he taught and practiced printmaking (1926–40) at the Chelsea School of Art. His early work was characterized by an exacting representationalism that evolved into SURREALISM. He turned primarily to painting c. 1935 and served as official war artist 1940–45; his war paintings are an evocative record of desolation. His "thorn period" began with his *Crucifixion* (1946), considered to be one of the most important religious paintings of the 20th century. In such late works he incorporated anthropomorphic insect and plant forms, particularly thorns, which he transformed into powerful, frightening totemic images. Sutherland was known, too, for his expressionistic, penetrating portraits. He also designed the enormous tapestry (c. 1955–61) for the new Coventry Cathedral.

Two forms of automobile suspension. A vehicle is suspended over its wheels by springs, usually either coil or leaf springs (top and bottom, respectively). Irregularities in the road surface are transmitted mechanically to the springs. The energy in the compressed springs is dissipated by shock absorbers mounted inside or outside coil springs or beside leaf springs.

© MERRIAM-WEBSTER INC.

Sutherland, Dame Joan (b. Nov. 7, 1926, Sydney, Austl.) Australian soprano. After debuting in Sydney in 1947, she moved to London. Having sung minor roles at Covent Garden from 1952, she established her status as one of the leading coloraturas of the 20th century in a 1959 performance of *Lucia di Lammermoor*. She made her Metropolitan Opera debut in 1961, and she became a favourite there and worldwide in bel canto roles until her retirement in 1991.

Sutlej River \'sət-ˌlej\ River, Asia. The longest of the "Five Rivers" that give Punjab its name, it is 900 mi (1,450 km) long. It rises in southwestern Tibet and flows west through the Himalayas, across Himachal Pradesh and Punjab, India, then southwest across Punjab province of Pakistan. It forms 65 mi (105 km) of the Indo-Pakistani border. It joins the Chenab River in Pakistan to become the Panjnad, the link between the Five Rivers and the Indus. Its middle course is used extensively for irrigation.

sutra \'sü-trə\ *Pali* **sutta** In Hinduism, a brief aphoristic composition; in Buddhism, a more extended exposition of a subject and the basic form of the scripture of both Theravada and Mahayana traditions. Since the early Indian philosophers did not work with written texts at all, and later philosophers often disdained them, there was a need for very brief explanatory works that could be committed to memory. The earliest sutras were expositions of ritual procedures, but their use spread, and eventually nearly all Indian philosophical systems had their own sutras. See also Avatamsaka-sutra, Diamond Sutra, Lotus Sutra, Tripitaka.

Sutta Pitaka \'sůt-tə-'pi-tə-kə\ Major section of the Tripitaka, the canon of Theravada Buddhism, largely attributed to the Buddha himself. It is divided into five collections, or *Nikayas*: the *Digha Nikaya* ("Long Collection"), containing 34 lengthy sutras, including some of the most important doctrinal expositions; the *Majjhima Nikaya* ("Medium Collection"), containing 152 sutras dealing with a variety of subjects; the *Samyutta Nikaya* ("Cluster Collection"), with more than 7,000 sutras arranged according to subject; the *Anguttara Nikaya* ("Gradual Collection"), a numerical arrangement, for mnemonic purposes, of 9,557 terse sutras; and the Khuddaka Nikaya ("Short Collection"). See also Abhidhamma Pitaka; Vinaya Pitaka.

suttee *or* **sati** \'sə-ˌtē, ˌsə-'tē\ Indian practice whereby a widow burns herself to death either on the funeral pyre of her husband or soon after his death. The custom may be rooted in ancient beliefs that a husband needed his companions in the afterlife, though opponents point to it as an indication of a value system deeply hostile to women. Developed by the 4th century BC, it became widespread in the 17th–18th centuries but was banned in British India in 1829. Frequent instances of suttee continued to occur for many years thereafter, and occasional instances in remote areas are still reported today.

Sutter, John (Augustus) *orig.* **Johann August Suter** (b. Feb. 15, 1803, Kandern, Baden—d. June 18, 1880, Washington, D.C., U.S.) German-born U.S. pioneer. Fleeing financial failures, he left his family in Switzerland and arrived in the U.S. in 1834. He obtained a land grant from the Mexican governor and established the colony of Nueva Helvetia (later Sacramento, Calif.). On the American River he built Sutter's Fort, a frontier trading post, in 1841. When gold was found there in 1848, he tried to keep it a secret. In the resulting gold rush, squatters and gold seekers invaded his land and stole his goods and livestock. U.S. courts denied his claim to his Mexican land grant, and Sutter was bankrupt by 1852.

Sutton Hoo Estate in Suffolk, England, the site of the grave or cenotaph of an Anglo-Saxon king. One of the richest Germanic burials ever found in Europe (1939), the Sutton Hoo site contained an 80-ft (24-m) wooden ship equipped for the afterlife (but with no body). It displayed both pagan and Christian features. The burial's grave goods demonstrate a high level of craftsmanship and included solid gold and silver objects, such as cups and bowls, and weapons, including a bejeweled sword. There were also coins from the Continent and a dish bearing the stamp of the Byzantine emperor Anastasius I, which reveal broader contacts for the people of England at the time than had been previously recognized. The burial may have been for Raedwald (d. 624?) or Aethelhere (d. 654). Parallels to Swedish finds suggest a possible Swedish origin for the East Anglian royal dynasty.

Sutton, Walter S(tanborough) (b. 1877, Utica, N.Y., U.S.—d. Nov. 10, 1916, Kansas City, Kan.) U.S. geneticist. He received a medical degree from Columbia University and practiced surgery the rest of his life. In 1902 he provided the earliest detailed demonstration that somatic chromosomes (those in cells other than sex cells) occur in distinct pairs of like chromosomes, hypothesizing that chromosomes carry the units of inheritance and that their behaviour during meiosis is the physical basis of Gregor Mendel's concept of heredity. In 1903 he concluded that chromosomes contain units of heredity (now known as genes) and that their behaviour during meiosis is random. His work formed the basis for the chromosomal theory of heredity.

Suva Seaport, (pop., 2003 est.: urban area, 210,472), capital of Fiji. Founded in 1849, it was made a city in 1952; it is now one of the largest urban centres in the South Pacific Ocean. With its fine harbour, Suva is Fiji's chief port and commercial centre and the site of educational and cultural institutions.

Suvorov \sü-'vô-rôf**, Aleksandr (Vasilyevich), Count** (b. Nov. 24, 1729, Moscow, Russia—d. May 18, 1800, St. Petersburg) Russian army commander. Joining the army at age 15, he became an officer in 1754 and served in the Seven Years' War. He wrote a battle-training manual that helped Russia win the Russo-Polish conflict (1768–72) and a conflict with the Turks in 1773–74. He led the army in the Russo-Turkish War and was created a count. After crushing a revolt in Poland in 1794, he was promoted to field marshal. He commanded a Russo-Austrian force in Italy in 1799 and captured Milan, expelling most of the French army from Italy. Ordered to relieve a Russian force in Switzerland, he marched

© 2006 Encyclopædia Britannica, Inc.

across the Alps; surrounded by a larger French force, he succeeded in breaking out and, repulsing the pursuing French, escaped with most of his army, a remarkable feat.

Suwannee \sə-'wä-nē\ **River** River, southeastern Georgia and northern Florida, U.S. The river rises in the Okefenokee Swamp and enters the Gulf of Mexico at Suwannee Sound after a course of 250 mi (400 km). All but 35 mi (56 km) of its course are in Florida. It is the Swanee River of Stephen Foster's famed "Old Folks at Home." In the 1780s the bays and inlets of Suwannee Sound were rendezvous points for pirates.

Suzdal \'süz-dəl\ Medieval principality, between the Oka River and the Upper Volga, northeastern Russia. Ruled by a branch of the Rurik dynasty during the 12th–14th centuries, it united with Rostov and in the 12th century with Vladimir. Suzdal-Vladimir achieved great political and economic importance, but in the 13th–14th centuries it disintegrated into small principalities, which ultimately were absorbed by Moscow. See also Vladimir-Suzdal school.

Suzman \'süz-mən**, Helen** *orig.* **Helen Gavronsky** (b. Nov. 7, 1917, Germiston, S.Af.) South African legislator. Born in the Transvaal to Lithuanian immigrants, she graduated from the University of Witwatersrand, where she later taught economic history (1945–52). Elected to Parliament in 1953, she and 11 others formed the Progressive Party to oppose apartheid. Suzman alone of the group was reelected in 196l; until 1974 she often cast the lone vote against an increasing number of apartheid measures. In 1978 she received the UN Human Rights award. Until her retirement in 1989, she remained a significant voice in the South African Parliament.

Svalbard \'sfäl-ˌbär\ Archipelago, Norway. Located in the Arctic Ocean, north of the Arctic Circle, Svalbard consists of nine main islands, the largest being Spitsbergen (formerly West Spitsbergen). The islands are mountainous, with glaciers and snowfields covering nearly 60% of the area. The islands were first visited in modern times by the Dutch in 1596. In the early 20th century many countries, including the U.S., debated ownership of mineral rights there. Officially a Norwegian possession since 1920, the islands have been the site of many scientific polar expeditions (beginning in 1773). The population changes seasonally but numbers about 3,000; there are no indigenous inhabitants. Longyearbyen is the administrative centre.

Svealand \'svā-ə-ˌländ\ Region, south-central Sweden. Stretching across the breadth of the country, it covers an area of 31,212 sq mi (80,844 sq km). Settled as early as the Stone Age, it was the original home of the Svear, a people who gave Sweden its name, and it was the political and cultural centre from which Sweden developed and later secured its independence. Its diversified economy includes agriculture, manufacturing, forestry, and mining.

Svedberg \'svād-ˌbarʸ,\ *English* \'sved-ˌbərg**, The(odor)** (b. Aug. 30, 1884, Fleräng, near Gävle, Swed.—d. Feb. 25, 1971, Örebro) Swedish chemist. He won a Nobel Prize in 1926 for his studies in the chemistry of colloids and for his invention of the ultracentrifuge (see centrifuge), which has become invaluable to research in biochemistry and other areas. Svedberg used it to determine precisely the molecular weights of highly complex proteins (e.g., hemoglobin). Later he made studies in nuclear chemistry, contributed to the improvement of the cyclotron, and helped his student Arne Tiselius (1902–71) develop electrophoresis.

Sverdlov \'svʸerd-ləf**, Yakov (Mikhaylovich)** (b. June 3, 1885, Nizhny Novgorod, Russia—d. March 16, 1919, Moscow) Soviet politician. A Bolshevik organizer and agitator in the Urals, he was often arrested and exiled. In the Russian Revolution of 1917, he headed the Bolshevik secretariat and helped plan and execute the October coup that brought the Bolsheviks to power. As titular head of state, he worked closely with Vladimir Lenin to consolidate power in the Communist Party's Central Committee. His untimely death at age 33 from an infectious illness left a void in the party hierarchy that was filled by Joseph Stalin in 1922.

Sverdlovsk See Yekaterinburg

Svevo \'zvā-vō**, Italo** *orig.* **Ettore Schmitz** (b. Dec. 19, 1861, Trieste, Austrian Empire—d. Sept. 13, 1928, Motta di Livenza, Italy) Italian writer. Though family financial difficulties forced him to leave school and become a bank clerk, he read on his own and began to write. *A Life* (1892), revolutionary in its analytical, introspective treatment of an ineffectual hero, was ignored on publication, as was *As a Man Grows Older* (1898). He gave up writing until, encouraged by James Joyce (then living in Trieste), he produced his most famous novel, *Confessions of Zeno* (1923), a brilliant work in the form of a patient's statement for his psychiatrist. He died in an auto accident. Two short-story collections, essays, dramatic works, correspondence with Eugenio Montale, and his unfinished *Further Confessions of Zeno* (1969) were published after his death. He is regarded as a pioneer of the psychological novel.

Svyatoslav I \'svyä-tə-släf\ (d. 972) Grand prince of Kiev (945–72). The greatest of the Varangian princes of early Russian history, he defeated the Khazar and other peoples in the northern Caucasus (963–965) and conquered the Bulgars (967). Hoping to found a Russo-Bulgarian empire, he refused to cede his conquest to the Byzantines until their army defeated him and forced the surrender of Balkan territory (971). He was killed in an ambush on his way back to Kiev.

Swabia *German* **Schwaben** \'shväb-ᵊn\ Duchy, medieval Germany, and current administrative district. The duchy of Swabia was nearly coextensive with modern Baden-Württemberg, Hesse, and western Bavaria states, as well as parts of eastern Switzerland and Alsace. The Suevi and Alemanni tribes occupied the area from the 3rd century, and the region was known as Alemannia until the 11th century. In the 7th century Irish missionaries began to introduce Christianity. From c. 10th century it became one of the five great tribal duchies of early medieval Germany. It was ruled by the Hohenstaufen dynasty c. 1077–1268, after which the duchy was divided. Several alliances of cities, known as the Swabian Leagues, were formed in the 14th–16th centuries. The region was a territorial division of the Holy Roman Empire in the 16th–19th centuries. Its chief cities included Augsburg, Freiburg, Konstanz, and Ulm. Created in 1934, the administrative district is coextensive with the eastern portion of the larger historic region of Swabia and has an area of 3,859 sq mi (9,994 sq km) and a population (2002 est.) of 1,767,193.

swage \'swāj, 'swej\ Perforated cast-iron or steel block with grooved sides, used by metalworkers for shaping their work by holding it on the work (or the work on it) and striking with a hammer or sledge. Swage blocks are used in heading bolts and swaging bars by hand.

Swahili \swä-'hē-lē\ **language** Bantu language spoken in Tanzania, Kenya, Uganda, and Congo (Kinshasa). It is spoken as a first language by more than 2 million people and as a second language by some 60 million. Standard Swahili is based on the Unguja (kiUnguja) dialect of Zanzibar, which was spread far inland in the 19th century by entrepreneurs seeking ivory and slaves. Its use was perpetuated by the European colonial governments that occupied East Africa toward the end of the century. Modern Swahili is usually written in the Latin alphabet, though Swahili literature in Arabic script dates to the early 18th century. Among Bantu languages, Swahili is remarkable for the number of loanwords it has absorbed, especially from Arabic.

swallow Any of 74 species (family Hirundinidae) of songbirds found nearly worldwide. Swallows are 4–9 in. (10–23 cm) long, with long, pointed, narrow wings; a short bill; small, weak feet; and sometimes a forked tail. The dark upper plumage may have a metallic blue or green sheen. Swallows capture insects on the wing. They nest in tree holes, burrow into sandbank, or plaster mud nests to walls. Some species (e.g., the common swallow, *Hirundo rustica*) are long-distance migrants; all have a strong homing instinct. The swallows of California's San Juan Capistrano Mission are cliff swallows (*Petrochelidon pyrrhonota*). See also martin.

Common swallow (*Hirundo rustica*).
STEPHEN DALTON—NATURAL HISTORY PHOTOGRAPHIC AGENCY/EB INC.

swallowing *or* **deglutition** \ˌdē-ˌglü-'tish-ən\ Act that moves food from the mouth to the stomach. The tongue pushes liquid or chewed food mixed with saliva into the pharynx. Reflex takes over as the soft palate rises to close off the nasal cavity; the larynx rises and the epiglottis covers the trachea, interrupting breathing. Pressure in the mouth and pharynx pushes food toward the esophagus, whose upper sphincter opens to let food in and closes to prevent backflow. Breathing resumes as the lar-

© 2006 Encyclopædia Britannica, Inc.

ynx lowers. As PERISTALSIS pushes food to the STOMACH, the lower esophageal sphincter opens and then closes to prevent reflux. Painful swallowing is usually caused by INFLAMMATION; other problems are caused by blockage or disorders affecting the motions of swallowing.

swallowtail butterfly Any of more than 500 species (genus *Papilio*, family Papilionidae) of BUTTERFLIES found worldwide except in the Arctic. Some have tail-like extensions of the hind wing. Colour patterns vary with species, sex, season, and sometimes location (see TIGER SWALLOWTAIL). Most adults have yellow, orange, red, green, or blue markings on an iridescent black, blue, or green background. The brightly coloured larvae eat foliage. Some have markings resembling a snake's head, and many discharge a bad-smelling substance when disturbed. The giant swallowtail (*P. cresphontes*), with a wingspan of 4–5.5 in. (10–14 cm), is the largest butterfly in the U.S. and Canada.

swami See SADHU AND SWAMI

Swammerdam \'sväm-ər-ˌdäm**, Jan** (b. Feb. 12, 1637, Amsterdam, Neth.—d. Feb. 15, 1680, Amsterdam) Dutch naturalist. An adept microscopist, in 1658 he became the first person to observe and describe red blood cells. In his *General History of Insects* he accurately described and illustrated the life histories and anatomy of many insect species and classified insects into four major divisions, three of which have been more or less retained in modern classification. He studied tadpole and adult frog anatomy and described the ovarian follicles of mammals. His improved techniques for injecting wax and dyes into cadavers had important consequences for the study of human anatomy. He showed that muscles alter in shape but not in size during contraction.

swamp Freshwater wetland ecosystem characterized by poorly drained mineral soils and plant life dominated by trees. Swamps have a sufficient water supply to keep the ground waterlogged, and the water has a high-enough mineral content to stimulate decay of organisms and to prevent the accumulation of organic materials. They are found throughout the world. See also MARSH.

swan Long-necked, heavy-bodied, big-footed WATERFOWL (genus *Cygnus*, family Anatidae). Among waterfowl, swans are the largest and fastest, both swimming and flying; at about 50 lbs (23 kg), the mute swan (*C. olor*) is the heaviest flying bird. Swans dabble in shallows for aquatic plants. Five all-white, black-legged species live in the Northern Hemisphere; a black and a black-necked species live in the Southern Hemisphere. Males (cobs) and females (pens) look alike. Swans mate for life. The cob keeps guard while the pen incubates, on average, six eggs on a heap of vegetation; the young (cygnets) are tended for several months. Their graceful form when swimming has made swans emblems of beauty for centuries.

Mute swan (*Cygnus olor*) and cygnet

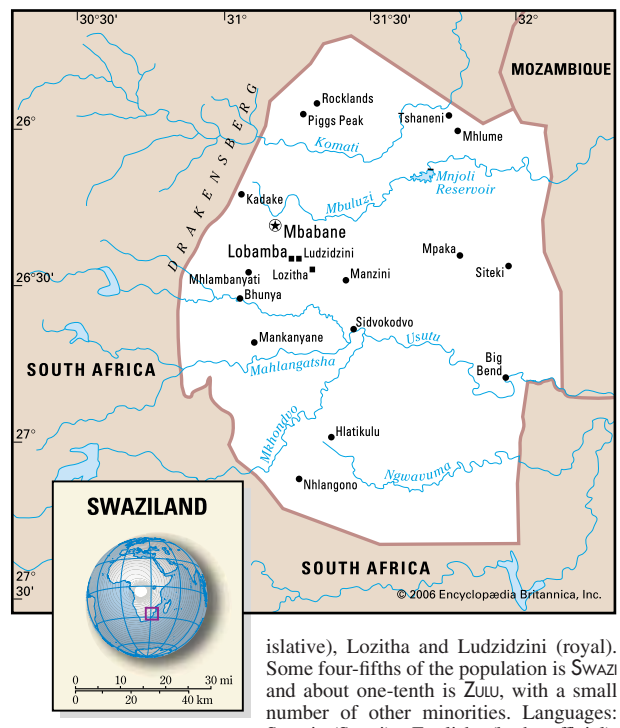
Swan, Sir Joseph (Wilson) (b. Oct. 31, 1828, Sunderland, Durham, Eng.—d. May 27, 1914, Warlingham, Surrey) English physicist and chemist. By 1871 he had invented the dry photographic plate, an important improvement in photography. He had already produced an early electric lightbulb (1860), and in 1880, independently of THOMAS ALVA EDISON, he produced a carbon-filament incandescent electric lamp. He also patented a process for squeezing nitrocellulose through holes to form fibres, a process that became widely employed in the textile industry.

Swan River Ephemeral river, southwestern Western Australia. It flows 224 mi (360 km) west to the Indian Ocean. Called the Avon in its upper course, it is known as the Swan only along its lower 60-mi course. PERTH lies near its mouth. The river is dry during much of the summer and autumn. In 1829, western Australia's first free settlement was made on its banks.

Swansea \'swän-zē\ *Welsh* **Abertawe** \ˌa-bər-'taù-ə\ Seaport and county (pop., 2001: 223,293), southern Wales. Lying along the BRISTOL CHANNEL, it is the second largest city in Wales. It dates from the 12th century. Until the early 18th century it was a small market town and coal port; thereafter it grew steadily with industry, and by the mid-19th century it was the focus of the world copper trade. The city centre was almost totally destroyed by German bombing in 1941 but has been redeveloped, and Swansea is now the chief shopping and service hub for southwestern Wales. The poet DYLAN THOMAS was born there.



SWAPO See SOUTH WEST AFRICA PEOPLE'S ORGANIZATION

Swarthmore College Private liberal arts college in Swarthmore, Pa., near Philadelphia. It was founded by a group of Quakers in 1864. Consistently ranked as one of the best colleges in the U.S., it offers bachelor's degree programs in a wide variety of disciplines. It participates in an exchange program with BRYN MAWR and HAVERFORD colleges and the University of PENNSYLVANIA.

swastika Equilateral cross with its arms bent at right angles, all in the same rotary direction, usually clockwise. It is used widely throughout the world as a symbol of prosperity and good fortune. In India, it continues to be the most common auspicious symbol of Hindus and Jains, as well as for Buddhists, for whom it symbolizes the Buddha's feet or footprints. In China and Japan, where it traveled with the spread of Buddhism, it has been used to denote plurality, prosperity, and long life. It occurs as a motif in early Christian and Byzantine art, as well as in Maya and Navajo art. The counterclockwise swastika, suggested as a general anti-Semitic symbol in 1910 by the German poet and nationalist Guido von List, was adopted as the symbol of the NAZI PARTY at its founding in 1919–20.

Swazi \'swä-zē\ *or* **Swati** \'swä-tē\ Bantu-speaking people inhabiting the grasslands of SWAZILAND and neighbouring regions of South Africa and Mozambique. With the ZULU and the XHOSA, the Swazi (numbering more than two million) form the southern NGUNI ethnolinguistic group. They are chiefly agriculturalists and pastoralists. The highest traditional political, economic, and ritual powers are shared by a hereditary male ruler and his mother. The king's wives and children are settled in royal villages, diplomatically dispersed throughout the territory.

Swaziland *officially* **Kingdom of Swaziland** Country, southern Africa. Area: 6,704 sq mi (17,364 sq km). Population (2005 est.): 1,032,000. Capitals: MBABANE (administrative and judicial), LOBAMBA (legislative), Lozitha and Ludzidzini (royal). Some four-fifths of the population is SWAZI and about one-tenth is ZULU, with a small number of other minorities. Languages: Swazi (Swati), English (both official). Religions: Christianity (predominantly other [African, unaffiliated] Christians; also Protestant, Roman Catholic); also traditional beliefs. Currency: lilangeni. The landlocked country is composed of high, middle, and low

© 2006 Encyclopædia Britannica, Inc.

velds, culminating in the Lubombo escarpment in the east. Fauna includes hippopotamuses, antelopes, zebras, and crocodiles. Four major rivers, including the Komati, flow through the country and irrigate citrus and sugarcane estates. Mineral resources include asbestos and diamonds. Swaziland is a monarchy with two legislative houses; its head of state and government is the king, assisted by the prime minister. Stone tools and rock paintings indicate prehistoric habitation in the region, but it was not settled until the Bantu-speaking Swazi people migrated there in the 18th century and established the nucleus of the Swazi nation. The British gained control in the 19th century after the Swazi king sought their aid against the Zulu. Following the South African War, the British governor of Transvaal administered Swaziland; his powers were transferred to the British high commissioner in 1906. In 1949 the British rejected the Union of South Africa's request to control Swaziland. The country gained limited self-government in 1963 and achieved independence in 1968. In the 1970s new constitutions were framed based on the supreme authority of the king and traditional government. Although the kingdom remained in place in the early 21st century, steps were being taken to establish a constitution. Swaziland has one of the highest rates of HIV infection in the world, with some two-fifths of the population infected.

sweat gland Either of two types of perspiration glands in the skin. Eccrine sweat glands, controlled by the sympathetic nervous system, use evaporation to cool the skin by secreting water when body temperature rises. Apocrine sweat glands, usually associated with hair follicles, are concentrated in the underarms and genital region. Starting at puberty, hormones stimulate them to continuously secrete a fatty sweat. Certain specialized glands, such as mammary glands and wax-secreting glands of the ear canal, probably developed from this type of gland.

sweat lodge Hut or lodge used for ritual purification. Its use originated with Native Americans—for whom it remains a significant ceremony—but it is now common among other non-Indian groups who recognize its health as well as spiritual benefits. The structure of the sweat lodge is usually made of bent saplings and skin or blanket coverings and is heated by steam from water poured on hot stones. A ceremony typically surrounds the lodge's construction and use. Some groups believe the lodge becomes a symbolic centre in which the six cardinal directions, the past and present, and the human and spiritual worlds are connected.

Sweden *officially* **Kingdom of Sweden** Country, eastern Scandinavian Peninsula, northern Europe. Area: 173,860 sq mi (450,295 sq km). Population (2005 est.): 9,024,000. Capital: Stockholm. The population is largely homogeneous, although there are Finnish and Sami (Lapp) minorities and 10% of the inhabitants are immigrants or their descendents. Language: Swedish (official). Religions: Christianity (predominantly Protestant; also Roman Catholic); also Islam. Currency: Swedish krona. Sweden has three traditional regions: mountainous Norrland covers about three-fifths of the country and has vast forests and large ore deposits; Svealand has undulating glacial ridges and contains most of the country's 90,000 lakes; and Götaland comprises the stony Småland highlands and the rich Skåne plains. About 15% of Sweden lies north of the Arctic Circle. The economy is largely based on services, heavy industries, and international trade. Sweden has large deposits of iron ore; industries include mining, lumbering, steel manufacturing, and tourism. Agricultural products include grains, sugar beets, potatoes, and livestock. One of the world's richest countries, Sweden is known for its comprehensive social welfare system. It is a constitutional monarchy and parliamentary state with one legislative house; its chief of state is the king, and the head of government is the prime minister. The first traces of human life in Sweden date from about 9000 BC. During the Viking era (9th–10th century AD), the Swedes controlled river trade in eastern Europe between the Baltic Sea and the Black Sea; they also raided western European lands. Sweden was loosely united and Christianized in the 11th–12th century. It conquered the Finns in the 12th century, and in the 14th century it united with Norway and Denmark under a single monarchy. Sweden broke away in 1523 under Gustav I Vasa. In the 17th century it emerged as a great European power in the Baltic region, but its dominance declined after its defeat in the Second Northern War (1700–21). It became a constitutional monarchy in 1809 and united with Norway in 1814; it acknowledged Norwegian independence in 1905. Sweden maintained its neutrality during both World Wars. It was a charter member of the UN but abstained from membership in NATO and did not join the European Union until 1995. A new constitution drafted in 1975 reduced the monarch's powers to those of a ceremonial chief of state. In 1997 Sweden began the controversial shutdown of its nuclear power industry. By the early 21st century it had emerged as a European centre of telecommunications and information technology.

Swedenborg, Emanuel (b. Jan. 29, 1688, Stockholm, Swed.—d. March 29, 1772, London, Eng.) Swedish scientist, theologian, and mystic. After graduating from the University of Uppsala, he spent five years abroad studying the natural sciences. On his return he began publication of Sweden's first scientific journal, *Daedelus Hyperboreas*, and Charles XIII appointed him assessor with the Royal Board of Mines. His writing gradually shifted toward philosophy of nature and metaphysics, in concert with his growing belief that the universe had a basically spiritual structure. In 1744 he had a vision of Christ, and in 1745 he received a call to abandon worldly learning. He spent the rest of his career interpreting the Bible and relating what he had seen in his visions. He maintained that God was the power and life within all creatures and that the Christian Trinity represented the three essential qualities of God: love, wisdom, and activity. He believed redemption consisted in humankind's being recreated in God's image through Christ's glorification. He published more than 30 works, including *The True Christian Religion* (1771). Societies were soon founded to propagate his pantheistic teaching, notably the New Jerusalem Church, established in London in 1787. Swedenborgians came to the U.S. in the 1790s. See pantheism.

Swedenborgians See New Church

Swedish language National language of Sweden and one of two official languages of Finland, spoken by about nine million people. It belongs to the East Scandinavian group of the Germanic languages and is closely related to Norwegian and Danish. Its history from the Common Scandinavian period (600–1050) until c. 1225 is known chiefly from inscriptions in runic writing. Modern Swedish is usually dated from 1526, when a translation of the New Testament was first printed. The standard language began to emerge in the 17th century, based largely on the Svea dialects spoken in Stockholm. Swedish, like Norwegian, has two tonal word accents.

sweet pea Annual plant (*Lathyrus odoratus*) of the pea family (see legume), native to Italy and widely

Sweet pea (*Lathyrus odoratus*)

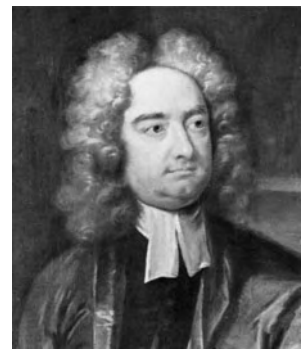
cultivated elsewhere for its beautiful, fragrant flowers. The long (4–6 ft, or 1.2–2 m), vinelike stem climbs by means of tendrils and bears feather-like leaves. White, pink, red, violet, or purple flowers, reminiscent of butterflies in shape, are borne singly or in clusters of two to four. The fruit is a hairy pod about 2 in. (5 cm) long. Hundreds of varieties of sweet pea have been developed. The plant was the subject of important genetics experiments by Reginald Crundall Punnett and William Bateson.

sweet potato Food plant (*Ipomoea batatas*; family Convolvulaceae) native to tropical America and widely cultivated in tropical and warm temperate climates. Botanically unrelated to the white, or Irish, potato or the yam, sweet potatoes are oblong or pointed oval, tuberous roots. Skin colour ranges from light buff to brown to purplish red; the pulp may be white (highest in starch) to orange (also high in carotene) to purple. Long, trailing plant stems bear funnel-shaped flowers tinged with pink or rose violet. Sweet potatoes are served baked or mashed and used as pie filling.

sweet William Garden plant (*Dianthus barbatus*) in the pink family, grown for its clusters of small, brightly coloured flowers. It usually grows as a biennial, with seed sown the first year producing spring-flowering plants the second year. The plants grow about 2 ft (60 cm) high and produce numerous flowers with fringed petals in white, pink, or rose to violet, sometimes also bicoloured.

Sweet William (*Dianthus barbatus*)
GRANT HEILMAN



sweetbrier *or* **eglantine** Small, prickly wild rose (*Rosa eglanteria*, or *R. rubiginosa*) with fragrant foliage and numerous small pink flowers, native to Europe and western Asia. Widely naturalized in North America, it grows along roadsides and in pastures from eastern Canada southwest to Tennessee and Kansas. The shrub form, which can grow 6 ft (2 m) high, is useful for screening out traffic noise and beautifying highways.

Sweyn \'svān\ **I** *or* **Sweyn Forkbeard** (d. Feb. 3, 1014, Gainsborough, Lincolnshire, Eng.) King of Denmark (c. 987–1014) and Viking conqueror of Norway and England. He rebelled against his father, Harald Bluetooth (987), chasing him from Denmark. With Swedish and Norwegian allies, he defeated Olaf I Tryggvason (c. 1000), becoming virtual ruler of Norway. Sweyn led raids on England in 1003–04 and became king after a successful military campaign in 1013, forcing Ethelred II into exile. Norway reverted to Norwegian rule after Sweyn's death, but the Anglo-Danish empire continued under his son Canute the Great.

swift Any of about 75 species (family Apodidae) of birds found almost worldwide. The fastest of small birds, swifts can fly at 70 mph (110 kph). They are 4–9 in. (9–23 cm) long and have long wings, a chunky dark body, a broad head, and a short, wide, slightly curved bill. The tail may be short or long and deeply forked. Swifts capture insects, drink, bathe, and sometimes mate on the wing. The feet, incapable of perching, are used to cling to vertical surfaces. Swifts use their sticky saliva to glue the nest to a cave wall, the inside of a chimney, or a tree hollow.

Swift, Gustavus Franklin (b. June 24, 1839, West Sandwich, Mass., U.S.—d. March 29, 1903, Chicago, Ill.) U.S. meatpacker. Swift started as a butcher's helper at age 14 and by 1859 was operating his own butcher shop. In 1872 he became the partner of a Boston meat dealer; three years later he transferred their cattle-buying operations to Chicago. Believing profits would increase if fresh meat rather than live cattle were shipped from Chicago, he had a refrigerator car designed and made his first shipment in 1877. With his brother he formed Swift & Co. (1885). During his 18 years as president, its capitalization rose from $300,000 to $25 million. Like his rivals Philip D. Armour and Nelson Morris, Swift was a leader in byproduct utilization, entering related businesses such as soap, glue, fertilizer, and margarine.

Swift, Jonathan (b. Nov. 30, 1667, Dublin, Ire.—d. Oct. 19, 1745, Dublin) Irish author, the foremost prose satirist in English. He was a student at Dublin's Trinity College during the anti-Catholic Revolution of 1688 in England. Irish Catholic reaction in Dublin led Swift, a Protestant, to seek security in England, where he spent various intervals before 1714. He was ordained an Anglican priest in 1695. His first major work, *A Tale of a Tub* (1704), comprises three satiric sketches on religion and learning; he also became known for religious and political essays and impish pamphlets written under the name "Isaac Bickerstaff." Reluctantly setting aside his loyalty to the Whigs, in 1710 he became the leading writer for the Tories because of their support for the established church. *Journal to Stella* (written 1710–13) consists of letters recording his reactions to the changing world. As a reward for writing and editing Tory publications, in 1713 he was awarded the deanery of St. Patrick's Cathedral, Dublin. He spent nearly all the rest of his life in Ireland, where he devoted himself to exposing English wrongheadedness and their unfair treatment of the Irish. His ironic tract "A Modest Proposal" (1729) proposes ameliorating Irish poverty by butchering children and selling them as food to wealthy English landlords. His famously brilliant and bitter satire *Gulliver's Travels* (1726), ostensibly the story of its hero's encounters with various races and societies in remote regions, reflects Swift's vision of humanity's ambiguous position between bestiality and rationality.

Jonathan Swift, detail of an oil painting by Charles Jervas; in the National Portrait Gallery, London.

swimming In recreation and sports, the propulsion of the body through water by combined arm and leg motions. Swimming is popular as an all-around fitness routine and as a competitive sport. It has been included in the modern Olympic Games since their inception in 1896. Events include freestyle (crawl-stroke) races at distances of 50, 100, 200, 400, 800, and 1,500 m; backstroke, breaststroke, and butterfly races at 100 and 200 m; individual medley races at 200 and 400 m; freestyle relays, 4 × 100 m and 4 × 200 m; and the medley relay, 4 × 100 m. Long-distance swimming competitions, usually of 15–37 mi (24–59 km), are generally held on lakes and inland waters.

swimming cat See Turkish van cat

Swinburne, Algernon Charles (b. April 5, 1837, London, Eng.—d. April 10, 1909, Putney, London) English poet and critic. After attending Eton and the University of Oxford, Swinburne lived on an allowance from his father. His verse drama *Atalanta in Calydon* (1865) first showed his lyric powers. *Poems and Ballads* (1866), containing some of his best work, displays his paganism and masochism and provoked controversy; a second series (1878) was less hectic and sensual. His verse is marked by emphatic rhythms, much alliteration and internal rhyme, and lush subject matter. His health collapsed in 1879 and he spent his last 30 years under a friend's guardianship. His early poetry is noted for innovations in prosody, but his later poetry is considered less important. Among his outstanding critical writings are *Essays and Studies* (1875) and monographs on William Shakespeare (1880), Victor Hugo (1886), and Ben Jonson (1889).

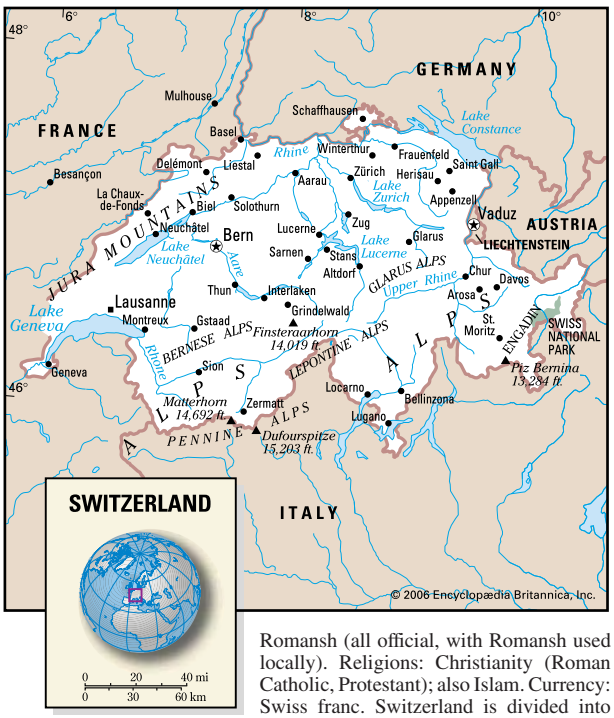
swing Jazz played with a steady beat using the harmonic structure of popular songs and the blues as the basis for improvisations and arrangements. The popular music of the U.S. from about 1930 to 1945 (years sometimes called the swing era), swing is characterized by syncopated rhythmic momentum with equal stress accorded to the four beats of a measure. Larger jazz bands required some arranged material, and Fletcher Henderson, Duke Ellington, and Count Basie were the primary innovators



© 2006 Encyclopædia Britannica, Inc.

of big-band swing. In smaller ensembles, improvised instrumental solos generally follow a rendering of the melody.

Swiss chard See CHARD

switching theory Theory of CIRCUITS made up of ideal digital devices, including their structure, behaviour, and design. It incorporates Boolean logic (see BOOLEAN ALGEBRA), a basic component of modern digital switching systems. Switching is essential to telephone, telegraph, data processing, and other technologies in which it is necessary to make rapid decisions about routing information. See also QUEUING THEORY.

Switzerland *officially* **Swiss Confederation** Country, central Europe. Area: 15,940 sq mi (41,284 sq km). Population (2005 est.): 7,519,000. Capitals: BERN (administrative), Lausanne (judicial). The population is German, French, and Italian. Languages: German, French, Italian, Romansh (all official, with Romansh used locally). Religions: Christianity (Roman Catholic, Protestant); also Islam. Currency: Swiss franc. Switzerland is divided into three regions: the meadow-covered JURA MOUNTAINS; the central Mittelland, a rich agricultural and urbanized area; and the lofty crags of the ALPS. It is one of the world's major financial centres; its economy is based largely on international trade and banking, as well as light and heavy industries. Manufactures include watches, precision instruments, machinery, and chemicals. Tourism and agriculture are also important; products include grains, sugar beets, fruits and vegetables, dairy products, chocolate, and wine. Despite diverse ethnic groups, religions, and languages, Switzerland has maintained the world's oldest democracy for some 700 years. It is a federal state with two legislative houses; its head of state and government is the president of the federal council. The original inhabitants were the Helvetians, who were conquered by the Romans in the 1st century BC. Germanic tribes penetrated the region from the 3rd to the 6th century AD, and Muslim and Magyar raiders ventured in during the 10th century. It came under the rule of the FRANKS in the 9th century and the medieval empire (later the HOLY ROMAN EMPIRE) in the 11th century. In 1291 three cantons formed an anti-Habsburg league that became the nucleus of the Swiss Confederation. It was a centre of the REFORMATION, which divided the confederation and led to a period of political and religious conflict. The French organized Switzerland as the HELVETIC REPUBLIC in 1798. In 1815 the Congress of VIENNA recognized Swiss independence and guaranteed its neutrality. A new federal state was formed in 1848 with Bern as the capital. Switzerland remained neutral in both World War I and World War II and has continued to defend this neutrality. It joined the EUROPEAN FREE TRADE ASSOCIATION in 1960, but it has opted against joining the EUROPEAN UNION. It joined the UNITED NATIONS in 2002.

Swope, Gerard (b. Dec. 1, 1872, St. Louis, Mo., U.S.—d. Nov. 20, 1957, New York, N.Y.) U.S. business leader. After graduating from the Massachusetts Institute of Technology, he joined WESTERN ELECTRIC in 1895 and became a director in 1913. He was made president of GENERAL ELECTRIC CO.'s international subsidiary in 1919 and greatly increased the company's foreign business. As president of General Electric (1922–39, 1942–44), he expanded its line of consumer products and pioneered PROFIT SHARING and other employee benefit programs. He also served on the Department of Commerce's Business Advisory Council, and his ideas and support underlay such important New Deal programs as the NATIONAL RECOVERY ADMINISTRATION and SOCIAL SECURITY.

sword Hand weapon consisting of a long metal blade fitted with a handle or hilt. Roman swords had a short, flat blade and a hilt distinct from the blade. Medieval European swords were heavy and equipped with a large hilt and a protective guard, or pommel. The blade was straight, double-edged, and pointed. The introduction of firearms did not eliminate the sword but led to new designs; the discarding of body armour required the swordsman to be able to parry, and the rapier, a double-edged sword with a narrow, pointed blade, came into use. Swords with curved blades were used in India and Persia and were introduced into Europe by the Turks, whose scimitar, with its curved, single-edged blade, was modified in the West to the cavalry sabre. Japanese swords are renowned for their hardness and extreme sharpness; they were the weapon of the SAMURAI. Repeating firearms ended the value of the sword as a military weapon, though its continued use in duels led to the modern sport of FENCING. See also KENDO.

sword dance Folk dance by men, with swords or two-handled blades, expressing themes such as human and animal sacrifice for fertility, battle mime, and defense against evil spirits. It originated in Greek and Roman times. A sword dance appeared in Germany in 1350 and later was part of the court ballet when mock battles were staged. The Scottish sword dance is a descendant of the early crossed-sword dances, and the MORRIS DANCE retains remnants of the sword dance. Outside of Europe, such dances are found in India, Borneo, and the Balkans.

swordfish Species (*Xiphias gladius*) of prized food and game fish, found in warm and temperate oceans worldwide. A slender, scaleless fish, it has a tall dorsal fin and a long extension of the snout, used for slashing at prey. The "sword" is flat, rather than rounded as in MARLINS. The swordfish is also distinguished by its lack of teeth and pelvic fins. It is purplish or bluish above, silvery below, and grows as large as 15 ft (4.5 m) and 1,000 lb (450 kg). Though a popular food fish, it may have dangerous levels of mercury concentrated in its flesh.

Sybaris \'si-bə-rəs\ Ancient Greek city, southern Italy, on the Gulf of Tarentum. Founded c. 720 BC by ACHAEANS and known for its wealth and luxury (hence, the English word *sybarite*), it was one of the oldest cities of MAGNA GRAECIA. Twice razed by the Crotoniates (510 BC and c. 448 BC), it attempted rebuilding and relocating but never regained its importance.

Sycaminum See HAIFA

sycamore \'si-kə-ˌmȯr\ Any of several distinct trees called by the same name though in different genera and families. In the U.S. the term refers to the American PLANE TREE or buttonwood (*Platanus occidentalis*), a hardy street tree. The sycamore MAPLE, or mock plane (*Acer pseudoplatanus*), is sometimes also called simply sycamore. The biblical sycamore, actually the sycamore FIG (*Ficus sycomorus*), was used by the ancient Egyptians to make mummy cases.

Sydenham \'si-dᵊn-əm**, Thomas** (b. 1624, Wynford Eagle, Dorset, Eng.—d. Dec. 29, 1689, London) British physician. His *Observationes medicae* (1676) was a standard textbook for two centuries, noted for its detailed observations and the accuracy of its records. His treatise on gout (1683) is considered his masterpiece. He was among the first to explain the nature of hysteria and St. Vitus dance (Sydenham chorea) and to use iron to treat iron-deficiency anemia. Sydenham also named scarlet fever and differentiated it from measles, first used laudanum (a solution of opium in alcohol) as a medication, and helped popularize the use of quinine for malaria.

Sydney City (pop., 2001: 3,997,321), capital of NEW SOUTH WALES, Australia. Located on Australia's southeastern coast, it is the oldest and largest city in Australia and a major commercial and manufacturing centre. It was founded in 1788 as a penal colony (see BOTANY BAY) and quickly became a major trading centre. It is built on low hills surrounding one of the world's finest natural harbours, which supports extensive port facili-

© 2006 Encyclopædia Britannica, Inc.

ties. It is dominated by Sydney Harbour Bridge, one of the biggest single-span bridges in the world, and the Sydney Opera House. The city is widely known for its water sports, recreational facilities, and cultural life. It is the site of the Universities of Sydney (1850) and New South Wales (1949), and Macquarie University (1964). Sydney was the host of the 2000 Summer Olympic Games.

Sydney Opera House Performing-arts centre on the harbour in Sydney, Australia. Its dynamic, imaginative design by Danish architect Jørn Utzon (b. 1918) won a competition in 1957 and brought Utzon international fame. Construction posed a variety of problems, many resulting from the bold design consisting of a series of glittering white shell-shaped roofs. After several years of research, Utzon gave the vaults a more spherical geometry, making them easier and more economical to build. The roofs are made up of precast concrete sections held together by cables. The centre finally opened in 1973.

Sydow \'sē-dō,\ *Swedish* \'sœ-dȯv**, Max von** *orig.* **Carl Adolf von Sydow** (b. April 10, 1929, Lund, Swed.) Swedish actor. After studying at Stockholm's Royal Dramatic Theatre School (1948–51), he became a noted stage actor in Malmö and Stockholm. He is best known for his dour, brooding characterizations in Ingmar Bergman's films, notably *The Seventh Seal* (1957), *The Virgin Spring* (1960), *Winter Light* (1963), *Shame* (1968), and *The Passion of Anna* (1969). His numerous U.S. and international movies include *The Greatest Story Ever Told* (1965), *The Exorcist* (1973), *Pelle the Conqueror* (1988), *What Dreams May Come* (1998), and *Minority Report* (2002).

syllable Segment of speech usually consisting of a vowel with or without accompanying consonant sounds (e.g., *a*, *I*, *out*, *too*, *cap*, *snap*, *check*). A syllabic consonant, like the final *n* sound in *button* and *widen*, also constitutes a syllable. Closed (checked) syllables end in a consonant, open (free) syllables in a vowel. Syllables play an important role in the study of speech and in phonetics and phonology.

syllogism \'si-lə-ˌji-zəm\ Form of argument that, in its most commonly discussed instances, has two categorical propositions as premises and one categorical proposition as conclusion. An example of a syllogism is the following argument: Every human is mortal (every M is P); every philosopher is human (every S is M); therefore, every philosopher is mortal (every S is P). Such arguments have exactly three terms (human, philosopher, mortal). Here, the argument is composed of three categorical (as opposed to hypothetical) propositions, it is therefore a categorical syllogism. In a categorical syllogism, the term that occurs in both premises but not in the conclusion (human) is the middle term; the predicate term in the conclusion is called the major term, the subject the minor term. The pattern in which the terms S, M, and P (minor, middle, major) are arranged is called the figure of the syllogism. In this example, the syllogism is in the first figure, since the major term appears as predicate in the first premise and the minor term as subject of the second.

syllogistic \ˌsi-lə-'jis-tik\ Formal analysis of the syllogism. Developed in its original form by Aristotle in his *Prior Analytics* c. 350 BC, syllogistic represents the earliest branch of formal logic. Syllogistic comprises two domains of investigation. Categorical syllogistic confines itself to categorical propositions and their variation with respect to modalities. Noncategorical syllogistic is a form of logical inference using whole propositions as its units, an approach traceable to the Stoics but only fully developed by John Neville Keynes (1852–1949).

Sylvester II *orig.* **Gerbert of Aurillac** (b. c. 945, near Aurillac, Auvergen, France—d. May 12, 1003, Rome) First French pope (999–1003). Renowned as a scholar of logic and mathematics, he became archbishop of Reims (991) and of Ravenna (c. 998). Appointed pope by his former student, Otto III, Sylvester worked closely with Otto, strengthening papal authority in distant states such as Kiev and Norway as well as in Italy. He denounced simony, demanded clerical celibacy, and limited the power of the bishops. He wrote textbooks on mathematics, the sciences, and music and the philosophical work *De rationali et de ratione uti* ("Concerning the Rational and the Use of Reason"). According to legends that emerged shortly after his death, his great learning was the result of magical arts or the Devil's coaching.

symbiosis Any of several living arrangements between members of two different species, including commensalism, mutualism, and parasitism. The species involved are called symbionts. In commensalism, one species (the commensal) obtains nutrients, shelter, support, or locomotion from the host species, which is substantially unaffected (e.g., remoras obtain locomotion and food from sharks). In mutualism, both species benefit. Many mutualistic relationships are obligative; neither species can live without the other (e.g., protozoans in the gut of termites digest the wood ingested by the termites).

symbol Element of communication intended to represent or stand for a person, object, group, process, or idea. Symbols may be presented graphically (e.g., the red cross and crescent for the worldwide humanitarian agency) or representationally (e.g., a lion representing courage). They may involve associated letters (e.g., C for the chemical element carbon), or they may be assigned arbitrarily (e.g., the mathematical symbol ∞ for infinity). Symbols are devices by which ideas are transmitted between people sharing a common culture. Every society has evolved a symbol system that reflects a specific cultural logic; and every symbolism functions to communicate information between members of the culture in much the same way as, but more subtly than, conventional language. Symbols tend to appear in clusters and to depend on one another for their accretion of meaning and value. See also semiotics.

symbolic interactionism See interactionism

Symbolism In art, a loosely organized movement that flourished in the 1880s and '90s and was closely related to the Symbolist movement in literature. In reaction against both Realism and Impressionism, Symbolist painters stressed art's subjective, symbolic, and decorative functions and turned to the mystical and occult in an attempt to evoke subjective states of mind by visual means. Though aspects of Symbolism appear in the work of Paul Gauguin, Vincent van Gogh, and the Nabis, its leading exponents were Gustave Moreau, Odilon Redon, and Pierre Puvis de Chavannes. Though associated primarily with France, it flourished all over Europe, had great international impact, and influenced 20th-century art and literature.

Symbolist movement Literary movement that originated with a group of French poets in the late 19th century, spread to painting and the theatre, and influenced Russian, European, and American arts of the 20th century. Reacting against the rigid conventions of traditional French poetry, as seen in the precise description favoured by the Parnassian poets, Symbolist poets sought to convey individual emotional experience through the subtle, suggestive use of highly metaphorical language. The arcane and indirect meaning of the symbol is evoked as a substitute for the increasingly attenuated sense of collective and universal meanings. Principal Symbolist poets included the Frenchmen Stéphane Mallarmé, Paul Verlaine, and Arthur Rimbaud, and the Belgian poet Émile Verhaeren. Many Symbolists were also identified with the Decadent movement. Just as Symbolist painters avoided concrete representation in favour of fantasy and imagination, Symbolist dramatists relied on myth, mood, and atmosphere to reveal only indirectly the deeper truths of existence.

Symington \'sī-miŋ-tən**, William** (b. October 1763, Leadhills, Lanarkshire, Scot.—d. March 22, 1831, London, Eng.) British engineer. Educated for the ministry, he became a mechanic instead. He created a working model of a steam-driven road carriage in 1786 and first used steam for marine purposes the following year. In 1801–02 he developed a successful steam-driven paddle wheel and used it to propel one of the first practical steamboats, the *Charlotte Dundas*. Though his engine was used successfully on the Forth and Clyde Canal in 1802, cautious managers caused the project to be abandoned in 1803.

symmetry In geometry, the property by which the sides of a figure or object reflect each other across a line (axis of symmetry) or surface; in biology, the orderly repetition of parts of an animal or plant; in chemistry, a fundamental property of orderly arrangements of atoms in molecules or crystals; in physics, a concept of balance illustrated by such fundamental laws as the third of Newton's laws of motion. Symmetry in nature underlies one of the most fundamental concepts of beauty. It connotes balance, order, and thus, to some, a type of divine principle.

Symonds \'si-məndz**, John Addington** (b. Oct. 5, 1840, Bristol, Gloucestershire, Eng.—d. April 19, 1893, Rome) English essayist, poet, and biographer. He traveled extensively for his health, finally settling in Switzerland. His chief work, *Renaissance in Italy* (1875–86), is a series of extended essays on cultural history. His writings include translations, travel sketches, and studies of personalities such as Percy B. Shelley, Ben Jonson, Sir Philip Sidney, Michelangelo, and Walt Whitman. His poetry served primarily as a release from his difficult emotional life. *A Problem*

© 2006 Encyclopædia Britannica, Inc.

in Greek Ethics (written 1871) and *A Problem in Modern Ethics* (1881) were among the first serious works treating homosexuality.

Symonds, chalk drawing by C. Orsi; in the National Portrait Gallery, London

Symons \'si-mənz\, **Arthur (William)** (b. Feb. 28, 1865, Milford Haven, Pembrokeshire, Eng.—d. Jan. 22, 1945, Wittersham, Kent) English poet and critic. He contributed to *The Yellow Book*, an avant-garde journal, and edited *The Savoy* (1896). His *Symbolist Movement in Literature* (1899), the first English work championing the French SYMBOLIST MOVEMENT in poetry, summed up a decade of interpretation and influenced WILLIAM BUTLER YEATS and T.S. ELIOT. His poetry, mainly disillusioned in feeling, appears in such volumes as *Silhouettes* (1892) and *London Nights* (1895). He also translated the poetry of PAUL VERLAINE and wrote travel pieces. After a nervous breakdown in 1908, he produced little apart from *Confessions* (1930), a moving account of his illness.

symphonic poem *or* **tone poem** Musical work for orchestra inspired by an extramusical story, idea, or "program," to which the title typically refers or alludes. It evolved from the concert OVERTURE, an overture not attached to an opera or play yet suggestive of a literary or natural sequence of events. FRANZ LISZT, who coined the term, wrote 13 such works. Famous symphonic poems include BEDŘICH SMETANA's *The Moldau* (1879), CLAUDE DEBUSSY's *Prelude to the Afternoon of a Faun* (1894), PAUL DUKAS's *The Sorceror's Apprentice* (1897), RICHARD STRAUSS's *Don Quixote* (1897), and JEAN SIBELIUS's *Finlandia* (1900).

symphony Long musical composition for orchestra, usually in several movements. The term (meaning "sounding together") came to be the standard name for instrumental episodes, and especially overtures, in early Italian opera. The late-17th-century Neapolitan opera overture, or *sinfonia*, as established especially by ALESSANDRO SCARLATTI c. 1780, had three movements, their tempos being fast-slow-fast. Soon such overtures began to be performed by themselves in concert settings, like another forerunner of the symphony, the CONCERTO GROSSO. The two merged in the early 18th century in the symphonies of Giovanni Battista Sammartini (1700/01–75). In c. 1750 German and Viennese composers began to add a MINUET movement. JOSEPH HAYDN, the "father of the symphony," wrote more than 100 symphonies of remarkable originality, intensity, and brilliance in the years 1755–95; since Haydn, the symphony has been regarded as the most important orchestral genre. WOLFGANG AMADEUS MOZART wrote about 35 original symphonies. LUDWIG VAN BEETHOVEN's nine symphonies endowed the genre with enormous weight and ambition. Later symphonists include FRANZ SCHUBERT, FELIX MENDELSSOHN, ROBERT SCHUMANN, ANTON BRUCKNER, JOHANNES BRAHMS, ANTONÍN DVOŘÁK, PYOTR ILYICH TCHAIKOVSKY, and GUSTAV MAHLER; their 20th-century successors include RALPH VAUGHAN WILLIAMS, JEAN SIBELIUS, DMITRY SHOSTAKOVICH, and WITOLD LUTOSŁAWSKI.

symposium In ancient Greece, an aristocratic banquet at which men met to discuss philosophical and political issues and recite poetry. It began as a warrior feast. Rooms were designed specifically for the proceedings. The participants, all male aristocrats, wore garlands and leaned on the left elbow on couches, and there was much drinking of wine, served by slave boys. Prayers opened and closed the meetings; sessions sometimes ended with a procession in the streets. In PLATO's famous *Symposium*, an imaginary dialogue takes place between SOCRATES, ARISTOPHANES, ALCIBIADES, and others on the subject of love. ARISTOTLE, XENOPHON, and EPICURUS wrote symposium literature on other subjects.

synagogue In Judaism, a community house of worship that also serves as a place for assembly and study. Though their exact origins are uncertain, synagogues flourished side by side with the ancient Temple cult; they existed long before Jewish sacrifice and the established priesthood were terminated with Titus's destruction of the Second Temple (AD 70). Thereafter, synagogues took on even greater importance as the unchallenged focal point of Jewish life. There is no standard synagogue architecture. A typical synagogue contains an ark (where the scrolls of the Law are kept), an "eternal light" burning before the ark, two candelabra, pews, a *bimah* (see BEMA), and sometimes a ritual bath (*mikvah*).

synapse \'si-ˌnaps\ Site of transmission of electric nerve impulses between two nerve cells or between a nerve cell and a gland or muscle cell. At chemical synapses, impulses are transmitted across microscopic spaces via chemical substances called neurotransmitters. In electric synapses, direct communication between nerve cells whose membranes are fused is possible because ions flow between the cells through channels. Electric synapses are found mainly in invertebrates and lower vertebrates; they transmit messages faster than chemical synapses. Chemical transmission seems to have evolved in large, complex vertebrate nervous systems, in which multiple messages must be transmitted over long distances.

Synchromism \'siŋ-krə-ˌmi-zəm\ Art movement concerned with the purely abstract use of colour. Founded in Paris in 1912–13 by the U.S. artists Stanton Macdonald-Wright and Morgan Russell, Synchromism ("colours together") was based on theories of colour with analogies to musical patterns. It has much in common with the ORPHISM of ROBERT DELAUNAY. The first Synchromist work, Russell's *Synchromy in Green* (1913), was exhibited at the SALON DES INDÉPENDANTS in 1913. Synchromism briefly attracted several other U.S. artists, including THOMAS HART BENTON.

synchronized swimming Swimming sport in which the movements of one or more swimmers are synchronized with a musical accompaniment. The sport developed in the U.S. in the 1930s and was admitted as an Olympic event (solo and duet only) in 1984; in 1996 the rules were changed to allow only teams of eight women. Teams are judged on compulsory and optional routines.

synchrotron \'siŋ-krə-ˌträn\ Cyclic PARTICLE ACCELERATOR in which the particle is confined to its orbit by a MAGNETIC FIELD. The strength of the magnetic field increases as the particle's MOMENTUM increases. An alternating ELECTRIC FIELD in synchrony with the orbital frequency of the particle produces acceleration. Synchrotrons are named according to the particles they accelerate. The Tevatron, a proton synchrotron at the Fermi National Accelerator Laboratory in Illinois, U.S., produces the highest particle energies achieved so far.

synchrotron radiation ELECTROMAGNETIC RADIATION emitted by charged particles that are moving at speeds close to that of light when their paths are altered. It is so called because it is produced by high-speed particles in a SYNCHROTRON. Such radiation is highly polarized (see POLARIZATION) and continuous. Its intensity and FREQUENCY depend on the strength of the MAGNETIC FIELD that alters the path of the particles, as well as on the energy of those particles. Synchrotron radiation at radio frequencies is emitted by high-energy ELECTRONS as they spiral through magnetic fields in space, such as those around Jupiter. Synchrotron radiation is emitted by a variety of astronomical objects, from planets to supernova remnants to quasars.

syncope \'siŋ-kə-pē\ Effect of temporary impairment of blood circulation to a part of the body. It is often used as a synonym for fainting, which is loss of consciousness due to inadequate blood flow to the brain. Paleness, nausea, sweating, and then pupil dilation, yawning, deep rapid breathing, and rapid heartbeat usually precede it. It lasts from under a minute to several minutes and may be followed by headache, confusion, and a weak feeling. The cause may be physical (e.g., HEART FAILURE, low blood sugar) or emotional (e.g., fear, anxiety). Abnormal vagus or autonomic nerve response can cause fainting (without preceding symptoms) triggered by ordinary activities such as urination, swallowing, coughing, or standing up or by pressure on the pulse point in the neck. Local syncope is coldness and numbness in a small area, especially the fingers, from diminished blood flow.

syndicalism \'sin-di-kə-ˌli-zəm\ Movement advocating direct action by the working class to abolish the capitalist order, including the state, and to replace it with a social order based on the *syndicat*, a free association of self-governing producers. Developed as a doctrine by leaders of the French trade union movement at the end of the 19th century, syndicalism was strongly influenced by the traditional ANARCHISM and antiparliamentarianism of the French working class. Syndicalists looked forward to victory in a class war, after which society would be organized around the *syndicats*. These bodies would coordinate their activities through a labour exchange, which would function as an employment and economic planning agency. At the peak of its influence, before World War I, the movement had in excess of one million members in Europe, Latin America,

© 2006 Encyclopædia Britannica, Inc.

and the U.S. After the war, syndicalists tended to drift toward the Soviet model of COMMUNISM or to be lured by the ostensible benefits offered by LABOUR UNIONS and democratic reforms. See also CORPORATISM.

Synge \'siŋ**, John Millington** (b. April 16, 1871, Rathfarnham, near Dublin, Ire.—d. March 24, 1909, Dublin) Irish playwright. After studying languages and music in Dublin and France, he met WILLIAM BUTLER YEATS, who advised Synge to go to the west coast of Ireland to draw material from life. From 1899 to 1902 he spent his summers on the Aran Islands, observing the people and learning their language; he based his first plays, *In the Shadow of the Glen* (1903) and *Riders to the Sea* (1904), on islanders' stories. His travels on the Irish west coast inspired his most famous play, *The Playboy of the Western World* (1907); its unsentimental treatment of Irish character traits caused riots at its opening at the ABBEY THEATRE. His unfinished *Deirdre of the Sorrows* was performed in 1910. A poetic dramatist of great power, he was a leading figure of the IRISH LITERARY RENAISSANCE.

synodic \sə-'nä-dik\ **period** Time required for a body in the SOLAR SYSTEM to return to the same or about the same position relative to the Sun as seen from Earth. The Moon's synodic period is the time between successive recurrences of the same phase (e.g., the period between one full moon and the next). A planet's synodic period is the time required for Earth to overtake it as both go around the Sun or (in the case of fast-moving Mercury or Venus) for the other planet to overtake Earth. See also SIDEREAL PERIOD.

syntax Arrangement of words in sentences, clauses, and phrases, and the study of the formation of sentences and the relationship of their component parts. In English, the main device for showing this relationship is word order; for example, "The boy loves his dog" follows standard subject-verb-object word order, and switching the order of such a sentence would change the meaning or make the sentence meaningless. Word order is much more flexible in languages such as Latin, in which word endings indicate the case of a noun or adjective; such inflections make it unnecessary to rely on word order to indicate a word's function in the sentence.

synthesizer Machine that electronically generates and modifies sounds, frequently with the use of a digital computer, for use in the composition of electronic music and in live performance. The synthesizer generates wave forms and then subjects them to alteration in intensity, duration, frequency, and timbre. It may use subtractive synthesis (removing unwanted components from a signal containing a fundamental and all related overtones), additive synthesis (building tones from signals for pure sine-wave tones), or other techniques, most importantly whole-sound sampling (digital recording of sounds, usually from acoustic instruments). The first synthesizer was developed c. 1955 by RCA. Compact, commercially viable synthesizers, generally with pianolike keyboards, were produced in the 1960s by Robert Moog (born 1934), Donald Buchla (born 1937), and others. With transistor technology, these soon became portable and cheap enough for practical performance use, and such instruments became fixtures in rock bands, often displacing electric pianos and organs. See also MIDI.

synthetic ammonia process See HABER-BOSCH PROCESS

syphilis \'si-fə-ləs\ SEXUALLY TRANSMITTED DISEASE caused by the SPIROCHETE *Treponema pallidum*. Without treatment, it may progress through three stages: primary, characterized by a CHANCRE and low fever; secondary (weeks to months later; only half of those infected display symptoms), with a skin and mucous-membrane rash, LYMPH NODE swelling, and bone, joint, eye, and nervous system involvement; and tertiary. The tertiary stage follows a latency period that can last years, and only one-fourth of those infected display tertiary symptoms. These can be benign or incapacitating and even fatal; almost any part of the body may be attacked. Syphilis can spread to a fetus from an infected mother. Other species of *Treponema* cause similar but milder, nonsexually transmitted forms of syphilis (see YAWS). Several blood tests can detect syphilis, even during latency. Antibiotic treatment is effective.

Syr Darya \ˌsir-dər-'yä\ *ancient* **Jaxartes River** River, Central Asia, in Uzbekistan, Tajikistan, and Kazakhstan. Formed by the confluence of two headstreams in the fertile FERGANA VALLEY, it flows west-northwest for 1,374 mi (2,212 km) to empty into the ARAL SEA. Its lower course is on the eastern edge of the KYZYLKUM desert. It is the longest river in Central Asia but carries less water than does the AMU DARYA. It is used extensively for hydroelectric power and irrigation.

Syracuse *Italian* **Siracusa** *ancient* **Syracusae** Seaport city (pop., 2001 prelim.: 121,000), eastern coast of Sicily, Italy. Founded in 734 BC by Greeks from CORINTH, it was seized by Hippocrates of Gela in 485 BC and ruled by tyrants until a revolution established a democratic government c. 465 BC. In 413 BC, during the PELOPONNESIAN WAR, Syracuse defeated an Athenian invasion force. Under the rule of DIONYSIUS I the Elder (405–367 BC), it became the most powerful of the Greek cities, fighting three wars against rival CARTHAGE. Syracuse fell to Rome in 211 BC. It was sacked by Frankish invaders in AD 280 and captured by Arabs in 878; its importance waned in medieval times. Now the commercial centre for an agricultural district, it also supports the fishing and tourist industries. It has many examples of medieval and Renaissance architecture as well as Greek and Roman ruins. It is the birthplace of THEOCRITUS and ARCHIMEDES.

Syracuse City (pop., 2001: 147,306), central New York, U.S. The site, at the southern end of Lake Oneida, was once the territory of the Onondaga Indians and the headquarters of the IROQUOIS CONFEDERACY. The area was visited by the French in the 17th century. Indian hostility and the swampy location precluded settlement until the establishment of a trading post in 1786. Soon a saltworks based on its brine springs began operation; it supplied most of the nation's salt until 1870. An important port on the ERIE CANAL, Syracuse serves as a distribution centre for the central New York agricultural region. It also manufactures pharmaceuticals and electronics. It is the site of Syracuse University (1870) and the Everson Museum of Art (founded 1896).

Syria *officially* **Syrian Arab Republic** Country, Middle East, along the eastern coast of the Mediterranean Sea. Area: 71,498 sq mi (185,180 sq km). Population (2005 est.): 17,794,000. Capital: DAMASCUS. Arabs are

the main ethnic group, and Kurds are the largest minority. Languages: Arabic (official), Kurdish, Armenian. Religions: Islam (predominantly Sunni); also Christianity, Druze. Currency: Syrian pound. Syria consists of a coastal zone with abundant water supplies, a mountain zone that includes the ANTI-LEBANON MOUNTAINS, and a portion of the SYRIAN DESERT. The EUPHRATES RIVER is its most important water source and only navigable river. Syria has a mixed economy based on agriculture, trade, and mining and manufacturing. Crops include cotton, cereals, fruits, tobacco, and livestock. The main mineral resources are petroleum, natural gas, and iron ore; manufactures include textiles, cement, and steel. Syria is a republic with one legislative house; its head of state and government is the president, who by law must be a Muslim. The legal system is based largely on Islamic law. The area that now comprises Syria has been inhabited for several thousand years. From the 3rd millennium BC it was under the control variously of Sumerians, Akkadians, Amorites, Egyptians, Hittites,

© 2006 Encyclopædia Britannica, Inc.

Assyrians, and Babylonians. In the 6th century BC it became part of the Persian ACHAEMENIAN EMPIRE, which fell to ALEXANDER THE GREAT in 330 BC. SELEUCID rulers governed it (301–c. 164 BC); then Parthians and Nabataean Arabs divided the region. It flourished as a Roman province (64 BC–AD 300) and as part of the BYZANTINE EMPIRE (300–634), until Arab Muslims invaded and established control. Thereafter the region was ruled by various Muslim dynasties. It came under the OTTOMAN EMPIRE in 1516, which held it, except for brief periods, until the British invaded in World War I (1914–18). After the war it became a French mandate; it was fully independent by 1946. It united with Egypt in the United Arab Republic (1958–61). During the SIX-DAY WAR (1967), it lost the GOLAN HEIGHTS to Israel. Syrian troops frequently clashed with Israeli forces in Lebanon during the 1980s and '90s. ḤĀFIZ AL-ASSAD's long regime (1971–2000) also was marked by antagonism toward Syria's neighbours Turkey and Iraq.

Syrian Desert Arid wasteland, Middle East. It extends over much of northern Saudi Arabia, eastern Jordan, southern Syria, and western Iraq. Largely covered by lava flows, it formed a nearly impenetrable barrier between the populated areas of the LEVANT and MESOPOTAMIA until modern times; several major highways and oil pipelines now cross it.

syrinx See PANPIPE

system of equations *or* **simultaneous equations** In algebra, two or more equations to be solved together (i.e., the solution must satisfy all the equations in the system). For a system to have a unique solution, the number of equations must equal the number of unknowns. Even then a solution is not guaranteed. If a solution exists, the system is consistent; if not, it is inconsistent. A system of linear equations can be represented by a MATRIX whose elements are the coefficients of the equations. Though simple systems of two equations in two unknowns can be solved by substitution, larger systems are best handled with matrix techniques.

systems analysis In INFORMATION PROCESSING, a phase of SYSTEMS ENGINEERING. The principal objective of the systems-analysis phase is the specification of what the system needs to do to meet the requirements of end users. In the systems-design phase such specifications are converted to a hierarchy of charts that define the data required and the processes to be carried out on the data so that they can be expressed as instructions of a computer program. Many information systems are implemented with generic software, rather than with such custom-built programs.

systems ecology Branch of ecosystem ecology (the study of energy budgets, biogeochemical cycles, and feeding and behavioral aspects of ecological communities) that attempts to clarify the structure and function of ECOSYSTEMS by means of applied mathematics, mathematical models, and computer programs. It concentrates on input and output analysis and has stimulated the development of applied ecology: the application of ecological principles to the management of natural resources, agricultural production, and problems of environmental pollution.

systems engineering Technique of using knowledge from various branches of engineering and science to introduce technological innovations into the planning and development stages of a system. Systems engineering was first applied to the organization of commercial telephone systems in the 1920s and '30s. Many systems-engineering techniques were developed during World War II in an effort to deploy military equipment more efficiently. Postwar growth in the field was spurred by advances in electronic systems and by the development of computers and information theory. Systems engineering usually involves incorporating new technology into complex, man-made systems, in which a change in one part affects many others. One tool used by systems engineers is the FLOWCHART, which shows the system in graphic form, with geometric figures representing various subsystems and arrows representing their interactions. Other tools include mathematical models, probability theory, statistical analysis, and computer simulations.

systems programming Development of computer SOFTWARE that is part of a computer OPERATING SYSTEM or other control program, especially as used in computer NETWORKS. Systems programming covers data and program management, including operating systems, control programs, network software, and DATABASE MANAGEMENT SYSTEMS.

Szczecin \'shchet-ˌshēn\ *German* **Stettin** \shte-'tēn\ Seaport (pop., 2000 est.: 416,500), near the mouth of the Oder River, northwestern Poland. A Slavic fishing and commercial centre for centuries, it was annexed to Poland by MIESZKO I in the 10th century. Szczecin joined the HANSEATIC LEAGUE in 1360. It passed to Sweden in 1648 and to Prussia in 1720 and remained under German control until it was transferred to Poland after World War II. During the war the port was completely destroyed and the city greatly depopulated. Under Polish administration the port and city were rebuilt, and Szczecin is now part of Poland's largest port complex. It is a cultural hub of western Poland, and several institutions of higher education are located there.

Széchenyi \'sā-chen-yi**, István, Count** (b. Sept. 21, 1791, Vienna, Austrian Empire—d. April 8, 1860, Döbling, near Vienna) Hungarian reformer and writer. Born to an aristocratic Hungarian family, he fought against Napoleon and then traveled extensively in Europe. He returned to Budapest to found the Hungarian National Academy of Sciences (1825) and wrote several works that called for economic reforms and urged the nobility to pay taxes to modernize Hungary. He led projects that improved roads, made the Danube River navigable to the Black Sea, and built the first suspension bridge at Budapest. In the 1840s he lost his following to the more radical Lajos KOSSUTH. Entering the cabinet in 1848, Széchenyi lost his sanity when conflict with Vienna erupted; he was removed to an asylum near Vienna and later committed suicide.

Szechwan See SICHUAN

Szell \'sel, 'zel**, George** (b. June 7, 1897, Budapest, Hung., Austria-Hungary—d. July 30, 1970, Cleveland, Ohio, U.S.) Hungarian-born U.S. conductor. He made his debut as a pianist at age 11, and before his 20th birthday he had appeared with the Berlin Philharmonic as pianist, conductor, and composer. He established himself as an opera conductor in various German cities, including Berlin (1924–30) and Prague (1930–36). When World War II broke out, he settled in the U.S., conducting at the Metropolitan Opera (1942–46) and then serving as musical director of the Cleveland Orchestra (1946–70). There he imposed stern discipline but won his players' devotion by his own fierce dedication. Under his direction the orchestra became known for its precision in playing and was considered one of the world's finest.

Szent-Györgyi \sānt-'jȯrj, sānt-'jȯr-jē**, Albert** (b. Sept. 16, 1893, Budapest, Hung., Austria-Hungary—d. Oct. 22, 1986, Woods Hole, Mass., U.S.) Hungarian-born U.S. biochemist. His discoveries about the roles played by certain organic compounds, especially VITAMIN C, in the oxidation (see OXIDATION-REDUCTION) of nutrients by cells brought him a 1937 Nobel Prize. He found and isolated an organic reducing agent from plant juices and adrenal gland extracts and showed it was identical to vitamin C. His work on intermediates in the cell laid the foundation for the elucidation of the TRICARBOXYLIC ACID CYCLE by HANS ADOLF KREBS. In later years he worked on the biochemistry of muscular action (demonstrating the role of ATP) and of CELL division.

Szilard \'zi-ˌlärd**, Leo** (b. Feb. 11, 1898, Budapest, Hung., Austria-Hungary—d. May 30, 1964, La Jolla, Calif., U.S.) Hungarian-born U.S. physicist. He taught at the University of Berlin (1922–33), then fled to England (1934–37) and the U.S., where he worked at the University of Chicago from 1942. In 1929 he established the relation between entropy and transfer of information, and in 1934 he helped develop the first method of separating isotopes of artificial radioactive elements. He helped ENRICO FERMI conduct the first sustained nuclear chain reaction and construct the first nuclear reactor. In 1939 he was instrumental in establishing the MANHATTAN PROJECT, in which he helped develop the atomic bomb. After the first use of the bomb, he promoted the peaceful uses of atomic energy and the control of nuclear weapons, founding the Council for a Livable World. In 1959 he received the Atoms for Peace Award.

Szymborska \shim-'bȯr-skə**, Wisława** (b. July 2, 1923, Bnin, Pol.) Polish poet. From 1953 to 1981 Szymborska was on the staff of the weekly *Życie Literackie* ("Literary Life"), gaining a reputation as a poet, book reviewer, and translator of French poetry. Her first two volumes of poetry were attempts to conform to SOCIALIST REALISM. Later poems, notable for their precise and concrete language and ironic detachment, express her dissatisfaction with communism and explore philosophical, moral, and ethical issues. A selection of her poems was published in English translation as *View with a Grain of Sand* (1995). She received the Nobel Prize for Literature in 1996.

T cell With the B CELL, one of the two main types of white blood cell, essential parts of the immune system. T cells originate in the bone marrow, mature in the thymus, and travel in the blood to other lymphoid tissues, such as the spleen, tonsils, and lymph nodes. Through receptor molecules on their surfaces, T cells directly attack invaders (ANTIGENS) by binding to them and helping remove them from the body. Because the body contains millions of T and B cells, many of which carry unique receptors, it can respond to virtually any antigen. See also ANTIBODY, IMMUNOLOGY.

T Tauri \'tē-'tȯr-ī\ **star** Any of a class of very young STARS with masses less than about twice the Sun's. Characterized by unpredictable changes in brightness, they represent an early stage in stellar evolution, having only recently been formed by the gravitational condensation of interstellar gas and dust. The energy by which they shine derives from the gravitational collapse itself. These young stars, though now contracting more slowly, are still relatively unstable and will remain so until their interior temperatures become high enough to support NUCLEAR FUSION for energy generation. More than 500 T Tauri stars have been observed.

T1 Type of broadband telecommunications connection (see BROADBAND TECHNOLOGY) used especially to connect INTERNET SERVICE PROVIDERS to the Internet's infrastructure. Developed by Bell Labs in the 1960s, the "T-carrier systems" offer entirely digital, full-duplex exchange of data over traditional wire, coaxial cable, optical fibre, microwave relay, or other communications media. The T1 lines carry about 1.5 megabits of data per second, while the related T3 lines carry over 40. However, such systems are generally too expensive for individual network users, who turn instead to ISDN lines, CABLE MODEMS, DSL connections, or some form of wireless or satellite system for high-speed Internet access.

Taaffe \'tä-fə**, Eduard, count von** (b. Feb. 24, 1833, Vienna, Austria—d. Nov. 29, 1895, Ellischau, Bohemia, Austria-Hungary) Austrian politician and prime minister (1868–70, 1879–93). A boyhood friend of the future emperor FRANCIS JOSEPH, he entered the civil service in 1852 and rose rapidly, serving as governor of upper Austria, minister of the interior (1867, 1870–71, 1879), governor of Tirol (1871–79), and prime minister. In his second term as premier, he forged a conservative coalition that restored a degree of order among the Austrian Empire's quarreling nationalities by granting concessions to the Polish and Czech nationalists and bringing them into the Habsburg civil service.

Taal \tä-'äl, 'täl**, Lake** *formerly* **Lake Bombon** Lake, southwestern LUZON, Philippines. It covers an area of 94 sq mi (244 sq km) and occupies a volcanic crater less than 10 ft (3 m) above sea level. Volcano Island (984 ft or 300 m), which rises from the lake and is also called Taal Volcano, contains another small crater (Yellow Lake). The volcano has erupted 25 times since 1572, most recently in 1970. Located within a national park, the lake is a major tourist attraction.

Ṭabarī \'tä-bə-rē**, al-** *in full* **Abū Ja'far Muḥammad ibn Jarīr al-Ṭabarī** (b. c. 839, Āmol, Iran—d. 923, Baghdad, Iraq) Muslim scholar, Qur'ānic commentator, and historian. After studying in Islamic centres of learning in Iraq, Syria, and Egypt, he wrote the compendious *Commentary on the Qur'ān* (see TAFSĪR), in which he annotated Islam's holy book with all of the juridical, lexicographical, and historical explanations transmitted in the ḤADĪTH. His other major work was the *History of Prophets and Kings*, which charted the history of human civilization from creation to the fall of the UMAYYAD DYNASTY.

Tabasco \tə-'bas-kō\ State (pop., 2000: 1,891,829), southeastern Mexico. It covers an area of 9,756 sq mi (25,267 sq km), and its capital is VILLAHERMOSA. Pre-Columbian Indian cultures included those of the QUICHÉ, OLMEC, Tabasca, and NAHUA peoples. The area was first visited by Europeans in 1518; in 1519 HERNÁN CORTÉS clashed with the Indians, who were partially subdued in the 1530s and '40s. Tabasco became a state in 1824. Agriculture, forestry, beekeeping, commercial fishing, and cattle-raising provided much of the state's income before petroleum exploitation began in the 1960s. The state is now a major oil producer.

Tabernacle In Jewish history, the portable sanctuary constructed by MOSES as a place of worship for the Hebrew tribes during the period of wandering that preceded their arrival in the Promised Land. Elaborately described in EXODUS, it was divided into an outer room, the "holy place," and an inner room, the HOLY OF HOLIES, which housed the ARK of the Covenant. With the erection of the Temple of JERUSALEM, the Tabernacle no longer served a purpose. In modern ROMAN CATHOLICISM and EASTERN ORTHODOXY, the tabernacle is the receptacle on the church altar in which the consecrated elements of the EUCHARIST are stored.

tabla \'tä-blə\ Pair of small drums, the principal percussion in Hindustani music of northern India. The higher-pitched *daya*, played with the right hand, is a roughly cylindrical one-skinned drum, usually wooden, normally tuned to the RAGA's tonic. The *baya*, played with the left hand, is a deep kettledrum usually of copper; its pitch varies with pressure from the heel of the player's hand. A disk of black tuning paste on the membrane of each drum gives it harmonic overtones.

table Article of furniture used in the Western world since at least the 7th century BC, consisting of a flat slab of stone, metal, wood, or glass supported by trestles, legs, or a pillar. Though tables were used in ancient Egypt, Assyria, and Greece, only during the Middle Ages, with the growing formality of life under feudalism, did tables increasingly take on social significance. Tables with attached legs appeared in the 15th century. The draw top was invented in the 16th century, making it possible to double the table length. Increasing contact with the East in the 18th century led to increasing specialization in the design of occasional tables.

Table Bay Inlet, Atlantic Ocean, forming the harbour of CAPE TOWN, South Africa. It is 12 mi (19 km) long and 8 mi (12 km) wide. Although less sheltered than other bays along the coast, it became a port of call for ships traveling to India and the East because of the availability of fresh water. The shore was permanently settled by the Dutch in 1652.

table tennis *or (trademark)* **Ping-Pong** Game similar to lawn tennis that is played on a tabletop with wooden paddles and a small, hollow, plastic ball. The object is to hit the ball so that it goes over the net and bounces on the opponent's half of the table in such a way as to defeat the opponent's attempt to reach and return it. Both singles and doubles games are played. A match consists of the best of any odd number of games, each game being won by the player or team who first reaches 11 points or who, after 10 points each, gains a two-point lead. Invented in England in the early 20th century, it soon spread throughout the world. Since the mid-1950s, East Asian countries have dominated the sport. It has been an Olympic sport for both men and women since 1988.

taboo Prohibition against touching, saying, or doing something for fear of immediate harm from a supernatural force. The term is of Polynesian origin and was first noted by Capt. JAMES COOK during his 1771 visit to Tonga, but taboos have been present in virtually all cultures. They may include prohibitions on fishing or hunting at certain seasons, eating certain foods, interacting with members of other social classes, coming into contact with corpses, and (for women) performing certain activities during menstruation. Although some taboos can be traced to evident risks to health and safety, there is no generally accepted explanation of most others; most authorities agree that they tend to relate to objects and actions that are significant for the maintenance of social order.

Tabrīz \ta-'brēz\ City (pop., 1996: 1,191,043), northwestern Iran. Earthquakes and invasions by Arabs, Turks, and Mongols have damaged the city numerous times. The Turkic ruler TIMUR conquered it in 1392. During the next 200 years control passed several times between Ṣafavid Iran and the Ottoman Empire. During the 18th–19th centuries it passed between the Ottomans and the Russian Empire, and the same powers fought over it in World War I (1914–18). In the 1850s a schismatic Shī'ite religious leader known as the BĀB ("Gateway") and 40,000 of his followers were executed there. It was damaged during the IRAN-IRAQ WAR (1980–90). Notable ancient sites include the 15th-century Blue Mosque, renowned for the splendour of its blue tile decoration, and the remains of the 12-sided tomb of Mongol leader MAḤMŪD GHĀZĀN.

© 2006 Encyclopædia Britannica, Inc.

Tabrīz school School of miniaturist painting founded by the Mongol Il-Khans early in the 14th century. Reflecting the penetration of East Asian traditions into Islamic painting, early Tabrīz works were characterized by light, feathery brush strokes, gentle colouring, and an attempt to create the illusion of spatiality. The school reached its peak just as the Il-Khans were being conquered by the Islamic Timurids (1370–1506). It continued to be active in this period, though it was overshadowed by the workshops in Shiraz and Herat.

Tachism \'ta-ˌshi-zəm\ (from French, *tache*: "spot") Style of painting practiced in Paris after World War II and through the 1950s. Like its U.S. equivalent, ACTION PAINTING, it featured the intuitive, spontaneous gesture of the artist's brush stroke. The Tachists, including Hans Hartung and Georges Mathieu, produced large works of sweeping brush strokes and of drips, blots, stains, and splashes of colour. Tachism was part of the postwar movement known as Art Informel, inspired by U.S. ABSTRACT EXPRESSIONISM.

tachycardia \ˌta-ki-'kär-dē-ə\ HEART rate over 100 (as high as 240) beats per minute. When it is a normal response to exercise or stress, it is no danger to healthy people, but when it originates elsewhere, it is an ARRHYTHMIA. Symptoms include fatigue, faintness, shortness of breath, and feeling the heart thumping. It may subside within minutes or hours with no lasting ill effects, but in serious heart, lung, or circulatory disease it can precede ATRIAL FIBRILLATION or HEART ATTACK and demands immediate medical attention. Tachycardias can be treated by an electric shock to the heart, by antiarrhythmic drugs, and by pacemakers.

tachyon \'ta-kē-ˌän\ Hypothetical SUBATOMIC particle whose velocity is always greater than that of light. Its existence appears consistent with the theory of RELATIVITY. Just as an ordinary particle such as an electron can exist only at speeds less than that of light, a tachyon can exist only at speeds greater than that of light. At such speeds, its mass would be real and positive. On losing energy, a tachyon accelerates; the faster it travels, the less energy it has. The existence of tachyons has not been established experimentally.

Tacitus \'ta-sə-təs\ *in full* **Publius Cornelius Tacitus** (b. AD 56—d. c. 120) Roman orator, public official, and historian. After studying rhetoric, he began his career with a minor magistracy, eventually advancing to the proconsulate of Asia, the top provincial governorship (112–113). In 98 he wrote *De vita Julii Agricolae,* a biographical account of his father-in-law, governor of Britain; and *De origine et situ Germanorum* (known as the *Germania*), describing the people of the Roman frontier on the Rhine. His works on Roman history are the *Histories*, concerning the empire from AD 69 to 96, and the later *Annals*, dealing with the empire from AD 14 to 68; the latter effectively diagnoses the decline of Roman political freedom he had described in the *Histories*. Only parts of each are extant. Tacitus is regarded as perhaps the greatest historian and one of the greatest prose stylists to write in Latin.

Tacoma City and seaport (pop., 2000: 193,556), western Washington, U.S. Located on PUGET SOUND, Tacoma was settled in 1864 and grew to become a lumbering and port city. Docks and wharves line its waterfront. A boat-building centre, the city also has smelters, foundries, and electrochemical plants. It is a gateway to Mount RAINIER National Park and is connected by bridge to the Olympic Peninsula recreation areas. It is the seat of the University of Puget Sound (1888) and Pacific Lutheran University (1890).

Taconic Orogeny \tə-'kä-nik-ȯ-'rä-jə-nē\ Mountain-building event that affected the APPALACHIAN GEOSYNCLINE along the eastern coast of the U.S. Evidence for the OROGENY is most pronounced in the northern Appalachian Mountains, but its effects can be noted as far away as Tennessee and Georgia. Events ascribed to it include the development of New York's Taconic Range and Vermont's Green Mountains. Originally thought to have occurred at approximately the Ordovician-Silurian boundary (c. 443 million years ago), it is now generally considered to have consisted of several pulses from the mid-Ordovician to the early Silurian Period.

Taconic Range Part of the APPALACHIAN MOUNTAIN system, northeastern U.S. The range extends 150 mi (240 km) from southern Vermont to northern New York. Mount Equinox (3,816 ft [1,163 m]) in southwestern Vermont is the highest peak. In Massachusetts the mountains form the western section of the BERKSHIRE HILLS. Taconic State Park, in New York, is a popular mountain recreation area.

taconite \'ta-kə-ˌnīt\ Low-grade IRON formation (e.g., in Minnesota). Recovery of the iron requires fine grinding and concentration of iron-bearing phases (see MINERAL PROCESSING), which are then formed into pellets suitable for BLAST FURNACES. As high-grade deposits of iron ore have become depleted, taconite deposits have increased in importance.

tactics In warfare, the art and science of fighting battles. It is concerned with the approach to combat, placement of troops, use made of weapons, vehicles, ships, or aircraft, and execution of movements for attack or defense. In general, tactics deal with the problems encountered in actual fighting. Tactical thinking attempts to coordinate personnel with the existing weapons technology and apply both to the terrain and enemy forces in a way that uses the fighting force to best advantage. Deployment involves placing each type of weapon where it can do the most damage to the enemy or provide the most protection to one's own forces. Timing and direction of attack are also important considerations. At sea, direction was especially crucial in the era of wind-powered warships. In recent wars, timing has been a crucial factor in mounting airborne strikes that take advantage of the element of surprise. See also STRATEGY.

Tadema, Lawrence Alma- See Lawrence ALMA-TADEMA

Tadmor See PALMYRA

tadpole *or* **polliwog** Aquatic larval stage of FROGS and TOADS. Tadpoles have a short, oval body, broad tail, small mouth, and no external gills. Most are herbivorous, but those of some species are predatory or even cannibalistic. Tadpole METAMORPHOSIS follows a pattern of gradual development of forelimbs and hind limbs, resorption of the tail, shortening of the intestine, disappearance of the gills, and development of the lungs. On completion of metamorphosis, the young frog or toad emerges onto land.

tae kwon do \'tī-'kwän-'dō\ Korean MARTIAL ART resembling KARATE. It is characterized by the use of high standing and jump kicks as well as punches and is practiced for sport, self-defense, and spiritual development. In sparring, blows are stopped just short of contact. Based on earlier forms of Korean self-defense, tae kwon do was formalized and named in 1955. It became an Olympic sport in the year 2000.

Taegu \'ta-'gü\ Metropolitan city (pop., 2000: 2,473,990), capital of North Kyŏngsang province, southeastern South Korea. For centuries the administrative, economic, and cultural centre of South Korea, it developed during the CHOSŎN DYNASTY (1392–1910) into one of the country's three big market cities. It has important textile industries but is best known for the apples grown in the surrounding area, which are exported throughout East and Southeast Asia. The area attracts visitors to its several parks, ancient pagodas, and the 9th-century Buddhist temple containing the TRIPITAKA. It is home to many universities and colleges.

T'aejo See YI SONG-GYE

Taejon \'ta-'jȯn\ Metropolitan city (pop., 2000: 1,365,961), capital of South Ch'ungch'ŏng province, southeastern South Korea. It was a poor village until rail connections spurred development in the early 1900s. During the KOREAN WAR (1950–53) it was a temporary capital of South Korea, and 70% of the city was destroyed; it has since been rebuilt. The manufacture of cotton textiles, machinery, and chemicals has been developed. Chungnam National University and several other colleges are located there.

Taeuber \'tȯi-bər**, Conrad; and Barnes Taeuber, Irene** *orig.* **Irene Barnes** (respectively b. June 15, 1906, Hosmer, S.D., U.S.—d. Sept. 11, 1999, Nashua, N.H.; b. Dec. 25, 1906, Meadville, Mo.—d. Feb. 24, 1974, Hyattsville, Md.) U.S. demographers, statisticians, and social scientists. Working for various government agencies, the couple developed a scholarly approach to the census that helped found the science of DEMOGRAPHY and made them authorities on population movements in the U.S. Their books *The Changing Population of the United States* (1958) and *The Population of Japan* (1958) are considered classics in demography.

Taewon-gun \'tä-'wən-'gün\ (b. 1821—d. 1898) Father of the last ruling Korean king, Kojong (r. 1864–1907), and regent (1864–73). As regent, Taewon-gun inaugurated reforms to strengthen the central government. He also modernized Korea's armies. He opposed concessions to Japan or the West but was kidnapped and held in China three years, during which time his power and many of his reforms were eliminated.

Taff Vale case (1900–01) Successful trial in Britain of a suit brought by the Taff Vale Railway Company against the Amalgamated Society of

© 2006 Encyclopædia Britannica, Inc.

Railway Servants (ASRS). In August 1900 the ASRS struck for higher wages but settled within two weeks when the company used strikebreakers. The company sued the union for violating the Protection of Property Act, and the courts held that a union could be sued for damages caused by a strike, effectively eliminating the strike as a weapon of organized labour. Opposition to the decision spurred the growth of the Labour Party and led to the passage of the Trade Disputes Act of 1906, which nullified the decision's effect.

Tafilalt \ˌta-fi-ˈlalt\ Oasis, southeastern Morocco. The country's largest Saharan oasis, it covers 533 sq mi (1,380 sq km). It comprises six fortified villages and palm groves stretching for some 30 mi (50 km) along the Wadi Ziz. Its old capital was the prosperous Berber stronghold of Sijilmassa, founded in AD 757 on the Saharan caravan route and finally destroyed in the 19th century. The oasis is noted for its groves of date palms.

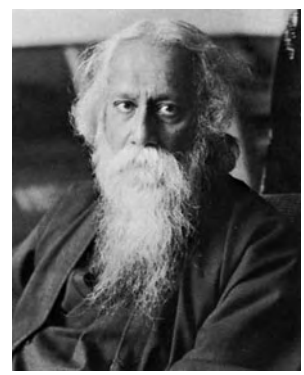
tafsīr \tȧf-ˈsēr\ Science of explanation and interpretation of the Qur'ān. It arose after the death of Muhammad to deal with ambiguity, variant readings, defective texts, and apparent contradictions in the scripture. Starting from mere personal speculation, *tafsīr* developed into a system of systematic exegesis of the Qur'ān's text, proceeding verse by verse and sometimes word by word. Early efforts relied on the Hadīth, later giving rise to a more dogmatic type of *tafsīr*. The most comprehensive work was compiled by the scholar al-Ṭabarī. Some Muslim modernists have employed *tafsīr* as a vehicle for reformist ideas.

Taft, Robert A(lphonso) (b. Sept. 8, 1889, Cincinnati, Ohio, U.S.—d. July 31, 1953, New York, N.Y.) U.S. politician. The son of William H. Taft, he served in the Ohio legislature before being elected to the U.S. Senate (1939–53). He became known as a strong advocate of traditional conservativism and earned the nickname "Mr. Republican." He opposed centralizing power in the federal government and cosponsored the Taft-Hartley Act to restrict organized labour. An isolationist, he opposed U.S. involvement in postwar international organizations. He was a favourite-son candidate for president at Republican Party national conventions, especially in 1948 and 1952, but internationalists in the party opposed his conservative views. After the election of Dwight Eisenhower, Taft became Senate majority leader and Eisenhower's chief adviser in the Senate.

Taft, William Howard (b. Sept. 15, 1857, Cincinnati, Ohio, U.S.—d. March 8, 1930, Washington, D.C.) 27th president of the U.S. (1909–13). He served on the Ohio superior court (1887–90), as U.S. solicitor general (1890–92), and as U.S. appellate judge (1892–1900). He was appointed head of the Philippine Commission to set up a civilian government in the islands and was the Philippines' first civilian governor (1901–04). He served as U.S. secretary of war (1904–08) under Pres. Theodore Roosevelt, who supported Taft's nomination for president in 1908. He won the election but became allied with the conservative Republicans, causing a rift with party progressives. He was again the nominee in 1912, but the split with Roosevelt and the Bull Moose Party resulted in the electoral victory of Woodrow Wilson. Taft later taught law at Yale University (1913–21), served on the National War Labor Board (1918), and was a supporter of the League of Nations. As chief justice of the U.S. Supreme Court (1921–30), he introduced reforms that made the court more efficient. His important opinion in *Myers* v. *U.S.* (1926) upheld the president's authority to remove federal officials.

William Howard Taft, 1909.
LIBRARY OF CONGRESS, WASHINGTON, D.C.

Taft-Hartley Act *officially* **Labor-Management Relations Act** (1947) U.S. legislation that restricted labour unions. Sponsored by Sen. Robert A. Taft and Rep. Fred A. Hartley, Jr., the act amended much of the pro-union Wagner Act (1935) and was passed by a Republican-controlled Congress over the veto of Pres. Harry S. Truman. It allowed employees the right not to join unions (outlawing the closed shop) and required advance notice of a labour strike, authorized an 80-day federal injunction when a strike threatened national health or safety, narrowed the definition of unfair labour practices, specified unfair union practices, restricted union political contributions, and required union officials to take an oath pledging they were not communists. See also Landrum-Griffin Act.



Tagalog \tə-ˈgä-ləg\ Any member of the largest cultural-linguistic group in the Philippines. They are the dominant population of Manila and of several provinces near the city. Most are Roman Catholic, and most are farmers; their main cash crops are sugarcane and coconuts. Manila's dominance has given the urban Tagalog economic leadership in the Philippines. The Tagalog language is the basis of Pilipino, the national language.

Tagalog language Austronesian language of the Philippines, spoken as a first language by about 17 million people on the island of Luzon and by at least half a million immigrant Filipinos. As the language of Manila, the capital and chief city of the Philippines, Tagalog has long had an importance outside its own speech area. With vocabulary enrichment from other Philippine languages, it has been made the basis of Pilipino, the national language; widely used in education and the media, Pilipino is now understood by more than 60% of the Philippine population. Though a script ultimately of South Asian origin was in use for Tagalog in the 16th century (see Indic writing systems), all recent literature in the language has utilized adaptations of the Latin alphabet.

Taglioni \täl-ˈyō-nē**, Marie** (b. April 23, 1804, Stockholm, Swed.—d. April 24, 1884, Marseille, Fr.) Italian ballet dancer. She trained with her dancer-choreographer father, Filippo Taglioni (1777–1871), and made her debut in Vienna in 1822. In her father's ballet *La Sylphide*, introduced at the Paris Opéra in 1832, she became one of the first to dance on pointe. She created a delicate new style, marked by floating leaps and balanced poses such as the arabesque, that typified the early 19th-century Romantic style. Her diaphanous white skirts would evolve into the tutu worn by most classical ballerinas. She toured throughout Europe and, after leaving the Opéra in 1837, danced with the Imperial Ballet in St. Petersburg; she retired from dancing in 1847.

Tagore \ˈtä-ˌgȯr,\ *English* \tə-ˈgȯr**, Debendranath** (b. May 15, 1817, Calcutta, India—d. Jan. 19, 1905, Calcutta) Hindu philosopher and religious reformer. Born into a wealthy landowning family, he was educated in both Eastern and Western philosophy. Striving to purge Hinduism of abuses, he spoke vehemently against suttee and tried to bring education within the reach of all. He was active in the Brahmo Samaj. In his zeal to erase idolatry and undemocratic practices, he rejected the Vedas as deficient in dictating guidelines for human behaviour. Failing to find a middle path between radical rationalism and Brahman conservatism, he retired from public life. He was known as the Great Sage. Rabindranath Tagore was his son.

Tagore, Rabindranath (b. May 7, 1861, Calcutta, India—d. Aug. 7, 1941, Calcutta) Bengali poet, writer, composer, and painter. The son of Debendranath Tagore, he published several books of poetry, including *Manasi*, in his 20s. His later religious poetry was introduced to the West in *Gitanjali* (1912). Through international travel and lecturing, he introduced aspects of Indian culture to the West and vice versa. He spoke ardently in favour of Indian independence; as a protest against the Massacre of Amritsar, he repudiated the knighthood he had received in 1915. He founded an experimental school in Bengal where he sought to blend Eastern and Western philosophies; it became Vishva-Bharati University (1921). He was awarded the 1913 Nobel Prize for Literature.

ness it for irrigation and hydroelectric power, and large artificial lakes have been created. Navigable for about 100 mi (160 km) in its lower courses, it supplies a fine natural harbor at Lisbon.

Taha Hussein *or* **Taha Husayn** \'tä-hä-hü-'sān\ (b. Nov. 14, 1889, Maghāghah, Egypt—d. Oct. 28, 1973, Cairo) Egyptian writer. Though blinded by an illness at age two, he became a professor of Arabic literature at the secular University of Cairo, where his bold views often enraged Islamic religious conservatives. An outstanding figure of the modernist movement in Egyptian literature, he wrote novels, stories, criticism, and social and political essays. Outside Egypt he is best known for his autobiography, the two-part *Al-Ayyam*, published in English as *An Egyptian Childhood* (1932) and *The Stream of Days* (1943), which was the first modern Arab literary work to be acclaimed in the West.

Tahiti Island, Society Islands, French Polynesia, central South Pacific Ocean. The largest of the Society Islands, it occupies an area of 402 sq mi (1,042 sq km) in their eastern group. Papeete, the capital of French Polynesia, is on Tahiti. The island's interior is mountainous, rising to 7,339 ft (2,237 m) at Mount Orohena; its towns are located on the coastal plain. Long inhabited by Polynesians, it was visited by British Capt. Samuel Wallis in 1767 and in 1768 by Louis-Antoine de Bougainville, who claimed it for France. The first permanent European settlers were English missionaries who arrived in 1797. It became a French colony in 1880 and is now part of the self-governing overseas territory of French Polynesia. Continued French nuclear testing in the area has angered the inhabitants and brought calls for independence. Tourism is economically important.

Tahoe, Lake Lake on the California-Nevada border in the northern Sierra Nevada, U.S. The lake, which occupies a fault basin, covers 193 sq mi (500 sq km). It is 22 mi (35 km) long by 10 mi (16 km) wide and lies at an elevation of 6,229 ft (1,899 m). Its water level has varied during seasons of drought in recent decades. Fed by numerous small streams, the intensely blue lake and the surrounding national forests have been developed as popular tourist resorts.

Lake Tahoe in Toiyabe National Forest, Nevada.
JOHN F. SHRAWDER/SHOSTAL

Ṭahṭāwī \täh-'tä-,wē**, Rifāʿah Rāfiʿ al-** (b. 1801, Ṭahṭā, Egypt—d. 1873, Egypt) Egyptian teacher and scholar. Beginning in 1826, he spent five years in Paris as a religious teacher for a group of Egyptian students and later was appointed head of a state language school (1836) and a translation bureau (1841) in Cairo. In these capacities he played a central role in bringing Western science and methods to Egypt. Under the anti-Western administration of khedive ʿAbbās I (1848–54), he was sent to teach school in Khartoum, Sudan, but later returned to resume his work in translation and education.

Tai \'tī\ Any member of the dominant group of mainland Southeast Asia. They include the Thai, or Siamese (in Thailand), the Lao (in Laos and Thailand), the Shan (in Myanmar), the Lü (primarily in Yunnan province, China), the Yunnan Tai (in Yunnan), and the tribal Tai (in Vietnam). All speak Tai languages, and most are Buddhists of the Theravada school. The status of Tai women is high. The Tai number about 76 million.

Tai See Shan

Tai, Lake *Chinese* **Tai Hu** \'tī-'hü\ *or* **T'ai Hu** Lake, between Zhejiang and Jiangsu provinces, eastern China. Roughly crescent-shaped, it covers an area of 850 sq mi (2,200 sq km). It lies in a plain and is served by a maze of natural and man-made waterways, some dating from the 7th century AD. Several islands in the eastern section were traditionally famous Daoist and Buddhist religious sites. The area's great natural beauty attracts many tourists.

Tai Chi Chuan *Chinese* **taijiquan** *or* **t'ai-chi-ch'üan** \'tī-'jē-'chwän\ Ancient Chinese form of exercise or of attack and defense. As exercise, it is designed to provide relaxation in the process of body conditioning, which it accomplishes partly by harmonizing the principles of yin-yang. It employs flowing, deliberate movements with carefully prescribed stances and positions. As a mode of attack and defense, it resembles kung fu and is properly considered a martial art. Dating to the 3rd century AD, Tai Chi Chuan consists of two major schools, the Wu and the Yang. Depending on the school, the number of exercises varies from 24 to more than 100.

T'ai-chung \'tī-'chùŋ\ City (pop., 2002 est.: 990,041), west-central Taiwan. Most of the old town was torn down under the Japanese occupation (1895–1945) and replaced by a planned modern city. An agricultural centre since the early 19th century, it is a major market for the rice, sugar, and bananas produced in the surrounding area. In the 1970s an international seaport was developed west of the city, and T'ai-chung was designated an export-processing zone to encourage foreign investment. It is also a cultural centre, with various institutions of higher education. In 1999 it suffered one of Taiwan's worst earthquakes.

T'ai Hsü See Tai Xu

Tai languages Family of closely related languages spoken in Southeast Asia and southern China by more than 80 million people. According to a widely used classification, Tai comprises three branches. The Southwestern group includes Thai, the national language of Thailand; northeastern Thai and Lao, spoken in eastern Thailand and Laos; Pak Tay (South Thai), spoken in southern Thailand; Shan, spoken in eastern and northern Myanmar; and Tai Dam (Black Tai) and Tai Don (Tai Khaw, or White Tai), spoken mainly in North Vietnam. The Central group includes Nung and South Zhuang, a dialect chain in northern Vietnam and China's Guangxi province; and Tay (Thô), spoken in the same area. The Northern group includes Buyi and North Zhuang, a dialect chain spoken in Guangxi, Guizhou, and Yunnan, China. All Tai languages are tone languages. Most scholars believe the Tai family is related to a number of other languages spoken by minority peoples of southern China and northern Vietnam. Together with Tai, the entire group has been named the Kadai or Tai-Kadai family.

T'ai-nan \'tī-'nän\ *formerly* **Dainan** City (pop., 2002 est.: 742,574), southwestern Taiwan. It is one of the oldest urban settlements on the island. The Han Chinese settled there as early as 1590. The Dutch arrived in the city in 1623 and stayed until they were driven out in 1662 by Zheng Chenggong, who made it his capital. It remained the island's capital when the Qing dynasty reestablished Chinese control over Taiwan (1683). Under Chinese rule in the 19th century, it grew into a prosperous city and was the commercial and educational centre of Taiwan. After the transfer of the capital to Taipei in 1891, it became primarily commercial. It expanded during the Japanese occupation (1895–1945). Today it is a major market and tourism centre.

T'ai-tsung See Taizong

Tai Xu *or* **T'ai Hsü** \'tī-'shü\ *orig.* **Lü Peilin** (b. Jan. 8, 1890, Haining, Zhejiang province, China—d. March 17, 1947, Shanghai) Chinese Buddhist monk and philosopher. After training as a Buddhist monk near Ningbo, he helped organize the Association for the Advancement of Buddhism (1912). In 1921 he began publication of the influential journal *Haichaoyin* ("The Voice of the Sea Tide"). Heavily influenced by Sun Yat-sen and the revolution of 1911, he sought to reform the education of monks and promoted social welfare activities. From 1925 to 1941 he traveled extensively to promote the formation of national and international Buddhist organizations in Japan, Europe, the U.S., and South and Southeast Asia.

Taieri River \'tī-ə-rē\ River, southeastern South Island, New Zealand. It rises in the Lammerlaw Range and flows 179 mi (288 km) north and southeast in a great arc, across plains and around the Rock and Pillar Range, to enter the Pacific Ocean near Dunedin. Gorges are found in both the upper and lower reaches.

taiga \'tī-gə\ *or* **boreal forest** Open coniferous forest (see conifer) growing on swampy ground that is commonly covered with lichens. It is the characteristic vegetation of the subpolar region of northern Eurasia (principally Russia, including Siberia, and Scandinavia) and northern North America, bounded by the colder tundra to the north and the warmer temperate zone to the south. Spruces and pines are the dominant trees. Soil organisms are protozoans, nematodes, and rotifers; larger invertebrates (e.g., insects) that decompose plant litter are lacking, so humus accumulates very slowly. The taiga is rich in fur-bearing animals (e.g., sable, fox,

© 2006 Encyclopædia Britannica, Inc.

and ermine) and is home to elks, bears, and wolves. Siberian taiga alone accounts for 19% of the world's forested area and possibly 25% of total forest volume. Despite the remoteness of the taiga, it is a major source of lumber for construction, and huge expanses have been clear-cut.

Taiga, Ike no See Ike no Taiga

taijiquan See t'ai chi ch'uan

tail Extension of the vertebral column beyond the trunk, or any slender projection resembling such a structure. In fishes and other animals living completely or partly in water, it is very important to movement through water. Many tree-dwelling animals (e.g., squirrels) use the tail for balance and as a rudder when leaping; in some (e.g., certain monkeys), it is adapted for grasping. Birds' tail feathers aid in flight maneuverability. Other animals use their tails for defense (e.g., porcupines), social signals (e.g., dogs and cats), warning signals (e.g., deer and rattlesnakes), and hunting (e.g., alligators).

Táin Bó Cúailgne See Cattle Raid of Cooley, The

Taine \'ten**, Hippolyte (-Adolphe)** (b. April 21, 1828, Vouziers, Ardennes, France—d. March 5, 1893, Paris) French thinker, critic, and historian. Taine came to believe as a youth that knowledge must be based on sense experience, observation, and controlled experiment, a conviction that guided his career. Teaching at the École des Beaux-Arts in Paris (1864–83), he earned a reputation as one of the most esteemed exponents of 19th-century French positivism with his attempts to apply the scientific method to the study of the humanities. His works include a *History of English Literature* (1863–64), containing an explanation of his approach to cultural and literary history and his scientific attitude toward criticism; *On Intelligence* (1871), a study in psychology; and his monumental historical analysis *Les Origines de la France contemporaine*, 3 vol. (1876–99).

Taino \'tī-nō\ Extinct Arawak Indian group of the island of Hispaniola in the Caribbean Sea. They also inhabited Puerto Rico and the eastern tip of Cuba. They grew cassava and corn (maize), hunted birds and small animals, and fished. They were skillful at working stone and wood. Their society consisted of three tiers—nobles, commoners, and slaves—and they were ruled by hereditary chiefs and subchiefs; religious beliefs centred on a hierarchy of nature spirits and ancestors. They became extinct within 100 years of the Spanish conquest.

Taipei \'tī-'pā\ City, special (province-level) municipality (pop., 2005 est.: 2,622,472), and seat of government of the Republic of China (Taiwan). Founded in the early 18th century, it became an important centre of overseas trade in the mid-19th century. When Taiwan was proclaimed a province of China in 1886, Taipei was later made the capital, and it retained that designation under Japanese rule (1895–1945). In 1949 it became the administrative centre of the Chinese Nationalist government. It was designated a special municipality in 1967. Taipei is the commercial, financial, industrial, and transportation centre of Taiwan. Its many educational institutions include the National Taiwan University (1928). The city's National Palace Museum houses one of the world's largest collections of Chinese artifacts. The Taipei 101 building became the world's tallest building upon completion of its framework in 2003.

Taiping \'tī-'piŋ\ **Rebellion** (1850–64) Large-scale rebellion against the Qing dynasty in China. The peasants, having suffered floods and famines in the late 1840s, were ripe for rebellion, which came under the leadership of Hong Xiuquan. Hong's visions convinced him he was the younger brother of Jesus, and he saw it as his duty to free China from Manchu rule. He preached the brotherhood and sisterhood of all people under God; property was to be held in common. His followers' militant faith unified a fiercely disciplined army that swelled to more than a million men and women (women were treated as equals by Taiping rebels). They captured Nanjing in 1853 and renamed it Tianjing ("Heavenly Capital"). Their attempts to capture Beijing failed, but an expedition into the upper Yangtze River (Chang Jiang) valley scored many victories. Hong's idiosyncratic Christianity alienated both Western missionaries and the Chinese scholar-gentry. Without the gentry, the Taiping forces were unable to govern the countryside or supply their cities effectively. The leadership strayed from its original austerity and descended into power struggles that left Hong without competent help. In 1860 an attempt to take Shanghai was repelled by U.S.- and British-led forces, and by 1862 Chinese forces under Zeng Guofan had surrounded Nanjing. The city fell in 1864, but almost 100,000 of the Taiping followers preferred death to capture. Sporadic resistance continued elsewhere until 1868. The rebellion ravaged 17 provinces, took some 20 million lives, and left the Qing government unable to regain an effective hold over the country. See also Li Hongzhang; Nian Rebellion.

Taira Kiyomori \'tī-rä-ˌkē-yō-'mȯ-rē\ (b. 1118, Japan—d. March 21, 1181, Kyōto) Leader of the powerful Taira family and the first member of the warrior class (samurai) to rule Japan. The Taira family had made itself useful to the imperial court quelling pirates on Japan's Inland Sea. In 1156, when the retired emperor Sutoku (see insei) enlisted the aid of the Minamoto warrior family to help in a rebellion against the reigning emperor Go-Shirakawa, Kiyomori supported Go-Shirakawa and defeated the Minamoto. The Minamoto staged a comeback in 1159–60, but Kiyomori defeated them again, executing all the Minamoto males except the children Minamoto Yoritomo and Minamoto Yoshitsune, who would later overthrow him. Temporarily victorious, Kiyomori received the highest court rank and manipulated the throne by marrying his daughters into the imperial family. The Taira forces took on the effete ways of the aristocrats and were no match for the frontier-hardy Minamoto, who defeated them in 1185. See also Gempei War; Kamakura period.

Taishō period (1912–26) Period in Japanese history corresponding to the reign of the Taishō emperor, Yoshihito (1879–1926). It followed the Meiji period and represented a continuation of Japan's rise on the international scene and liberalism at home. Politically, the country moved toward broader representational government. The tax qualification for voting was reduced, enfranchising more voters, and was eliminated in 1925. Party politics flourished, and legislation favourable to labour was passed. Japan continued to push China for economic and political concessions and entered into treaties with Western nations that acknowledged its interests in Korea, Manchuria, and the rest of China. Rural Japan did not fare as well as urban Japan, and an economic depression at the end of the Taishō period caused much suffering. See also Shōwa period.

Tait, Archibald C(ampbell) (b. Dec. 21, 1811, Edinburgh, Scot.—d. Dec. 3, 1882, Addington, Surrey, Eng.) English cleric. The son of Presbyterian parents, he became an Anglican while studying at the University of Oxford. In 1836 he became a deacon and for five years he was also a curate at two villages near Oxford. In 1842 he succeeded Thomas Arnold as headmaster of Rugby School, and in 1849 he became dean of Carlisle Cathedral. He became bishop of London in 1856; in that position he stressed reconciliation between evangelical churchmen and those who supported the Oxford movement. As archbishop of Canterbury (from 1868), he oversaw the disestablishment of the Anglican Church of Ireland and the passage of the Burials Act (1880), which allowed non-Anglican burial services in Anglican churchyards.

Taiwan *formerly* **Formosa** Island, western Pacific Ocean, off southeastern China, and since 1949 the principal component of the Republic of China (which also includes Matsu and Quemoy islands and the Pescadores). Area: 13,972 sq mi (36,188 sq km), including its outlying islands. Population (2005 est.): 22,725,947. Administrative centre: Taipei. Han Chinese constitute virtually the entire population. Languages: Mandarin Chinese (official); Taiwanese, Fukien, and Hakka dialects also spoken. Religions: Buddhism, Daoism, Confucianism, Christianity. Currency: new Taiwan dollar. Lying 100 mi (160 km) off the Chinese mainland, Taiwan is composed mainly of mountains and hills, with densely populated coastal plains in the west. It has one of the highest population densities in the world and is a leading industrial power of the Pacific Rim, with an economy based on manufacturing industries, international trade, and services. Leading exports include nonelectrical and electrical machinery, electronics, textile products, plastic articles, and transportation equipment. Taiwan is a major producer of Chinese-language motion pictures. It is a republic with one legislative branch; its chief of state is the president, and the head of government is the premier. Known to the Chinese as early as the 7th century, the island of Taiwan was widely settled by them early in the 17th century. In 1646 the Dutch seized control of the island, only to be ousted in 1661 by a large influx of Chinese refugees, supporters of the Ming dynasty. Taiwan fell to the Manchu in 1683 and was not open to Europeans again until 1858. In 1895 it was ceded to Japan following the first Sino-Japanese War. A Japanese military centre in World War II, it was frequently bombed by U.S. planes. After Japan's defeat it was returned to China, which was then governed by the Nationalists. When the communists took over mainland China in 1949, the Nationalist Party government fled to Taiwan and made it their seat of government, with Gen. Chiang Kai-shek as president. Since then, both the Nationalist government and the People's Republic of China (mainland China) have considered

© 2006 Encyclopædia Britannica, Inc.

Taiwan a province of China. In 1954 Chiang and the U.S. signed a mutual defense treaty, and Taiwan received U.S. support for almost three decades, developing its economy in spectacular fashion. It was recognized as the representative of China in the UN until 1971, when it was replaced there by the People's Republic. Martial law in Taiwan, in effect since 1949, was lifted in 1987, and travel restrictions with mainland China were removed in 1988. In 1989 opposition parties were legalized. The relationship with the mainland grew increasingly close in the 1990s, but it again became strained over the future status of Taiwan after Chen Shui-bian (Ch'en Shui-pian) was elected president in 2000.

Taiwan Strait *or* **Formosa Strait** Arm of the northwestern Pacific Ocean. Lying between the coast of China's Fujian province and the island of Taiwan, it is about 100 mi (160 km) wide. The strait connects the South China Sea and East China Sea.

Taiyuan \'tī-'ywän\ *or* **T'ai-yüan** City (pop., 1999 est.: 1,768,530), capital of Shanxi province, China, lying on the Fen River. Known since the time of the Zhou dynasty, it was a strategic centre and administrative capital in the time of the Mongols (12th–14th century). It was the scene of a massacre in 1900 of foreign missionaries during the Boxer Rebellion and was one of the first areas to oppose the emperor in 1911. Invaded by the Japanese in 1937, it was again besieged by communist forces in 1948–49. One of the greatest industrial cities in China, it produces cement, iron and steel, and coal. It also is an education and research centre. There are notable cave temples from the Tang and Yuan eras in the area.

Taizong *or* **T'ai-tsung** \'tī-'dzùŋ\ *orig.* **Li Shimin** (b. 598, China—d. 649, China) Second emperor of China's Tang dynasty. In his father's campaign against the Sui dynasty, Li Shimin was responsible for the conquest of Luoyang, the eastern capital. There he built up a regional administration and an entourage of talented officials. His brothers are said to have plotted to kill him; he did away with them instead, and his father soon abdicated in his favour. He restored normal civil administration to local government and created a unified civil service. He further developed the state schools created by his father and launched the editing of the Confucian Classics. On the frontiers, he fought eastern and western Turks and began to establish sovereignty over the oasis kingdoms of Xinjiang. An invasion of the Korean Koguryŏ kingdom failed, but he won great prestige for the Tang and came to be widely revered.

Taizu *or* **T'ai-tsu** \'tī-'dzü\ (b. 927, Luoyang, China—d. Nov. 14, 976, Kaifeng) First emperor of the Song dynasty, who began the unification of China, which his brother would complete. Initially a general for the founder of the Later Zhou dynasty (951–960), he was induced by his troops to take over when the dynasty was left in the hands of a child successor. An upright man, Taizu forgave minor faults while holding his officials accountable in important matters. He had his ministers submit rough drafts of papers for his review, and he frequently traveled about incognito to observe conditions among his people. He reformed the Chinese examination system to prevent favouritism and began to award larger numbers of degrees. He gradually moved the administration of the prefectures from the military to civil officials. At his death, a solid foundation had been laid for the future development of the dynasty.

Taj Mahal \'täzh-mə-'häl\ Mausoleum complex on the southern bank of the Yamuna River, outside Agra, India. It was built by the Mughal emperor Shah Jahān in memory of his wife, Mumtāz Maḥal, who died in 1631. The Taj complex, begun c. 1632, took 22 years to complete. At its centre lies a square garden area bounded by two smaller, oblong sections, one comprising the mausoleum and the other an entrance gateway. The mausoleum, of pure-white marble inlaid with semiprecious stones, is flanked by two red sandstone buildings, a mosque on one side and an identical building for aesthetic balance on the other. It stands on a high marble plinth with a minaret at each corner. It has four identical facades, each with a massive central arch 108 ft (33 m) high, and is surmounted by a bulbous double dome and four domed kiosks. Its interior, with fine, restrained stone decoration, centres on an octagonal chamber containing the marble tombs, enclosed by a perforated marble screen, with sarcophagi below. Regarded as one of the world's most beautiful buildings, it was designated a UNESCO World Heritage site in 1983. Steps have been taken since the late 1990s to reduce air pollution that has damaged the facade of the building.

Tajikistan \tä-ˌji-ki-'stan\ *officially* **Republic of Tajikistan** Country, Central Asia. Area: 55,300 sq mi (143,100 sq km). Population (2005 est.): 6,849,000. Capital: Dushanbe. The majority of the population are Tajiks;

Uzbeks make up a large minority. Language: Tajik (official). Religion: Islam (predominantly Sunni). Currency: somoni. Tajikistan is a mountainous country; about half of its territory lies at elevations above 10,000 ft (3,000 m), with the Pamirs dominating the east. The entire region is prone to seismic activity. The Amu Darya and Syr Darya rivers cross it and are used for irrigation. Cotton, cattle, fruits, vegetables, and grains are raised. Heavy industries include coal mining, petroleum and natural gas extraction, metalworking, and nitrogen fertilizer production. Notable light industries are cotton milling, food processing, and textiles. Tajikistan is a republic with two legislative houses; the chief of state is the president, and the head of government is the prime minister. Settled by Persians c. the 6th century BC, Tajikistan was part of the empires of the Persian Achaemenian

© 2006 Encyclopædia Britannica, Inc.

dynasty and of Alexander the Great and his successors. In the 7th–8th century AD it was conquered by the Arabs, who introduced Islam. The Uzbeks controlled the region in the 15th–18th centuries. In the 1860s the Russian Empire took over much of Tajikistan. In 1924 it became an autonomous republic under the administration of the Uzbek S.S.R., and it gained union republic status in 1929. It achieved independence with the collapse of the Soviet Union in 1991. Civil war raged through much of the 1990s between government forces and an opposition composed mostly of Islamic militants. A peace agreement was reached in 1997.

Tajumulco \ˌtä-hü-ˈmül-kō\ **Volcano** Volcanic mountain, western Guatemala. Part of a mountain range that extends into Guatemala from southern Mexico, it is the highest peak in Central America, 13,845 ft (4,220 m) high. It is thought to sit atop the remains of an older volcano.

Takebe Katahiro (b. 1664, Edo, Japan—d. Aug. 24, 1739, Edo) Japanese mathematician of the *wasan* ("Japanese calculation") tradition who extended and disseminated the mathematical research of his teacher Seki Takakazu. He served successively two shoguns, Tokugawa Ienobu and Tokugawa Yoshimune (see Tokugawa period). Takebe became a pupil of Seki at the age of 13 and, together with his brother Kataaki, remained with him until his death in 1708. The brothers were the main craftsmen of Seki's project (launched 1683) to record mathematical knowledge in an encyclopaedia. The *Taisei sankei* ("Comprehensive Classic of Mathematics"), in 20 volumes, was finally completed by Takebe Kataaki in 1710. It gives a good picture of Seki's skill at reformulating problems, as well as Takebe Katahiro's ability to correct, perfect, and extend his master's intuitions.

Takemitsu \tä-ke-ˈmit-sü**, Tōru** (b. Oct. 8, 1930, Tokyo, Japan—d. Feb. 20, 1996, Tokyo) Japanese composer. In 1951 he founded Tokyo's Experimental Laboratory to promote an integration of Japanese music with contemporary European developments. Soon acknowledged as Japan's leading composer, he explored avant-garde techniques such as serialism, aleatory music, graphic notation, and electronic music, combining them with traditional Japanese motives and instruments (e.g., *November Steps*, 1967, for *biwa*, *shakuhachi*, and orchestra). He created an individual sound world in which silence itself is an important element.

Takfīr wa al-Hijrah \tȧk-ˈfēr-wȧl-ˈhij-rə\ *Arabic* **"Excommunication and [Holy] Flight"** Name given by Egyptian authorities to a radical Islamic group calling itself the Society of Muslims. It was founded in 1971 by a young agronomist, Shukrī Muṣṭafā, who had been arrested in 1965 for distributing Muslim Brotherhood leaflets and was released from prison in 1971. Appealing to those who saw mainstream society—from which the group sought to flee (see Hijrah)—as weak, corrupt, and un-Islamic, it engaged in acts of terrorism and was initially thought to be behind the assassination of Anwar el-Sādāt. The group soon dissolved, partly because of the extreme rigour of its doctrine, and is noteworthy because its actions initiated the repression of fundamentalist groups by security services in Egypt in the late 1970s.

Takla Makan \ˌtä-klə-mə-ˈkän\ **Desert** *Chinese* **Taklimakan Shamo** *or* **T'a-k'o-la-ma-kan Sha-mo** Desert, forming the greater part of the Tarim Basin, west-central China. One of the world's largest sandy wastes, it is about 600 mi (965 km) across, with an area of 105,000 sq mi (272,000 sq km). It is flanked by high mountain ranges, including the Kunlun Mountains, whose rivers penetrate the desert 60–120 mi (100–200 km) before drying up in its sands. Its wind-blown sand cover is as much as 1,000 ft (300 m) thick and has formed such features as pyramidal dunes that can reach heights of 1,000 ft (300 m).

Taksin \ˈtäk-sin\ *or* **Phraya Taksin** (b. April 17, 1734, Ayutthaya—d. April 6, 1782, Thon Buri) Thai general and later king (1767–82) who reunited Siam (Thailand) after its defeat by Myanmar (Burma). While Taksin was a provincial governor, his troops were among those besieged by the forces of Myanmar in 1766–67, but he escaped and raised new troops. He drove out the invaders and defeated other contenders for the throne, then extended his power into neighbouring states. A better conqueror than ruler, he was deposed and probably executed in 1782.

Talbot, William Henry Fox (b. Feb. 11, 1800, Melbury Abbas, Dorset, Eng.—d. Sept. 17, 1877, Lacock Abbey, near Chippenham, Wiltshire) English chemist and pioneer photographer. In 1840 he developed the calotype, an early photographic process that improved on the daguerreotype; it involved the use of a photographic negative from which multiple prints could be made. In 1835 he published his first article documenting a photographic discovery, that of the paper negative. His *The Pencil of Nature* (1844–46) was the first book with photographic illustrations. Talbot also published many articles on mathematics, astronomy, and physics.

talc Common silicate mineral that is distinguished from almost all other minerals by its extreme softness. Its soapy or greasy feel accounts for the name soapstone, given to compact aggregates of talc with other rock-forming minerals. Soapstones have been used since ancient times for carvings, ornaments, and utensils. Resistant to most reagents and to moderate heat, they are especially suitable for sinks and countertops. Talc is also used in lubricants, leather dressings, toilet and dusting powders, and certain marking pencils; as a filler in ceramics, paint, paper, roofing materials, plastic, and rubber; as a carrier in insecticides; and as a mild abrasive in the polishing of cereal grains.

Talcahuano \ˌtäl-kä-ˈwä-nō\ City (pop., 2002 est.: 245,000), south-central Chile. Lying on a small peninsula that forms the southwestern shore of Concepción Bay, it is a major port and the site of Chile's main naval station. It is also an important commercial, fishing, and manufacturing centre. The Peruvian ironclad *Huáscar*, captured by Chile during the War of the Pacific (1879), is moored in the harbour.

Taliban \ˌtä-lē-ˈbän\ Political and religious faction and militia that came to power in Afghanistan in the mid-1990s. Following the Soviet Union's 1989 withdrawal from Afghanistan (see Afghan Wars), the Taliban (Persian: "Students")—whose name refers to the Islamic religious students who formed the group's main recruits—arose as a popular reaction to the chaos that gripped the country. In 1994–95, under the leadership of Mullah Mohammad Omar, the Taliban extended its control in Afghanistan from a single city to more than half the country, and in 1996 it captured Kabul and instituted a strict Islamic regime. By 1999, the Taliban controlled most of Afghanistan but failed to win international recognition of its regime because of its harsh social policies—which included the almost complete removal of women from public life—and its role as a haven for Islamic extremists. Among these extremists was Osama bin Laden, the expatriate Saudi Arabian leader of Al-Qaeda, a network of Islamic militants that had engaged in numerous acts of terrorism. The Taliban's refusal to extradite bin Laden to the U.S. following the September 11 attacks in 2001 prompted the U.S. to attack Taliban and Al-Qaeda forces in Afghanistan, driving the former from power and sending the leaders of both groups into hiding. See also Islamic fundamentalism.

Taliesin \ˌta-lē-ˈe-sin\ Home, as well as architectural school, of Frank Lloyd Wright. Located near Spring Green, Wis., it was begun in 1911 and was rebuilt after fires in 1914 and 1925. Taliesin West, near Scottsdale, Ariz., was begun in 1938 as a winter home for Wright and his students. Both structures were continually renovated and added to until Wright's death in 1959, after which they continued to be occupied by members of the Wright Foundation. Wright, of Welsh descent, named them after the renowned Welsh poet (fl. 6th century AD).

talk show Radio or television program in which a well-known personality interviews celebrities and other guests. The late-night programs hosted by Johnny Carson, Jay Leno, David Letterman, and Conan O'Brien have emphasized entertainment, incorporating interludes of music or comedy. Other talk shows have focused on politics (see David Susskind), controversial social issues or sensationalistic topics (Phil Donahue), and emotional therapy (Oprah Winfrey). See also Merv Griffin; Larry King; Jack Paar.

Tallahassee City (pop., 2000 est.: 150,624), capital of Florida, U.S. Originally an Appalachee Indian village, the area attracted Spanish settlers after the visit of Hernando de Soto in 1539. Tallahassee became the capital of the Florida Territory in 1824 and of the state in 1845. During the American Civil War it was the only capital of a Confederate state east of the Mississippi not captured by Union forces. Today it is a wholesaling and distribution point for the surrounding lumber, cotton, and cattle-raising industries. Educational institutions include Florida State University (founded 1851).

Tallahatchie River River, northern Mississippi, U.S. It rises in Tippah county and flows southwest 230 mi (370 km) to join the Yalobusha River and form the Yazoo River. The Tallahatchie is navigable for about 100 mi (160 km). Its upper section is sometimes called the Little Tallahatchie River.

Tallapoosa River River, Georgia and Alabama, U.S. Rising in northwestern Georgia, the Tallapoosa flows southwest for about 268 mi (431

© 2006 Encyclopædia Britannica, Inc.

km) before joining the larger Coosa River just north of Montgomery, Ala., to form the Alabama River. Three private power dams have created reservoirs, including Lake Martin, for river control, power, and recreation.

Tallchief, Maria (b. Jan. 24, 1925, Fairfax, Okla., U.S.) U.S. ballet dancer of Native American descent. Tallchief studied with Bronislava Nijinska before joining the Ballet Russe de Monte Carlo (1942–47). She joined the New York City Ballet in 1948 and became its prima ballerina, creating leading roles in many ballets choreographed for her by George Balanchine (her husband from 1946 to 1952), including *Symphonie concertante* (1947), *Caracole* (1952), and *Pas de dix* (1955). She left the company in 1965, became artistic director of the Lyric Opera Ballet in Chicago, and founded the Chicago City Ballet in 1980.

Maria Tallchief in *Swan Lake*.
MARTHA SWOPE

Talleyrand \tȧ-le-'rän\ **(-Périgord), Charles-Maurice de** (b. Feb. 2, 1754, Paris, France—d. May 17, 1838, Paris) French statesman. Ordained a priest, he became bishop of Autun in 1788. Elected to represent the clergy at the Estates-General (1789), he became the "bishop of the Revolution" by calling for confiscation of church property to fund the new government and supporting the Civil Constitution of the Clergy. Excommunicated by the pope in 1790, he was sent to England as an envoy in 1792. He was expelled from France during the Reign of Terror, lived in the U.S. (1794–96), then returned to serve in the Directory as foreign minister (1797–99). He was forced to resign briefly for involvement in bribery scandals, including the XYZ Affair. Adept at political survival, he supported Napoleon and again became foreign minister (1799–1807) and later grand chamberlain (1804–07). He resigned in opposition to Napoleon's policy toward Russia but continued to advise him, arranging his marriage with Marie-Louise of Austria. As Napoleon faced defeat, Talleyrand secretly worked to restore the monarchy; in 1814 he was appointed foreign minister to Louis XVIII and represented France at the Congress of Vienna. Forced by ultraroyalists to resign (1815), he later became involved in the July Revolution of 1830 and served as ambassador to Britain (1830–34).

Tallinn \'ta-lən\ *formerly (until 1918)* **Revel** \'rā-vəl\ Seaport city (pop., 2001: 399,850), capital of Estonia. It is located on the Gulf of Finland. A fortified settlement existed there from the late 1st millennium BC and a town in the 12th century AD. In 1219 it was captured by the Danes, who built a new fortress. Trade flourished after it joined the Hanseatic League in 1285. In 1346 it was sold to the Teutonic Order, and in 1561 it passed to Sweden. Russia captured it in 1710, and it remained a Russian city until 1918, when it became the capital of independent Estonia. From 1940 to 1991 Estonia was a republic of the U.S.S.R. During World War II the city was occupied by German forces and was severely damaged. Rebuilt, it again became the capital of independent Estonia in 1991. It is a major commercial and fishing port, an industrial centre, and the cultural focus of Estonia, with numerous educational institutions. Historical structures include a medieval city wall and a 13th-century church.

Tallis \'ta-ləs**, Thomas** (b. c. 1505—d. Nov. 23, 1585, Greenwich, London, Eng.) British composer. An organist at abbeys and churches from 1532, by 1543 he was a gentleman of the Chapel Royal, as both organist and composer. Though a Catholic, he was one of the first to write hymns in English for the Anglican church. During Mary I's Catholic reign, he wrote Latin masses, but he remained in favour after Elizabeth I's accession. His powerful *Lamentations of Jeremiah* are regarded as his greatest body of work; his 40-part motet *Spem in alium* is his most famous piece. He also wrote three masses and about 40 other motets. In 1575 Tallis and his pupil William Byrd were given the first exclusive license to print music in England.

Talma \tȧl-'mȧ**, François-Joseph** (b. Jan. 16, 1763, Paris, France—d. Oct. 19, 1826, Paris) French actor and theatre manager. He made his debut at the Comédie-Française in 1787. Influenced by the painter Jacques-Louis David, he became an early advocate of historical costuming, and he created a sensation by appearing onstage in a Roman toga. After political dissension split the company (1789), the pro-republican Talma established a rival troupe. He developed realism in his staging and insisted on a naturalistic rather than a declamatory acting style. In 1799 his troupe was reunited with the Comédie-Française; as head of the company, he became recognized as the supreme tragedian of the era, winning the admiration of Napoleon.

Talmud \tȧl-'müd, 'tal-məd\ In Judaism, the systematic amplification and analysis of passages of the Mishna, the Gemara, and other oral law, including the Tosefta. Two Talmuds exist, produced by two different groups of Jewish scholars: the Babylonian Talmud (c. AD 600) and the Palestinian Talmud (c. AD 400). The Babylonian Talmud is more extensive and thus more highly esteemed. Both Talmuds formulate their own hermeneutics to convey their theological system by defining the Torah and by demonstrating its perfection and comprehensive character. The Talmud remains a text of central importance, particularly in Orthodox Judaism. Intensive modern Talmudic scholarship is pursued in Israel and the U.S. See also Halakhah.

Talmud Torah \tȧl-'müd-tō-'rä, 'tal-məd-'tō-rə\ Religious study of the Torah in search of the God who makes himself known in that work. It focuses on learning God's message for contemporary times through inquiry into the books of Hebrew scripture or those that record the original oral Torah of Sinai, the Mishna, Midrash, and Talmuds. Talmud Torah is also the name given to an elementary school under Jewish auspices that places special emphasis on religious education.

tamarin Any of about 25 species of long-tusked marmosets in the genera *Leontopithecus* (or *Leontideus*, according to some authorities) and *Saguinus*. Tamarins are 8–12 in. (20–30 cm) long, excluding the 12–16-in. (30–40-cm) tail. The emperor tamarin (*Saguinus imperator*) has long, grizzled, gray fur; a reddish tail, and a long white moustache. The three species of *Leontopithecus* are endangered. See also golden lion tamarin.

tamarind \'ta-mə-rənd\ Evergreen tree (*Tamarindus indica*) of the pea family (see legume), native to tropical Africa and cultivated elsewhere as an ornamental and for its edible fruit. The tree grows about 80 ft (24 m) tall and has featherlike leaves. It bears small clusters of yellow flowers and plump pods that do not split open. The soft, brownish edible pulp contains 1–12 large, flat seeds that are used in Oriental foods, beverages, and medicines.

Tamarind (*Tamarindus indica*)
WALTER DAWN

Tamaulipas \ˌtä-maù-'lē-päs\ State (pop., 2000: 2,753,222), northeastern Mexico. Located on the Gulf of Mexico, it covers 30,650 sq mi (79,384 sq km). The capital is Ciudad Victoria. Though largely mountainous, it has extensive, fertile plains in the north and a sandy, lagoon-dotted coastal zone. Large areas are irrigated, and agriculture is the main economic activity; products include sorghum, soybeans, sugarcane, cotton, coffee, and fruit. Fisheries and copper mining also are important. It produces one-third of Mexico's natural gas and large quantities of crude oil.

Tamayo \tə-'mī-ō**, Rufino** (b. Aug. 26, 1899/1900, Oaxaca, Mex.—d. June 24, 1991, Mexico City) Mexican painter and graphic artist. He studied at Mexico City's School of Fine Arts and then taught at the National Museum of Archaeology (1921–26). He preferred easel painting to the monumental proportions and political rhetoric of José Clemente Orozco, Diego Rivera, and David Alfaro Siqueiros. His distinctive style blended Cubism and Surrealism with Mexican folk-art subjects involving semiabstract figures, still lifes, and animals in vibrant colours. From 1936 he lived principally in New York City. In 1950 an exhibition at the Venice Biennale brought him international recognition. He designed murals for Mexico City's Palace of Fine Arts (1952–53) and UNESCO's Paris headquarters (1958). In 1974 he donated his collection of pre-Hispanic art to his native Oaxaca.

Tambo, Oliver (b. Oct. 27, 1917, Bizana, near Johannesburg, S.Af.) President (1969–91) of South Africa's African National Congress (ANC). In 1944, with Nelson Mandela and others, he cofounded the Youth League

© 2006 Encyclopædia Britannica, Inc.

of the ANC. He became the ANC's deputy president in 1958 and was forced into exile in Zambia when it was banned in 1960. He was elected ANC president in 1969 after the death of Albert Lutuli. He returned to South Africa in ill health in 1990 and yielded the party presidency to Mandela.

tambourine Small frame drum with one skin nailed or glued to a shallow circular frame, into which jingles or pellet bells are set. It is held with one hand and struck with the other, or simply shaken. Tambourines were played in ancient Mesopotamia, Greece, and Rome, especially in religious contexts, and they have long been prominent in Middle Eastern folk and religious use. Crusaders took them to Europe in the 13th century.

Tamburlaine See Timur

Tamerlane See Timur

Tamil \'tä-məl, 'ta-məl\ Any member of a people originally of southern India who speak the Tamil language. The Tamil have a long history of achievement; sea travel, city life, and commerce seem to have developed early among them. They traded with the ancient Greeks and Romans. They have the oldest cultivated Dravidian language and a rich literary tradition. They are mostly Hindus (the Tamil area in India is a centre of traditional Hinduism). Sri Lanka has two distinct Tamil populations, the so-called Ceylon Tamil and the Indian Tamil. Tensions between the Ceylon Tamil and the Sinhalese Buddhist majority prompted a Tamil guerrilla insurgency in the 1980s that continued into the 21st century. The Tamil number about 57 million, with 3.2 million living in Sri Lanka.

Tamil language Dravidian language spoken by more than 63 million people. It is an official language of Tamil Nadu state in India and one of the official languages of Sri Lanka. Large Tamil-speaking communities also reside in Malaysia and Singapore, South Africa, and the Indian Ocean islands of Réunion and Mauritius. The earliest Tamil inscriptions date from c. 200 BC; literature in the language has a 2,000-year history. Tamil script is descended from the southern Indian Pallava script (see Indic writing systems). Tamil has several regional dialects, Brahman and non-Brahman caste dialects, and a marked division between literary and colloquial forms (see diglossia).

Tamil Nadu \'ta-məl-'nä-dü\ *formerly* **Madras** \mə-'dräs\ State (pop., 2001 prelim.: 62,110,839), southeastern India. Lying on the Bay of Bengal, its coastline includes the enclaves of Pondicherry and Karaikal (both parts of Pondicherry union territory); it is also bordered by Kerala, Karnataka, and Andhra Pradesh states. Tamil Nadu covers an area of 50,216 sq mi (130,058 sq km), and its capital is Chennai (Madras). Its interior includes the fertile Kaveri River delta. By the 2nd century AD the region was occupied by Tamil kingdoms. The Hindu kingdom of Vijayanagar ruled the southern regions from 1336 to 1565. The Portuguese entered the area in 1498, only to be displaced by the Dutch in the 16th–17th centuries. The British established a settlement in 1611, which expanded to become the separate presidency of Madras, which lasted from 1653 to 1946. The state of Tamil Nadu was formed in 1956. It is one of India's most industrialized states, manufacturing vehicles, electrical equipment, and chemicals.

Tamiris \tə-'mir-əs**, Helen** *orig.* **Helen Becker** (b. April 24, 1905, New York, N.Y., U.S.—d. Aug. 4, 1966, New York City) U.S. choreographer, modern dancer, and teacher. In 1930 she founded her own company and school, which she directed until 1945. Many of her own works, such as *Walt Whitman Suite* (1934), drew on American themes. From 1945 to 1957 she choreographed Broadway musicals, including *Annie Get Your Gun* (1946), *Touch and Go* (1949; Tony Award for choreography), and *Fanny* (1954). In 1960 she and her dancer-husband, Daniel Nagrin, founded the Tamiris-Nagrin Dance Company.

Helen Tamiris.

Tammany \'ta-mə-nē\ **Hall** Executive committee of the Democratic Party in New York City. The group was organized in 1789 in opposition to the Federalist Party's ruling "aristocrats." The Society of Tammany was incorporated in 1805 as a benevolent body; its name derived from a pre-Revolutionary association named after the benevolent Indian chief Tammanend. The group became identified with the city's Democratic Party. The makeup of the society was substantially altered in 1817 when Irish immigrants, protesting Tammany bigotry, forced their right to membership and benefits. Tammany later championed the extension of the franchise to white propertyless males. Nevertheless, the society's appeal to particular ethnic and religious minorities, the doling out of gifts to the poor, and the bribing of leaders of rival political factions, among them the notorious boss William Marcy Tweed, made the name Tammany Hall synonymous with political corruption. Its power was greatest in the late 19th and early 20th century; it declined in the 1930s under the reforms of Pres. Franklin D. Roosevelt and Mayor Fiorello La Guardia.

Tammuz \'tä-ˌmüz\ Mesopotamian god of fertility. He was the son of Enki, god of water, and Duttur, a personification of the ewe. Worship of Tammuz was centered around two yearly festivals, one in the early spring in which his marriage to the goddess Inanna symbolized the fertilization of nature for the coming year, and one in summer when his death at the hands of demons was lamented. He is thought to be the precursor of several later deities associated with agriculture and fertility, including Ninsun, Damu, and Dumuzi-Abzu.

Tammuz, alabaster relief from Ashur, *c.* 1500 BC; in the Staatliche Museen zu Berlin, Germany
FOTO MARBURG—ART RESOURCE/EB INC.

tamoxifen \ta-'mäk-si-ˌfen\ Synthetic hormone, marketed as Nolvadex, that prevents the binding of estrogen to estrogen-sensitive breast cancer cells. Initially used to prevent recurrences of breast cancer after successful treatment, it was later found to prevent first occurrences in women at high risk. The most serious side effect is an increased risk of thrombosis, which may require patients to take an anticoagulant as well. Studies on its effectiveness against breast and other cancers continue.

Tampa City (pop., 2000: 303,447), west-central Florida, U.S. Located on the northeastern end of Tampa Bay, the U.S. Army established Fort Brooke on the site in 1824 to oversee the removal of the Seminole Indians. The town was incorporated in 1855. Tampa developed as a cigar-making centre after the town's first cigar factory was established (1886). It now has a wide range of industries and is a major distribution centre. It is a winter and fishing resort and major tourist destination; attractions include Busch Gardens.

Tampa Bay Inlet, Gulf of Mexico, western Florida, U.S. The bay is 25 mi (40 km) long and 7–12 mi (11–19 km) wide, and it serves the recreational and commercial activities of Saint Petersburg on the western shore and Tampa on the northeast. Hernando de Soto began his travels through the southeastern U.S. region when he reached Tampa Bay in 1539. Tampa Bay is spanned by the 15-mi (24-km) Sunshine Skyway Bridge.

Tampico \täm-'pē-kō\ Port and city (pop., 2000: 295,442), southeastern Tamaulipas state, northeastern Mexico. It lies on the Pánuco River and is almost surrounded by swampland and lagoons. It grew around a Franciscan monastery founded c. 1532. Destroyed by pirates in 1683, it was not resettled until 1823. It was occupied briefly by U.S. troops (1846) during the Mexican War and by the French in 1862. Until 1901 it was a second-rate port with a reputation for unsanitary conditions. It grew with the rapid exploitation of surrounding petroleum resources to become the most modern port in Mexico and one of the country's leading seaports. It is also a seaside resort.

Tan Cheng Lock \'tän-'cheŋ-'lȯk\ (b. April 5, 1883, Malacca, Straits Settlements—d. Dec. 8, 1960, Malacca) Malaysian Chinese community leader and politician. Born to a wealthy Chinese family, he campaigned against "pro-Malay" policies and in favour of equal rights for all ethnic groups, whether immigrant or indigenous. After World War II, he supported the British proposal for a unitary state with common citizenship, which the Malays rejected. During the Malayan Emergency, he cooperated

© 2006 Encyclopædia Britannica, Inc.

with the British to promote national unity. In 1949 he was chosen to head the Malayan Chinese Association, the first full-fledged centrist Malayan Chinese political party, and he continued as its head after Malayan independence in 1957.

Tan Malaka \'tän-mä-'lä-kä**, Ibrahim Datuk** (b. 1894—d. April 16, 1949, Blitar, Java, Indon.) Indonesian communist leader. A schoolteacher, he became a communist after returning from Europe in 1919. He was exiled by the Dutch for trying to incite a general strike in 1922 but returned to Java in 1944 and, competing with SUKARNO for control of the Indonesian nationalist movement, created a coalition that briefly came to power in 1946. He was imprisoned later that year on charges of attempting a coup. In 1948, while the Dutch and Indonesians were at war, he proclaimed himself head of Indonesia. Forced to flee the invading Dutch, within a few months he was captured and executed by Sukarno's supporters.

Tana, Lake Lake, Ethiopia. The country's largest lake, its surface area covers more than 1,400 sq mi (3,620 sq km). It forms the main reservoir for the Blue Nile (see NILE RIVER), which pours from it over a lava barrier, dropping 138 ft (42 m) to form Tisisat Falls. Coptic monasteries were built on two of its islands during the Middle Ages.

Tana River \'tä-nä\ River, Kenya. The country's longest river, it rises in the Aberdare Range and flows in a curve northeast, east, and south 440 mi (708 km) to the Indian Ocean. It is navigable by small craft for about 150 mi (240 km) upstream.

Tana River \'tä-nə\ River, northeastern Norway. It flows 224 mi (360 km) north and northeast to empty into Tana Fjord, an inlet of the ARCTIC OCEAN on the northeastern coast of Norway. The river forms a section of the boundary between Norway and Finland.

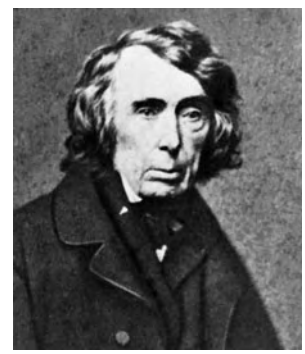
tanager \'ta-nə-jər\ Any of 200–220 species (family Emberizidae) of New World songbirds inhabiting forests and gardens. Most species are 4–8 in. (10–20 cm) long and have a short neck. Bills vary in shape, but all are slightly toothed and hooked. Tanagers have brilliant plumage in reds, yellows, greens, blues, and black, sometimes strikingly patterned. Most species are arboreal; most eat fruit, and some eat insects. The scarlet, summer, and western tanagers breed in temperate North America. The hepatic tanager breeds from Arizona to central Argentina. Most other species are chiefly tropical.

Tanagra \'ta-nə-grə, tə-'na-grə\ Ancient town, BOEOTIA, eastern central Greece. First occupied by an Athenian clan, it became the chief town of the eastern Boeotians, with lands extending to the Gulf of Euboea. It was the scene of the Athenian defeat by the Spartans in 457 BC during the first PELOPONNESIAN WAR. Finely modeled terra-cotta statuettes, known as TANAGRA FIGURES, were made there c. 340–150 BC and exported to Mediterranean countries.

Tanagra figure Any of the small terra-cotta figures dating primarily from the 3rd century BC and named after the site in Boeotia, Greece, where they were found. The statuettes, mostly of well-dressed young women standing or sitting, were all formed from molds and originally were covered with a white coating and then painted. On their discovery in the 19th century, they became enormously popular and were extensively and expertly forged.

Tanaka \'tä-nä-kä**, Kakuei** (b. May 4, 1918, Kariwa, Niigata prefecture, Japan—d. Dec. 16, 1993, Tokyo) Prime minister of Japan (1972–74). As prime minister, Tanaka pushed through many government construction projects and was responsible for the economic revitalization of much of western Japan and for establishing diplomatic relations with the People's Republic of China. In 1976 he was charged with accepting, while prime minister, $2 million from Lockheed Aircraft Corp. to influence All Nippon Airways to buy Lockheed jets; he was convicted in 1983. However, he remained powerful in the Liberal-Democratic Party until he retired from politics in 1990.

Tanaka Tomoyuki (b. April 16, 1910, Ōsaka, Japan—d. April 2, 1997, Tokyo) Japanese film producer. Tanaka was associated for nearly 60 years with Japan's Toho Studios, for which he produced more than 200 films. Of these, his best known are the 22 films in the Godzilla series, beginning with *Godzilla, King of the Monsters* in 1954 and ending with *Godzilla vs. Destroyer* in 1995. He also produced films for renowned director KUROSAWA AKIRA.



Tanana \'ta-nə-ˌnȯ\ **River** River, east-central Alaska, U.S. Rising from two headstreams fed by glaciers high in the WRANGELL MOUNTAINS, the Tanana flows northwest 550 mi (885 km) to join the YUKON RIVER; it is the Yukon's chief southern tributary. The Tanana was first explored by Russian traders in the mid-19th century. Its valley was an important gold-producing area in the 1904 GOLD RUSH; it is also a lumbering district and one of Alaska's major farming regions. The ALASKA HIGHWAY follows it for nearly its entire course.

Tananarive See ANTANANARIVO

Tancred \'taŋ-krəd\ (d. Feb. 20, 1194, Palermo) King of Sicily (1190–94), the last of the Norman rulers. He rebelled twice (1155, 1161) against his uncle William I of Sicily, and he gained the Sicilian throne after the death of William II. He gave in to the demand of RICHARD I (the Lionheart) in 1191 for the legacy left him by William II and the return of the dowry of his sister Joan, William's widow, after Richard occupied Messina. Emperor HENRY VI sought to wrest the Sicilian throne from Tancred, unsuccessfully besieging Naples in 1191 and marching on Sicily again in 1194. Tancred died before his arrival, and Henry was crowned king.

Tandy, Jessica See Hume CRONYN and Jessica Tandy

Taney, Roger B(rooke) (b. March 17, 1777, Calvert county, Md., U.S.—d. Oct. 12, 1864, Washington, D.C.) U.S. jurist. A lawyer from 1801, he served in Maryland's legislature before being named state attorney general (1827–31). He was appointed U.S. attorney general in 1831 by Pres. ANDREW JACKSON and achieved national prominence by opposing the BANK OF THE UNITED STATES. In 1833 Jackson nominated him to serve as secretary of the treasury, but his appointment was rejected by the Senate. In 1835 Jackson selected him to serve as associate justice on the Supreme Court of the United States, and after the death of Chief Justice JOHN MARSHALL, Jackson sought to have him confirmed as chief justice. Despite powerful resistance led by HENRY CLAY, JOHN C. CALHOUN, and DANIEL WEBSTER, Taney was sworn in as chief justice in March 1836. His tenure (1836–64) remains the second longest in the Supreme Court's history. He is remembered principally for the DRED SCOTT DECISION (1857), in which he argued that a slave was not a citizen and could not sue in a federal court, that Congress had no power to exclude slavery from the territories, and that blacks could not become citizens. He is also noted for his opinion in *Abelman* v. *Booth* (1858), which denied state power to obstruct the processes of the federal courts, and in *Charles River Bridge* v. *Warren Bridge* (1837), which declared that rights not specifically conferred by a charter could not be inferred from the language of the document. Though he considered slavery an evil, he believed its elimination should be brought about gradually and chiefly by the states in which it existed.

LIBRARY OF CONGRESS, WASHINGTON, D.C.

tang See SURGEONFISH

Tang dynasty *or* **T'ang** \'täŋ\ **dynasty** (618–907) Chinese dynasty that succeeded the short-lived SUI and became a golden age for poetry, sculpture, and Buddhism. The Tang capital of CHANG'AN became a great international metropolis, with traders and embassies from Central Asia, Arabia, Persia, Korea, and Japan passing through. A NESTORIAN Christian community also existed there, while mosques were established in Guangzhou (Canton). The economy flourished in the 8th–9th centuries, with a network of rural market towns growing up to join the metropolitan markets of Chang'an and Luoyang. Buddhism enjoyed great favour, and there were new translations of the Buddhist scriptures and growth of indigenous sects, including Chan (see ZEN). Poetry was the greatest glory of the period; nearly 50,000 works by 2,000 poets survive. Foreign music and dance became popular, and ancient orchestras were revived. The Tang government never completely controlled the northern Chinese border, where nomad tribes made constant incursions; periodic rebellions from the mid-8th century onward also weakened its power (see AN LUSHAN REBELLION). In its later years, the government's focus was on eastern and southeastern China rather than Central Asia. See also TAIZONG; WU HOU.

Tanganyika \ˌtan-gən-ˈyē-kə**, Lake** Lake, central Africa. Located on the boundary between Tanzania and Congo (Kinshasa), it is the longest freshwater lake in the world, 410 mi (660 km) long, and the second deepest, 4,710 ft (1,436 m) deep. Fed by several rivers, it tends to be brackish. Oil palms and rice grow along its steep shores; hippopotamuses and crocodiles abound. It was first visited by Europeans, searching for the source of the Nile, in 1858.

Tange \ˈtän-gā\ **Kenzō** (b. Sept. 4, 1913, Ōsaka, Japan—d. March 22, 2005, Tokyo) Japanese architect. Tange worked in the office of Maekawa Kunio before setting out on his own. His first major commission involved the reconstruction of Hiroshima. In addition to planning the city, he helped design Hiroshima's Peace Memorial Park, and its peace centre (1950) and museum (1952) are among his best-known early works. His Kagawa prefectural offices in Takamatsu (1958) were a particularly fine blend of the modern and traditional. In 1959 Tange and his students published the Boston Harbor project, launching the Metabolist school. His work in the 1960s took on more boldly dramatic forms, and he became a master at manipulating complex geometries; his National Gymnasiums for Tokyo's 1964 Olympic Games are exemplary. During 1966–70 he designed the master plan for the Japan World Exposition (Expo 70), which was held in Ōsaka. More-recent works include the New Tokyo City Hall Complex (1991) and the Tokyo Dome Hotel (2000). Also influential as a writer, teacher, and town planner, Tange was awarded the Pritzker Architecture Prize in 1987.

tangent See trigonometric function

tangent line \ˈtan-jənt\ In geometry, a line that intersects a circle exactly once; in calculus, a line that touches a curve at one point and whose slope is equal to that of the curve at that point. Particularly useful as approximations of curves in the immediate vicinity of the point of tangency, tangent lines are the basis of many estimation techniques, including linear approximation. The numerical value of the slope of the tangent line to the graph of a function at any point equals that of the function's derivative at that point. This is one of the keystones of differential calculus. See also differential geometry.

tangerine Small, thin-skinned variety of the mandarin orange species (*Citrus reticulata deliciosa*) of the rue family (citrus family). Probably native to Southeast Asia, today it is cultivated in subtropical regions worldwide, especially southern Europe and the southern U.S. The tree is smaller than other orange trees, with slender twigs and lance-shaped leaves. The fruit is slightly flattened at each end and has a loose, reddish orange peel. Easily separated segments of tender, juicy, richly flavoured pulp are abundant in vitamin C. Oil from the fragrant skin is a characteristic ingredient in several flavourings and liqueurs. The tangerine crossed with the grapefruit produced the hybrid known as the tangelo.

GRANT HEILMAN—EB INC.

Tangier \tan-ˈjir\ *French* **Tanger** \tänⁿ-ˈzhā\ *Arabic* **Ṭanjah** \ˈtän-jə\ *ancient* **Tingis** Seaport city (pop., 1994: 521,735), northern Morocco. Located at the western end of the Strait of Gibraltar, it was first known as an ancient Phoenician trading post and later became a Carthaginian and then a Roman settlement. After five centuries of Roman rule, it was captured successively by the Vandals, Byzantines, and Arabs. It fell to the Portuguese in 1471; it later passed to the British, who gave it up to Morocco in 1684. When the rest of Morocco became a French protectorate in 1912, Tangier was granted special status; in 1923 it officially became an international city, governed by an international commission. It remained an international zone until it was integrated in 1956 with the independent kingdom of Morocco. It became a free port and royal summer residence in the 1960s. The old town is dominated by a Casbah (citadel) and the Great Mosque. It is a busy port and trade centre; industries include tourism, fishing, and textiles, especially carpets.

tango Spirited Spanish flamenco dance; also a South American ballroom dance. It evolved into a ballroom dance in Buenos Aires, Arg., possibly influenced by the Cuban habanera. It was made popular in the U.S. by Vernon and Irene Castle, and by 1915 it was being danced throughout Europe. Early versions were fast and exuberant; these were later modified to the smoother ballroom step, characterized by long pauses and stylized body positions and danced to music in ¼ time.

Tango danced by Rudolph Valentino and partner from the motion picture *Four Horsemen of the Apocalypse,* 1921

Tangun \ˈtän-ˈgün\ Mythological first king of the Koreans, whose reign began in 2333 BC. According to one legend, Tangun's father descended from heaven to rule earth from a mountaintop. When a bear and a tiger expressed the wish to become human, he ordered them into a cave for 100 days; after the tiger grew impatient and left, the bear was transformed into the beautiful woman who became Tangun's mother. Buddhism and Daoism credited Tangun with establishing a national religion and originating the Korean maxim "Hongik-ingan" ("Love humanity"). His birthday is a school holiday.

Tangut \ˈtän-ˈgůt\ People historically living in southern Inner Mongolia at the terminus of the Silk Road. They engaged in irrigated agriculture and pastoralism and acted as middlemen in trade between Central Asia and China. They adopted Buddhism as their state religion, created their own writing system, and in 1038 proclaimed their kingdom of Xi Xia, which survived nearly 200 years.

Tanguy \täⁿ-ˈgē**, Yves** (b. Jan. 5, 1900, Paris, France—d. Jan. 15, 1955 Waterbury, Conn., U.S.) French painter. In 1923, after serving in the merchant marine, he was inspired to start painting when he saw the works of Giorgio de Chirico, though he had no formal art training. He joined the Surrealist group in 1925 and participated in all their major exhibitions. He developed a unique style, reminiscent of Salvador Dalí's, depicting strange, amorphous creatures and unidentifiable objects set in barren, brightly lit landscapes with infinite horizons. Despite their smooth, painstaking detail, his pictures have a timeless, dreamlike quality (e.g., *The Invisibles*, 1951). He emigrated to the U.S. in 1939.

Tanimbar Islands \tə-ˈnim-ˌbär, ˈta-nəm-ˌbär\ Group of about 30 islands, southeastern Moluccas, Indonesia. It includes the large island of Jamdena, 70 mi (113 km) long by 28 mi (45 km) wide, and the nearby islands of Larat and Selaru. Though there is a lack of fresh water, the soil supports corn, rice, coconut palms, and fruits. The Dutch claimed the group in 1639 but did not establish rule until 1900. After World War II, the islands became part of Indonesia.

Tanis \ˈtā-nəs\ *biblical* **Zoan** Ancient city, Egypt. Its remains are located in the Nile River delta. Capital of a province of Lower Egypt and, under the 21st and 22nd dynasties (c. 1075–c. 700 BC), of the whole country, it was important as one of the ports nearest to the Asian seaboard. In 1939 several intact royal tombs containing silver coffins, gold masks, and gold and silver jewelry were excavated within the ancient main temple enclosure.

Tanit \ˈtä-nit\ Chief goddess of Carthage, the equivalent of Astarte. She first appeared around the 5th century BC. Though she seems to have had some connection with the heavens, she was also a mother goddess and symbol of fertility. She was the consort of Baal Hammon, chief god of Carthage, whose cult she eventually eclipsed. Archaeological evidence suggests that children, probably firstborn, were sacrificed both to her and to Baal Hammon. Outside Carthage, Tanit also enjoyed a following on Malta, on Sardinia, and in Spain.

Tanizaki Jun'ichirō \ˌtä-nē-ˈzä-kē-ˈjün-ē-ˌchē-rō\ (b. July 24, 1886, Tokyo, Japan—d. July 30, 1965, Yugawara) Japanese novelist. Though his earliest short stories have affinities with those of Edgar Allan Poe and the French Decadents, Tanizaki later turned to exploring more traditional Japanese ideals of beauty. His novels include *Some Prefer Nettles* (1928–29), which tells of marital unhappiness that is in fact a conflict between the new and the old, with the implication that the old will win; and his masterpiece, *The Makioka Sisters* (1943–48; film, 1983), which describes, in the leisurely style of classical Japanese literature, the inroads of the harsh modern world on traditional society. His writings are characterized by eroticism and ironic wit.

© 2006 Encyclopædia Britannica, Inc.

tank Heavily armed and armoured combat vehicle that moves on two continuous metal chains called tracks. It is usually equipped with a CANNON mounted in a revolving turret as well as lighter automatic weapons. The British developed tanks during World War I to fill the need for an armoured assault vehicle that could cross the muddy, uneven terrain of the trench battle zone. They first saw combat at the BATTLE OF THE SOMME (1916). In World War II, Germany's tank force was initially the most effective in Europe because it was organized into fast-moving massed formations with great striking power. After World War II, tanks became larger and more heavily armed. Most modern main battle tanks weigh more than 50 tons yet are capable of road speeds of 30–40 mph (50–70 kph). The standard main armament is a 120-mm gun, which fires armour-piercing projectiles; laser range-finders and infrared imaging devices aid in sighting.

Tannenberg \'tä-nən-ˌberk**, Battle of** (July 15, 1410) Major Polish-Lithuanian victory over the Knights of the TEUTONIC ORDER. Fought near the villages of Grünfelde and Tannenberg in northeastern Poland (formerly East Prussia), the battle marked the end of the order's expansion along the southeastern coast of the Baltic Sea and the beginning of the decline of its power.

Tannenberg \'tä-nən-ˌberk**, Battle of** (August 26–30, 1914) Battle in WORLD WAR I between Germany and Russia in modern northeastern Poland. Two Russian armies invaded German East Prussia but became separated. German forces under PAUL VON HINDENBURG attacked one of the isolated armies and forced its retreat, inflicting Russian casualties of over 30,000 and capturing over 90,000 men. German casualties were about 13,000. The battle was disastrous for Russia, but it forced Germany to divert troops from the attack on France.

Tanner, Henry Ossawa (b. June 21, 1859, Pittsburgh, Pa., U.S.—d. May 25, 1937, Paris, France) U.S. painter. He studied under THOMAS EAKINS at the Pennsylvania Academy of the Fine Arts, where he was the only black student. He moved to Paris in 1891, and by 1894 his work was being exhibited at the annual Salons, where he was awarded honourable mention in 1896 for *Daniel in the Lions' Den* and won a medal in 1897 for his *Raising of Lazarus*. He gained international acclaim and many awards for his landscapes and his treatments of biblical themes. He was made a chevalier of the Legion of Honour in 1923, and in 1927 he became the first African American granted full membership in the National Academy of Design.

Tannhäuser \'tän-ˌhȯi-zər\ (b. c. 1200—d. c. 1270) German lyric poet and legendary hero. A professional MINNESINGER, Tannhäuser served several noble patrons; a few of his works are extant. In the legend preserved in a popular ballad, "Danhauser," he lives a life of pleasure but, torn by remorse, goes to Rome to seek remission of his sins. The pope tells him that, as his pilgrim's staff would never put on leaf again, so his sins can never be forgiven. Shortly afterward his discarded staff puts forth green leaves. The pope sends messengers to search for him, but he is never seen again. The legend, popular among 19th-century Romantic writers, was retold in RICHARD WAGNER's opera *Tannhäuser* (produced 1845).

tannin *or* **tannic acid** Any of a group of pale yellow to light brown amorphous substances widely distributed in plants and used chiefly in TANNING leather, dyeing fabric, and making ink. Their solutions are acid and have an astringent taste. They are isolated from oak bark, sumac, myrobalan (an Asian tree), and galls. Tannins give TEA astringency, colour, and some flavour. Tannins are used industrially to clarify wine and beer, reduce viscosity of oil-well drilling mud, and prevent scale in boiler water; they have also had medical uses.

tanning Chemical treatment of raw animal hides or skins to convert them into LEATHER. Vegetable tanning (using bark, wood, roots, or berries) has been practiced since prehistoric times. After removal of hair, flesh, or fat, a tanning agent displaces water from the interstices between the PROTEIN (mostly COLLAGEN) fibres in the skin and cements the fibres together. The agents most widely used are vegetable TANNIN, SALTS such as chromium sulfate, and fish or animal oil. The tanning of fair skin in humans by sunlight is completely different: ultraviolet light causes production and redistribution of the pigment MELANIN in epidermal cells.

tansy \'tan-zē\ Any of about 50 species of strong-smelling, poisonous herbs, especially common tansy (*Tanacetum vulgare*, or *Chrysanthemum vulgare*), of the COMPOSITE FAMILY, native to the northern temperate zone. *T. vulgare* has button-shaped yellow flower heads of disk flowers (no ray flowers) that are arranged in a flat-topped cluster, deeply cut leaves, and many stems. It is sometimes cultivated in herb gardens and was formerly used in medicines and insecticides. See also CHRYSANTHEMUM.

tantalum \'tan-tə-ləm\ Metallic chemical ELEMENT, one of the TRANSITION ELEMENTS, chemical symbol Ta, atomic number 73. It is a dense, hard, unreactive, silvery gray METAL with an extremely high melting point (5,425 °F [2,996 °C]). Relatively rare, it occurs native in a few places. It is difficult to separate from niobium, the element above it in the PERIODIC TABLE, with which it shares many properties. The most important uses are in electrolytic capacitors, corrosion-resistant chemical equipment, dental and surgical instruments, tools, catalysts, components of electron tubes, rectifiers, and PROSTHESES. Its compounds are relatively unimportant commercially; tantalum carbide is used in machine tools and dies.

Tantalus \'tan-tᵊl-əs\ In GREEK MYTHOLOGY, the king of Sipylus (or Phrygia). An intimate friend of the gods, he was allowed to dine at their table until he offended them by repeating their secrets on earth. Another version of the myth held that he killed his son PELOPS and served him to the gods. In the underworld he was placed up to his neck in water, which flowed away every time he tried to drink, just as the branches overhead swung out of reach whenever he tried to pick the fruit from them.

tantra \'tən-trə\ In some Indian religions, a text that deals with esoteric aspects of religious teaching. There is considerable tantric literature and practice in HINDUISM, BUDDHISM, and, to a lesser extent, JAINISM. Because tantric practices typically represent teachings of relatively late development and incorporate elements of different traditions, they are often eschewed by orthodox practitioners. In Hinduism, tantras deal with popular aspects of the religion, such as spells, rituals, and symbols. Buddhist tantric literature, believed to date from the 7th century or earlier, has reference to numerous practices, some involving sexual activity, that have no basis in canonical literature.

Tanzania \ˌtan-zə-'nē-ə\ *officially* **United Republic of Tanzania** Country, eastern Africa. It is mostly on the African mainland but also includes the islands of ZANZIBAR, Pemba, and Mafia in the Indian Ocean.

Area: 364,901 sq mi (945,090 sq km). Population (2005 est.): 36,766,000. Capital: DAR ES SALAAM; DODOMA, designated. There are about 120 identifiable ethnic groups; the largest, the Sukuma, are about one-tenth of the population. Languages: Swahili, English (both official). Religions: Christianity (Protestant, Roman Catholic), Islam, traditional beliefs. Currency: Tanzanian shilling. Although most of Tanzania consists of plains and plateaus, it has some spectacular relief features, including KILIMANJARO and Ol Doinyo Lengai, an active volcano. All or portions of Lakes NYASA, TANGANYIKA, VICTORIA, and RUKWA lie within Tanzania, as do the head-

© 2006 Encyclopædia Britannica, Inc.

waters of the Nile, Congo, and Zambezi rivers. Serengeti National Park is the most famous of its extensive game reserves. Important mineral deposits include gold, diamonds, gemstones, coal, and natural gas. The centrally planned economy is based largely on agriculture; major crops include corn, rice, coffee, cloves, cotton, sisal, cashews, and tobacco. Industries include food processing, textiles, cement, and brewing. Tanzania is a republic with one legislative house; its head of state and government is the president. Inhabited from the 1st millennium BC, it was occupied by Arab and Indian traders and Bantu-speaking peoples by the 10th century AD. The Portuguese gained control of the coastline in the late 15th century, but they were driven out by the Arabs of Oman and Zanzibar in the late 18th century. German colonists entered the area in the 1880s, and in 1891 the Germans declared the region a protectorate as part of German East Africa. During World War I, Britain captured the German holdings, which became a British mandate (1920) under the name Tanganyika. Britain retained control of the region after World War II when it became a UN trust territory. Tanganyika gained independence in 1961 and became a republic in 1962. In 1964 it united with Zanzibar under the name Tanzania and was led by Pres. Julius Nyerere until 1985. The country subsequently experienced both political and economic struggles; it held its first multiparty elections in 1995.

Tanzimat \ˌtän-zē-ˈmät\ (Turkish: "Reorganization") (1839–76) Series of reforms undertaken in the Ottoman Empire to modernize society along secular and bureaucratic lines. The first set of reforms (1839) sought to secularize the government's treatment of people and property and to reform taxation and military conscription. Later reforms (1856) established a secular school system and a new law code. Efforts to centralize government administration, however, ended by concentrating all authority in the hands of the sultan, who often abused the power. The constitution of 1876, while promising democratic reforms, actually was intended to stave off European intervention. See also Abdülhamid II; Young Turks.

tao See Dao

Tao Hongjing \ˈtau̇-ˈhůŋ-ˈjiŋ\ *or* **T'ao Hung-ching** (b. 451, Mo-ling, China—d. 536, Hua-yang) Chinese poet, calligrapher, physician, and naturalist. He became a tutor to the imperial court while still a youth. In 492 he retired to a mountain retreat at Mao Shan to devote himself to the study of Daoism. His research in proper eating and living practices led him to write one of the major pharmacological works of China. He also edited and annotated the religious writings of his major Daoist predecessors, producing *Declarations of the Perfected* and *Secret Instructions for Ascent to Perfection*.

Tao-te ching See Daodejing

Taoism See Daoism

Taos \ˈtau̇s\ Town (pop., 2000: 4,700) and resort, northern New Mexico, U.S. Located on a branch of the Rio Grande in the Sangre de Cristo Mountains, Taos is composed of three villages: Don Fernando de Taos (known as Taos), the pueblo of San Geronimo (Taos Pueblo), and the Ranchos de Taos. An early Spanish settlement, it was the scene of a revolt (1680) of Taos and other Pueblo Indians against Spain and later was an important commercial centre on the Santa Fe Trail. In the 20th century artists and writers moved there, including D.H. Lawrence. Lawrence's home and that of Kit Carson are historic sites; Carson's grave is in a memorial state park.

tap dance Style of American theatrical dance using precise rhythmical patterns of foot movement and audible foot tapping. It is derived from the traditional clog dance of northern England, the jigs and reels of Ireland and Scotland, and the rhythmic foot stamping of African dances. Popular in 19th-century minstrel shows, versions such as "buck-and-wing" (danced vigorously in wooden-soled shoes) and "soft-shoe" (danced smoothly in soft-soled shoes) developed as separate techniques; by 1925 they had merged, and metal taps were attached to shoe heels and toes to produce a more pronounced sound. The dance was also popular in variety shows and early musicals.

Tapajós \ˌtä-pä-ˈzhȯs\ **River** River, northern Brazil. Formed by the confluence of the Teles Pires and the Juruena rivers, it flows northeast to empty into the Amazon River just above Santarém after a course of about 400 mi (650 km). Though interrupted by rapids, its entire length is navigable. Several important rubber plantations lie along its banks.

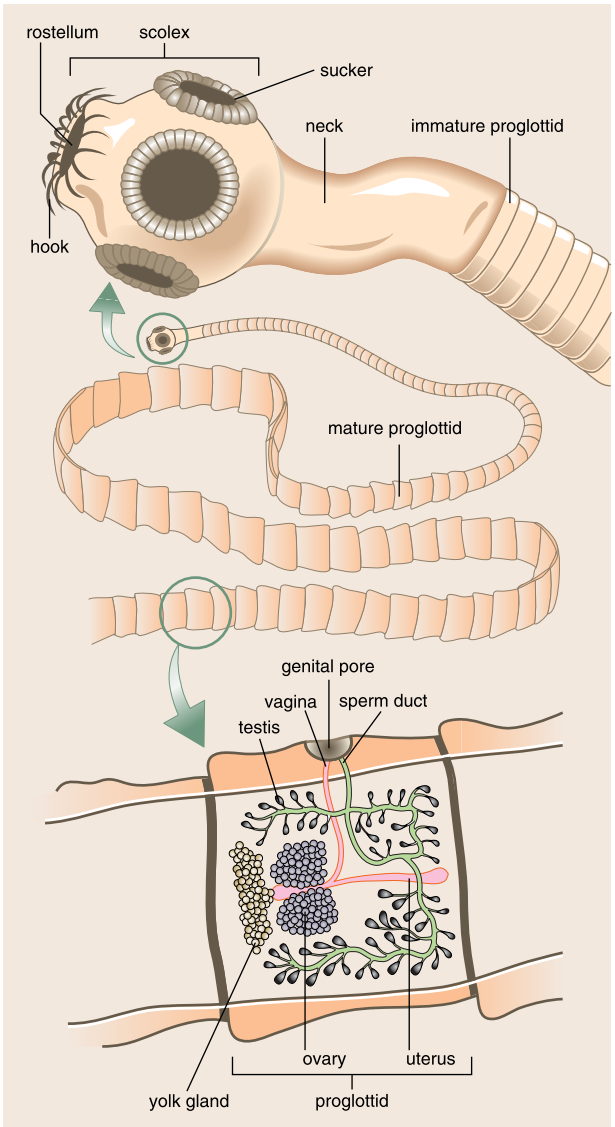
tapas \ˈtə-pəs\ Ascetic practice carried out to achieve spiritual power or purification. In Hinduism, it is associated with Yoga as a way of purifying the body in preparation for the more exacting spiritual exercises leading to liberation. In Jainism, its practice is a central means of breaking the cycle of rebirths by preventing new karma from forming and by eliminating the old. Tapas can take many forms, including fasting, controlling the breath, and holding difficult and painful body postures. Extreme forms are carried out by sadhus, many of whom earn alms for their unusual abilities or deprivations.

tape recorder Recording system that makes use of electromagnetic phenomena to record and reproduce sound waves. The tape consists of a plastic backing coated with a thin layer of tiny particles of magnetic powder. The recording head of the tape deck consists of a tiny C-shaped magnet with its gap adjacent to the moving tape. The incoming sound wave, having been converted by a microphone into an electrical signal, produces a time-varying magnetic field in the gap of the magnet. As the tape moves past the recording head, the powder is magnetized in such a way that the tape carries a record of the shape of the wave being recorded.

tapestry Heavy, reversible, patterned or figured hand-woven textile, usually in the form of a hanging or upholstery fabric. Tapestries are usually designed as single panels or as sets of panels related by subject and style and intended to be hung together. The earliest known tapestries were made from linen by the ancient Egyptians. Tapestry weaving was well established in Peru by the 6th century, and outstanding silk tapestries were made in China beginning in the Tang dynasty (AD 618–907). In western Europe, tapestry making flourished from the 13th century. Among the greatest European tapestries are the 15th-century *Lady with the Unicorn* set and the 16th-century *Acts of the Apostles* set, based on cartoons by Raphael. Tapestry art was revitalized in late-19th-century Britain with the Arts and Crafts Movement. In the 20th century, abstract tapestries were produced at the Bauhaus, and many painters, including Pablo Picasso and Henri Matisse, allowed their paintings to provide the basis for tapestry art.

tapeworm Any of about 3,000 species (class Cestoda, phylum Platyhelminthes) of bilaterally symmetrical parasitic flatworms found worldwide. Tapeworms range from 0.04 in. (1 mm) to more than 50 ft (15 m) long. The head bears suckers and often hooks for attaching to the liver or digestive tract of the host. Once attached, a tapeworm absorbs food through its body wall. The body is often divided into a head, or scolex, possessing the suckers and hooks, an unsegmented neck, and a series of proglottids (units containing both male and female reproductive organs) that continually form in a growth region at the base of the neck. Following fertilization, each mature proglottid containing thousands of embryos breaks off and is eliminated in the host's feces. If these are ingested by an animal (the intermediate host) grazing on food contaminated with feces, they develop into larvae, which bore through the intestinal wall into the circulatory system and are carried to muscle tissues, which they burrow into, forming a dormant cyst. When meat is inadequately cooked, humans become infested with the larvae, which attach to the intestinal wall. Many species that infest humans belong to the genus *Taenia*; the intermediate host is implied by the name (e.g., beef tapeworm, *T. saginata*). Humans can also acquire tapeworms through fecal contamination of soil or water. See illustration on the following page.

Tapi \ˈtä-pē\ **River** *or* **Tapti River** \ˈtäp-tē\ River, west-central India. It flows west from the mountains of Madhya Pradesh to the Gulf of Khambhat and the Arabian Sea. It is about 435 mi (700 km) long and largely unnavigable.



Tápies \ˈtäp-yes**, Antoni** (b. Dec. 13, 1923, Barcelona, Spain) Catalan painter. In 1946 he abandoned the study of law to devote his time to painting, which he taught himself. His early works were influenced by Surrealism, Paul Klee, and Joan Miró. In 1953, after seeing the works of Jean Dubuffet, he developed a unique blend of abstraction, assemblage, and impasto that established his international reputation. He has produced lithographs and illustrated books; his belief in the validity of commonplace materials has had worldwide influence. In 1990 the Tàpies Foundation, housing some 2,000 of his works, opened in Barcelona.

tapir \ˈtā-pər\ Any of four extant members (genus *Tapirus*) of the family Tapiridae, heavy-bodied, odd-toed ungulates, 6–8 ft (1.8–2.5 m)

Lowland tapir (*Tapirus terrestris*)
WARREN GARST—TOM STACK & ASSOCIATES

Principal features of the beef tapeworm (*Taenia saginata*). The head, or scolex, contains suckers and hooks for attaching to the host. A series of reproductive organs (proglottids) continually form at the base of the neck, and following fertilization they mature and break off. Each proglottid, eliminated in the host's feces, contains thousands of embryos to continue the life cycle.

long and up to 3 ft (1 m) high. They have short ears and legs and a fleshy snout overhanging the upper lip. The feet have three functional toes. Body hair is usually short and sparse, but two species have a short, bristly mane. The Malayan tapir (*T. indicus*) has a black head, shoulders, and legs and white rump, back, and belly. The single Central and two South American species are plain brown or gray. Tapirs inhabit the deep forest or swamp.

Tappan \'tap-ən**, Arthur** (b. May 22, 1786, Northampton, Mass., U.S.—d. July 23, 1865, New Haven, Conn.) U.S. merchant and philanthropist. He operated various businesses, including a silk-importing firm in New York (1826–37) with his brother Lewis Tappan (1788–1873); they also founded the first commercial credit-rating service (1841). He used his wealth to support missionary societies and the abolitionist crusade, helping found the American Anti-Slavery Society and serving as its first president (1833–40). After breaking with William Lloyd Garrison, he created the American and Foreign Anti-Slavery Society (1840). The Tappan brothers later supported the Underground Railroad.

taproot Main root of a primary-root system. It grows vertically downward. From the taproot arise smaller lateral roots (secondary roots), which in turn produce even smaller lateral roots (tertiary roots). Most dicotyledonous plants (see cotyledon), such as dandelions, produce taproots. The system may be modified into a fibrous, or diffuse, system, in which the initial secondary roots soon equal or exceed the primary root in size and there is no well-defined single taproot. Fibrous root systems are generally shallower than taproot systems. Carrots and beets are tuberous roots modified from taproots.

Tapti River See Tapi River

taqiyyah \tə-'kē-ə\ In Islam, the practice of concealing one's faith and forgoing ordinary religious duties under threat of death or injury to oneself or one's fellow Muslims. Its basis is found in the Qur'ān, and Muhammad is regarded as having set its first example when he chose to make the Hijrah. It has since been practiced mostly among minority groups, particularly those of the Shīʿite branch. Various rules governing its application are meant to ensure that *taqiyyah* does not become an excuse for cowardice or for failure to take appropriate action. Consideration of community rather than private welfare is generally stressed.

taqlīd \ta-'klēd\ In Islamic canon law, the unquestioning acceptance of legal precedent. The interpretation of *taqlīd* varies widely among the major schools of Islamic law. *Taqlīd* is compulsory for Shīʿites. Of the four Sunnite legal schools, views are mixed; most scholars of the Shāfiʿī, Mālikī, and Ḥanafī schools embrace *taqlīd*, but those of the Ḥanbalī do not view the opinions of earlier scholars as necessarily binding. Support for the practice is based mainly on the belief that early Muslim scholars, being closer in time to Muhammad, were in the best position to derive authoritative legal opinions.

tar sand *or* **bituminous sand** Deposit of loose sand or partially consolidated sandstone that is saturated with highly viscous bitumen. Oil recovered from tar sands, commonly referred to as synthetic crude, is a potentially significant form of fossil fuel. The largest known deposits of tar sands occur in Canada's Athabasca River valley, where commercial projects for synthetic oil production from tar sands are being carried out.

Tara \'tä-rä\ In Buddhism, a saviour-goddess with numerous forms. Her worship is widely popular in Nepal, Tibet, and Mongolia. She is the feminine counterpart of Avalokitesvara. She came into existence when his tear fell to the ground and formed a lake; out of its waters rose a lotus, which, on opening, revealed the goddess. She is the protector of navigation and earthly travel, as well as of spiritual travel along the path to enlightenment. In art she typically holds a lotus and has a third eye. She is represented in various colours, signifying different aspects of her powers.

Ṭarābulus See Tripoli (Lebanon) and Tripoli (Libya)

Tarai *or* **Terai** \tə-'rī\ Region of northern India and southern Nepal. It runs parallel to the lower ranges of the Himalayas and stretches from the Yamuna River to the Brahmaputra River. Numerous springs at its northern edge form several streams, including the Ghaghara River, that intersect the region and give it its marshy character. Much of the area's marshland, once malarial, has been drained and put under cultivation.

Tarantino, Quentin (b. March 27, 1963, Knoxville, Tenn., U.S.) U.S. director and screenwriter. He worked in a video store in California before selling two screenplays that became *True Romance* (1993) and Oliver Stone's *Natural Born Killers* (1994). He made his directing debut with *Reservoir Dogs* (1993). His controversial *Pulp Fiction* (1994) won the

© 2006 Encyclopædia Britannica, Inc.

Academy Award for best screenplay and the Golden Palm at the Cannes Film Festival. His films, including *Jackie Brown* (1997), *Kill Bill: Vol. 1* (2003), and *Kill Bill: Vol. 2* (2004), are known for their stylized violence, razor-sharp dialogue, and fascination with film and pop culture. Tarantino also worked as an actor, producer, and executive of a film distribution company, Rolling Thunder.

Taranto \tä-rän-ˌtō\ *ancient* **Tarentum** Seaport (pop., 2001 prelim.: 201,349), Puglia region, southeastern Italy. Located on the Gulf of Taranto, the old city is on a small island, with newer areas on the adjacent mainland. Founded by Spartans in the 8th century BC, it was called Taras and became one of the leading cities of Magna Graecia. It reached its zenith in the 4th century BC under Archytas. It came under Rome in 272 BC. Between the 5th and the 11th centuries AD it was taken by the Goths, Byzantines, Lombards, Arabs, and Normans. By the 15th century it was part of the Kingdom of Naples. It became part of the Kingdom of the Two Sicilies from 1815 and then joined the Kingdom of Italy in 1861. Taranto was an important stronghold of the Italian navy in both world wars; it was heavily bombed in 1940 and was occupied by British forces in 1943. Still an important naval base, it is the site of extensive shipyards and a large iron- and steelworks.

tarantula \tə-ran-chə-lə\ Name that originally referred to the wolf spider but now covers any spider in the family Theraphosidae. It is found from the southwestern U.S. to South America. Many species live in a burrow, and most have a hairy body and long, hairy legs. They are nocturnal predators of insects and, occasionally, amphibians and mice. Certain South American tarantulas eat small birds. In the southwestern U.S., tarantulas of the genus *Aphonopelma* may have a body 2 in. (5 cm) long and a leg spread of nearly 5 in. (12 cm). They may inflict a painful bite if provoked. The most common U.S. species, *Eurypelma californicum*, may live up to 30 years.

Mexican red-kneed tarantula (*Brachypelma smithii*).
LYNAM/TOM STACK & ASSOCIATES

Tarasco *or* **Tarascan** Indian people of Michoacán state in central Mexico. Traditionally, they have been farmers, though they fish, hunt, trade, and work for wages as well. Each village tends to specialize in a craft (e.g., woodworking, weaving, pottery, net weaving, embroidering, or sewing). Their Roman Catholicism is only slightly influenced by pre-Columbian religion. They are gradually becoming assimilated to the mestizo culture, though their primary language remains Tarascan.

Tarawa \tə-'rä-wə, 'ta-rə-wä\ Coral atoll (pop., 1995: 32,354), Gilbert Islands, Kiribati. The site of Bairiki, the capital of Kiribati, Tarawa is made up of 15 islets along a reef 22 mi (35 km) long. Occupied by the Japanese during World War II, it was seized by U.S. Marines in 1943 after a costly battle. Now a commercial and educational centre, it exports copra and mother-of-pearl and has an extension of the University of the South Pacific. It was the capital of Gilbert and Ellice Islands until 1975.

Tarbell \'tär-bəl**, Ida M(inerva)** (b. Nov. 5, 1857, Erie county, Pa., U.S.—d. Jan. 6, 1944, Bridgeport, Conn.) U.S. investigative journalist, lecturer, and chronicler of American industry. In 1891 Tarbell went to Paris, where she supported herself by writing for U.S. magazines. She became best known for *The History of the Standard Oil Company* (1904), an account of the rise of a business monopoly that first appeared serially in *McClure's Magazine* and led to the government's epochal antitrust suit against the company. For her work Tarbell became one of the journalists Theodore Roosevelt dubbed muckrakers.

Tardieu \tär-'dyœ**, André (-Pierre-Gabriel-Amédée)** (b. Sept. 22, 1876, Paris, France—d. Sept. 15, 1945, Menton) French politician. After work in the diplomatic service, he became foreign editor of *Le Temps* and was elected to the Chamber of Deputies in 1914. A delegate to the Paris Peace Conference, he was instrumental in drafting the Treaty of Versailles. A supporter of Georges Clemenceau in his early career, he served in various government posts, and as the leader of the right-centre in the Chamber of Deputies, he twice served as premier (1929–30, 1932), advocating a policy of large national expenditure. Disillusioned with the failures of the parliamentary system, he retired in 1936.

Targum \'tär-gəm\ Any of several translations of the Hebrew scriptures or its parts into Aramaic. The earliest date from after the Babylonian Exile and were designed to meet the needs of uneducated Jews who did not know Hebrew. After the destruction of the Second Temple of Jerusalem (AD 70), Targums became established in synagogues, where scripture was read aloud with a translation in Aramaic. These readings eventually incorporated paraphrase and commentary. Targums were regarded as authoritative throughout the Talmudic period (see Talmud) and began to be committed to writing in the 5th century.

Tarhun \'tär-ˌkůn\ *or* **Taru** \'tär-ˌů\ Ancient Anatolian weather god whose name appears in records as early as 1400 BCE. He was one of the supreme deities of the Hittite pantheon and was regarded as the embodiment of the state in action. He was the consort of Arinnitti, the Hittite sun goddess and principal deity. His sacred animal is the bull, and in art he may be depicted standing on one. Jupiter Dolichenus arose as a development of Tarhun.

tariff *or* **customs duty** Tax levied upon goods as they cross national boundaries, usually by the government of the importing country. The words *tariff*, *duty*, and *customs* are generally used interchangeably. Usually assessed on imports, tariffs may apply to all foreign goods or only to goods produced outside the borders of a customs union. A tariff may be assessed directly, at the border, or indirectly, by requiring the prior purchase of a license or permit to import specified quantities of the good. Examples of tariffs include transit duties and import or export taxes, which may be levied on goods passing through a customs area en route to another destination. In addition to providing a source of revenue, tariffs can effectively protect local industry by driving up the price of an imported item that competes with domestic products. This practice allows domestic producers either to charge higher prices for their goods or to capitalize on their own lighter taxes by charging lower prices and attracting more customers. Tariffs are often used to protect "infant industries" or to safeguard older industries that are in decline. They are sometimes criticized for imposing hidden costs on domestic consumers and encouraging inefficiency in domestic industries. Tariffs are subject to negotiation and treaties among nations (see General Agreement on Tariffs and Trade; trade agreement; World Trade Organization).

Tarim \'dä-'rēm\ **River** *Chinese* **Talimu** \'tä-'lē-'mü\ **He** *or* **T'a-li-mu Ho** Chief river of Xinjiang autonomous region, China. Formed by the confluence of two rivers in the far west, it follows an undefined riverbed for much of its course, flowing along the northern edge of the Takla Makan Desert before turning southeast. Because it frequently changes course, its length varies but is about 1,260 mi (2,030 km). The Tarim Basin is enclosed by the Tien Shan, the Pamirs, and the Kunlun Mountains. It is the driest region of Eurasia.

ṭarīqah \tä-'rē-kə\ In Sufism, the spiritual path toward direct knowledge of God. For early Sufi mystics, the term referred to an individual's spiritual path; later it came to mean the path advocated by a particular school or order of Sufis and then of the order itself. Each mystic order claimed a chain of spiritual descent from Muhammad. Today Sufi *ṭarīqah* number in the hundreds.

Tarkington, (Newton) Booth (b. July 29, 1869, Indianapolis, Ind., U.S.—d. May 19, 1946, Indianapolis) U.S. novelist and dramatist. He became known for satirical and sometimes romanticized pictures of Midwesterners in humorous portrayals of boyhood and adolescence that include the young-people's classics *Penrod* (1914), *Seventeen* (1916), and *Gentle Julia* (1922). The trilogy *Growth* (1927) includes *The Magnificent Ambersons* (1918, Pulitzer Prize; film, 1942), which traces the decline of a once-powerful and prominent family. *Alice Adams* (1921; film, 1923, 1935), a searching character study, is perhaps his most finished novel.

Tarkovsky \tär-'kȯf-skē**, Andrey (Arsenyevich)** (b. April 4, 1932, Moscow, Russia, U.S.S.R.—d. Dec. 29, 1986, Paris, France) Soviet film director. The son of a poet, he studied at the Soviet State Film School and won praise for his first feature film, *Ivan's Childhood* (1962). His religious and aesthetic concerns were reflected in *Andrei Rublev* (1966), about a medieval icon painter confronted with the brutality of war. His later films, noted for their striking visual images, visionary tone, and paucity of conventional plot, include *Solaris* (1972), *A Mirror* (1975), and *Stalker* (1978). Soviet authorities hindered domestic distribution of his films, and in 1984, after making *Nostalgia* (1983), he defected to the West, where he made his last film, the acclaimed *The Sacrifice* (1986).

© 2006 Encyclopædia Britannica, Inc.

Tarn River River, southwestern France. Rising in the Lozère Mountains, it flows west and southwest for 233 mi (375 km) into the Garonne River. Its magnificent gorges, which extend more than 30 mi (48 km) through limestone plateaus, are popular tourist attractions.

taro \'tär-ō\ Herbaceous plant (*Colocasia esculenta*) of the arum family, probably native to Southeast Asia and taken to the Pacific islands. It is a staple crop cultivated for its large, starchy, spherical tubers, which, though poisonous raw, become edible with heating. They are consumed as a cooked vegetable or are made into puddings, breads, or Polynesian poi (a thin, pasty, highly digestible mass of fermented taro starch). Poi is a staple food in Hawaii. The large leaves (also poisonous raw) of the taro are commonly eaten stewed.

tarot \'tar-ˌō\ Sets of cards used in fortune-telling and in certain card games. The origins of tarot cards are obscure; cards approximating their present form first appeared in Italy and France in the late 14th century. Modern tarot decks consist of 78 cards, of which 22 have pictures representing forces, characters, virtues, and vices. The remaining cards are divided into four suits—(1) wands, batons, or rods, (2) cups, (3) swords, and (4) coins, pentacles, or disks—of 14 cards each. Each suit has 10 numbered cards and 4 court cards (king, queen, knight, and page). Modern playing cards evolved from these suit cards. Initially used as playing cards, tarot cards were imbued with esoteric associations in the 18th century and are now used widely for fortune-telling. Each card's basic meaning is altered by the card's position in the spread of cards laid out by the fortune-teller, by the card's orientation, and by the cards that are near it.

Moon, the eighteenth card of the Major Arcana
MARY EVANS PICTURE LIBRARY

tarpon Any of certain marine fish (family Megalopidae) having an elongated last dorsal fin ray and a bony throat plate between the sides of the protruding lower jaw. The scales are large, thick, and silvery. The Atlantic tarpon (*Tarpon atlanticus* or *Megalops atlanticus*) is found inshore in warm parts of the Atlantic Ocean, on the Pacific Ocean side of Central America, and sometimes in rivers. It habitually breaks the water's surface and gulps air. It grows to 6 ft (1.8 m) and 100 lb (45 kg) or larger and is a favourite game fish. The Pacific tarpon (*M. cyprinoides*) is similar.

Young Atlantic tarpon (*Tarpon atlanticus*)
COURTESY OF MIAMI SEAQUARIUM

Tarquinia \tär-'kwēn-yä\ *formerly (until 1922)* **Corneto** Town (pop., 1991: 14,000), northern Lazio region, central Italy. It developed out of the ancient Tárchuna, one of the chief cities of the Etruscan confederation. It was defeated by Rome in the 4th century BC and became a Roman colony (as Tarquinii) in the 1st century BC. It was moved to its present site after Lombard and Saracen invasions in the 6th–8th centuries AD. In medieval times it was called Corneto. Remains of the ancient city include the foundations of a great Etruscan temple with a group of terra-cotta winged horses that is considered a masterpiece of Etruscan art. The famous necropolis contains the most important painted tombs in Etruscan Italy.

tarragon \'tar-ə-gən\ Bushy aromatic herb (*Artemisia dracunculus*) of the composite family, the dried leaves and flowering tops of which are used to add tang to many culinary dishes. Tarragon is a common ingredient in seasoning blends, such as fines herbes. The fresh leaves are used in salads, and vinegar in which fresh tarragon has been steeped is a distinctive condiment. The plant is probably native to Siberia; a French variety is cultivated in Europe and North America.

tarsier \'tär-sē-ər, 'tär-sē-ˌā\ Any of three species (genus *Tarsius*, family Tarsiidae) of nocturnal prosimian primates found on several South Asian islands. Tarsiers have large, goggling eyes and a round head that can be rotated 180°. The ears are large, membranous, and almost constantly in motion. Tarsiers are 4–6 in. (9–16 cm) long; the thin, tufted tail of about twice that length provides balance and support. The gray to dark brown fur is thick and silky. Tarsiers cling vertically to trees and leap from trunk to trunk. They have greatly elongated hind limbs and disklike adhesive pads on the digit tips. Tarsiers prey mainly on insects. The well-furred newborn is born with eyes open.

Tarsus City (pop., 1997: 190,184), south-central Turkey. It is located near the Mediterranean Sea coast. Settled from Neolithic times, it was razed and rebuilt c. 700 BC by the Assyrian king Sennacherib. Later, Achaemenid and Seleucid rule alternated with periods of autonomy. In 67 BC it was absorbed into the new Roman province of Cilicia, becoming its principal city. It was the site of the first meeting in 41 BC between Mark Antony and Cleopatra and was the birthplace of St. Paul. It remained a leading industrial and cultural centre through the early Byzantine period. It came under various powers in the 10th–15th centuries and passed to the Ottoman Empire in the early 16th century. Modern Tarsus is a prosperous agricultural and cotton-milling centre.

tartan Cross-checkered repeating pattern (or "sett") of bands, stripes, or lines of various colours and of definite width and sequence, woven into woolen cloth, sometimes with silk added. Such patterns have existed for centuries in many cultures but have come to be regarded as fundamentally Scottish and as a quasi-heraldic Scottish family or clan emblem. Though claims of great antiquity have been made for Scottish tartans, few seem to predate the 17th or even 18th century as clan emblems. The Scottish Tartans Society (founded 1963) maintains a register of all known tartans, numbering about 1,300.

Royal Stuart (Stewart) tartan.

Tartarus \'tär-tə-rəs\ In Greek mythology, the lowest depths of the underworld. It was a region of eternal darkness where the evil were punished after death for having offended the gods. Here Zeus confined the Titans, who were prevented from escaping by hundred-armed giants. Later classical authors sometimes used Tartarus interchangeably with Hades to designate the entire underworld.

Tartikoff \'tär-ti-ˌkȯf**, Brandon** (b. Jan. 13, 1949, New York, N.Y., U.S.—d. Aug. 27, 1997, Los Angeles, Calif.) U.S. television executive. He successfully promoted local ABC television stations before being hired by Fred Silverman as ABC's director of dramatic development. From 1978 the two men worked together at NBC, and in 1980 Tartikoff became president of NBC entertainment (then the bottom-rated television network) and the youngest division chief in U.S. network history. He developed dramatic series such as *St. Elsewhere* and *Hill Street Blues* as well as the popular sitcoms *Family Ties*, *The Golden Girls*, *The Cosby Show*, *Cheers*, and *Seinfeld*, making NBC the top-rated network. Tartikoff later became head of Paramount Pictures and New World Entertainment.

Taru See Tarhun

tashbīh \täsh-'bē, täsh-'bē-hə\ In Islam, the comparison of God to created things. The practice of attributing human characteristics to the deity is regarded as a sin in Islamic theology, as is its opposite, *taʿtīl* (divesting God of all attributes). The difficulty of dealing with the nature of God in Islam arises from seemingly contradictory views in the Qurʾān, which describes God as unique, yet also refers to him as having eyes, ears, hands, and face. *Tashbīh* is forbidden out of the fear that its practice will lead to paganism and idolatry; *taʿtīl* is feared to lead to atheism.

Tashkent \tash-'kent, tash-'kend\ *or* **Toshkent** City (pop., 1998 est.: 2,124,000), capital of Uzbekistan. Dating from about the 1st century BC,

© 2006 Encyclopædia Britannica, Inc.

it was an important trade centre on the caravan routes to Europe and East Asia. The Arabs conquered it in the early 8th century; it fell to the Mongols in the 13th century and was under Turkish control in the 14th–15th centuries. Taken by the Russians in 1865, it was made the administrative centre of Turkistan in 1867, and a new European city grew up beside the old native one. The city was heavily damaged by an earthquake in 1966. Today it is the main economic and cultural centre of Central Asia. Its many institutions of higher education include the Uzbek Academy of Sciences (1943).

Tasman \'täs-mən**, Abel Janszoon** (b. 1603?, Lutjegast, Neth.—d. probably before Oct. 22, 1659, certainly before Feb. 5, 1661) Dutch explorer. In the service of the Dutch East India Company, he made exploratory and trading voyages to East and Southeast Asia (1634–39). In 1642 he was sent by Anthony van Diemen to find the hypothetical southern continent of the Pacific and a possible route to Chile. Sailing from Batavia (modern Jakarta), he reached 49° S at 94° E, then turned north and discovered land he named Van Diemen's Land (Tasmania), then sailed along the coast of New Zealand, believing it to be the southern continent. He also discovered Tonga and the Fiji Islands. On his next voyage (1644) he sailed into the Gulf of Carpentaria and along the northern and western coasts of Australia.

Tasman Peninsula \'taz-mən\ Peninsula, southeastern Tasmania, Australia. About 26 mi (42 km) long by 20 mi (32 km) wide, it has sea cliffs and unusual rock formations. First explored in 1642, it was not settled until a penal colony was established at Port Arthur in 1830. Its partly restored ruins are now a tourist attraction, and the peninsula is part of Australia's National Estate.

Tasman Sea Part of the South Pacific Ocean, between southeastern Australia and western New Zealand. About 1,400 mi (2,250 km) wide, it has maximum depths exceeding 17,000 ft (5,200 m) in the Tasman Basin. Explored by Abel Janszoon Tasman in 1642 and by Capt. James Cook in the 1770s, it is notoriously stormy. Economic resources include fisheries and petroleum deposits.

Tasmania \taz-'mā-nē-ə\ *formerly* **Van Diemen's** \'dē-mənz\ **Land** Island (pop., 2005 est.: 485,199) and state, Australia. Located off the southeastern corner of the continent and separated from it by Bass Strait, the state has an area of 26,410 sq mi (68,400 sq km) that also includes numerous smaller islands. Hobart is the capital. Originally inhabited by Australian Aboriginals, the island was explored and named Van Diemen's Land by Abel Janszoon Tasman in 1642. Taken by the British in the early 1800s and made a colony in 1825, it was used as an auxiliary penal settlement until the 1850s. It was granted self-government and renamed Tasmania in 1856; it became a state of the Australian Commonwealth in 1901. Chief economic activities include copper, zinc, tin, and tungsten mining; livestock raising, especially sheep for wool; and tourism. Several natural areas, collectively called the Tasman Wilderness, were designated a UNESCO World Heritage site in 1982 (extended in 1989).

Tasmanian Any member of a now-extinct population of Tasmania. An isolate population of Australian Aboriginals who entered Tasmania 25,000–40,000 years ago, they were cut off from the mainland when a general rise in the sea level flooded the Bass Strait about 10,000 years ago. Subsistence was based on hunting land and sea mammals and collecting shellfish and vegetable food. The first permanent white settlement was made in Tasmania in 1803, and the settlers provoked a war in 1804. Of an estimated 4,000 Tasmanians present when the Europeans first arrived, only 200 remained by the 1830s; moved to Flinders Island for their protection, they did not survive long in their new home, and the last full-blooded Tasmanian died in 1876.

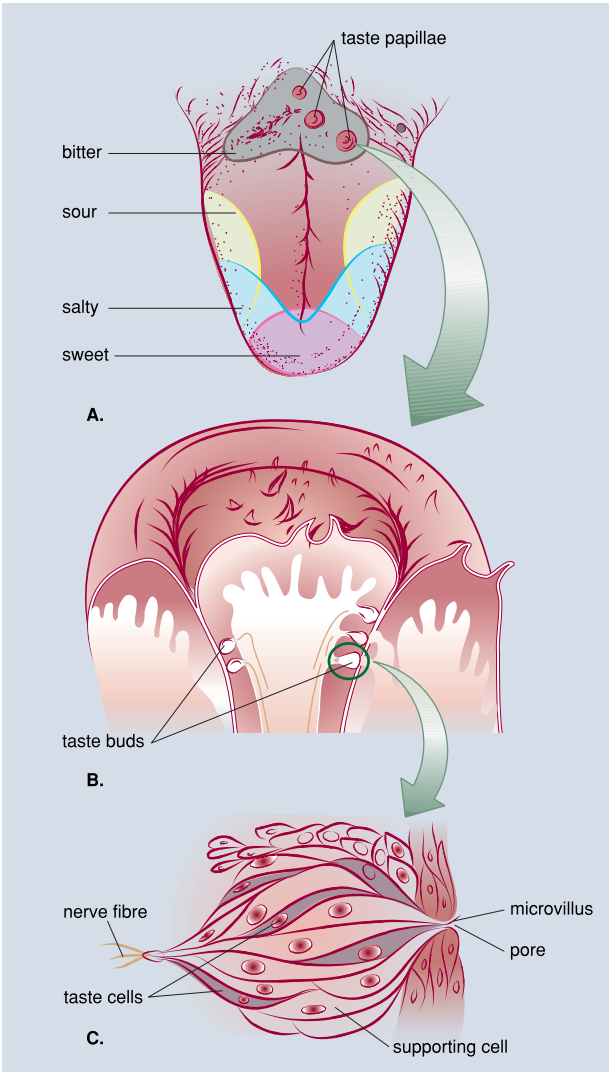
Tasmanian devil Marsupial species (*Sarcophilus harrisii* or *S. ursinus*, family Dasyuridae), now extinct on the Australian mainland, that survives in remote rocky areas of Tasmania. It is 30–40 in. (75–100 cm) long, with a stocky body, large head and jaws, and long bushy tail. The coat is usually black and brown with a white-marked breast. Named for its devilish expression and husky snarl, it is mainly a scavenger of wallaby and sheep carcasses but also eats beetle larvae and occasionally poultry. Its three or four young remain in the mother's pouch about five months.

Tasmanian devil (*Sarcophilus harrisii*).
JOHN YATES/SHOSTAL ASSOCIATES

Tasmanian wolf *or* **Tasmanian tiger** *or* **thylacine** Extinct, slender, fox-faced marsupial (*Thylacinus cynocephalus*,family Thylacinidae), 40–50 in. (100–130 cm) long. It was yellowish brown, with dark bars on the back and rump. It hunted at night for wallabies and birds. The female carried her young in a shallow pouch. Once found on the Australian mainland and New Guinea, it was confined to Tasmania in historical times, when competition with the dingo led to its disappearance from the mainland. Europeans in Tasmania hunted it to protect their sheep; the last known individual died in captivity in 1936.

Tasso \'täs-sō**, Torquato** (b. March 11, 1544, Sorrento, Kingdom of Naples—d. April 25, 1595, Rome) Italian poet. The son of a poet and courtier, Tasso became a courtier of Duke Alfonso II d'Este at Ferrara. In a period of intense poetic activity he produced the pastoral drama *L'Aminta* (1581; performed 1573), a lyrical idealization of court life. In 1575 he completed his celebrated masterpiece on the First Crusade, *Gerusalemme liberata* (1581; *Jerusalem Delivered*), a heroic epic in ottava rima that blends historical events with imaginary romantic and idyllic episodes. He developed a persecution mania and from 1579 to 1586 was incarcerated in a hospital by order of the duke. *Gerusalemme* was translated and imitated in many European languages, and Tasso was the subject of literary legend for centuries. He is regarded as the greatest Italian poet of the late Renaissance.

taste *or* **taste perception** Special sense for perceiving and distinguishing the sweet, sour, bitter, or salty quality of a dissolved substance, mediated by taste buds on the tongue. More than 9,000 taste buds on the tongue are responsible for the chemoreception of taste. Some taste buds are also found on the roof of the mouth and throat. See illustration on following page.



Tatar \'tä-tər\ *or* **Tartar** Any member of the Turkic-speaking peoples who today live mainly in west-central Russia east to the Ural Mountains, in Kazakhstan, and in western Siberia. They first appeared as nomadic tribes in northeastern Mongolia in the 5th century. Some joined the armies of Genghis Khan. Especially identified with the Golden Horde, they were converted to Islam in the 14th century. The Golden Horde soon became independent Tatar khanates (see khan). Their economy was based on mixed farming and herding, which remain central to their economy. They developed craftsmanship in wood, ceramics, leather, cloth, and metal and have been well known as traders. Today there are about six million Tatars in all regions; they constitute about half the population of the Russian republic of Tatarstan. See also Tatar language.

Tatar \'tä-tər\ **language** *formerly* **Volga Tatar language** Turkic language with some eight million speakers. Its speakers include less than half the population of Tatarstan in Russia, with the remainder scattered in enclaves across eastern European Russian, Siberia, and the Central Asian republics. Tatar, like the closely related Bashkir language, is characterized by a remarkable series of vowel shifts that distinguish it (at least in its most characteristic varieties) from all other Turkic languages. It has numerous dialect distinctions; the conventional division is between a central group that includes the Tatar of most of Tatarstan and the literary language based on Kazan speech, a western group, and an eastern group. Crimean Tatar, belonging to the southwestern group of Turkic languages, and Chulym Tatar, belonging to the northeastern group, are not closely related to Tatar.

Tatar Strait \'tä-ˌtär\ Wide passage in the northwestern Pacific Ocean, connecting the Sea of Japan (East Sea) and the Sea of Okhotsk. Located between Sakhalin Island and Russia's Far East mainland, it is generally shallow, with depths less than 700 ft (210 m). Ice impedes its ports for half the year.

Tate, (John Orley) Allen (b. Nov. 19, 1899, Winchester, Ky., U.S.—d. Feb. 9, 1979, Nashville, Tenn.) U.S. poet and novelist. While attending Vanderbilt University Tate helped found *The Fugitive* (1922–25), a poetry magazine concentrating largely on the South, and contributed to *I'll Take My Stand* (1930), a Fugitive manifesto defending the region's conservative agrarian society. From 1934 he taught at several institutions, including Princeton University and the University of Minnesota, becoming a leading exponent of the New Criticism. He emphasized the writer's need for tradition, which he found in Southern culture and later in Roman Catholicism, to which he converted in 1950. His best-known poem is "Ode to the Confederate Dead" (1926).

© 2006 Encyclopædia Britannica, Inc.

A. Taste centres on the tongue's surface. Taste buds on the tip of the tongue are most sensitive to sweet tastes, those on the sides to sour, those at the back to bitter, and those on the tip and sides to salty. B. Close-up of a papilla showing location of the taste buds. C. Structure of a taste bud. Each is composed of narrow modified epithelial taste cells with specialized hairs (microvilli) that project into a pore opening onto the tongue's surface and of broader supporting cells. Impulses from the taste cells are carried by nerve pathways to the brain.

© MERRIAM-WEBSTER INC.

Tate, Nahum (b. 1652, Dublin, Ire.—d. July 30, 1715, London, Eng.) Irish-English poet and playwright. After graduating from Trinity College, Dublin, Tate moved to London. Though he wrote plays of his own, he is best known for his adaptations of Elizabethan works, notably William Shakespeare's *King Lear*, with a happy ending, which was performed well into the 19th century. He wrote the libretto for Henry Purcell's *Dido and Aeneas* (1689?) and collaborated with Nicholas Brady in *A New Version of the Psalms of David* (1696). The best of his own poems is "Panacea: A Poem upon Tea" (1700). He became England's poet laureate in 1692.

Tate Gallery Art museum in London housing the national collection of British painting and sculpture and of modern British and European art since c. 1870. It is named after Sir Henry Tate (1819–1899), a sugar refiner and inventor of the sugar cube, who donated his collection of Victorian art to the nation in 1890. The Neoclassical building, designed by Sidney R. J. Smith, opened in 1897. Originally administered by the National Gallery, the museum became completely independent only in 1954. In 1987 the Clore Gallery was built to house the principal collection of J.M.W. Turner's works. In 1988 a branch was opened in Liverpool. The Tate Modern, a converted power plant housing the modern collections, opened in 2000.

Tathagata \tə-'tä-gə-tə\ Epithet of the Buddha that he employed primarily when referring to himself. He also used it to refer to other buddhas who preceded him and who would follow. Tathagatha refers to one who has trod the path to full awakening and so reached the end of suffering and escaped samsara. The implication is that the path is open to all who would follow it. In later Mahayana Buddhism, Tathagata came to mean the essential buddha nature found in everyone.

Tati \tä-'tē**, Jacques** *orig.* **Jacques Tatischeff** (b. Oct. 9, 1908, Le Pecq, France—d. Nov. 5, 1982, Paris) French film actor and director. He became a popular music-hall entertainer in the 1930s with a pantomime act that caricatured athletes. After appearing in comedy shorts, he wrote, directed, and starred in a series of comic feature films—*Jour de fête* (1949), *Monsieur Hulot's Holiday* (1953), *Mon oncle* (1958), *Playtime* (1968), *Traffic* (1971), and *Parade* (1974)—in which he became known for his inspired physical comedy and his accident-prone alter ego, Monsieur Hulot. In his films Tati forsakes traditional narrative in favour of vignettes that use sight gags, timing, mannerisms, and physical action to reveal the humour and texture of modern living.

Tatlin \'tät-lyin**, Vladimir (Yevgrafovich)** (b. Dec. 16, 1885, Kharkov, Russian Empire—d. May 31, 1953, Moscow, U.S.S.R.) Ukrainian sculptor and painter. After a visit to Paris (1914), he became the leader of a group of Moscow artists who sought to apply engineering techniques to sculpture construction, a movement that developed into Constructivism. He pioneered the use of iron, glass, wood, and wire in nonrepresentational constructions. His *Monument to the Third International*, commissioned by the Soviet government, was one of the first buildings conceived entirely in abstract terms and was intended to be, at more than 1,300 ft (400 m), the world's tallest structure. A model was exhibited at the 1920 Soviet Congress, but the government disapproved of nonfigurative art and it was never built. After 1933 Tatlin worked largely as a stage designer.

tattoo Permanent mark or design made on the body by pigment introduced through ruptures in the skin. The term is also loosely applied to the inducement of scars (cicatrization). Tattooing has been practiced in most parts of the world, and examples have been found on Egyptian and Nubian mummies dating from 2000 BC. Decoration is perhaps the most common motive, though designs may also serve to identify rank, status, or membership and are thought by some to provide magical protection against sickness or misfortune. The word comes from Tahiti, where it was recorded by James Cook's expedition in 1769. The first electric tattooing implement was patented in the U.S. in 1891.

Tatum \'tā-təm**, Art(hur)** (b. Oct. 13, 1909, Toledo, Ohio, U.S.—d. Nov. 5, 1956, Los Angeles, Calif.) U.S. jazz pianist. Tatum was blind from birth. Influenced by Fats Waller and Earl Hines, his playing represents a synthesis of stride and swing piano traditions. He developed an unprecedented technical and harmonic control on the instrument and was capable of astonishing speed and intricate elaborations of melody. By 1937 he was recognized as the outstanding pianist in jazz. He formed a trio with guitar and bass in 1943 but frequently made solo performances that showcased his unique mastery.

Tatum, Edward L(awrie) (b. Dec. 14, 1909, Boulder, Colo., U.S.—d. Nov. 5, 1975, New York, N.Y., U.S.) U.S. biochemist. He worked with George Wells Beadle at Stanford University, where they confirmed that all biochemical processes in organisms are ultimately controlled by genes, that these processes can be broken down into a series of individual sequential chemical reactions, each controlled by a single gene, and that mutation of a single gene changes the cell's ability to carry out only a single chemical reaction. Each gene was found to determine the structure of a specific enzyme (the "one gene, one enzyme" hypothesis). With Joshua Lederberg, Tatum discovered the occurrence of genetic recombination, or "sex," between certain bacteria. Largely because of their efforts, bacteria became the main source of information about genetic control of biochemical processes in the cell. Tatum, Beadle, and Lederberg shared the Nobel Prize in 1958.

Taunton Town (pop., 1995 est.: 55,000), county seat of Somerset, England. An Anglo-Saxon king founded it c. 710. Its castle was besieged

© 2006 Encyclopædia Britannica, Inc.

during the English Civil Wars and subsequently dismantled. Taunton later was the scene of the duke of Monmouth's rebellion (1685). It is in an agricultural region; tourism is also important to the economy.

Taupo \'taù-pō**, Lake** Lake, North Island, New Zealand. The largest lake in New Zealand, it is 234 sq mi (606 sq km) in area and covers the remains of several volcanic craters. The Waikato River flows into and out of it. Numerous geothermal springs on the lake's borders are used for health resorts and for generating electricity.

Taurus (Latin: "Bull") In astronomy, the constellation lying between Aries and Gemini; in astrology, the second sign of the zodiac, governing approximately the period April 20–May 20. Its symbol is a bull, a reference to the Greek myth in which Zeus transformed himself into a white bull to abduct Europa.

Taurus Mountains Mountain chain, southern Turkey, running parallel with the Mediterranean Sea coast. The system extends along a curve from Lake Egridir in the west to the upper reaches of the Euphrates River in the east. It has many peaks rising above 10,000–12,000 ft (3,000–3,700 m) in elevation. The Cilician Gates pass, 38 mi (61 km) long and used by caravans and armies since antiquity, crosses the range north of Tarsus.

Taussig \'taù-sig**, Helen Brooke** (b. May 24, 1898, Cambridge, Mass., U.S.—d. May 20, 1986, Kennett Square, Pa.) U.S. physician. She received her medical degree from Johns Hopkins in 1927. As head of a Baltimore heart clinic (1930–63), she studied "blue babies" (babies whose heart malformations cause low blood oxygen content) and pioneered use of fluoroscopy and X rays to pinpoint the defect responsible for each set of symptoms. The surgical treatment she devised with Alfred Blalock saved thousands of such infants, and her research spurred development of other surgical treatments for heart disorders. Her *Congenital Malformations of the Heart* (2 vol., 1947) comprehensively described heart defects and diagnostic tools, techniques, and findings. She also played a key role in alerting U.S. physicians to the dangers of thalidomide.

tautog See wrasse

tautology \tò-'tä-lə-jē\ In logic, a statement that cannot be denied without inconsistency. Thus, "All bachelors are either male or not male" is held to assert, with regard to anything whatsoever that is a bachelor, that it is male or it is not male. In the propositional calculus, even complicated symbolic expressions such as $[(A \supset B) \wedge (C \supset \neg B)] \supset (C \supset \neg A)$ can be shown to be tautologies by displaying in a truth table every possible combination of T (true) and F (false) of its arguments A, B, C. A tautology can be purely formal (a statement form rather than a statement), and in some usages only such formal truths are tautologies.

tautomerism \tò-'tä-mə-ˌri-zəm\ Existence of two or more chemical compounds that have the same chemical composition but different structures (isomers) and that convert easily from one to another. A major class of tautomeric reactions involves exchange of a hydrogen atom between two other atoms in the same molecule, in both cases forming a covalent bond. For example, in keto-enol tautomerism, the hydrogen atom bonded to the carbon atom in a carbonyl (keto) group (—CH—C=O; see functional group) moves to the oxygen atom, making it an enol group (—C=C—OH). The keto form predominates in many aldehydes and ketones, the enol form in phenols. Sugars (e.g., glucose) exhibit tautomerism between open (chain) forms and closed (ring) forms. See also isomerism.

Tawney, Richard Henry (b. Nov. 30, 1880, Calcutta, India—d. Jan. 16, 1962, London, Eng.) English economic historian. He was educated at Rugby School and at the University of Oxford, where he wrote his first major work, *The Agrarian Problem in the Sixteenth Century* (1912). From 1913 he taught at the London School of Economics. An ardent socialist, he helped formulate the economic and moral viewpoint of the Labour Party in the 1920s and '30s. In his most influential book, *The Acquisitive Society* (1920), he argued that the acquisitiveness of capitalist society was a morally wrong motivating principle. His *Religion and the Rise of Capitalism* (1926), which built on the work of Max Weber, also became a classic.

tax Government levy on persons, groups, or businesses. Taxes are a general obligation of taxpayers and are not paid in exchange for any specific benefit. They have existed since ancient times—property taxes and sales taxes were known in ancient Rome—but tariffs were favoured over internal taxes as a source of revenue. In modern economies, there has been a trend away from tariffs in favour of internal taxes, which provide the majority of revenues. Taxes have three functions: to cover government spending, to promote stable economic growth, and to lessen inequalities in the distribution of income and wealth. They have also been used for nonfiscal reasons, such as to encourage or discourage certain activities (e.g., cigarette consumption). Taxes may be classified as direct or indirect. Direct taxes are those that the taxpayer cannot shift onto someone else; they are mainly taxes on persons and are based on an individual's ability to pay as measured by income or net wealth. Direct taxes include income taxes, taxes on net worth, death duties (i.e., inheritance and estate taxes), and gift taxes. Indirect taxes are those that can be shifted in whole or in part to someone other than the person legally responsible for payment. These include excise taxes, sales taxes, and value-added taxes. Taxes may also be classified according to the effect they have on the distribution of wealth. A proportional tax is one that imposes the same relative burden on all taxpayers, unlike progressive taxes and regressive taxes.

Taxco \'täs-kō\ *in full* **Taxco de Alarcón** Town (pop., 2000: 50,488), Guerrero state, south-central Mexico. A silver-mining site in pre-Columbian times, it became one of the first mining centres to be inhabited by Spaniards. It prospered in the colonial period and is still renowned for its silver. Because of its colonial character, with its cobblestone streets and the baroque Church of Santa Prisca, it has been declared a national landmark.

taxidermy Practice of creating lifelike representations of animals by using their prepared skins and various supporting structures. Taxidermy began with the ancient custom of keeping trophies of the hunt. Beginning in the 18th century, a growing interest in natural history resulted in collections and exhibits of birds, beasts, and curiosities. Chemically preserving skins, hair, and feathers made it possible to recreate the appearance of live animals by stuffing the sewed-up skin with straw or hay. Constructing and sculpting anatomically correct manikins of clay and plaster are the basis of modern taxidermy.

Taxila \'tak-sə-lə\ Ancient city, northwestern Pakistan. Its ruins, including temples and a fortress, lie just northwest of Rawalpindi. It was the capital of the Buddhist kingdom of Gandhara and a centre of learning. Founded by Bharata, the younger brother of Rama, it came under Persian rule and in 326 BC was surrendered to Alexander the Great. Ruled by a succession of conquerors, including Bactrians and Scythians, the city became an important Buddhist centre under King Ashoka (c. 261 BC). The apostle Thomas reputedly visited it in the 1st century AD. Taxila's prosperity in ancient times resulted from its position at the junction of three great trade routes. When they declined, the city sank into insignificance; it was finally destroyed by the Huns in the 5th century.

taxol \'taks-ȯl\ Organic compound with a complex multi-ring molecule that occurs in the bark of Pacific yew trees (*Taxus brevifolia*). It is active against certain cancers of the lung, ovary, breast, head, and neck, disrupting cell division and interfering with separation of the nuclear chromosomes. A semisynthetic process to make it from yew needles and twigs eliminated the prospect of widespread destruction of yew forests, and total synthesis methods were later developed.

taxonomy \tak-'sä-nə-mē\ In biology, the classification of organisms into a hierarchy of groupings, from the general to the particular, that reflect evolutionary and usually morphological relationships: kingdom, phylum, class, order, family, genus, species. The black-capped chickadee, for example, is an animal (kingdom Animalia) with a dorsal nerve cord (phylum Chordata) and feathers (class Aves: birds) that perches (order Passeriformes: perching birds) and is small with a short bill (family Paridae), a song that sounds like "chik-a-dee" (genus *Parus*), and a black-capped head (species *atricapillus*). Most authorities recognize five kingdoms: monerans (prokaryotes), protists, fungi (see fungus), plants, and animals. Carolus Linnaeus established the scheme of using Latin generic and specific names in the mid-18th century; his work was extensively revised by later biologists.

Tay, River Longest river in Scotland. It rises on the northern slopes of Ben Lui and flows through Loch Tay to enter the North Sea below Dundee after a course of 120 mi (193 km). It drains 2,400 sq mi (6,200 sq km), the largest drainage area in Scotland.

Tay-Sachs \'tā-'saks\ **disease** Recessive hereditary metabolic disorder, mostly in Ashkenazi Jews, causing progressive mental and neurologic deterioration and death by age five. A lipid, ganglioside GM_2, accumulates in the brain (because of inadequate activity of the enzyme that breaks it

© 2006 Encyclopædia Britannica, Inc.

down), with devastating neurological effects. Infants appear normal at birth but soon become listless and inattentive, lose motor abilities, and develop seizures. Blindness and general paralysis usually precede death. Tests can detect the disease in fetuses and the Tay-Sachs gene in carriers. There is no treatment.

Taylor, Dame Elizabeth (Rosemond) (b. Feb. 27, 1932, London, Eng.) U.S. film actress. She left London for Los Angeles with her American parents at the outset of World War II. Noted for her exceptional beauty from childhood, she was discovered by a talent scout in Beverly Hills. She made her screen debut in 1942, appeared in *Lassie Come Home* in 1943, and became a star with *National Velvet* in 1944. She was a glamorous adult star in *A Place in the Sun* (1951), *Cat on a Hot Tin Roof* (1958), and *Butterfield 8* (1960, Academy Award). In *Who's Afraid of Virginia Woolf* (1966, Academy Award) and other films, she starred opposite her husband, Richard Burton. After the mid-1970s, she appeared only intermittently in films, Broadway plays, and television films. Taylor's personal life (she was married eight times) was exceptionally well publicized and often tended to overshadow her acting career.

Taylor, Frederick W(inslow) (b. March 20, 1856, Philadelphia, Pa., U.S.—d. March 21, 1915, Philadelphia) U.S. inventor and engineer. He worked at Midvale Steel Co. (1878–90), where he introduced time-and-motion study in order to systematize shop management and reduce manufacturing costs. Though his system provoked resentment and opposition from labour when carried to extremes, it had an immense impact on the development of mass production techniques and has influenced the development of virtually every modern industrial country. Taylor is regarded as the father of scientific management. See also production management; Taylorism.

Taylor, Sir Geoffrey Ingram (b. March 7, 1886, London, Eng.—d. June 27, 1975, Cambridge) British physicist. He taught at Cambridge University from 1911 to 1952. He made important discoveries in fluid mechanics, as well as significant contributions to the theory of the elastostatic stress and displacement fields created by dislocating solids, the quantum theory of radiation, and the interference and diffraction of photons.

Taylor, John *known as* **John Taylor of Caroline** (b. Dec. 19?, 1753, Caroline county, Va.—d. Aug. 21, 1824, Caroline county, Va., U.S.) U.S. politician. He served in the Continental Army (1775–79) and the Virginia militia (1781) in the American Revolution. A strong advocate of states' rights, he opposed ratification of the U.S. Constitution. He was a member of the U.S. Senate (1792–94, 1803, 1822–24), and he introduced the Virginia and Kentucky Resolutions in the Virginia legislature (1798). A supporter of Thomas Jefferson, he wrote essays on the importance of maintaining an agrarian democracy as a defense against the development of an overly powerful central government.

Taylor, Joseph H(ooton), Jr. (b. March 24, 1941, Philadelphia, Pa., U.S.) U.S. physicist. He received his Ph.D. from Harvard University. While teaching at the University of Massachusetts (1968–81), he and Russell Alan Hulse discovered the first binary pulsar (1974). Their discovery provided evidence in support of Albert Einstein's relativistic theory of gravitation, which predicts that objects accelerated in a strong gravitational field will emit gravitational waves. With its enormous interacting gravitational fields, the binary pulsar should emit such waves, draining energy and reducing the orbital distance between the two stars. In 1978 they showed, on the basis of tiny variations in the pulsar's radio emission, that the two stars are revolving ever faster and closer around each other at a rate agreeing precisely with Einstein's prediction. Their discoveries won the two men a 1993 Nobel Prize.

Taylor, Lawrence (Julius) (b. Feb. 4, 1959, Williamsburg, Va., U.S.) U.S. football linebacker. He played for the University of North Carolina, making All-American in 1980. During his 13-year career with the New York Giants (1981–94), he was twice named Defensive Player of the Year (1981, 1982) and once named Most Valuable Player (1986), only the second defensive player to be so honoured. The prototypical linebacker of his era, he possessed the strength to defeat blocks from linemen and the speed to chase down running backs.

Taylor, Maxwell (Davenport) (b. Aug. 26, 1901, Keytesville, Mo., U.S.—d. April 19, 1987, Washington, D.C.) U.S. army officer. He graduated from West Point and helped organize the army's first airborne division early in World War II. He commanded a parachute assault in the Normandy Campaign and in the Battle of the Bulge (1944). He served as commanding general of UN forces in Korea (1953), as U.S. Army chief of staff (1955–59), and as chairman of the Joint Chiefs of Staff (1962–64). He was appointed ambassador to South Vietnam (1964–65) and was a special consultant to Pres. Lyndon B. Johnson (1965–69). He advocated the maintenance of conventional infantry as a prudent alternative to the use of nuclear weapons in war.

Taylor, Paul (Belville) (b. July 29, 1930, Wilkinsburg, Pa., U.S.) U.S. modern dancer, choreographer, and director. In 1953 he joined Martha Graham's company, where he was a leading soloist until 1960. In 1957 he established the Paul Taylor Dance Company. As a choreographer he employed a wide variety of movement styles, some of which he described as "flat" (two-dimensional in appearance), "dance scribbling" (emphasis on action rather than on shape or line), and "lyric" ("long arms"). His works include *Duet* (1957), *Aureole* (1962), *Orbs* (1966), and *Nightshade* (1979). In 1993 he formed Taylor 2, a small group of dancers who perform in smaller venues and teach the Taylor style.

Paul Taylor and Bettie de Jong in *Scudorama,* 1967
JACK MITCHELL

Taylor, Peter (Hillsman) (b. Jan. 8, 1917, Trenton, Tenn., U.S.—d. Nov. 2, 1994, Charlottesville, Va.) U.S. short-story writer, novelist, and playwright. Taylor studied in the 1930s under several poets associated with the Southern literary renaissance. He taught at various schools, including the University of Virginia. He is best known for his short stories, which are usually set in contemporary Tennessee and which reveal conflicts between the old rural society and the industrialized "New South." The novella *A Woman of Means* (1950) is perhaps his finest work; his later works include *The Old Forest and Other Stories* (1985) and *A Summons to Memphis* (1986, Pulitzer Prize).

Taylor, Zachary (b. Nov. 24, 1784, Montebello, Va., U.S.—d. July 9, 1850, Washington, D.C.) 12th president of the U.S. (1849–50). He fought in the War of 1812, the Black Hawk War (1832), and the Seminole War in Florida (1835–42), earning the nickname "Old Rough-and-Ready" for his indifference to hardship. Sent to Texas in anticipation of war with Mexico, he defeated the Mexican invaders at the battles of Palo Alto and Resaca de la Palma (1846). After the Mexican War formally began, he captured Monterrey and granted the Mexican army an eight-week armistice. Displeased, Pres. James K. Polk transferred Taylor's best troops to the command of Winfield Scott to serve in the invasion of Veracruz. Taylor ignored orders to remain in Monterrey and marched south to defeat a large Mexican force at the Battle of Buena Vista (1847). He became a national hero and was nominated as the Whig candidate for president (1848). He defeated Lewis Cass to win the election. His brief term was marked by a controversy over the new territories that produced the Compromise of 1850 and by a scandal involving members of his cabinet. He died, probably of cholera, after only 16 months in office and was succeeded by Millard Fillmore.

Taylorism System of scientific management advocated by Fred W. Taylor. In Taylor's view, the task of factory management was to determine the best way for the worker to do the job, to provide the proper tools and training, and to provide incentives for good performance. He broke each job down into its individual motions, analyzed these to determine which were essential, and timed the workers with a stopwatch. With unnecessary motion eliminated, the worker, following a machinelike routine, became far more productive. See also production management, time-and-motion study.

Taymyr \tī-'mir\ **Peninsula** Peninsula, north-central Siberia, northern Russia. It lies between the Kara Sea, the Laptev Sea, and the Vilkitsky Strait and includes Cape Chelyuskin, the northernmost point of Asia. Its central part is crossed by the Taymyra River, which is 400 mi (644 km) long. It occupies an area of approximately 150,000 sq mi (400,000 sq km). The Byrranga Mountains, in its centre, reach a height of about 3,800 ft (1,150 m).

© 2006 Encyclopædia Britannica, Inc.

Tbilisi \tə-bi-'lē-sē\ *formerly* **Tiflis** City (pop., 2002: 1,081,679), capital of the Republic of GEORGIA, on the KURA RIVER. Founded c. AD 458 as the capital of the Georgian kingdom, its strategic position on trade routes between Europe and Asia led to its frequent capture. It endured under successive Persian, Byzantine, Arab, Mongol, and Turkish rulers and came under the control of the Russian Empire c. 1801. It was made the capital of the Transcaucasian S.F.S.R. by 1922, of the Georgian S.S.R. in 1936, and of independent Georgia in 1991. Some ancient structures still exist in the city, which is now a major cultural, educational, research, and industrial centre.

Tchaikovsky \chə-'kȯf-skē, chī-'kȯf-skē**, Pyotr Ilyich** (b. May 7, 1840, Votkinsk, Russia—d. Nov. 6, 1893, St. Petersburg) Russian composer. Sensitive and interested in music from his early childhood, Tchaikovsky turned to serious composition at age 14. In 1862 he began studying at the new St. Petersburg Conservatory; from 1866 he taught at the Moscow Conservatory. His *Piano Concerto No. 1* (1875) was premiered in Boston and became immensely popular. He wrote his first ballet, *Swan Lake* (first performed 1877), on commission from the BOLSHOI BALLET. In 1877 he received a commission from the wealthy Nadezhda von Meck (1831–94), who became his patron and longtime correspondent. The opera *Eugene Onegin* (1878) soon followed. Though homosexual, he married briefly; after three disastrous months of marriage, he attempted suicide. His composition was overshadowed by his personal crisis for years. His second ballet, *Sleeping Beauty* (1889), was followed by the opera *The Queen of Spades* (1890) and the great ballet *The Nutcracker* (1892). The *Pathétique Symphony* (1893) premiered four days before his death from cholera; claims that he was forced to commit suicide by noblemen outraged by his sexual liaisons are unfounded. He revolutionized the ballet genre by transforming it from a grand decorative gesture into a staged musical drama. His music has always had great popular appeal because of its tuneful, poignant melodies, impressive harmonies, and colourful, picturesque orchestration.

TCP/IP *in full* **Transmission Control Protocol/Internet Protocol** Standard INTERNET communications PROTOCOLS that allow DIGITAL COMPUTERS to communicate over long distances. The Internet is a packet-switched network, in which information is broken down into small packets, sent individually over many different routes at the same time, and then reassembled at the receiving end. TCP is the component that collects and reassembles the packets of data, while IP is responsible for making sure the packets are sent to the right destination. TCP/IP was developed in the 1970s and adopted as the protocol standard for ARPANET (the predecessor to the Internet) in 1983.

te See DE

Te Anau Lake \tā-'ä-naù\ Lake, southwestern SOUTH ISLAND, New Zealand. The largest of the Southern Lakes, it is 38 mi (61 km) long and 6 mi (10 km) wide, and a source of the Waiau River. In a superb alpine setting bordered by forested mountains, it is known for fishing and tourism.

Te Kanawa \te-'kä-nə-wə**, Dame Kiri (Janette)** (b. March 6, 1944, Gisborne, North Island, N.Z.) New Zealand-born (half-Maori) soprano. After winning various singing competitions at home, she went to London for further study in 1966 and made her Covent Garden debut in 1970. Soon moving into leading roles, she became especially admired as the Countess in *The Marriage of Figaro*. In 1974 she made a triumphal debut at the Metropolitan Opera, substituting at the last moment in GIUSEPPE VERDI's *Otello*. A glamorous and regally imperturbable presence with a rich voice, she was chosen to sing at the 1981 wedding of Prince Charles, and she has made many recordings.

tea Beverage produced by steeping in freshly boiled water the young leaves and leaf buds of the tea plant, *Camellia sinensis*, a member of the family Theaceae, which contains 40 genera of trees and shrubs. Tea cultivation is first documented in China in AD 350; according to legend, it had been known there since c. 2700 BC. It was established in Japan by the 13th century and was spread to Java by the Dutch and to India by the English in the 19th century. Today tea is the most widely consumed drink in the world, drunk (either hot or cold) by half the world's population. Major tea types are classified by processing method: fermented, or black, tea produces an amber-colored, full-flavored beverage without bitterness; semifermented, or oolong, tea yields a slightly bitter, light brownish-green liquid; and unfermented, or green, tea, results in a mild, slightly bitter, pale greenish-yellow beverage. CAFFEINE is responsible for tea's stimulating effect. Green tea, long regarded as healthful in the Far East, has in recent years attracted much favorable attention in the West for a wide range of possible beneficial effects. Infusions and decoctions of the leaves, bark, and roots of many other, unrelated plants are commonly drunk as herbal or medicinal teas.

Tea Act (1773) British legislation giving a tea monopoly in the American colonies to the British East India Co. It adjusted the duty regulations to allow the failing company to sell its large tea surplus below the prices charged by colonial competitors. The act was opposed by colonists as another example of taxation without representation. Resistance to the act resulted in the BOSTON TEA PARTY.

tea ceremony *Japanese* **chadō** *or* **cha-no-yu** Ritualized preparation and drinking of TEA developed in Japan. It involves a host and one or more guests; the tea, utensils, and movements used in preparing, serving, and drinking the tea are all prescribed. When tea was introduced from Song-dynasty China by the Zen monk Eisai (1141–1215), it was drunk by Zen monks to help them stay awake during meditation. The laity enjoyed tea-tasting competitions that developed into a more refined, meditative form among the warrior aristocracy in the 15th century. The most famous exponent of the tea ceremony was Sen Rikyū (1522–91), tea master to TOYOTOMI HIDEYOSHI, who codified a style known as *wabi*, which favoured rustic, rough-shaped tea bowls and spare, simple surroundings. Three popular schools of the tea ceremony trace their roots to Rikyū, and other schools exist as well; today mastery of the tea ceremony is one accomplishment of a well-bred young woman.

Teach, Edward See BLACKBEARD

teaching Profession of those who give instruction, especially in an elementary or secondary school or a university. The teaching profession is a relatively new one. Traditionally, parents, elders, religious leaders, and sages were responsible for teaching children how to behave and think and what to believe. Germany introduced the first formal criteria for the education of teachers in the 18th century. In the 19th century, as society became more industrialized, the concept of schooling became more universal. In industrialized nations today, most teachers are university graduates. Teacher-training programs usually include both general and specialized academic, cultural, or vocational courses; the study of educational principles; and a series of professional courses combined with practical experience in a typical school setting. Most countries also require professional certification following formal training. See also NATIONAL EDUCATION ASSOCIATION.

Teagarden, Jack *orig.* **Weldon Leo Teagarden** (b. Aug. 20, 1905, Vernon, Texas, U.S.—d. Jan. 15, 1964, New Orleans, La.) U.S. JAZZ trombonist and singer. He worked with two of the most popular bands of the early SWING era, those of Ben Pollack (1928–33) and PAUL WHITEMAN (1933–38). After leading his own group (1938–47), he joined LOUIS ARMSTRONG's All Stars and recorded and toured with them internationally until 1951. Teagarden's trademark relaxed, bluesy approach was evident in both his playing and singing, his engaging Texas accent seeming to colour both.

teak Large deciduous tree (*Tectona grandis*) of the VERBENA family, and its wood, one of the most valuable and durable timbers. Teak has been widely used in India for more than 2,000 years; some temples contain teak beams more than 1,000 years old. The tree has a straight stem, often thickened at the base, a spreading crown, and four-sided branchlets. The rough leaves are opposite or sometimes whorled, and the branches end in many small white flowers. The unseasoned heartwood has a pleasant, strong aromatic fragrance and a beautiful golden-yellow colour, which on seasoning darkens into brown, mottled with darker streaks. Resistant to the effects of water, teakwood is used for shipbuilding, fine furniture, door and window frames, wharves, bridges, cooling-tower louvers, flooring, and paneling. Its desirability has led to severe overcutting in tropical forests.

Holarctic American green-winged teal drake (*Anas crecca carolinensis*). GORDON LANGSBURY/BRUCE COLEMAN INC.

teal Any of about 15 species (genus *Anas*, family Anatidae) of small DABBLING ducks found on the major continents and many islands. Many are popular game birds. The Holarctic

© 2006 Encyclopædia Britannica, Inc.

green-winged teal, usually found in a dense flock, is 13–15 in. (33–38 cm) long. The small blue-winged teal breeds across Canada and the northern U.S. and winters south of the U.S. The Hottentot teal of Africa frequently remains immobile among vegetation even when shots are fired nearby. Teal are primarily herbivorous, but some species eat small animals. Flocks of many species take off and change direction in unison.

Teamsters Union *officially* **International Brotherhood of Teamsters, Chauffeurs, Warehousemen and Helpers of America (IBT)**, *formerly (until 1940)* **International Brotherhood of Teamsters, Chauffeurs, Stablemen and Helpers of America (IBT)** Largest private-sector labour union in the U.S., representing truck drivers and workers in related industries such as aviation. It was formed in 1903 with the merger of two team-drivers' unions, and local deliverymen using horse-drawn vehicles remained the core membership until the 1930s, when intercity truck drivers became predominant. From 1907 to 1952 the union was headed by Daniel J. Tobin, who built it up from 40,000 members in 1907 to more than one million in 1950. Disclosures of corruption in the leadership led to the Teamsters' expulsion from the AFL-CIO in 1957. Between 1957 and 1988 three Teamsters presidents—Dave Beck, Jimmy Hoffa, and Roy Williams—were convicted of various criminal charges and sentenced to prison terms. (Hoffa has been missing, and presumed dead, since 1975.) While Teamsters representation of truck drivers declined with the growth of nonunion trucking companies in the 1980s, the union gained new members in clerical, service, and technology occupations. The union was readmitted to the AFL-CIO in 1987. Presidents Ron Carey (1992–99) and James P. Hoffa (1999–), son of the former president, focused on job security and family issues.

Teapot Dome scandal Secret leasing of U.S. government land to private interests. In 1922 oil reserves at Teapot Dome, Wyo., and Elk Hills, Calif., were improperly leased to private oil companies by Secretary of the Interior Albert Fall, who accepted cash gifts and no-interest loans from the companies. When the leases became known, Congress directed Pres. Warren G. Harding to cancel them. A later investigation revealed illegal actions by several government officials, some of whom later received fines and short prison sentences. The scandal became a symbol of government corruption.

tear duct and gland *or* **lachrymal** \'lak-rə-məl\ **duct and gland** Structures that produce, distribute, and carry away tears. An almond-shaped gland above the outer corner of each eye secretes tears between the upper eyelid and the eyeball. Tears moisten and lubricate the conjunctiva (the membrane that lines the eyelid and covers the white of the eye) and then flow into the barely visible openings (near the inner corners of the eyelids) of the tear ducts, which lead to the nasal cavity. Oil (from sebaceous glands on the edge of the eyelid) keeps tears from spilling out unless secretion increases because of crying or a reflex triggered by stimuli such as eye irritation, bright lights, or spicy foods.

tear gas Any of a group of substances, most often synthetic organic halogen compounds, that irritate the mucous membranes of the eyes, causing a stinging sensation and tears. They may also irritate the upper respiratory tract, causing coughing, choking, and general debility. Tear gas was first used in warfare in World War I, but since its effects are short-lasting and rarely disabling, it came into use by law-enforcement agencies as a means of dispersing mobs, disabling rioters, and flushing out armed suspects without the use of deadly force.

Teasdale, Sara *orig.* **Sara Trevor Teasdale** (b. Aug. 8, 1884, St. Louis, Mo., U.S.—d. Jan. 29, 1933, New York, N.Y.) U.S. poet. While living in St. Louis she made frequent trips to Chicago, where she eventually joined Harriet Monroe's *Poetry* magazine circle. Her collection *Rivers to the Sea* (1915) established her as a popular poet, and *Love Songs* (1917) won the first Pulitzer Prize for poetry. Over time her verse became simpler and more austere. After her marriage ended in divorce in 1929, she moved to New York City, where she lived in virtual retirement. Many of the poems in her last book, *Strange Victory* (1933), foreshadow her suicide.

teasel \'tē-zəl\ Any of about 15 species constituting the genus *Dipsacus* of the family Dipsacaceae (the teasel family), native to Europe, the Mediterranean area, and tropical Africa. Many teasels are prickly, coarse biennials with tall-domed heads of numerous, four-lobed flowers that sit on a crownlike circle of spiny, narrow bracts. The spiny, dry fruiting heads of fuller's teasel (*D. sativus*) have been used since Roman times to raise the nap of woolen fabrics in a process known as fulling.

Tebaldi \tā-'bäl-dē**, Renata** (b. Feb. 1, 1922, Pesaro, Italy—d. Dec. 19, 2004, San Marino) Italian soprano. After her debut in *Mefistofele* in 1944, she established herself at La Scala, performing with the conductor Arturo Toscanini for the 1946 reopening concert and over the next decade. Her debuts at Covent Garden (1950) and the Metropolitan Opera (1955) were both in the role of Desdemona, and she sang at the Met for 17 years in roles such as Tosca, Manon Lescaut, Mimi, and Violetta. She retired in 1976.

technetium \tek-'nē-shē-əm\ Metallic chemical element, one of the transition elements, chemical symbol Tc, atomic number 43. All its isotopes are radioactive (see radioactivity); some occur in trace amounts in nature as nuclear fission products of uranium. Its isotope technetium-97 was the first element artificially produced (1937; see cyclotron). Technetium-99, a fission product of nuclear reactors that emits gamma rays, is the most-used tracer isotope in nuclear medicine. Technetium resembles platinum in appearance and manganese and rhenium in chemical behaviour. It is also used as a metallurgical tracer and in corrosion-resistant products.

technical education Academic and vocational preparation of students for jobs involving applied science and modern technology. It emphasizes the understanding and practical application of basic principles of science and mathematics, rather than the attainment of proficiency in manual skills that is properly the concern of vocational education. The goal of technical education is to prepare graduates for occupations that are classified above the skilled crafts but below the scientific or engineering professions. People so employed are frequently called technicians. See also employee training.

techno Electronic dance music that first appeared in the U.S. in the 1980s and became globally popular in the 1990s. It originated with Detroit deejay-producers who, inspired by European electro-pop, underlaid dreamy synthesizer melodies with rapid electronic rhythms. Imported in Europe, it was adopted by the burgeoning rave scene of all-night dance parties (which often featured the hallucinogen ecstasy) and is celebrated in the annual Love Parade in Berlin.

technology Application of knowledge to the practical aims of human life or to changing and manipulating the human environment. Technology includes the use of materials, tools, techniques, and sources of power to make life easier or more pleasant and work more productive. Whereas science is concerned with how and why things happen, technology focuses on making things happen. Technology began to influence human endeavour as soon as people began using tools. It accelerated with the Industrial Revolution and the substitution of machines for animal and human labour. Accelerated technological development has also had costs, in terms of air and water pollution and other undesirable environmental effects.

tectonics Scientific study of the deformation of the rocks that make up the Earth's crust and the forces that produce such deformation. It deals with the folding and faulting associated with mountain building; the large-scale, gradual, upward and downward movements of the crust; and sudden horizontal displacements along faults. Other phenomena studied include igneous processes and metamorphism. The chief working principle of tectonics is the concept of plate tectonics. See also continental drift; seafloor spreading.

tectonism See diastrophism

Tecumseh \tə-'kəm-sə\ (b. 1768, Old Piqua, in modern Clark county, Ohio, U.S.—d. Oct. 5, 1813, near Thames River, Upper Canada) Shawnee Indian chief. As a boy during the American Revolution, Tecumseh participated in combined British and Indian attacks on American colonists. In 1794 he fought unsuccessfully against Gen. Anthony Wayne. He eventually established a confederation made up of members of the Creek and other nations. In 1811 his brother's attack on William H. Harrison's troops at Tippecanoe, Ind., ended in defeat. As the War of 1812 approached, Tecumseh assembled his followers under the British banner and captured Detroit. Several lesser successes followed, ending with his death at the Thames River in what is now Ontario, marking the end of Indian resistance in the Old Northwest (as the East North Central states were sometimes known).

Tedder (of Glenguin), Arthur William Tedder, 1st Baron (b. July 11, 1890, Glenguin, Stirling, Scot.—d. June 3, 1967, Banstead, Surrey, Eng.) British air marshal. He joined the British army in 1913, transferred to the Royal Flying Corps in 1916, and after World War I commanded a branch of the Royal Air Force (RAF). As head of the RAF

© 2006 Encyclopædia Britannica, Inc.

Middle East Command in World War II, he commanded Allied air operations in North Africa and Italy, and in 1944 he was appointed head of Allied air operations in western Europe. His policy of bombing German communications and providing close air support of ground operations contributed significantly to the success of the Normandy Campaign and the Allied advance into Germany. He later became the first peacetime chief of the air staff (1946–50).

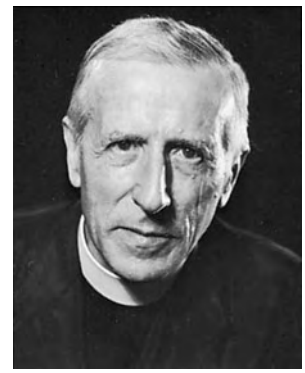
Tees River \'tēz\ River, northern England. It rises in the northern PENNINES and flows 70 mi (110 km) east to the North Sea. There are falls and reservoirs along its course. Teesside, the urban area at the river's mouth, has seen large-scale industrial development since the railroad arrived in 1825.

Teflon Trademark for a POLYMER of tetrafluoroethylene fluorocarbon (polytetrafluoroethylene [PTFE]). Teflon is a tough, waxy, nonflammable organic compound with a slippery surface, attacked by very few chemicals and stable over a wide temperature range. Its qualities make it useful in gaskets, bearings, container and pipe linings, electrical insulation, parts for valves and pumps used for corrosive fluids, and protective nonstick coatings on cooking utensils, saw blades, and other articles. A closely related fluorocarbon polymer, fluorinated ethylene-propylene (FEP), has properties and applications similar to those of Teflon.

Tegea \'tē-jē-ə\ Ancient city, eastern ARCADIA, southern Greece. It was under Spartan rule from the mid-6th century BC until THEBES' victory over SPARTA in the battle of Leuctra c. 371 BC. Afterward it joined a succession of leagues, and by the early 1st century AD was the only important town in Arcadia. It survived the Goth invasion in 395–396 and flourished under Byzantine and Frankish rule. It is the site of the Temple of Athena Alea, built by the city's traditional founder, Aleus, and rebuilt in the 4th century BC by the sculptor SCOPAS.

Tegernsee \'tā-gərn-ˌzā\ Lake, southern BAVARIA, southeastern Germany. Located in the foothills of the ALPS, it covers 3.5 sq mi (9 sq km). Surrounded by wooded mountains, it is a popular resort and recreation area. The castle of Maximilian I lies on the eastern shore.

Tegucigalpa \tā-ˌgü-sē-'gäl-pä\ City (pop., 2001: 769,061), capital of Honduras. Located on hilly terrain hemmed in by mountains, it was founded in 1578 as a gold- and silver-mining centre. It was made the permanent capital of Honduras in 1880. It produces textiles and sugar. Principal buildings include the presidential and legislative palaces, the National University of Honduras (1847), and an 18th-century cathedral.



Tehrān *or* **Teheran** \ˌtā-(ə-)'rän\ City (pop., 1996: 6,758,845), capital of Iran. It is situated on the southern slopes of the ELBURZ MOUNTAINS. It was originally a suburb of ancient RHAGAE (Rey), which was destroyed by the Mongols in 1220 and was later the home of several ṢAFAVID rulers of Persia (16th–18th centuries). It became prominent after its capture by Āghā Muḥammad Khan, founder of the QĀJĀR DYNASTY, who made it his capital in 1785. It underwent rapid modernization after 1925 and especially after World War II (1939–45). In 1943 it was the site of the TEHRAN CONFERENCE. In 1979, following the Islamic revolution in Iran, the U.S. embassy there was seized and its staff taken hostage by Iranian militants (see IRAN HOSTAGE CRISIS). A transportation and industrial centre, Tehrān produces more than half of Iran's manufactured goods. It is the seat of several educational institutions, including the University of Tehrān (1934).

Tehrān Conference (Nov. 28–Dec. 1, 1943) Meeting of FRANKLIN ROOSEVELT, WINSTON CHURCHILL, and JOSEPH STALIN in Tehrān during World War II to discuss military strategy and political issues. Stalin agreed to launch a military offensive from the east to coincide with a planned invasion of German-occupied France from the west. Also discussed but not settled were eastern Europe's postwar borders, including Poland's postwar status, and a postwar international organization.

Tehuantepec \tā-'wän-tā-ˌpek**, Gulf of** Inlet of the Pacific Ocean, southeastern Mexico. It extends 300 mi (500 km) between OAXACA and CHIAPAS states and is 100 mi (160 km) wide at its mouth. Numerous lagoons mark its shores, and the Tehuantepec River and numerous smaller streams flow into it. Its southern shore forms the Isthmus of Tehuantepec.

Teide \'tā-ˌthā**, Pico de** *or* **Pico de Tenerife** \'pē-kō-dā-ˌtān-ə-'rēf-ə\ Volcanic peak on the island of Tenerife, CANARY ISLANDS. At 12,198 ft (3,718 m) tall, it is the highest point on Spanish soil. Vents within its crater and on its slopes eject hot gases. The peak is atop a volcanic cone on the upper reaches of El Teide, a conglomeration of several volcanoes; its last eruption was in 1789. It lies within a national park. Nearby is an international solar observatory.

Teilhard de Chardin \ˌtā-yȧr-də-shȧr-'da^{n}**, (Marie-Joseph-) Pierre** (b. May 1, 1881, Sarcenat, France—d. April 10, 1955, New York, N.Y., U.S.) French philosopher and paleontologist. Ordained a Jesuit priest in 1911, he taught geology from 1918 at the Institut Catholique in Paris. In 1929 he directed the excavations at the Peking man site at ZHOUKOUDIAN. This and other geological work won him high honours, though it came to be disapproved of by the Jesuit order. His philosophy was strongly informed by his scientific work, which he believed helped prove the existence of God. He is known for his theory that mankind is evolving, mentally and socially, toward a final spiritual unity that he called the Omega point. Though his major philosophical works, *The Divine Milieu* (1957) and *The Phenomenon of Man* (1955), were written in the 1920s and '30s, their publication in his lifetime was forbidden by the Jesuits.

Teilhard de Chardin
© PHILIPPE HALSMAN

Tekakwitha \ˌtek-ə-'kwith-ə**, Kateri** (b. 1656, probably Ossernenon, New Netherland—d. April 17, 1680, Caughnawaga, Que.) First North American Indian considered for canonization. The daughter of an Algonquin Christian mother and a non-Christian Mohawk father, she was born in what is now Auriesville, N.Y., U.S., and was partially blinded by smallpox as a child. She was deeply impressed by the lives and words of three Jesuit missionaries she met at age 11, and at 20 she was baptized. Harassed and threatened with torture in her home village, she fled 200 mi (320 km) to a Christian Indian mission near Montreal, where she became known as the "Lily of the Mohawks" for her kindness, faith, and heroic suffering before her early death. She was beatified in 1980.

tektite Any of a class of small, natural glassy objects found on the Earth's surface and associated with meteorite impacts. The extremely high temperatures and enormous pressures generated when a large meteorite, comet, or asteroid hits the Earth melt the rocks at the site, producing masses of molten droplets that are blasted into and out of the Earth's atmosphere. The droplets cool quickly to a glassy form and then fall back to the Earth.

Tel Aviv–Yafo \ˌtel-ə-'vēv-'yä-fō\ *or* **Tel Aviv–Jaffa** \ˌtel-ə-'vēv-'jä-fə\ City (pop., 1999 est.: 348,100) and main port of Israel. The hub of Israel's largest urban centre, it was formed in 1950 by the incorporation of the ancient port of Jaffa with Tel Aviv, its former suburb. Tel Aviv was founded in 1909 and was the capital of Israel (1948–50). It grew with Jewish immigration in the early 20th century and by 1936 was the largest and most important city in Palestine. Jaffa was an old Canaanite city that was taken by Egypt in the 15th century BC and occupied by the Israelite kings DAVID and SOLOMON. Over the centuries it was ruled by the Ptolemies, Syrians, and Romans, captured by the Crusaders, and razed by the Mamlūks. The British occupied it in 1917; it surrendered to Jewish military forces during the first ARAB-ISRAELI WAR (1948). Israel's main business, communications, and cultural centre, it is the site of more than half of Israel's industrial plants, the country's stock exchange, Tel Aviv University (1953), and Bar-Ilan University (1953).

telecommunications Communication between parties at a distance from one another. Modern telecommunication systems—capable of transmitting TELEPHONE, FAX, data, RADIO, or TELEVISION signals—can transmit large volumes of information over long distances. Digital transmission is employed in order to achieve high reliability with minimal noise, or interference, and because it can transmit any signal type, digital or analog. For digital transmission, analog signals must be subjected to a process of analog-to-digital conversion; most television, radio, and voice communications are analog and must be digitized before transmission. Transmission may occur over cables, wireless radio relay systems, or via satellite links.

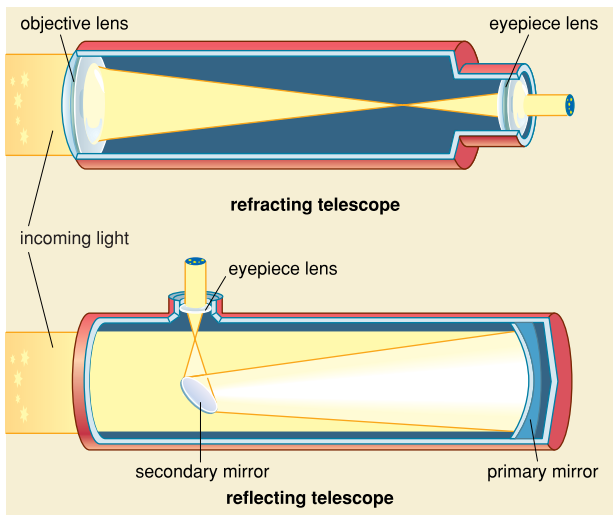
© 2006 Encyclopædia Britannica, Inc.

telegraph Electromagnetic communication device. In 1832 Samuel F.B. Morse made sketches of ideas for a system of electric telegraphy, and in 1835 he developed a code to represent letters and numbers (Morse code). In 1837 he was granted a patent on an electromagnetic telegraph that transmitted signals along a wire. That same year British inventors patented a telegraph system that activated five needle pointers that could be made to point to specific letters and numbers on their mounting plate. Public use of Morse's telegraph system began in 1844 and lasted more than 100 years. By the late 20th century the telegraph had been replaced in most applications in developed countries by digital data transmission systems based on computer technology. See also Western Union Corp.

Teleki \'te-le-ki**, Pál, Count** (b. Nov. 1, 1879, Budapest, Hung., Austria-Hungary—d. April 3, 1941, Budapest) Hungarian politician. An eminent geographer, he was a member of the Hungarian Parliament from 1905 and a delegate to the Paris Peace Conference (1919) after World War I. In 1921, however, he withdrew from party politics. He then taught at Budapest University before returning to office as minister of education (1938–39) and premier (1939–41). Hoping to use Germany's power to win back territories lost through the Treaty of Trianon (1920), he initially cooperated with Adolf Hitler. In 1941, caught between German demands for support after it invaded Yugoslavia (with whom Hungary had signed a friendship treaty in 1940) and British threats against helping Germany, he committed suicide.

Telemann \'tā-lə-ˌmän**, Georg Philipp** (b. March 14, 1681, Magdeburg, Brandenburg—d. June 25, 1767, Hamburg) German composer. By age 10 he had learned several instruments, and he composed an opera at age 12, but his family discouraged his pursuit of a musical profession. While studying law at Leipzig University, he organized student music groups and became music director of the Leipzig Opera (1702), organist at the New Church (1704), and kapellmeister to a count (1705). Moving to Eisenach (c. 1708), where he met Johann Sebastian Bach, he composed French-style instrumental music and German-style sacred music. He moved to Gotha (1717) and then Hamburg (1721), where he served as musical director of the Opera (1722–38), for which he wrote several dozen Italian-influenced works. He wrote some 600 cantatas and a total of some 2,000 pieces, many of high quality.

telemetry \tə-'le-mə-trē\ Highly automated communications process by which data are collected from instruments located at remote or inaccessible points and transmitted to receiving equipment for measurement, monitoring, display, and recording. Transmission of the information may be over wires or, more commonly, by radio. The technique is used extensively for oil-pipeline monitoring and control systems and in oceanography and meteorology. Telemetry for rockets and satellites bloomed in the 1950s and has continued to grow in complexity and in breadth of application. Data can be transmitted from inside internal-combustion engines during tests, from steam turbines in operation, and from manned and unmanned spacecraft. Major scientific applications include biomedical research and remote observation of operations with highly radioactive material.



teleological argument See argument from design

teleological ethics Theory that derives duty from what is valuable as an end, in a manner diametrically opposed to deontological ethics. Teleological ethics holds that the basic standard of duty is the contribution that an action makes to the realization of nonmoral values. Teleological theories differ on the nature of the nonmoral goods that actions ought to promote. Eudaemonism emphasizes the cultivation of virtue in the agent as the end of all action. Utilitarianism holds that the end consists in the aggregate balance of pleasure to pain for all concerned. Other teleological theories claim that the end of action is survival and growth, as in evolutionary ethics (Herbert Spencer); power over others (Niccolò Machiavelli and Friedrich Nietzsche); satisfaction and adjustment, as in pragmatism (Ralph Barton Perry and John Dewey); and freedom, as in existentialism (Jean-Paul Sartre).

teleology \ˌtē-lē-'ä-lə-jē\ Causality in which the effect is explained by an end (Greek, *telos*) to be realized. Teleology thus differs essentially from efficient causality, in which an effect is dependent on prior events. Aristotle's account of teleology declared that a full explanation of anything must consider its final cause—the purpose for which the thing exists or was produced. Following Aristotle, many philosophers have conceived of biological processes as involving the operation of a guiding end. Modern science has tended to appeal only to efficient causes in its investigations. See also mechanism.

telephone Instrument designed for simultaneous transmission and reception of the human voice. It works by converting the sound waves of the human voice to pulses of electrical current, transmitting the current, and then retranslating the current back to sound. The U.S. patent granted to Alexander Graham Bell in 1876 for developing a device to transmit speech sounds over electric wires is often called the most valuable ever issued. Within 20 years, the telephone acquired a form that has remained fundamentally unchanged for more than a century. The advent of the transistor (1947) led to lightweight, compact circuitry (see cell phone). Advances in electronics have allowed the introduction of a number of "smart" features such as automatic redialing, caller identification, call waiting, and call forwarding. Telephone systems are also a primary access route for the Internet.

telescope Device that collects light from and magnifies images of distant objects, undoubtedly the most important investigative tool in astronomy. The first telescopes focused visible light by refraction through lenses; later instruments used reflection from curved mirrors (see optics). Their invention is traditionally credited to Hans Lippershey (1570?–1619?), who adapted A. van Leeuwenhoek's use of lenses in microscopes. Among the earliest telescopes were Galilean telescopes, modeled after the simple instruments built by Galileo, who was the first to use telescopes to study celestial bodies. In 1611 Johannes Kepler proposed an improved version that became the basis for modern refracting instruments. The reflecting telescope came into its own after William Herschel (see Herschel family) used one to discover the planet Uranus in 1781. Since the 1930s radio telescopes have been used to detect and form images from radio waves emitted by celestial objects. More recently, telescopes have been designed to observe objects and phenomena in other parts of the electromagnetic spectrum (see gamma-ray astronomy; infrared astronomy; ultraviolet astronomy; X-ray astronomy). Spaceflight has allowed telescopes to be launched into Earth orbit to avoid the light-scattering and light-absorbing effects of the atmosphere (e.g., the Hubble Space Telescope). See also binoculars; observatory.

Two types of telescopes. A refracting telescope forms an image by focusing light from a distant object using an objective lens. A reflecting telescope uses mirrors to focus the light. Both types use a lens in the eyepiece to magnify the image formed.
© MERRIAM-WEBSTER INC.

Teletype Telegraphic instrument that was used for much of the 20th century to transmit and receive printed messages and data via telephone cables or radio relay systems. Teletypewriters (or teleprinters) became common for commercial use in the 1920s. In 1924 the Teletype Corp. introduced a series of teletypewriters so popular that the name Teletype became synonymous with teleprinters in the U.S. Coding schemes used for teleprinters included a variation of the Baudot code (1920s) and ASCII (1960s). (See Jean-Maurice-Émile Baudot.) With the advent of high-speed data transmission in the 1980s, teletype gave way to e-mail and fax.

televangelism Evangelism through religious programs on television. Such programs are usually hosted by a fundamentalist Protestant minis-

© 2006 Encyclopædia Britannica, Inc.

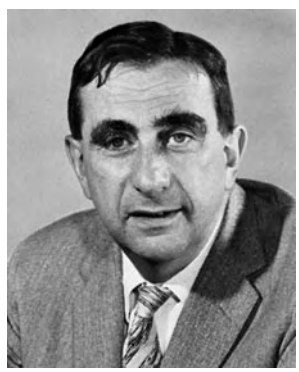
ter, who conducts services and often asks for donations. Billy Graham became known worldwide through his TV specials from the 1950s on. Other prominent televangelists have included Oral Roberts, Jerry Falwell, and Pat Robertson.

television (TV) Electronic system for transmitting still or moving images and sound to receivers that project a view of the images on a picture tube or screen and recreate the sound. Early versions (1900–20) of the cathode-ray (picture) tube, methods of amplifying an electronic signal, and theoretical formulation of the electronic-scanning principle later became the basis of modern TV. RCA demonstrated the first all-electronic TV in 1932. Colour TV (in the 1950s), cable TV systems (introduced in the 1960s), and recording or playback machines (in the 1980s; see VCR) followed. Digital high-definition (HDTV) systems (1990s) provide sharper, clearer pictures and sound with little interference or other imperfections and have the potential to merge TV functions with those of computers.

television, cable See cable television

telex International telegraphic message-transfer service consisting of a network of teleprinters. Subscribers to a telex service can exchange textual communications and data directly with one another. Telex systems originated in Europe in the early 1930s and were widely used for several decades. The ability to conduct high-speed digital communication over regular telephone lines led to a decline in the use of telex, but it is still used as a data transmission service for applications in which high transmission speeds are not necessary or in areas where more modern data equipment is not available.

Telford, Thomas (b. Aug. 9, 1757, near Westerkirk, Dumfries, Scot.—d. Sept. 2, 1834, London, Eng.) Scottish civil engineer. He built the Ellesmere, Caledonian, and Göta canals and the St. Katherine's Docks in London. His crowning achievement was the design and construction (1819–26) of the great Menai Bridge, a suspension bridge in Wales. In all he built some 1,200 bridges, over 1,000 miles of road, and many buildings. He was the first president of the British Institution of Civil Engineers (founded 1818).



Tell, William *German* **Wilhelm Tell.** Swiss national hero whose historical existence is disputed. According to tradition, in the 13th or early 14th century he defied Austrian authority and was forced to shoot an apple from his son's head with a crossbow at a distance of 80 paces by the hated Austrian governor. He subsequently ambushed and killed the governor, an event that supposedly led to rebellion against Austrian rule. He is first mentioned in a chronicle from 1470. The marksman's test is widely found in folklore, and the story has resemblances to the founding myths of other nations.

Teller, Edward *orig.* **Ede Teller** (b. Jan. 15, 1908, Budapest, Hung., Austria-Hungary—d. Sept. 9, 2003, Stanford, Calif.) Hungarian-born U.S. nuclear physicist. Born to a prosperous Jewish family, he earned a Ph.D. at the University of Leipzig (1930) before leaving Nazi Germany (1933) and settled in the U.S. in 1935. In 1941 he joined Enrico Fermi's team in the effort to produce the first self-sustaining nuclear reaction, and in 1943 J. Robert Oppenheimer recruited him for the Manhattan Project. At the war's end, Teller advocated development of a fusion bomb, and he won permission after initial government resistance. With Stanislaw Ulam he developed a workable hydrogen bomb in 1952. That same year he helped establish the Lawrence Livermore Laboratory (Livermore, Calif.), which became the chief U.S. factory for nuclear weapons. In 1954 he joined the opposition to Oppenheimer's continued security clearance. A staunch anticommunist, he devoted much energy to his crusade to keep the U.S. ahead of the Soviet Union in nuclear arms; he opposed nuclear weapons treaties, and he was principally responsible for convincing Pres. Ronald Reagan of the need for the Strategic Defense Initiative. In 2003 Teller was awarded the Presidential Medal of Freedom.

Telloh See Lagash

Telugu \'te-lə-ˌgü\ **language** Dravidian language spoken by more than 66 million people in South India and in immigrant communities elsewhere. It is the official language of the state of Andhra Pradesh. The earliest inscription entirely in Telugu is from the 6th century; literary texts begin in the 11th century. The Telugu script, derived from the writing of the Calukya dynasty, is closely akin to Kannada script (see Indic writing systems). Like other major Dravidian languages, Telugu has very marked distinctions between formal or literary and colloquial registers and between social dialects.

telum figure *or* **tellem figure** \'te-ləm\ Small, devotional image carved from wood or stone, probably used in private ancestor worship in primitive societies. Telum figures are known from northwestern New Guinea and in the Dogon art of Sudan. Extant examples are rare, perhaps because they had less intrinsic value than the more carefully executed statues used in formal ceremonies of ancestor worship.

Tempe \'tem-pē, tem-'pē\ City (pop., 2000: 158,625), southwest-central Arizona, U.S. Tempe is located on the Salt River, near Phoenix. First settled in 1872, it was renamed in 1880 for the Vale of Tempe in Greece. After World War II the city experienced rapid residential and economic growth with light-industrial development. Arizona State University (founded 1885), located there, has an auditorium designed by Frank Lloyd Wright.

Tempe \'tem-pē**, Vale of** *Greek* **Témbi** Narrow valley between Mount Olympus and Mount Ossa, northeastern Thessaly, Greece. The Pinios River flows through the 6-mi (10-km) valley before emptying into the Aegean Sea. The ancient Greeks dedicated Tempe to the cult of Apollo. Legends attribute its formation to a blow from Poseidon's trident; however, geologists believe it was carved by stream action. Because it provides access from the coast of Greece to the Thessalian plain, it has been a traditional invasion route. Ruins of castles and fortifications, from the Roman period to the Middle Ages, mark its strong points.

tempera painting Painting executed with ground pigment mixed with a water-soluble material, such as egg yolk, gum, or wax. The special ground for tempera painting is a rigid wood panel coated with thin layers of gesso, a preparation usually made of plaster of Paris and glue. Tempera paint is resistant to water and allows overpainting with more colour; the thin, transparent layers of paint produce a clear, luminous effect. The exclusive medium for panel painting in the Middle Ages and early Renaissance, it was largely superseded in the 15th century by oil paint.

temperament In the psychological study of personality, an individual's characteristic or habitual inclination or mode of emotional response. The notion of temperament in this sense originated with Galen, who developed it from an earlier theory regarding the four "humours": blood, phlegm, and black and yellow bile. The subject was taken up in the 20th century by Ernst Kretschmer and later theorists, including Margaret Mead. Today researchers emphasize physiological processes (including the endocrine and autonomic nervous systems) and culture and learning.

temperament See tuning and temperament

temperance movement International social movement dedicated to the control of alcohol consumption through the promotion of moderation and abstinence. It began as a church-sponsored movement in the U.S. in the early 19th century. It attracted the efforts of many women, and by 1833 there were 6,000 local temperance societies in the U.S. The first European temperance society was formed in Ireland in 1826. An international temperance movement began in Utica, N.Y., U.S., in 1851 and spread to Australia, Asia, Europe, India, South and West Africa, and South America. See also Carry Nation; Prohibition; Woman's Christian Temperance Movement.

temperature Measure of hotness expressed in terms of any of several arbitrary scales, such as Fahrenheit, Celsius, or Kelvin. Heat flows from a hotter body to a colder one and continues to do so until both are at the same temperature. Temperature is a measure of the average energy of the molecules of a body, whereas heat is a measure of the total amount of thermal energy in a body. For example, whereas the temperature of a cup of boiling water is the same as that of a large pot of boiling water (212°F,

© 2006 Encyclopædia Britannica, Inc.

or 100°C), the large pot has more heat, or thermal energy, and it takes more energy to boil a pot of water than a cup of water. The most common temperature scales are based on arbitrarily defined fixed points. The Fahrenheit scale sets 32° as the freezing point of water and 212° as the boiling point of water (at standard atmospheric pressure). The Celsius scale defines the triple point of water (at which all three phases, solid, liquid, and gas, coexist in equilibrium) at 0.01° and the boiling point at 100°. The Kelvin scale, used primarily for scientific and engineering purposes, sets the zero point at ABSOLUTE ZERO and uses a degree the same size as those of the Celsius scale.

temperature inversion In meteorology, an increase of air temperature with altitude. Such an increase is a reversal of the normal temperature condition of the TROPOSPHERE, where temperature usually decreases with altitude. Inversions play an important role in determining cloud forms, precipitation, and visibility. An inversion acts as a lid, preventing the upward movement of the air below it. Where a pronounced inversion is present at a low level, convective clouds cannot grow high enough to produce showers and, at the same time, visibility may be greatly reduced by trapped pollutants (see SMOG). Because the air near the base of the inversion is cool, fog is frequently present there.

tempering HEAT-TREATING of metal ALLOYS, particularly STEEL, to reduce brittleness and restore DUCTILITY. In tempering, steel is slowly heated to a temperature between 300 and 1,300 °F (150 and 700 °C), depending on desired properties, in an oil or salt bath and held for about two hours and then allowed to air cool. As steel is physically worked (e.g., ROLLING, WIREDRAWING, hammering), HARDENING takes place, and it grows progressively more brittle. Similarly, but more deliberately, heating and QUENCHING increase hardness. Combined quench-and-temper heat-treating is applied at many different cooling rates, holding times, and temperatures and is a very important means of controlling the properties of steel.

Tempest, Dame Marie *orig.* **Marie Susan Etherington** (b. July 15, 1864, London, Eng.—d. Oct. 15, 1942, London) British actress. She began her career as an operetta singer, winning acclaim for her charming and high-spirited performances in *Dorothy* (1887) and touring the U.S. and Canada in the early 1890s in operettas such as *The Bohemian Girl* and *The Pirates of Penzance*. Turning to straight comedy in 1899, she appeared notably in *English Nell* (1900), *Mrs. Dot* (1908), and *Hay Fever* (1925).

Tempietto \tem-'pyet-ō\ Small monument built in 1502 to mark the crucifixion spot of St. Peter in Rome. Designed by DONATO BRAMANTE, it is a circular, domed, unadorned masterpiece of High Renaissance architecture. Its outer face is a colonnade of bare Tuscan Doric, the earliest modern use of this ORDER. Because of its proportions, the tiny temple has the majesty of a great monument.

Templar \'tem-plər\ *or* **Knight Templar** Member of a religious military order of knighthood established during the CRUSADES. At its beginning (c. 1119), the group consisted of eight or nine French knights who devoted themselves to protecting from Muslim warriors those on pilgrimage to Jerusalem. They were given quarters near the site of the former TEMPLE OF JERUSALEM, from which they derived their name. Taking vows of poverty and chastity, they performed courageous service, and their numbers increased rapidly, partly because of the propagandistic writing of St. BERNARD DE CLAIRVAUX, who also wrote their rule of life. They flourished for two centuries, expanding to other countries, growing in number to 20,000, and acquiring vast wealth and property. By 1304 rumours, probably false, of irreligious practices and blasphemies had made them the target of persecution. In 1307 PHILIP IV of France and Pope CLEMENT V initiated the offensive that culminated in the Templars' final suppression in 1312, including the confiscation of all their property and the imprisonment or execution of many members; their last leader, Jacques de Molay (1243–1314), was burned at the stake.

temple Edifice constructed for the worship of a deity. Features commonly include a sanctuary and an ALTAR. Ancient Egypt had two kinds of temple: mortuary temples for the cults of dead kings, with a chapel in which offerings were presented, and cult temples that held images of deities. The cult temple typically included a massive PYLON entrance with a court leading to a HYPOSTYLE hall and, at the heart of the temple, a shrine for the cult image. Most Classical Greek temples were rectangular and built of marble or other stone on a low stylobate (stepped platform). A gable roof was supported by columns, with a portico at each end (amphiprostyle temple), a colonnade extending all around (peripteral temple), or a double line of columns all around (dipteral temple). An inner CELLA housed the image of a deity, and an altar stood outside the temple. Roman temples were profoundly influenced by Greek style, but the altar was inside the temple and the colonnade was often reduced to a row of engaged columns. Hindu temples vary regionally, but generally consist of a towering shrine and a columned hall surrounded by an elaborate wall. Buddhist temples range from half-buried sanctuaries with richly carved entrances to single carved towers or statues. The Chinese and Japanese Buddhist temple is typically a one-story building of richly carved, painted, or tiled timber constructed around an atrium used for worship, though towering PAGODAS were sometimes built as temples over a shrine. In the Americas, Inca and Mayan temples were constructed of stone, often richly carved; they were generally stair-stepped pyramids, with the shrine at the top. See also SYNAGOGUE.

Temple, Shirley *later* **Shirley Temple Black** (b. April 23, 1928, Santa Monica, Calif., U.S.) U.S. child actress. She was selected from her dancing class for a screen test and made her debut at age four. She won notice in *Stand Up and Cheer* (1934) and was featured in *Little Miss Marker* (1934) and *Bright Eyes* (1934), in which she sang "On the Good Ship Lollipop." A precocious performer known for her dimples and golden curls, she became the country's most popular female star and Hollywood's top box office attraction in the Great Depression era. She received a special Academy Award in 1934. Her later films include *The Little Colonel* (1935), *Wee Willie Winkie* (1937), and *The Little Princess* (1939). As an adult she served as a U.S. delegate to the UN General Assembly (1969–70) and as U.S. ambassador to Ghana (1974–76) and Czechoslovakia (1989–92).

Shirley Temple.
BROWN BROTHERS

Temple, Sir William (b. April 25, 1628, London, Eng.—d. Jan. 27, 1699, Moor Park, Surrey) British statesman. As ambassador to The Hague (1668–70, 1674–79), he formulated England's pro-Dutch foreign policy and arranged the marriage between William of Orange and Princess Mary of England (later WILLIAM III and MARY II). After retiring from politics in 1681, he wrote numerous essays that were collected for publication by his secretary, JONATHAN SWIFT. He also wrote the acclaimed *Observations upon the United Provinces* (1673).

Temple of Heaven Large religious complex in the old outer city of Beijing, considered the supreme achievement of traditional Chinese architecture. Its layout symbolizes the belief that heaven is round and earth square. The three buildings are built in a straight line. The Hall of Prayer for Good Harvests (1420) has three concentric circles of massive wood columns symbolizing the four seasons, 12 months, and 12 daily hours; in a remarkable feat of engineering, they support the three roof levels and, in succession, a huge square brace (earth), circular architrave (heaven), and vast interior cupola. The Imperial Vault of Heaven (1530; rebuilt 1572) is a smaller circular building constructed without crossbeams; its dome is supported by complicated span work. The Circular Mound Altar (1530; rebuilt 1749) is a triple-tiered white stone terrace enclosed by two sets of walls that are square outside and round inside.

Ashura, dry lacquer (*kanshitsu*) sculpture in the Tempyō style, Late Nara period (724–794); in the Kōfuku-ji, Nara, Japan
ASUKA-EN, JAPAN

Tempyō style \'temp-yō\ Japanese sculptural style of the NARA period (710–784), greatly influenced by the Chinese imperial style of the

S | T | U | V

© 2006 Encyclopædia Britannica, Inc.

Tang dynasty (618–907). Many supreme sculptural achievements of Japanese Buddhist art were created during this era, often in unbaked clay, solid wood, and lacquered cloth molded on a removable core (a technique called *kanshitsu*, or dry lacquer). Tempyō style shows a closer fusion of parts into a unified whole than is found in works of the Early Nara period, giving a sense of activity and realistic observation; the new realism is especially notable in portrait sculpture.

Ten Commandments List of religious precepts sacred in Judaism and Christianity. They include injunctions to honour God, the Sabbath, and one's parents, as well as bans on idolatry, blasphemy, murder, adultery, theft, false witness, and covetousness. In the book of Exodus, they are divinely revealed to Moses on Mount Sinai and engraved on two stone tablets. Most scholars propose a date between the 16th and 13th century BC for the commandments, though some date them as late as 750 BC. They were not regarded with deep reverence by Christians until the 13th century.

Ten Thousand Smokes, Valley of Volcanic region, southern Alaska, U.S. Located in Katmai National Park and Preserve, the valley covers 56 sq mi (145 sq km). It was created in 1912 when the eruption of the Novarupta and Mount Katmai volcanoes covered the valley in a flow of lava. When an expedition visited the site in 1916, it discovered tens of thousands of fissures known as fumaroles spouting smoke, gas, and steam in the valley floor. The largest was 150 ft (46 m) in diameter; some had temperatures as high as 1,200 °F (649 °C). About 60 years later there were fewer than 12 fumaroles left. In the 1960s U.S. astronauts used the scarred region to train for Moon landings.

tenant See landlord and tenant

tenant farming Agricultural system in which landowners rent their land to farmers and receive either cash or a share of the product in return. Landowners may also contribute operating capital and management. Under one arrangement, known as sharecropping, the landowner furnishes all the capital and sometimes the food, clothing, and medical expenses of the tenant and may also supervise the work. The sharecropper then pays the landowner with a portion of the output grown on the land. In other forms of tenant farming, the tenant may furnish all the equipment and have substantial autonomy in the farm's operation. Tenants and their families probably constitute two-fifths of the world's population engaged in agriculture. Tenant farming can be highly efficient, as has been shown in England and Wales. Abuses occur when landowners' power is excessive and the tenants are poor or of inferior social status.

Tendai See Tiantai

tendinitis *or* **tendonitis** \ˌten-dᵊn-ˈī-təs\ Inflammation of a tendon sheath, due to irritation of this thin, filmy tissue by overuse of the tendons, which slide within them, or to bacterial infection. It is often an occupational disease, affecting tendons used in repetitive motions on the job. The tendon becomes swollen and red, with pain that increases on motion. The swelling hampers the tendon's sliding within, causing stiffness. Treatment involves immobilization with a splint, cast, or bandage and gradually increasing motion after inflammation subsides, which may happen sooner with corticosteroid injections. Repeated episodes can permanently thicken the sheath, limiting motion.

tendon Tissue attaching a muscle to other body parts, usually bones, to transmit the mechanical force of muscle contraction to the other part. Much like ligaments, tendons are composed of dense, fibrous connective tissue with a high collagen content, which makes them remarkably tough and strong, with great tensile strength to withstand the stresses generated by muscle contraction.

tendril Plant organ specialized to anchor and support vining stems. A tendril is a slender, whiplike or threadlike strand, produced usually from the node of a stem and composed of either stem or leafstalk tissue, by which a vine or other plant may climb. Sensitive to contact, the tendril turns toward any object it brushes against, wraps about it, and clings to it for as long as the stimulation persists. Later, strong mechanical tissue develops in the tendrils, making them strong enough to support the weight of the plant. Some tendrils have enlargements at the ends that flatten and produce an adhesive that firmly cements them to their support. Common examples of tendril plants are grape, English ivy, sweet pea, gourds, and passionflowers.

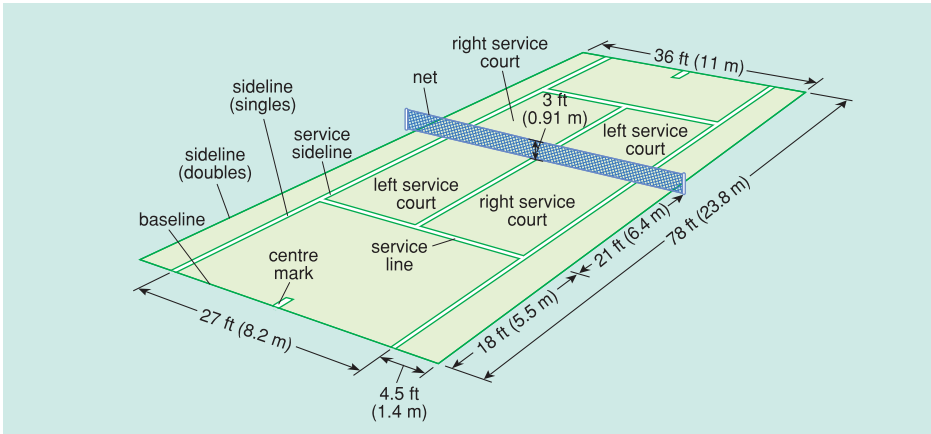
Teng Hsiao-p'ing See Deng Xiaoping

Teniers \tə-ˈnirs, tā-ˈnyā**, David** (baptized Dec. 15, 1610, Antwerp, Belg.—d. April 25, 1690, Brussels) Flemish painter. His father, also named David Teniers (1582–1649), was a painter of primarily religious subjects. The younger Teniers was highly prolific and is best known for his genre scenes of peasant life, many of which were used for tapestry designs in the 18th century. He was brilliant at handling crowd scenes in an open landscape and adept at characterizing his figures with a warm, human, and often humorous touch. As court painter to the archduke Leopold William, he also made many small-scale copies of paintings in the archduke's collection; engraved and published as *Theatrum Pictorium* (1660), they constitute a valuable source as a pictorial inventory of a great 17th-century collection.

Tennessee State (pop., 2000: 5,689,283), southeast-central U.S. It occupies 42,144 sq mi (109,153 sq km); its capital is Nashville. It is bordered by Kentucky and Virginia to the north, North Carolina to the east, Alabama and Mississippi to the south, and Arkansas and Missouri to the west. The Great Smoky Mountains edge the eastern part of the state, while the Mississippi River is on its western boundary. The Tennessee River valley dominates much of the state, and the Tennessee Valley Authority is the nation's largest electric-power generating system. Tennessee has a moderate climate; about half of it is forested. American Indians, including Chickasaw, Cherokee, and Shawnee, inhabited the region when Spanish, French, and English explorers visited it in the 16th–17th centuries. It was included in the British charter of Carolina and in the French Louisiana claim and was ceded to Great Britain after the French and Indian War. The first permanent settlement was made c. 1770. It was part of North Carolina until 1785, when the area's settlers broke away and formed the free state of Franklin. North Carolina relinquished its claim in 1789, and Tennessee became the 16th U.S. state in 1796. In 1861 it seceded from the Union; the hard-fought American Civil War battles of Shiloh, Chattanooga, Stones River, and Nashville occurred there. In 1866 it was the first state readmitted to the Union. During the Reconstruction era, blacks lost what little power they had gained. After World War II Tennessee became a testing ground for those involved in the civil rights movement. The state's economy is based on manufacturing.

Tennessee River Navigable river, Tennessee, northern Alabama, and western Kentucky, U.S. Formed by the confluence of the Holston and French Broad rivers in eastern Tennessee, it flows 652 mi (1,049 km) before joining the Ohio River in Kentucky. During the American Civil War it served as a strategic invasion route into the western Confederacy. Its development as one of the world's greatest irrigation and hydropower systems began with the establishment in 1933 of the Tennessee Valley Authority. The Tennessee River is linked to the Tombigbee River by the Tennessee-Tombigbee Waterway.



Tennessee Valley Authority (TVA) U.S. government agency established in 1933 to control floods, improve navigation, and generate electrical power along the Tennessee River and its tributaries. The TVA is a public corporation governed by a board of directors. It has jurisdiction over the entire basin of the river, which covers parts of seven states: Alabama, Georgia, Kentucky, Mississippi, North Carolina, Tennessee, and Virginia. Created by Congress as one of the major public-works projects of the New Deal, the TVA built a system of dams to control the region's chronic flooding, deepened the channel to improve navigation, and encouraged the development of port facilities along the river. The projects greatly increased traffic on the river and provided cheap electricity, spurring the industrial development of what had been a chronically depressed regional economy. See also Public Works Administration.

Tennessee Walking Horse *or* **Plantation Walking Horse** Breed of light horse with a distinctive, easy-to-sit gait, the running walk. It was developed for touring U.S. Southern plantations. It averages 15.2 hands (61 in. [154 cm]) high and weighs about 1,000 lb (450 kg). Coat colour varies. Its ancestors included any horse capable of a running walk, a natural gait that cannot be acquired, but the most influential stallion was a Standardbred. The running walk, faster than a flat-footed walk, is a low, gliding, reaching action; the front foot strikes the ground an instant before the diagonal hind foot, which then oversteps the front footprint by several inches.

Tenniel \ˈten-yəl**, Sir John** (b. Feb. 28, 1820, London, Eng.—d. Feb. 25, 1914, London) British illustrator and satirical artist. After attracting attention with his mural decorations, he was invited to contribute drawings to *Punch* magazine in 1850 and in time became its chief cartoonist.

© 2006 Encyclopædia Britannica, Inc.

His drawings lent new dignity to the political cartoon. Of his many book illustrations, best known are those for Lewis Carroll's *Alice's Adventures in Wonderland* (1865) and *Through the Looking-Glass* (1872), which are remarkable for their subtlety and cleverness.

A professional tennis court. The person serving stands behind the baseline, alternately to the right and left of the center mark, and must land the ball alternately in the opposite left and right service court. A narrower portion of the court is used in singles tennis (one person on a side) than in doubles (two people on a side), though the size of the service court does not change. In doubles, the two partners alternate in serving, but both may otherwise roam freely over the entire court.
© MERRIAM-WEBSTER INC.

tennis Game played with rackets and a light, elastic ball by two players or pairs of players on a rectangular court divided by a low net. Tennis is played indoors and outdoors, on hard-surface, clay, and grass courts. The object is to hit the ball over the net and into the opponent's half of the court in such a way as to defeat the opponent's attempt to reach and return it. Each player serves for an entire game. Points are scored as 15, 30, 40, and game (the term "love" is used for 0). A tied score ("deuce") requires continued play until a two-point margin is achieved. The first player to win six games, with a lead of two games, takes the set. A match consists of the best two out of three (or three out of five) sets. Since the early 1970s, tiebreakers have been employed to eliminate marathon sets. Tennis developed in the 1870s in Britain from earlier racket-and-ball games. The first world lawn-tennis championship was held in 1877 at Wimbledon; clay- and hard-court competitions emerged later. Current international team tournaments include the Davis Cup for men and the Federation Cup (since 1963) for women's teams. The major tournaments for individual players constitute the "Grand Slam" of tennis: the national championships of Britain (Wimbledon), the U.S., Australia, and France.

Tennis Court Oath (June 20, 1789) Oath taken by deputies of the Third Estate in the French Revolution. Believing that their newly formed National Assembly was to be disbanded, the deputies met at a nearby tennis court when they were locked out of their usual meeting hall at Versailles. They vowed never to separate until a written constitution was established for France. Their solidarity forced Louis XVI to order the clergy and the nobility to join with the Third Estate in the National Assembly.

Tennyson \'te-nə-sən**, Alfred, 1st Baron Tennyson (of Aldworth and Freshwater)** *known as* **Alfred, Lord Tennyson** (b. Aug. 6, 1809, Somersby, Lincolnshire, Eng.—d. Oct. 6, 1892, Aldworth, Surrey) English poet, the leading poet of the Victorian age. While attending Cambridge University, Tennyson developed a deep friendship with Arthur Hallam. His reputation as a poet increased at Cambridge, and he published *Poems, Chiefly Lyrical* (1830). Another volume, including "The Lotos-Eaters" and "The Lady of Shalott," was published in 1832 (dated 1833). Hallam's sudden death in 1833 prompted Tennyson to write poems that eventually became part of the vast *In Memoriam* (1850) and lyrics that later appeared in the brooding *Maud* (1855), his favourite poem. *Poems* (1842), including "Ulysses," "Morte d'Arthur," and "Locksley Hall," followed, then *The Princess* (1847), a long antifeminist fantasia that includes such lyrics as "Sweet and Low" and "Tears, Idle Tears." In 1850 he married; that year he was also named poet laureate of England. Among his subsequent works are "The Charge of the Light Brigade" (1855); *Idylls of the King* (1859), treating the Arthurian legend; and *Enoch Arden* (1864). A consummate poet who was inclined to melancholy, Tennyson was also regarded as a spokesman for the educated English middle class. His works often dealt with the difficulties of an age when traditional assumptions were increasingly called into question by science and modern progress.

Tenochtitlán \tā-ˌnōch-tēt-'län\ Ancient capital of the Aztec empire. Located at the site of modern Mexico City, it was founded c. 1325 in the marshes of Lake Texcoco. It formed a confederacy with Texcoco and Tlacopán and was the Aztec capital by the late 15th century. Originally located on two small islands in Lake Texcoco, it gradually spread through the construction of artificial islands to cover more than 5 sq mi (13 sq km). It was connected to the mainland by several causeways. The population in 1519 was estimated to be about 400,000 people, the largest residential concentration in Mesoamerican history. It contained the palace of Montezuma II, said to consist of 300 rooms, as well as hundreds of temples. It was destroyed by the Spanish conquistadores under Hernán Cortés in 1521.

tenor High male voice range, extending from about the second B below middle C to the G above it. In the polyphony of the 13th–16th centuries, the tenor was the part that held (Latin, *tenere*: "to hold") the cantus firmus. Tenor voices are often classified as dramatic, lyric, or heroic (heldentenor). In instrument families, tenor refers to the instrument in which the central range is roughly that of the tenor voice (e.g., tenor saxophone).

tenor tuba See euphonium

tenpounder See ladyfish

Tenrikyo \'ten-rē-ˌkyō\ Largest and most successful of the modern Shinto sects in Japan. Its founder, Nakayama Miki (1798–1887), was a charismatic peasant who, at age 40, claimed to be possessed by a god of divine wisdom. She developed a form of worship characterized by ecstatic dancing and shamanistic practices, and a doctrine emphasizing charity and the healing of disease through mental acts of faith. Her writings and deeds were considered divine models. Tenrikyo was one of the most powerful religious movements in Japan immediately after World War II, and its membership reached about 2.5 million in the late 20th century.

tense In grammar, an inflected form of a verb indicating the time of a narrated event in relation to the time at which the narrator is speaking. Time is often perceived as a continuum with three main divisions, past, present, and future, defined in relation to the time when the event is described. Other categories, including mood and aspect, may further specify the action as definite or indefinite, completed or not completed, lasting or nonlasting, and recurring or occurring once.

tensile \'ten-səl\ **strength** Ratio of the maximum load a material can support without fracture when being stretched to the original area of a cross section of the material. When stresses less than the tensile strength are removed, a material completely or partially returns to its original size and shape. As the stress approaches that of the tensile strength, a material that has begun to flow forms a narrow, constricted region that is easily fractured. Tensile strengths are measured in units of force per unit area. See also deformation and flow.

Tenskwatawa See The Prophet

tensor analysis Branch of mathematics concerned with relations or laws that remain valid regardless of the coordinate system used to specify the quantities. Tensors, invented as an extension of vectors, are essential to the study of manifolds. Every vector is a tensor, but tensors are more general and not easily pictured as geometrical objects. A tensor can be thought of as an abstract object defined as a set of components (like geometric coordinates) that, under a transformation of coordinates, undergo a specific type of transformation. While tensors were explored before

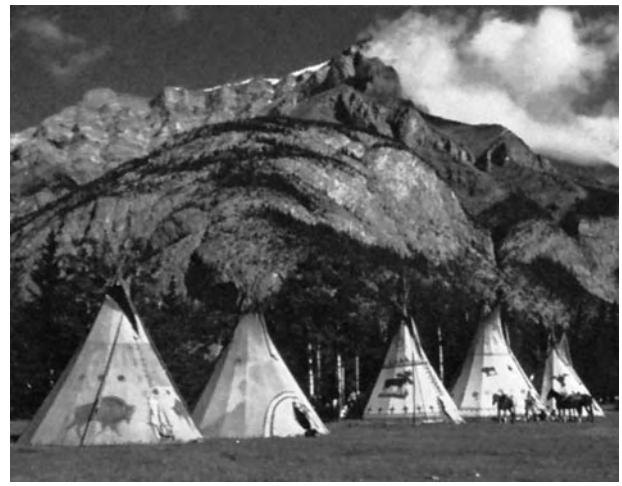
Albert Einstein, the success of his general theory of relativity led to their widespread exploration and use by mathematicians and physicists.

tent caterpillar Any moth larva of the genus *Malacosoma* (family Lasiocampidae). Tent caterpillars are often brightly coloured. Congregations of the eastern tent caterpillar (*M. americanum*) of eastern North America spin huge, tent-shaped communal nests in forked tree branches. Eggs the moth deposits on a tree in midsummer hatch in spring. The hatched caterpillars migrate to a tree crotch and construct a silken tent, which they leave each day throughout the summer to feed on the surrounding leaves. The forest tent caterpillar (*M. disstria*) is common in the southern U.S.

tent structure Building that uses masts or poles and tensile membrane (e.g., fabric or animal skin) enclosures. Tent structures are prestressed by externally applied forces so that they are held taut under anticipated load conditions. Tents have been the dwelling places of most of the world's nomadic peoples, from ancient times until the present. The traditional Bedouin tent consists of a rectangular membrane of strips of woven camel hair that is strained on webbing straps and secured with guys over a rectangle of poles. The American Plains Indians developed the conical tepee. The Central Asian nomadic pole dwelling, or yurt, uses skins and textiles as its covering. See also membrane structure, pole construction.

Tenure of Office Act (1867) Law forbidding the U.S. president to remove civil officers without the consent of the Senate. Passed by the Radical Republicans over the veto of Pres. Andrew Johnson, the measure sought to prevent Johnson from removing cabinet members who supported Congress's harsh Reconstruction policies. When Johnson tried to dismiss his secretary of war, Edwin M. Stanton, an ally of the Radical Republicans, Congress began impeachment proceedings against him. The law was partially repealed in 1869 and completely repealed in 1887; in 1926 it was found unconstitutional.

Tenzing Norgay \'ten-ˌziŋ-'nȯr-gē\ (b. May 15, 1914, Tshechu, Tibet [now Tibet Autonomous Region, China]—d. May 9, 1986, Darjeeling [now Darjiling], India) Tibetan Sherpa mountaineer. Tenzing served on numerous expeditions before joining Edmund Hillary as sirdar, or organizer of porters. In 1953 he and Hillary became the first two people to reach the summit of Mount Everest. A devout Buddhist, Tenzing left an offering of food at Everest's summit.



teosinte \ˌtā-ō-'sin-tē\ Tall, stout, annual grass (*Zea mexicana* or *Euchlaena mexicana*) of the family Poaceae (or Gramineae), native to Mexico. Related to corn, teosinte grows in large clumps, producing bundles of fruiting spikes enclosed in husks and with silk hanging from the upper ends, similar to corn ears. Species of corn have recently been crossed with teosinte to produce a perennial variety of corn.

Teotihuacán \ˌtā-ō-ˌtē-wä-'kän\ Largest (though not most populous) city of pre-Columbian central Mexico, about 30 mi (50 km) northeast of modern Mexico City. Teotihuacán wielded its greatest influence in the first 900 years ad, after which it was sacked by the Toltecs. At its height, some 150,000 people lived in the city, which covered about 8 sq mi (21 sq km). Its plazas, temples, and palaces are dominated by the Pyramid of the Moon and the huge Pyramid of the Sun. Teotihuacán was the capital of one of the earliest Mesoamerican civilizations, and some consider it also to have been the centre of Toltec civilization. See also Tula.

Tepe Gawra \'te-pā-gaù-'rä\ Ancient city, Mesopotamia. Located near present-day Mosul, Iraq, it was continuously occupied from the mid-6th to the mid-2nd millennium bc and gave its name to the Gawra Period (c. 3500–2900 bc). Its remains include the earliest known temple decorated with pilasters and recesses, a style that remained dominant in Mesopotamia for centuries. Its archaeological record illustrates the transition from early Stone Age farming villages to complex settlements.

Tepe Yahya \'te-pā-'yä-yä\ Ancient trading city, southeastern Iran. Almost continuously occupied in the 5th–3rd millennia bc, it flourished as a centre for the production and distribution of soapstone before being abandoned during the 2nd millennium. It was reoccupied from c. 1000 bc to c. ad 400.

tepee *or* **tipi** Tall tent dwelling used by the Plains Indians. It was suited to their nomadic life of buffalo hunting, because it could be easily folded and dragged by a horse. It was made by stretching dressed and fitted buffalo skins over a skeleton of 20–30 wooden poles, all slanted in toward a central point and tied together near the top. A flap at the top allowed smoke to escape, and a flap at the bottom served as a doorway. The tepee became a popular symbol of all American Indians, although the wigwam, wickiup, hogan, igloo, and longhouse were at least as important.

Tepees in Banff, Alta., Can.
alpha

Tepic \tā-'pēk\ City (pop., 2000: 265,817), capital of Nayarit state, west-central Mexico. It lies along the Tepic River, at the foot of an extinct volcano. Founded in 1542, much of the city retains a Spanish colonial atmosphere. Its isolation limited its growth until construction of the railroad in 1912; since then it has become a commercial, industrial, and agricultural centre. Nearby are Toltec ruins.

tequila \tə-'kē-lə\ Distilled liquor, usually clear in colour and unaged, made from the fermented juice of the Mexican agave plant. (See agave family.) It contains 40–50% alcohol. It was developed soon after the Spaniards brought distillation to Mexico, and is named for the town of Tequila. It is mixed with lime juice and orange liqueur to make the margarita cocktail, which is served in a glass rimmed with salt. Mescal, a stronger-flavoured liquor, is made from a wild agave from Oaxaca.

Terborch \tər-'bȯrk,\ *English* \tər-'bȯrk**, Gerard** *or* **Gerard ter Borch** (b. 1617, Zwolle, Neth.—d. Dec. 8, 1681, Deventer) Dutch painter. After travels in England, Italy, Westphalia, and Spain, he returned home in 1648 and settled in Deventer in 1654. His works consist almost equally of portraits and genre paintings. By subtlety of tonal gradations and mastery of rendering diverse textures, he achieved extraordinarily rich effects with the clothing in his portraits. His superb colour sense is seen to advantage in his interior genre pieces, in which he depicted with grace and fidelity the atmosphere of well-to-do middle-class life in 17th-century Holland.

Terbrugghen \tər-'brü-gən**, Hendrik** *or* **Hendrick ter Brugghen** (b. c. 1588, Deventer?, Neth.—buried Nov. 9, 1629, Utrecht) Dutch painter. He reportedly spent 10 years in Italy, and on his return to Utrecht in 1615 his work showed the strong influence of Caravaggio. His two versions of *The Calling of St. Matthew* (c. 1617, 1621) reflect knowledge of Caravaggio's treatment of the same subject. He is most indebted to Caravaggio for his chiaroscuro, though his own light is more atmospheric and silvery, as in *The Flute Player* (1621). His masterpiece is *St. Sebastian Attended by Irene and Her Maid* (1625). With Gerrit van Honthorst, he was a leader of the Utrecht school.

Terence *orig.* **Publius Terentius Afer** (b. c. 195, Carthage, North Africa—d. 159? BC, in Greece or at sea) Roman comic dramatist. Born as a slave, he was taken to Rome, where he was educated and later freed. His six extant verse plays are *The Woman of Andros*, *The Mother-in-Law*, *The Self-Tormentor*, *The Eunuch*, *Phormio*, and *The Brothers*. Produced between 166 and 160 BC, they were based on Greek originals (including four by MENANDER); Terence eliminated their original prologues, used contemporary colloquial Latin, and introduced a measure of realism. He influenced later dramatists such as MOLIÈRE and WILLIAM SHAKESPEARE.

Teresa (of Calcutta), Blessed Mother *orig.* **Agnes Gonxha Bojaxhiu** (b. Aug. 27, 1910, Skopje, Maced., Ottoman Empire—d. Sept. 5, 1997, Calcutta, India; beatified Oct. 19, 2003) Roman Catholic nun, founder of the Order of the Missionaries of Charity. The daughter of a grocer, she became a nun and went to India as a young woman. After studying nursing, she moved to the slums of Calcutta (Kolkata); in 1948 she founded her order, which served the blind, the aged, the disabled, and the dying. In 1963 the Indian government awarded her the Padmashri ("Lord of the Lotus") for her services to the people of India, and in 1971 Pope PAUL VI awarded her the first Pope John XXIII Peace Prize. In 1979 she received the Nobel Prize for Peace. Although in her later years she suffered from a worsening heart condition, Mother Teresa continued to serve the poor and sick and also spoke out against divorce, contraception, and abortion. Her order included hundreds of centres in more than 90 countries, with some 4,000 nuns and hundreds of thousands of lay workers. She was succeeded by the Indian-born Sister Nirmala. The process to declare her a saint began within two years of her death, and Pope JOHN PAUL II issued a special dispensation to expedite the process. She was beatified on Oct. 19, 2003, reaching the ranks of the blessed in the shortest time in the church's history.

Teresa of Ávila, Saint *orig.* **Teresa de Cepeda y Ahumada** (b. March 28, 1515, Ávila, Spain—d. Oct. 4, 1582, Alba de Tormes; canonized 1622; feast day October 15) Spanish CARMELITE nun, mystic, and saint. After entering a convent around the age of 20, she fell seriously ill. She underwent a religious awakening in 1555 and, despite her frail health, initiated the Carmelite Reform, leading the order's return to its original austere practices, including poverty and seclusion from the world. Against some opposition, she opened new convents (the first in 1562) under the reformed order throughout Spain. St. JOHN OF THE CROSS joined her in her efforts, establishing reformed Carmelite monasteries. Her doctrines have been accepted as the classical exposition of the contemplative life, and her spiritual writings are still widely read today, among them *The Interior Castle* (1588). In 1970 she became the first woman elevated to the position of Doctor of the Church.

Tereshkova \ˌter-əsh-ˈkō-və**, Valentina (Vladimirovna)** (b. March 6, 1937, Maslennikovo, Russia, U.S.S.R.) Russian cosmonaut. An accomplished parachutist, she was accepted for the cosmonaut program in 1961. In 1963 she became the first woman in space, making 48 orbits in 71 hours aboard VOSTOK 6. She left the program after her flight and served in various governmental positions until the early 1990s. She was named a hero of the Soviet Union and twice awarded the Order of Lenin.

Terkel \ˈtər-kəl**, Studs** *orig.* **Louis Turkel** (b. May 16, 1912, New York, N.Y., U.S.) U.S. radio personality and author. He moved with his family to Chicago when he was eight. Terkel gave up a legal career to become a radio disk jockey and interviewer, exposure that led to his own television show in 1950. In 1953, blacklisted from television for his leftist leanings, he returned to radio, continuing at the same station for 45 years. His books include *Division Street* (1967), about Chicago; *Hard Times* (1970), about the Depression; *Working* (1974), on Americans and their jobs; *The Good War*, on World War II (1984, Pulitzer Prize); and *Race* (1992), on American feelings about race.

Terman, Lewis M(adison) (b. Jan. 15, 1877, Johnson county, Ind., U.S.—d. Dec. 21, 1956, Palo Alto, Calif.) U.S. psychologist. After joining the faculty of Stanford University in 1910, he revised the Binet-Simon intelligence scale and published the Stanford-Binet IQ test (1916), which soon was widely adopted in the U.S. During World War I he developed group intelligence testing for the U.S. Army, and in 1921 he launched a long-term program for the study of gifted children. He wrote *The Measurement of Intelligence* (1916) and coauthored *Genetic Studies of Genius* (5 vol., 1926–59).

termite Any of 1,900 species (order Isoptera) of mostly tropical, social, cellulose-eating insects that are usually soft-bodied and wingless. Intestinal microorganisms enable them to digest cellulose. Termite colonies consist of a fertile queen and king (reproductives), workers (the most numerous), and soldiers (see CASTE). Kings are less than an inch long (1–2 cm), but a queen may grow to more than 4 in. (11 cm). Workers and soldiers are sterile and blind. They survive two to five years; reproductives may live for 60–70 years. Termites live in a sealed, humid nest in wood or underground. Underground nests may be built up into a mound. Periodically, alates (winged, sighted forms) develop and leave the nest to start a new colony. Termites eat chiefly wood. Soil-dwelling termites attack wood that is in contact with the ground; wood-dwelling termites, requiring less humidity than soil-dwellers, attack trees, posts, and wooden buildings.

tern Any of about 40 species (subfamily Sterninae, family Laridae) of slender, web-footed, migratory water birds found almost worldwide. Species vary from 8 to 22 in. (20–55 cm) long. The plumage is white, black-and-white, or black; the sharply pointed bill is black, red, or yellow; and the feet are red or black. Most species have long, pointed wings and a forked tail. Terns plunge into the water to catch crustaceans and fishes. They breed colonially, usually on the ground on islands. See also ARCTIC TERN.

terneplate \ˈtərn-ˌplāt\ STEEL sheet with a coating of terne metal, an alloy of LEAD and TIN applied by dipping the steel in molten metal. The lead content gives terneplate a dull appearance, a noncorrosive surface, and solderability. The tin (12–50% of the alloy) wets the steel, making possible the union of lead and iron, which would otherwise not alloy. While it is still used for roofing, gutters and downspouts, casket linings, gasoline tanks, oil cans, and various containers, it has largely been replaced by other, more durable steel products that are easier to manufacture. See also GALVANIZING, TINPLATING.

terpene See ISOPRENOID

terra-cotta *Italian* **"baked earth"** Fairly coarse, porous clay that, when fired, assumes a colour ranging from dull ochre to red. Terra-cotta objects are usually left unglazed and are often of a utilitarian kind, because of their cheapness, versatility, and durability. Small terra-cotta figures from 3000 BC have been found in Greece and others throughout the Roman Empire from the 4th century BC. The use of terra-cotta virtually died out when the Roman Empire collapsed, but it was revived in Italy and Germany in the 15th century.

"Virgin and Child," polychromed and gilded terra-cotta relief by Andrea del Verrocchio, c. 1470; in the Metropolitan Museum of Art, New York City.

Terranova Pausania See OLBIA

terrapin Any omnivorous aquatic TURTLE of the family Emydidae, especially the diamondback terrapin (*Malaclemys terrapin*). The diamondback inhabits salt marshes and coasts from New England to the Gulf of Mexico. It has raised diamond-shaped patterns on its brownish or black upper shell. The female attains a shell length of about 9 in. (23 cm); the male grows to about 6 in. (14 cm). The eight species of the turtle genus *Pseudemys* (or *Chrysemys*) are sometimes referred to as terrapins. They inhabit freshwaters from the northeastern U.S. to Argentina. The female's shell is 6–16 in. (15–40 cm) long. Infant red-eared turtles (*P. scripta elegans*) are sold in pet shops.

Red-eared turtle (*Pseudemys scripta elegans*).
LEONARD LEE RUE III FROM THE NATIONAL AUDUBON SOCIETY COLLECTION/PHOTO RESEARCHERS

terrazzo \tə-ˈrät-sō, tə-ˈra-zō\ Type of flooring consisting of marble chips set in cement or epoxy resin that is poured and ground smooth when dry. Terrazzo was ubiquitous in the 20th century in commercial and institutional buildings. Available in many colours, it forms a hard, smooth, durable surface that is easily cleaned.

© 2006 Encyclopædia Britannica, Inc.

terrier Any of several dog breeds developed, mostly in England, to find and kill vermin and for use in the sports of foxhunting and dog fighting. Bred to fight and kill, they often were pugnacious but are now bred for a friendlier temperament. Because terriers had to fit in rodent burrows, most breeds are small and lean and have a rough, wiry coat that requires little maintenance. They have a long head, square jaw, and deep-set eyes. All terriers are vocal and inclined to chase and confront. Most breeds were named for the place where they were developed. See also AIREDALE terrier, BEDLINGTON terrier, BOSTON TERRIER, BULL TERRIER, DANDIE DINMONT terrier, FOX TERRIER, IRISH TERRIER, PIT BULL TERRIER, SCOTTISH TERRIER, YORKSHIRE TERRIER.

territorial behaviour In zoology, the actions by which an animal, or group of animals, protects its territory from incursions by others of its species. Territorial boundaries may be marked by sounds (e.g., BIRDSONG), scents, or even piles of dung. If such advertisement does not discourage intruders, chases and fighting follow. Territories may be seasonal (usually for nesting and feeding the young) or maintained permanently (for hunting and living). Territorial behaviour benefits the species by permitting mating and rearing young without interruption and by preventing overcrowding and minimizing competition for food.

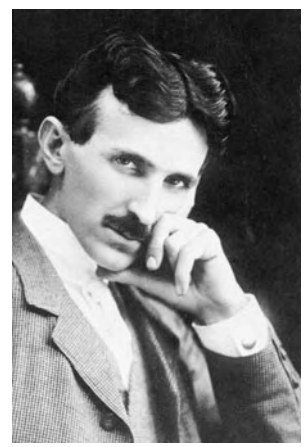
territorial waters Waters under the sovereign jurisdiction of a nation or state, including both marginal sea and inland waters. The concept originated in the 17th-century controversy over the status of the sea. Though the doctrine that the sea must be free to all was upheld, a nation's jurisdiction over its coastal waters was also recognized. Nations subscribing to the Law of the SEA observe a territorial limit of 12 nautical mi (22 km) from shore. Territorial rights include the airspace above those waters and the seabed below them. See also HIGH SEAS.

Terror, Reign of See REIGN OF TERROR

terrorism Systematic use of violence to create a general climate of fear in a population and thereby to bring about a particular political objective. It has been used throughout history by political organizations of both the left and the right, by nationalist and ethnic groups, and by revolutionaries. Although usually thought of as a means of destabilizing or overthrowing existing political institutions, terror also has been employed by governments against their own people to suppress dissent; examples include the reigns of certain Roman emperors, the French Revolution (see REIGN OF TERROR), Nazi Germany, the Soviet Union under Stalin, and Argentina during the "dirty war" of the 1970s. Terrorism's impact has been magnified by the deadliness and technological sophistication of modern-day weapons and the capability of the media to disseminate news of such attacks instantaneously throughout the world. The deadliest terrorist attack ever occurred in the United States on Sept. 11, 2001 (see SEPTEMBER 11 ATTACKS), when members of AL-QAEDA terrorist network hijacked four commercial airplanes and crashed two of them into the twin towers of the WORLD TRADE CENTER complex in New York City and one into the PENTAGON building near Washington, D.C.; the fourth plane crashed near Pittsburgh, Pa. The crashes resulted in the collapse of much of the World Trade Center complex, the destruction of part of the southwest side of the Pentagon, and the deaths of some 3,000 people.

Terry, Eli (b. April 13, 1772, East Windsor, Conn.—d. Feb. 26, 1852, Plymouth, Conn., U.S.) U.S. clockmaker. He made a specialty of one-day wooden shelf clocks, especially his "perfected wood clock" known as the Terry clock (1814). Using interchangeable parts made by mechanized techniques, production at his Plymouth factory rose to as high as 10,000–12,000 Terry clocks per year.

Terry, (Alice) Ellen (b. Feb. 27, 1847, Coventry, Warwickshire, Eng.—d. July 21, 1928, Small Hythe, Kent) English actress. Born into a family of actors, she made her stage debut at age nine. She acted with several companies before joining HENRY IRVING as his leading lady (1878–1902), playing a variety of Shakespearean roles in a notable partnership. Her warmth, gentleness, and beauty made her one of the most popular actresses in Britain and the U.S., and she continued to act until 1925. She conducted a famous correspondence with the playwright GEORGE BERNARD SHAW. The actor, stage designer, and drama theorist GORDON CRAIG was her son.



Tertiary \'tər-shē-ˌer-ē\ **Period** Interval of geologic time, 65–1.8 million years ago. It constitutes the first of the two periods of the CENOZOIC ERA, the second being the QUATERNARY. The Tertiary has five subdivisions: (from oldest to youngest) the PALEOCENE, EOCENE, OLIGOCENE, MIOCENE, and PLIOCENE epochs. During most of the Tertiary, the spatial distribution of the major continents was largely similar to that of today. Emergence and submergence of land bridges between continents critically affected the distribution of both terrestrial and marine animals and plants. Virtually all the existing major mountain ranges were formed either partly or wholly during the Tertiary.

Tertullian \tər-'təl-yən\ (b. c. 155/160, Carthage—d. after 220, Carthage) Early Christian theologian and moralist. Educated in Carthage, he became impressed by the courage, morality, and uncompromising monotheism of Christian martyrs, and he converted to Christianity. He became a leading member of the African church and one of the early APOLOGISTS. He devoted himself to writing for 20 years, producing works on such topics as defense of the faith, prayer and devotion, and morality, as well as the first Christian book on baptism, *De baptismo*. Later, dismayed by the laxity he witnessed among even his orthodox contemporaries, he joined the prophetic movement known as MONTANISM, then left it to form his own sect, which survived in Africa until the 5th century.

terza rima \'tert-sə-'rē-mə\ Verse form consisting of tercets, or three-line stanzas, in which the second line of each rhymes with the first and third lines of the next. The series ends with a separate line that rhymes with the second line of the last stanza, so that the rhyme scheme is *aba*, *bcb*, *cdc*, …, *yzy*, *z*. DANTE, in *The Divine Comedy* (c. 1310–14), was the first to use terza rima in a long poem. A demanding form, it has not been widely adopted in languages less rich in rhymes than Italian. It was introduced into England by THOMAS WYAT in the 16th century. Poets who have experimented with terza rima include PERCY B. SHELLEY, ROBERT BROWNING, ELIZABETH BARRETT BROWNING, and W.H. AUDEN; DEREK WALCOTT's book-length *Omeros* is written in modified terza rima.

Teschen \'te-shən\ Former eastern European duchy. It was originally a principality linked to the Polish duchy of SILESIA, and passed in 1526 to the HABSBURGS. Though most of Silesia was seized by PRUSSIA in 1742, Teschen remained under Habsburg rule until the end of World War I. In 1920 Poland and Czechoslovakia contested and then divided the region; Poland received the eastern district, including the city of Teschen (now Cieszyn), while Czechoslovakia received the rest. The Czechs were forced to cede their section to Poland in 1938. Germany occupied the entire region until after World War II, when the 1920 borders were restored.

Tesla, Nikola (b. July 9/10, 1856, Smiljan, Lika, Austria-Hungary—d. Jan. 7, 1943, New York, N.Y., U.S.) Serbian U.S. inventor and researcher. He studied in Austria and Bohemia and worked in Paris before coming to the U.S. in 1884. He worked for THOMAS ALVA EDISON and GEORGE WESTINGHOUSE but preferred independent research. His inventions made possible the production and distribution of alternating-current electric power. He invented an induction coil that is still widely used in radio technology, the Tesla coil (c. 1890); his system was used by Westinghouse to light the 1893 World's Columbian Exposition. Tesla established an electric power station at Niagara Falls in 1893. His research also included work on a carbon button lamp and on the power of electrical resonance. He discovered terrestrial stationary waves (1899–1900), proving that the Earth is a conductor. Due to lack of funds, many of his ideas remained only in his notebooks, which are still examined by engineers for inventive clues.

Nikola Tesla.
CULVER PICTURES

Test Act (1673) Act passed by the British Parliament that required holders of civil and military offices to profess the established religion and to receive Holy Communion according to the rites of the Church of ENGLAND. Though directed primarily against Roman Catholics, it extended in principle to all non-Anglicans; it was modified in 1689 to enable most non-Catholics to qualify. An act adopted in 1828 removed the test. In the U.S. CONSTITUTION, Article VI prescribes that "no religious test" shall be required for any officeholder. See also CATHOLIC EMANCIPATION.

© 2006 Encyclopædia Britannica, Inc.

testcross Experiment in which an organism with unknown genetic makeup is mated with an organism whose entire genetic makeup for a trait is known, to determine which genes are carried by the former. In a breed of dog, for example, in which the gene for black coat colour is dominant over the gene for red coat colour (see DOMINANCE), a dog with a black coat may be pure (with two genes for black coat colour) or hybrid (with one gene for black and one for red). When its mating with a red-coated dog (which always has two genes for red coat colour only) produces only black offspring, the black-coated parent must be pure, whereas if some of the young are red, the parent must be hybrid.

testes *or* **testicles** Male reproductive organs (see REPRODUCTIVE SYSTEM). Humans have two oval-shaped testes 1.5–2 in. (4–5 cm) long that produce SPERM and ANDROGENS (mainly TESTOSTERONE), contained in a sac (scrotum) behind the PENIS. Each testis is divided into 200–400 lobes containing three to 10 very thin coiled tubes (seminiferous tubules) each, which produce the sperm and contract to expel them through a complex network of canals to another structure in the scrotum, the epididymis, for temporary storage. The cells in the testes are undeveloped in early childhood; at PUBERTY they are stimulated by hormones to develop into fertile sperm cells.

testicular cancer Malignant tumour of the TESTIS, or testicle. Although relatively rare, testicular CANCER is the most common malignancy for men between the ages of 20 and 34. It typically affects men between 15 and 39 years old. A developmental abnormality of males in which one or both testes fail to descend into the scrotum about the time of birth increases the risk of developing the cancer later in life. The most notable symptom of testicular cancer is the formation of a painless lump in either testis. Treatment usually consists of the surgical removal of the cancerous testis, followed by radiation therapy or chemotherapy if the cancer has metastasized.

testing machine Machine used in MATERIALS SCIENCE to determine the properties of a material. Machines have been devised to measure TENSILE strength, strength in compression, shear, and bending (see STRENGTH OF MATERIALS), DUCTILITY, HARDNESS, impact strength (see IMPACT TEST), FRACTURE toughness, CREEP, and FATIGUE. Standardization of machines and tests is the province of the International Organization for Standardization, American National Standards Institute, British Standards Institution, and many governmental bodies. Many industries have special-purpose testing machines for the materials they use.

testosterone \tes-'tä-stər-ˌōn\ Masculinizing sex hormone produced by the TESTES. It is responsible for the development of the male sex organs and secondary sex characteristics (e.g., facial hair, masculine musculature, deep voice, and male-pattern baldness). Testosterone can be manufactured by modifying other, less expensive STEROIDS. It is used in the treatment of hypogonadism, undescended testes (cryptorchism), and certain cancers.

tetanus \'te-tə-nəs\ *or* **lockjaw** Acute BACTERIAL DISEASE caused by *Clostridium tetani* (see CLOSTRIDIUM). Spores of this organism are common, especially in soil; it thrives away from oxygen in deep wounds, especially punctures. Its toxin stimulates nerves, causing muscle rigidity with frequent spasms. This may occur around the site of the wound or, if the toxin reaches spinal motor GANGLIA via the bloodstream, throughout the body. The jaw muscles are almost always involved (lockjaw). Vaccination every few years is the best protection; an antitoxin prevents or delays symptoms in cases of suspect wounds but has limited value once they develop. Treatment usually includes antibiotics, sedatives, and muscle relaxants. Recovered patients are not immune.

Tetley (Jr.), Glen(ford Andrew) (b. Feb. 3, 1926, Cleveland, Ohio, U.S.) American dancer, choreographer, and ballet director. He trained in modern dance with HANYA HOLM and MARTHA GRAHAM. Between 1946 and 1962 he danced in Broadway musical productions as well as with dance companies such as the AMERICAN BALLET THEATRE. He became a choreographer in 1962, forming his own company and creating *Pierrot Lunaire*. Subsequently he staged works with most of the major dance companies throughout the world. Tetley's work helped to bring about a synthesis of modern dance and classical ballet. His creative staging and daring, often sexual, subject matter were sometimes controversial, but he was praised for the passion and strong physicality of his work.

Teton \'tē-ˌtän\ **Range** Segment of the Middle ROCKY MOUNTAINS, northwestern Wyoming, U.S. The range extends 40 mi (64 km) across Wyoming, from the southern boundary of YELLOWSTONE NATIONAL PARK to Teton Pass. Some foothills reach as far as southeastern Idaho. Many peaks exceed 12,000 ft (3,700 m); the highest point is Grand Teton (13,766 ft [4,196 m]), which was first ascended in 1872. Much of the range lies within GRAND TETON NATIONAL PARK.

tetra Any of numerous attractively coloured freshwater South American and African fishes (family Characidae), often kept in home aquariums. Tetras are small, lively, hardy, and unaggressive. The slender neon tetra (*Paracheirodon*, or *Hyphessobrycon, innesi*) has gleaming red hind parts and a neonlike blue-green stripe on its sides. The glowlight tetra (*Hemigrammus erythrozonus*) has a shining red stripe along each side. The body of the silver tetra (*Ctenobrycon spilurus*) is flattened sidewise.

Glowlight tetras (*Hemigrammus erythrozonus*)
JANE BURTON—BRUCE COLEMAN LTD.

tetracycline Any of a class of broad-spectrum ANTIBIOTICS with a common basic structure, including doxycycline. They may be isolated directly from several species of ACTINOMYCETES of the genus *STREPTOMYCES* or modified from the compounds isolated. They are the drugs of choice in the treatment of CHOLERA, rickettsial infections (see RICKETTSIA), psittacosis, BRUCELLOSIS, and tularemia; tetracyclines are also used in the treatment of ACNE. Overuse of these and other antibiotics has led to DRUG RESISTANCE in microorganisms.

Tetragrammaton \ˌte-trə-'gra-mə-ˌtän\ *Greek* **"having four letters"** Four Hebrew consonants *yod*, *he*, *vav*, and *he*—variously transliterated as JHVH, JHWH, YHWH, or YHVH—that together represent the name of God. Traditionally the tetragrammaton is not pronounced; Jehovah and Yahweh are two vocalizations of it.

tetrarch *Greek* **"ruler of a quarter"** In Greco-Roman antiquity, the ruler of a principality, originally the ruler of one-quarter of a region or province. The first tetrarchs ruled the four tetrarchies of Thessaly under PHILIP II of Macedonia. Tetrarchs ruled in Galatia (in Asia Minor) before the Roman conquest (169 BC) and still later in Hellenized Syria and Palestine, where the title denoted the semi-independent ruler of a divided kingdom or minor district. HEROD THE GREAT's realm after his death (4 BC) was ruled by his three sons, two of whom were called tetrarchs.

Teutates \'tā-ü-ˌtä-tēz\ *or* **Toutates** \'tō-ˌtä-tēz\ Celtic god, one of the three mentioned by the Roman poet Lucan in the 1st century AD, the other two being Esus and Taranis. Victims sacrificed to Teutates are believed to have been killed by being plunged headfirst into a vat filled with an unspecified liquid, possibly ale. He was identified with both MERCURY and MARS. The Irish god Tuathal Techtmar, one of the legendary conquerors of Ireland, may have been another manifestation.

Teutoburg Forest \'tü-tə-ˌbərg\ *German* **Teutoburger Wald** \'tȯi-tə-ˌbůr-gər-ˌvält\ Range of forested hills, northern Germany. It was the scene of a battle in AD 9 in which German tribes defeated the Roman legions, thus establishing the RHINE RIVER as the German-Latin border. The Hermannsdenkmal, a colossal statue commemorating the battle, stands outside Detmold. There are numerous health and holiday resorts in the forest's small hill towns.

Teutonic\tü-'tä-nik\ **Order** *or* **Teutonic Knights** *officially* **House of the Hospitallers of Saint Mary of the Teutons** Religious order important in eastern Europe in the late Middle Ages. Founded in 1189–90 to nurse the sick in Palestine during the Third CRUSADE, it was militarized in 1198 and given land in Jerusalem and Germany. It transferred its base of operations to eastern Europe in the 13th century, gaining control of Prussia by 1283 and making Marienburg the centre of a military principality (1309–1525). The order extended its influence until it was defeated at the Battle of TANNENBERG (1410). Another Polish victory in 1466 forced the knights to cede lands to Poland and become vassals of the Polish king. In 1525 the grand master in Prussia converted to PROTESTANTISM, dissolved the order in Prussia, and became a duke under Polish suzerainty. In other parts of Europe, especially Austria, the order survived the REFORMATION. NAPOLEON declared the order dissolved in 1809 and redistributed most of its remaining lands. In 1834 the Austrian emperor refounded it as a charitable religious order, and it is now headquartered in Vienna.

Tewodros II \tā-'wȯ-drȯs\ *or* **Theodore II** (b. c. 1818—d. April 13, 1868, Magela, Eth.) Emperor of Ethiopia (1855–68). Often called Ethiopia's first modern ruler, he came to the throne through the conquest of other chiefs. He reunified the various Ethiopian kingdoms into one empire, attempted to focus loyalty around the government rather than the Ethiopian church, and worked to abolish the feudal system. Though he failed in his aims, his example was followed by his successors. His reign ended when a British force under Robert Napier attacked in response to the imprisonment of several British citizens.

Texas State (pop., 2000: 20,851,820), southwestern U.S. Occupying 266,853 sq mi (691,146 sq km), it is the second largest state in both area and population. Many of Texas's boundaries are formed by water—the course of the Red River on the north makes up two-thirds of the state's boundary with Oklahoma; on the east the state is bordered in part by Arkansas, though the Sabine River forms most of Texas's eastern boundary with Louisiana; the Gulf of Mexico forms the coastal boundary to the southeast; the Rio Grande carves a shallow channel that separates Texas from Mexico on the southwest; the Panhandle section juts northward, forming a counterpart in the western part of Oklahoma; and New Mexico lies to the west. The capital of Texas is AUSTIN. Plains and hills make up the terrain, which ranges from the fertile prairie of the Coastal Plains on the Gulf of MEXICO through the central GREAT PLAINS grasslands to the arid High Plains of the Panhandle. The forerunners of West Texas Indians inhabited the area as much as 37,000 years ago. Some of the peoples later formed the CADDO confederacy. Indians, including APACHES, were living in the region when the Spanish arrived in 1528. The first settlement was attempted in 1685 by the French, who claimed the region as part of Louisiana. In 1803 the U.S. acquired the French claim in the LOUISIANA PURCHASE but relinquished it to Spain by treaty in 1819. It became part of Mexico at Mexican independence in 1821. In 1836 Texans declared independence from Mexico as the Republic of Texas (see STEPHEN AUSTIN; SAM HOUSTON). After a 10-year struggle to remain independent, Texas became the 28th U.S. state in 1845. Its boundary with Mexico was fixed after the MEXICAN WAR (1848). In the AMERICAN CIVIL WAR it seceded from the Union (1861); it was readmitted in 1869. After the war, railroad building and increased shipping helped expand the economy, and the discovery of oil in 1901 transformed it. While Texas still leads all other states in oil and natural gas production and in petroleum-refining capacity, its manufacture of electronics, aerospace components, and other high-technology items is increasingly important. It is also the leading cotton, beef cattle, and sheep producer in the U.S.

Texas, University of U.S. state university system with 13 campuses throughout the state. It was founded in 1883. The main campus, at Austin, is the second most populous campus in the U.S. It is a comprehensive research and teaching institution, offering about 100 undergraduate programs and about 190 graduate degree programs. There are more than 85 organized research units on campus, including centres for biomedical research, economic geology, and cognitive science. The LYNDON B. JOHNSON Library and Museum is located there.

Texas Instruments, Inc. (TI) U.S. manufacturer of CALCULATORS, MICROPROCESSORS, and digital signal processors. The direct antecedent to the company, headquartered in Dallas, Texas, was founded by John Karcher and Eugene McDermott in 1930 to provide seismographic data for the petroleum industry. In 1958 JACK KILBY, a researcher at TI, coinvented the INTEGRATED CIRCUIT (IC), and in 1967 he invented the basic design for handheld calculators. In 1973 TI began to manufacture dynamic random-access memory (DRAM, commonly shortened to RAM) chips for use in COMPUTERS, and in 1982 it introduced the single-chip digital signal processor (DSP), which it employs in CELL PHONES, GLOBAL POSTIONING SYSTEM (GPS) receivers, and adapters for computer networks.

Texas Rangers Loosely organized police force in Texas. The first members were "minutemen" hired by U.S. settlers as protection against Indian attacks in the 1830s. They did not wear uniforms or salute their officers but were highly disciplined and known for their marksmanship, making the six-shooter (the Colt revolver) the weapon of the West. At their peak in the 1870s, the Rangers brought law and order to hundreds of miles of Texas frontier. In 1935 they were merged with the state highway patrol.

Texcoco \tās-'kō-kō**, Lake** Lake, central Mexico. Originally one of the five lakes of the Valley of Mexico, Texcoco has been drained by channels and a tunnel to the PÁNUCO RIVER since the early 17th century. It now occupies only a small area surrounded by salt marshes just east of MEXICO CITY. TENOCHTITLÁN, the Aztec capital, stood on islands in old Lake Texcoco and was connected to the mainland by causeways.

textile Any filament, fibre, or YARN that can be made into fabric or cloth, and the resulting material itself. The word originally referred only to woven fabrics but now includes knitted, bonded, felted, and tufted fabrics as well. The basic raw materials used in textile production are fibres, either obtained from natural sources (e.g., WOOL) or produced from chemical substances (e.g., NYLON and POLYESTER). Textiles are used for wearing apparel, household linens and bedding, upholstery, draperies and curtains, wall coverings, rugs and carpets, and bookbindings, in addition to being used widely in industry.

Tezcatlipoca \ˌtās-kät-lē-'pō-kə\ Omnipotent god of the AZTEC pantheon and god of the constellation Ursa Major. The protector of slaves, he severely punished masters who ill-treated them. He is said to have put an end to the TOLTECS' golden age. Each year his worshipers selected a handsome prisoner of war who was allowed to live in princely luxury for a year before being sacrificed. Tezcatlipoca is represented in art with an obsidian mirror, in which he sees all, on his chest or in place of a foot.

Thackeray, William Makepeace (b. July 18, 1811, Calcutta, India—d. Dec. 24, 1863, London, Eng.) English novelist. He studied law and art but soon became a prolific writer for periodicals, using a variety of pen names. His early writings appear in such volumes as *The Book of Snobs* (1848), a collection of his articles from *Punch*; and *Miscellanies* (1855–57), which includes the historical novel *Barry Lyndon* (1844). His fame rests chiefly on the novels *Vanity Fair* (1847–48), a panoramic survey of English manners and human frailties set in the Napoleonic era, and *Henry Esmond* (1852), set in the early 18th century. *Pendennis* (1848–50) is a partly fictionalized autobiography. In his time he was regarded as the only possible rival of CHARLES DICKENS for his pictures of contemporary life, but his popularity declined in the 20th century.

William Makepeace Thackeray, detail of an oil painting by Samuel Laurence; in the National Portrait Gallery, London.

Thailand \'tī-ˌland\ *officially* **Kingdom of Thailand** *formerly* **Siam** Country, mainland Southeast Asia. Area: 198,116 sq mi (513,119 sq km). Population (2005 est.): 64,186,000. Capital: BANGKOK. The population is predominantly Thai, with significant Chinese, KHMER, and Malay minorities. Language: Thai (official). Religions: Buddhism (official); also Islam. Currency: Thai baht. The country encompasses forested hills and mountains, a central plain containing the CHAO PHRAYA RIVER delta, and a plateau in the northeast. Its market economy is based largely on services (notably trade) and light industries; agriculture employs a large proportion of the workforce. Thailand is a major producer of tungsten and tin. Among its chief agricultural products are rice, corn, rubber, soybeans, and pineapples; manufactures include clothing, canned goods, electronic equipment, and cement. Tourism is also important. Thailand is a constitutional monarchy with two legislative houses; its chief of state is the king, and the head of government is the prime minister. The region of Thailand has been continuously occupied for 20,000 years. It was part of the MON and Khmer kingdoms from the 9th century AD. Thai-speaking peoples immigrated from China c. the 10th century. During the 13th century two Thai states emerged: the SUKHOTHAI KINGDOM, founded c. 1220 after a successful revolt against the Khmer, and CHIANG MAI (which evolved into the kingdom of Lan Na with Chiang Mai as its capital), founded in 1296 after defeating the Mon. In 1351 the Tai kingdom of AYUTTHAYA (Siam) succeeded the Sukhothai. Myanmar (Burma) was its most powerful rival, Burman armies occupying it briefly in the 16th century and destroying it in 1767. The CHAKRI dynasty came to power in 1782, moved the capital to Bangkok, and extended its empire along the MALAY PENINSULA and into Laos and Cambodia. The empire was formally named Siam in 1856. Although Western influence increased during the 19th century, Siam's rulers avoided colonization by granting concessions to European coun-

© 2006 Encyclopædia Britannica, Inc.

tries; it was the only Southeast Asian country able to do so. In 1917 Siam entered World War I on the side of the Allies. Following a military coup in 1932, it became a constitutional monarchy and was officially renamed Thailand in 1939. It was occupied by Japan in World War II. It participated in the Korean War as a member of the UN forces and was allied with South Vietnam in the Vietnam War. The country subsequently became a regional economic powerhouse, though serious social problems also emerged, including a growing gap between rich and poor and a major AIDS epidemic.

Thailand, Gulf of *formerly* **Gulf of Siam** Inlet of the South China Sea. Mostly bordering Thailand, though Cambodia and Vietnam form its southeastern shore, it is 300–350 mi (500–560 km) wide and 450 mi (725 km) long. Thailand's main harbours lie along its shores, its waters are important fishing grounds, and beaches along its coast are popular tourist attractions.

Thalberg, Irving G(rant) (b. May 30, 1899, Brooklyn, N.Y., U.S.—d. Sept. 14, 1936, Santa Monica, Calif.) U.S. film executive. He suffered from health problems at a young age, and fearing his life would not be a long one, he threw himself into his career, joining Universal Pictures after completing high school. He soon became Universal's studio manager in Hollywood. Hired by MGM as head of production in 1925, he became known as the "boy wonder of Hollywood." He tightly controlled MGM's output by supervising script selection and final film editing, and he was responsible for the high quality of movies such as *The Barretts of Wimpole Street* (1934), *Mutiny on the Bounty* (1935), and *Romeo and Juliet* (1936) and for making stars of Nelson Eddy and Jeanette MacDonald with *Naughty Marietta* (1935). Thalberg was one of the founders of the Academy of Motion Picture Arts and Sciences.

Thales of Miletus \'thā-lēz...mī-'lē-təs\ (fl. 6th century BC) Greek philosopher. None of his writings survive, and no contemporary sources exist. The claim that Thales was the founder of Western philosophy rests primarily on Aristotle, who wrote that he was the first to suggest a single material substratum for the universe, namely water. Thales' significance lies in his attempt to explain nature by the simplification of phenomena and in his search for causes within nature itself rather than in the caprices of anthropomorphic gods.

thalidomide \thə-'li-də-ˌmīd\ Drug formerly used as a sedative and to prevent morning sickness during pregnancy. Synthesized in 1954, it was introduced in almost 50 countries, including West Germany and Britain, where it became popular because it was effective and huge overdoses were not fatal. In 1961 it was found to cause congenital disorders; when it is taken in early pregnancy, some 20% of fetuses have phocomelia (defective development of the limbs) and other deformities; 5,000–10,000 such babies were born. It was never distributed for clinical use in the U.S. (see Helen Brooke Taussig). Thalidomide appears effective against inflammatory and autoimmune disorders, including certain late-stage AIDS symptoms, and is licensed for use in such treatments in some countries.

thallus \'tha-ləs\ Plant body of algae, fungi (see fungus), and similar simple, plantlike organisms. Composed of filaments or plates of cells, a thallus ranges in size from a single-celled structure to a complex treelike form. The photosynthetic and supportive cells tend to be organized linearly, but a thallus lacks such differentiated specialized structures as stem, leaves, and conducting tissue. Most thallus plants are currently classified as complex protists.

Thames \'temz**, Battle of the** (Oct. 5, 1813) Decisive U.S. victory over the British in the War of 1812. After the British defeat in the Battle of Lake Erie, U.S. troops under Gen. William H. Harrison pursued retreating British soldiers across the Ontario peninsula. The British force of 600 regulars and 1,000 Indians under Tecumseh met 3,500 U.S. troops at the Thames River near Moraviantown, Ont. The outnumbered British were quickly defeated, and Tecumseh was killed. The U.S. victory ended the Indian alliance with the British and made Harrison a national hero.

Thames, River *ancient* **Tamesis** Principal river of England. It rises in the Cotswolds in Gloucestershire and winds 205 mi (330 km) eastward across south-central England into a great estuary, through which it empties into the North Sea. It is tidal for about 65 mi (104 km). Known by the Romans and by early English chroniclers, it has been celebrated by bards throughout history. One of the world's most important commercial waterways, it is navigable by large vessels to London.

thanatology \ˌtha-nə-'tä-lə-jē\ Description or study of death and dying and of the psychological mechanisms of dealing with them. One influential model proposed in 1969 by the psychiatrist Elisabeth Kübler-Ross (b. 1926) described five basic stages: denial, anger, bargaining, depression, and acceptance; however, not all dying persons follow a regular, clearly identifiable series of responses to their situation. Thanatology also examines attitudes toward death, the meaning and behaviours of bereavement and grief, and other matters.

Thanatos \'tha-nə-ˌtäs\ Ancient Greek personification of death. He was the son of Nyx, goddess of night, and brother to Hypnos, god of sleep. He appeared to humans to carry them off to the underworld when the time allotted to them by the Fates had expired. Thanatos was once defeated by Heracles, who wrestled him to save the life of Alcestis, and he was tricked by Sisyphus, who wanted a second chance at life.

Thānī \'tha-nē\ **dynasty** *also* **Āl Thānī ("Thānī family")** Ruling family of Qatar. They are from the Tamīm tribe, which migrated eastward from central Arabia to the Qatar peninsula in the mid-19th century. There have been eight leaders from 1868 to the present. The second sheikh, Qāsim ibn Muḥammad (1878–1913), is considered Qatar's founder. The seventh sheikh, Khalīfah ibn Ḥamad (r. 1972–95), was instramental in obtaining Qatar's independence from Britain in 1971 and became the first emir. The clan comprises about two-fifths of the native Qatari population.

Thanksgiving Day U.S. holiday. It originated in the autumn of 1621 when Plymouth governor William Bradford invited neighbouring Indians to join the Pilgrims for a three-day festival of recreation and feasting in gratitude for the bounty of the season, which had been partly enabled by the Indians' advice. Neither the standard Thanksgiving meal of turkey, cranberry sauce, and pumpkin pie nor the family orientation of the day reflects the Plymouth event, however. Proclaimed a national holiday in 1863, Thanksgiving is celebrated on the fourth Thursday in November (though it was moved back one week in 1939–41 to extend the Christmas shopping season). Canada adopted Thanksgiving as a national holiday in 1879; since 1957 it has been celebrated on the second Monday in October.

Thant, U (b. Jan. 22, 1909, Pantanaw, Burma—d. Nov. 25, 1974, New York, N.Y., U.S.) Third secretary-general of the United Nations (1961–71), the first Asian to hold the post. He entered the University of Yangôn, but the death of his father forced him to discontinue his education before he was able to graduate. He taught high school before entering government service. Posted to the UN in 1952, he became Burma's UN ambassador in 1957. In 1961 he became acting secretary-general after the death of Dag Hammarskjöld; he became permanent secretary-general in 1962.

© 2006 Encyclopædia Britannica, Inc.

While secretary-general, he played a diplomatic role in the CUBAN MISSILE CRISIS, devised a plan to end the Congolese civil war (1962), and sent peacekeeping forces to Cyprus (1964).

Thapsus \'thap-səs**, Battle of** (46 BC) Decisive battle in North Africa in the Roman civil war between Julius CAESAR and POMPEY (49–46). Caesar had laid siege to the seaport of Thapsus, near present-day Teboulba, Tunisia. Pompey was supported by the legions of his father-in-law, Quintus Metellus Scipio. When Caesar could not restrain his troops, they surged forward and overwhelmed the enemy, slaughtering about 10,000. It was the final blow delivered by Caesar against the forces of Pompey.

Thar \'tär, 'tər\ **Desert** *or* **Great Indian Desert** Region of hot, dry desert, northwestern India and southeastern Pakistan. Its undulating surface is composed of sand dunes separated by sandy plains and low, barren hills. Several saline lakes are found there. Covering some 77,000 sq mi (200,000 sq km), it is bordered by the INDUS RIVER plain, the Aravalli Range, the Arabian Sea, and the Punjab plain.

Thargelia \thär-'gē-lē-ə, thär-'jē-lē-ə\ In GREEK RELIGION, a chief Athenian festival of APOLLO, celebrated on the sixth and seventh days of Thargelion (April–May). It was named after the first fruits or the first bread from the new wheat. On the first day, one or two men acting as SCAPEGOATS were led through Athens, whipped on the genitalia, and driven across the border. An official registration of adopted people took place on the second day.

Tharp, Twyla (b. July 1, 1941, Portland, Ind., U.S.) U.S. dancer, director, and choreographer. She danced with PAUL TAYLOR's company from 1963 to 1965, when she formed her own troupe and began to choreograph works such as *Deuce Coupe* (1973), *Push Comes to Shove* (1976), *Baker's Dozen* (1979), *Nine Sinatra Songs* (1982), and *Fait Accompli* (1984). In 1988 she disbanded her company and was resident choreographer with the AMERICAN BALLET THEATRE (1988–91). She has also choreographed for the Broadway theatre (including *The Catherine Wheel*, 1981) and several films (including *Hair*, 1979, and *Amadeus*, 1984). Tharp is notable for her humour and particularly for having been one of the first American choreographers to use popular music.

Twyla Tharp.

Thásos \'thä-ˌsȯs\ Island, northern AEGEAN SEA, northeastern Macedonia, Greece. It covers 146 sq mi (379 sq km). It was colonized c. 700 BC by Greeks from Páros who exploited its gold mines and founded a school of sculpture. The Persians seized Thásos in the early 5th century BC; it later came under the authority of Athens as a member of the DELIAN LEAGUE. A Macedonian dependency in 202 BC, Thásos passed to Rome in 196 BC. The Turks ruled it from the mid-15th century AD until it was ceded to Greece in 1913. Its industries include boatbuilding, fishing, and tourism, and it has been a base for offshore oil exploration since the 1970s. Many 7th–2nd-century-BC monuments have been found there.

Thatcher, Margaret, Baroness Thatcher (of Kesteven) *orig.* **Margaret Hilda Roberts** (b. Oct. 13, 1925, Grantham, Lincolnshire, Eng.) British politician and prime minister (1979–90). She earned a degree from the University of Oxford, where she was one of the first woman presidents of the Oxford University Conservative Association, then worked as a research chemist. After her marriage to Denis Thatcher (1951), she read for the bar and specialized in tax law. She was elected to Parliament in 1959 and served as secretary of state for education and science (1970–74). As a member of the Conservative Party's newly energetic right wing, she succeeded EDWARD HEATH as party leader in 1975. In 1979 she became Britain's first woman prime minister. She advocated individual initiative, confronted the labour unions, privatized national industries and utilities and attempted to privatize aspects of health care and education, pursued a strong monetarist policy, and endorsed a firm commitment to NATO. Her landslide victory in 1983 owed partly to her decisive leadership in the FALKLAND ISLANDS WAR. A split in party ranks over European monetary and political integration led to her resignation in 1990, by which time she had become Britain's longest continuously serving prime minister since 1827.

Margaret Thatcher, 1983.
AP/WIDE WORLD PHOTOS

theatre Live performance of dramatic actions in order to tell a story or create a spectacle. The word derives from the Greek *theatron* ("place of seeing"). Theatre is one of the oldest and most important art forms in cultures worldwide. While the script is the basic element of theatrical performance, it also relies in varying degrees on acting, singing, and dancing, as well as on technical aspects of production such as STAGE DESIGN. Theatre is thought to have its earliest origins in religious ritual; it often enacts myths or stories central to the belief structure of a culture or creates comedy through travesty of such narratives. In Western civilization, theatre began in ancient Greece and was adapted in Roman times; it was revived in the medieval LITURGICAL DRAMAS and flourished in the Renaissance with the Italian COMMEDIA DELL'ARTE and in the 17th–18th centuries with established companies such as the COMÉDIE-FRANÇAISE. Varying theatrical forms may evolve to suit the tastes of different audiences (e.g., in Japan, the KABUKI of the townspeople and the NŌ theatre of the court). In Europe and the U.S. in the 19th and early 20th centuries theatre was a major source of entertainment for all social classes, with forms ranging from BURLESQUE SHOWS and VAUDEVILLE to serious dramas performed in the style of the MOSCOW ART THEATRE. Though the MUSICALS of BROADWAY and the FARCES of London's West End retain their popular appeal, the rise of television and movies has eroded audiences for live theatre and has tended to limit its spectators to an educated elite. See also LITTLE THEATRE.

theatre Building or space in which performances are given before an audience. It contains an AUDITORIUM and stage. In ancient Greece, where Western theatre began (5th century BC), theatres were constructed in natural hollows between hills. The audience sat in a tiered semicircle facing the orchestra, a flat circular space where the action took place. Behind the orchestra was the SKENE. The theatres of Elizabethan England were open to the sky, with the audience looking on from tiered galleries or a courtyard. During this period the main innovation was the rectangular thrust stage, surrounded on three sides by spectators. The first permanent indoor theatre was ANDREA PALLADIO's Olimpico Theatre in Vicenza, Italy (1585). The Farnese Theatre in Parma (1618) was designed with a horseshoe-shaped auditorium and the first permanent PROSCENIUM arch. Baroque European court theatres followed this arrangement, elaborating on the interior with tiered boxes for royalty. RICHARD WAGNER's Festspielhaus in Bayreuth, Ger. (1876), with its fan-shaped seating plan, deep orchestra pit, and darkened auditorium, departed from the Baroque stratified auditorium and reintroduced Classical principles that are still in use. The proscenium theatre prevailed in the 17th–20th centuries; though still popular in the 20th century, it was supplemented by other types of theatre, such as the thrust stage and THEATRE-IN-THE-ROUND. In Asia, stage arrangements have remained simple, with the audience usually grouped informally around an open space; notable exceptions are the NŌ drama and KABUKI of Japan. See also AMPHITHEATRE; ODEUM.

Theatre Guild U.S. theatrical society. Founded in New York City in 1918 by Lawrence Langner (1890–1962) and others, the group proposed to produce high-quality, noncommercial plays. Its board of directors shared responsibility for choice of plays, management, and production. After the premiere of GEORGE BERNARD SHAW's *Heartbreak House* in 1920, the Guild became his U.S. agent and staged 15 of his plays. It also produced successful plays by EUGENE O'NEILL, MAXWELL ANDERSON, and ROBERT SHERWOOD and featured actors such as the LUNTS and HELEN HAYES. It helped develop the American MUSICAL by staging *Porgy and Bess* (1935), *Oklahoma!* (1943), and *Carousel* (1945); it also produced the radio series *Theatre Guild on the Air* (1945–53) and presented plays on television.

theatre-in-the-round *or* **arena stage** Theatre in which the stage is located in the centre of the auditorium with the audience seated on all sides. The form evolved from Greek theatre and was used in medieval

© 2006 Encyclopædia Britannica, Inc.

times. From the 17th century the PROSCENIUM stage limited audience seating to the area directly in front of the stage. In the 1930s, plays at Moscow's Realistic Theatre were produced in the round and the arena stage began to gain favour in Europe and the U.S. Its advantages are its informality and the rapport it creates between audience and actors, but it requires actors to turn constantly to address new sections of the audience.

Théâtre National Populaire \tā-'ä-trᵊ-ná-syȯ-'nál-pó-pūē-'ler\ **(TNP)** French national theatre created in 1920 to bring theatre to the general public. Under the direction of its founder, Firmin Gémier (1869–1933), the TNP initially offered productions from the other national companies. In 1951 it established a permanent company under Jean Vilar (1951–63), giving 150 performances a year in and around Paris, charging ticket prices competitive with the movies. By 1959 it was as popular as the COMÉDIE-FRANÇAISE. In 1972, in an effort to decentralize the theatre, the government transferred its title to a subsidized theatre company in Lyon.

Theatre of Cruelty Theory advanced by ANTONIN ARTAUD, who believed the theatre's function was to rid audiences of the repressive effects of civilization and liberate their instinctual energy. He proposed to do so by shocking them with mythic spectacles that would include groans, screams, pulsating lights, and oversized stage puppets. He described the Theatre of Cruelty in his book *The Theatre and Its Double* (1938). Though only one of his plays, *Les Cenci*, was ever produced in accordance with his theory, his ideas influenced avant-garde movements such as the LIVING THEATRE and the THEATRE OF THE ABSURD.

Theatre of Fact *or* **documentary theatre** Movement to bring social issues to the stage by emphasizing factual information over aesthetic considerations. An outgrowth of the Living Newspaper technique employed in the 1930s by the WPA Federal Theatre Project in the U.S., the form became popular in the 1960s. In Germany Rolf Hochhuth's *The Representative* (1963), PETER WEISS's *The Investigation* (1965), and Heinar Kipphardt's *In the Matter of J. Robert Oppenheimer* (1964) examined recent historical events through authentic documentary sources such as trial transcripts and statistics. The movement influenced later political drama in Europe and the U.S.

Theatre of the Absurd Body of dramatic works of the 1950s and '60s that expressed the existentialist philosophy of meaninglessness and the absurdity of life. Playwrights such as ARTHUR ADAMOV, EDWARD ALBEE, SAMUEL BECKETT, JEAN GENET, EUGÈNE IONESCO, and HAROLD PINTER created Absurdist plays without traditional plots and with characters who engaged in circular, purposeless conversations. Beckett's *Waiting for Godot* (1953), in which two tramps wait for a mysterious man who never arrives, is a classic of the genre.

theatricalism Twentieth-century theatrical movement that emphasized artifice in reaction to 19th-century naturalism. Marked by stylized acting, a stage projecting into the audience, and frank scenic artifices and conventions, it did not strive to create the illusion of reality but rather to remind the audience of their role as viewers and critics of the artwork in progress before them. Theatricalism was found in the Expressionist, Dadaist, and Surrealist drama of the early 20th century and has continued as a current in the modern theatre.

Thebes \'thēbz\ *biblical* **No** Ancient city, EGYPT. Its remains are located on the Banks of the Nile River. In early times it also included KARNAK and LUXOR; the Valley of the KINGS is situated nearby. The earliest monuments in the city itself date from the 11th dynasty (c. 21st century BC), when the rulers of Thebes united Egypt and made Thebes the capital of Upper Egypt. It remained the capital until the end of the Middle Kingdom (c. 18th century BC). It was obscured for two centuries under the rule of various foreign invaders, after which the kings of Thebes restored Egyptian rule in the 16th century BC and again made it the capital. It flourished as Egypt's political and religious centre throughout the New Kingdom period and was well known for achievements in sculpture and architecture. It began to decline in the 12th century BC and was sacked by Assyrians in the mid-7th century BC, by Persians in the 6th–4th centuries BC, and by Romans c. 30 BC. Its ruins include great temples and tombs, including the Temple of Amon at Karnak (c. 20th century BC), the tomb of TUTANKHAMEN in the Valley of the Kings, and the great mortuary temples of RAMSES II and HATSHEPSUT. The region's antiquities were collectively designated a UNESCO WORLD HERITAGE SITE in 1979.

Thebes *Greek* **Thívai** \'thē-ve\ Ancient city, BOEOTIA, east-central Greece, one of the chief Greek city-states. Traditionally said to have been founded by CADMUS, it was the seat of the legendary OEDIPUS and the setting for many classic Greek tragedies. The building of its celebrated seven-gated wall is usually attributed to AMPHION. It was a centre of MYCENAEAN power in the Bronze Age (c. 1500–1200 BC). Hostility to ATHENS led it to side with the Persians in the PERSIAN WARS and with SPARTA in the PELOPONNESIAN WAR. Thebes and Sparta subsequently clashed, and the victorious Spartans occupied it. It revolted c. 380 BC and defeated Sparta at the battles of Tegyra (375 BC) and Leuctra (371 BC). For the next 10 years it was the chief military power in Greece. It joined Athens against PHILIP II of Macedon and shared the defeat at the Battle of CHAERONEA in 338 BC. It was sacked by ALEXANDER THE GREAT in 336 and eventually fell to Rome in the 1st century BC. Among the few ancient remains are remnants of the city walls, the Mycenaean palace (c. 1450–1350 BC), and a temple of APOLLO.

theft In law, the crime of taking the property or services of another without consent. Under most statutes, theft encompasses the crimes of larceny, robbery, and BURGLARY. Larceny is the crime of taking and carrying away the goods of another with intent to steal. Grand larceny, or larceny of property of substantial value, is a felony, whereas petty larceny, or larceny of less valuable property, is a misdemeanour. The same principle applies to grand theft and petty theft, which need not necessarily involve the "carrying away" of property and may include the theft of services. Robbery is an aggravated form of larceny involving violence or the threat of violence directed against the victim in his presence. Burglary is defined as the breaking and entering of the premises of another with an intent to commit a felony within. Two offenses usually distinguished from theft are EMBEZZLEMENT and FRAUD.

theism View that all observable phenomena are dependent on but distinct from one supreme being. The view usually entails the idea that God is beyond human comprehension, perfect and self-sustained, but also peculiarly involved in the world and its events. Theists seek support for their view in rational argument and appeals to experience. Arguments for God's existence are of four principal types: cosmological, ontological, teleological, or moral. A central issue for theism is reconciling God, usually understood as omnipotent and perfect, with the existence of evil. See also AGNOSTICISM, ATHEISM, DEISM, MONOTHEISM, POLYTHEISM, THEODICY.

Themistocles \the-'mis-tə-ˌklēz\ (b. c. 524—d. c. 460 BC) Athenian politician and naval strategist. As ARCHON (493) he built defensible harbours at Piraeus. In 483 he persuaded the assembly to increase the navy, believing it represented Athens's best chance of warding off Persian invaders. When the invasion of XERXES I did come, a Greek naval force at first yielded to Persia at Artemisium, but Themistocles lured Xerxes' remaining ships to their destruction at the Battle of SALAMIS. Despite his victory, Athens later ostracized the strongly democratic Themistocles (472) as the city's politics turned reactionary. When Sparta later accused him of complicity with Persia, he fled the Peloponnese and, until his death, served as governor of some Asian Greek cities still under Persian rule.

theocracy \thē-'ä-krə-sē\ Government by divine guidance or by officials who are regarded as divinely guided. In many theocracies, government leaders are members of the clergy, and the state's legal system is based on religious law. Theocratic rule was typical of early civilizations. The ENLIGHTENMENT marked the end of theocracy in most Western countries. Contemporary examples of theocracies include Saudi Arabia, Iran, and the Vatican. See also CHURCH AND STATE; DIVINE KINGSHIP.

Theocritus \thē-'ä-krə-təs\ (b. c. 300, Syracuse, Sicily—d. 260 BC) Greek poet. Little is known of his life. His surviving poems consist of bucolics and mimes, set in the country, and epics, lyrics, and epigrams, set in towns. The bucolics, his most characteristic and influential works, introduced the PASTORAL convention into poetry and were the sources of VIRGIL's *Eclogues* and much Renaissance poetry and drama. Theocritus's best-known IDYLLS include *Thyrsis*, a lament for Daphnis, the shepherd poet of mythology, and *Thalysia* ("Harvest Festival"), which presents the poet's friends and rivals in the guise of rustics.

theodicy \thē-'ä-də-sē\ Argument for the justification of God, concerned with reconciling God's goodness and justice with the observable facts of evil and suffering in the world. Most such arguments are a necessary component of THEISM. Under POLYTHEISM, the problem is solved by attributing evil to a conflict of wills between deities. The solution is less simple in MONOTHEISM, and it can take several forms. In some approaches, the perfect world created by God was spoiled by human disobedience or SIN. In others, God withdrew after creating the world, which then fell into decay.

© 2006 Encyclopædia Britannica, Inc.

Theodora (b. c. 497—d. June 28, 548, Constantinople) Byzantine empress, wife of JUSTINIAN I. The daughter of a bear keeper at the Hippodrome in Constantinople, she became an actress and the mistress of Justinian. He married her in 525, and when he became emperor in 527 she was proclaimed empress. Probably the most powerful woman in Byzantine history, she was her husband's most trusted adviser, sponsoring legal reforms and wielding great influence in diplomacy, military appointments, and internal politics. Her impassioned speech gave Justinian the strength to order the brutal suppression of the Nika revolt (532) and save his empire. She recognized the rights of women and ended persecution of Monophysite Christians, with whom she sympathized.

Theodora, detail of a Byzantine mosaic in the church of San Vitale, Ravenna, Italy.
ANDRE HELD/J.P. ZIOLO

Theodorakis \ˌthē-ə-də-ˈrä-kis**, Mikis** (b. July 29, 1925, island of Chios, Greece) Greek composer. He studied at the Athens and Paris conservatories. A member of the wartime resistance, he remained active in politics, serving several times in the Greek parliament. As a Communist Party member, he was arrested during the 1967 military coup and only released in 1970 under international pressure. He is best known outside Greece for his film scores, including *Zorba the Greek* (1964), *Z* (1969), and *State of Siege* (1972), but he also composed much concert music, including seven symphonies, four operas, ballets (including *Antigone*, 1959), and more than 1,000 songs. He is esteemed in his homeland as a national hero.

Theodore I Lascaris \ˈlas-kə-rəs\ (b. c. 1174—d. November 1221, Nicaea, Nicaean empire) First emperor of NICAEA, the Byzantine government-in-exile during the Crusaders' occupation of Constantinople. He distinguished himself during the sieges of Constantinople in the Fourth CRUSADE (1203–04). After the Byzantine capital fell, he gathered a band of refugees, first at Brusa and then at Nicaea, and formed a new Byzantine state. He took the title of emperor in 1208 and successfully defended Nicaea against the Crusaders, the Turks, and his rival emperor David Comnenus. He signed a treaty (c. 1214) with the Latin emperor of Constantinople defining Nicaea's boundaries and betrothed his daughter to the heir to the Latin imperial throne.

Theodore II See TEWODROS II

Theodore of Canterbury, Saint (b. c. 602, Tarsus, Cilicia, Asia Minor—d. Sept. 19, 690, Canterbury, Kent, Eng.; feast day September 19) Seventh archbishop of Canterbury (668–690). He was sent from Rome to Canterbury, where he helped establish a famous school at the monastery later known as St. Augustine's. Theodore organized and centralized the English church, calling its first general synod (672) to end Celtic practices, affirm church doctrine, and divide dioceses. He deposed WILFRID as bishop of York in 677 but restored him in 686; he also made peace between King Aethelred of Mercia and King Ecgfrith of Northumbia.

Theodore of Mopsuestia \ˌmäp-sü-ˈes-chə\ (b. c. 350, Antioch, Syria—d. 428/429, Mopsuestia, Cilicia) Syrian theologian and spiritual head of the school of Antioch. He entered a monastery near Antioch, where he lived and studied until 378. He was ordained in 381 and became bishop of Mopsuestia c. 392. His exegetical writings used scientific, critical, philological, and historical methods of analysis that anticipated modern scholarship. Theologically, he believed that Christ had two natures, divine and human, in some kind of union. He stressed the literal sense of scripture and opposed allegorical interpretations. The second COUNCIL OF CONSTANTINOPLE (553) condemned his views, but he was venerated by the NESTORIAN church as "the Interpreter." He is said to have introduced into the Nestorian church the doctrine of universal SALVATION.

Theodore Roosevelt National Park Preserve, west-central North Dakota, U.S. Established in 1947, it commemorates Pres. THEODORE ROOSEVELT's interest in the American West. The 110-sq-mi (285-sq-km) park contains several sites along the LITTLE MISSOURI RIVER, including a petrified forest, Wind Canyon, eroded badlands, and Roosevelt's Elkhorn Ranch cabin.

Theodoret \thē-ˈäd-ə-rət\ **of Cyrrhus** (b. c. 393, Antioch, Syria—d. c. 458/466) Syrian theologian and bishop whose writings were a moderating influence on the 5th-century Christological disputes. First a monk, he became bishop of Cyrrhus (near Antioch) by 423. Influenced by St. John CHRYSOSTOM and THEODORE OF MOPSUESTIA, he opposed allegorical interpretations of scripture and attributed a human nature to Christ. Accused of being a NESTORIAN heretic, he made conciliatory statements accepting the term "god-bearer" for Mary (thereby stressing Jesus' divinity). He was declared a heretic nevertheless (449) and was sent into exile. He was partially vindicated by the Council of CHALCEDON (451), which agreed to declare him orthodox provided he condemn his friend NESTORIUS, and he reluctantly complied.

Theodoric *known as* **Theodoric the Great** (b. 454—d. Aug. 30, 526) King of the OSTROGOTHS and founder of the Ostrogothic kingdom in Italy. Sent by the Byzantine emperor ZENO to invade Italy in 488, he made himself sole ruler by 493 and murdered ODOACER by treachery. With Ravenna as his capital he staved off the Franks and Bulgarians, and he held sway over a kingdom that included Sicily, Dalmatia, and some German lands. An Arian (see ARIANISM), he tolerated Catholicism and promoted peace between GOTHS and Romans.

Theodosius I \ˌthē-ə-ˈdō-shē-əs\ *or* **Theodosius the Great** *in full* **Flavius Theodosius** (b. Jan. 11, 347, Cauca, Gallaecia [Spain]—d. Jan. 17, 395, Mediolanum) Roman emperor of the East (379–392) and of East and West (392–395). Born of Christian parents, he served in the military under his father, a general. He distinguished himself against the SARMATIANS and was proclaimed coemperor by GRATIAN to rule in the eastern empire (379). To settle the contentious debate over true Christianity, he adopted the NICENE CREED as the Christian norm (380). He reached a treaty with the VISIGOTHS (382). When the Spanish general Maximus overthrew the new coemperor in the western empire (387), Theodosius defeated the usurper (388) and claimed supreme authority over the whole empire (392). He argued with St. AMBROSE over the role of the church in imperial affairs but did not grant power to the church. In 392 forces advocating paganism led by Arbogast and Eugenius took power in Rome. In 394 Theodosius defeated them and claimed the Christian God victorious over the pagan gods.

Theodosius I Boradiotes \ˌbȯr-ə-ˈdī-ə-ˌtēz\ (b. Antioch—d. after 1183, Constantinople) GREEK ORTHODOX patriarch of Constantinople (1179–83). As patriarch, he upheld stringent conversion requirements for converts from ISLAM against the wishes of Emperor MANUEL I COMNENUS. He also opposed Manuel's overtures to Pope ALEXANDER III and the Latin church of the West, refusing to cooperate with a proposed reunion of the two branches of Christianity. The succeeding emperor forced Theodosius to abdicate.

Theodosius II (b. April 10, 401, Constantinople—d. July 28, 450) Eastern Roman emperor (408–450). In 402 he was made coemperor with his father, Arcadius (son of THEODOSIUS I), then became sole ruler of the East at age seven, initially under a regency. A gentle, scholarly man, he allowed relatives and ministers to dominate his government. His generals twice repelled the Persians (422, 447) but failed to evict the VANDALS from Roman Africa (429) and to prevent ATTILA's invasions (441–443, 447). The NESTORIAN heresy caused internal upheaval. Theodosius was credited with building the wall around Constantinople (413), founding the University of Constantinople (425), and promulgating the Theodosian Code (438).

Theodosius of Alexandria (fl. 6th century—d. June 566, Constantinople) Patriarch of Constantinople (535–566). A moderate Monophysite, he was opposed by more extreme Monophysites and did not accept the orthodox position expressed by the Council of CHALCEDON (451). He was prevented from administering his patriarchate by his detention in Constantinople, but he influenced the independent churches in Antioch, Syria, and Egypt. See MONOPHYSITE HERESY.

theology Study of the nature of God and the relationship of the human and divine. The term was first used in the works of PLATO and other Greek philosophers to refer to the teaching of myth, but the discipline expanded within CHRISTIANITY and has found application in all theistic religions (see THEISM). It examines doctrines concerning such subjects as SIN, faith, and GRACE and considers the terms of God's COVENANT with humankind in matters such as SALVATION and ESCHATOLOGY. Theology typically takes for

© 2006 Encyclopædia Britannica, Inc.

granted the authority of a religious teacher or the validity of a religious experience. It is distinguished from PHILOSOPHY in being concerned with justifying and explicating a faith, rather than questioning the underlying assumptions of such faith, but it often employs quasi-philosophical methods.

Theophilus \thē-'ä-fə-ləs\ **(Presbyter)** *pseudonym of* **Roger of Helmarshausen** (fl. 12th century) German monk and writer. He is known for his *De Diversis Artibus* (c. 1110–40), a thorough account of the techniques of almost all the known crafts of the early 12th century. From his writings it can be deduced that he was a practicing craftsman of the Benedictine order.

theorem In mathematics or logic, a statement whose validity has been established or proved. It consists of a hypothesis and a conclusion, beginning with certain assumptions that are necessary and sufficient to establish a result. A system of theorems that build on and augment each other constitutes a theory. Within any theory, however, only statements that are essential, important, or of special interest are called theorems. Less important statements, usually stepping-stones in PROOFS of more important results, are called lemmas. A statement proved as a direct consequence of a theorem is a corollary of the theorem. Some theorems (and even lemmas and corollaries) are singled out and given titles (e.g., GÖDEL'S THEOREM, FUNDAMENTAL THEOREM OF ALGEBRA, FUNDAMENTAL THEOREM OF CALCULUS, PYTHAGOREAN THEOREM).

theosophy \thē-'ä-sə-fē\ Religious philosophy with mystical concerns that can be traced to the ancient world. It holds that God, whose essence pervades the universe as an absolute reality, can be known only through mystical experience (see MYSTICISM). It is characterized by esoteric doctrine and an interest in occult phenomena. Theosophical beliefs are found in NEOPLATONISM, GNOSTICISM, and among students of the KABBALA, but JAKOB BÖHME, who developed a complete theosophical system, is often called the father of modern theosophy. Today theosophy is associated with the Theosophical Society, founded by HELENA BLAVATSKY in 1875. See also ANNIE BESANT.

Thera See THÍRA

Theramenes \thē-'ra-mə-ˌnēz\ (d. 404/403 BC, Athens) Athenian politician. In 411 he helped install the Council of the FOUR HUNDRED. Sent to quell an insurrection at Piraeus, he instead led the mutineers in deposing the Council. In 410 he helped ALCIBIADES defeat the Peloponnesian navy at Cyzicus (see PELOPONNESIAN WAR). Under Alcibiades he taxed shipping from the Black Sea, helping the economy of Athens to recover and helping restore full constitutional government. During the siege of Athens (405/404) he was sent to deal with LYSANDER and negotiated terms of capitulation as Athens underwent three months of starvation. A leader of the THIRTY TYRANTS installed by Lysander, he fell out with Critias and was forced to drink hemlock.

Therapeutae \ˌther-ə-'pyü-tē\ *Greek* **"Worshipers"** Sect of Jewish ascetics believed to have settled along Lake Mareotis near ALEXANDRIA in the 1st century AD. Their origin and fate are unknown, and the only account of them is attributed to PHILO JUDAEUS. They shared with the ESSENES a dualistic view of the body and soul (see DUALISM) but differed from them in that their objective was "wisdom." They viewed the scriptures as allegorical. Devoting themselves entirely to prayer and spiritual exercise, members lived in isolation for six days of the week and met on the SABBATH for discourse and a common meal.

therapeutics \ˌther-ə-'pyü-tiks\ Treatment and care to combat disease or alleviate pain or injury. Its tools include drugs, surgery, radiation therapy, mechanical devices, diet, and psychiatry. Treatment may be active, to cure a disease (requiring no further treatment after recovery), treat it long-term, or heal a wound; symptomatic, to relieve symptoms until the IMMUNE SYSTEM heals the body; supportive, to keep body functions going until the disease clears; or palliative, to minimize discomfort for patients with no chance of recovery. It almost always includes prevention, usually tertiary (see PREVENTIVE MEDICINE). Therapeutic measures can be chosen, combined, and tailored based on accurate diagnosis to fit each patient. See also ALTERNATIVE MEDICINE; CHEMOTHERAPY; HOLISTIC MEDICINE; HYDROTHERAPY; NUCLEAR MEDICINE; OCCUPATIONAL THERAPY; PHYSICAL MEDICINE AND REHABILITATION; PSYCHOTHERAPY; RESPIRATORY THERAPY.

Theravada \ˌter-ə-'vä-də\ Major form of BUDDHISM, prevalent in Myanmar, Sri Lanka, Thailand, Cambodia, and Laos. It is the only survivor among the HINAYANA schools of Buddhism, and it is generally regarded as the oldest, most orthodox, and most conservative form of Buddhism. It is relatively uninfluenced by other indigenous belief systems. It is believed to have survived intact from the 500 Elders, who followed in the tradition of the monks of the first Buddhist SANGHA. Theravada has no hierarchical authority structure, though seniority is respected in the sangha. It accepts the Pali canon (see TRIPITAKA) as authoritative scripture. Theravadins revere the historical BUDDHA but do not recognize the various celestial buddhas and ancillary gods associated with MAHAYANA Buddhism.

Thérèse of Lisieux \lēz-'yœ**, Saint** *orig.* **Marie-Françoise-Thérèse Martin** (b. Jan. 2, 1873, Alençon, France—d. Sept. 30, 1897, Lisieux; canonized May 17, 1925; feast day October 1) French CARMELITE nun and Doctor of the Church. Born into a devout Roman Catholic family, she entered the convent at Lisieux at age 15, where she was plagued by depression and guilt but was known for her sweetness of temper. At the insistence of the prioress, she wrote an account of her spiritual development, in which she called for an absolute and childlike surrender to God, which she called the Little Way. After her death from tuberculosis at age 24, the book was published as *Story of a Soul* (1898) and became widely popular, and her burial site at Lisieux became a place of pilgrimage.

Theresienstadt \te-'rā-zē-ən-ˌshtät\ Nazi CONCENTRATION CAMP in WORLD WAR II. Originally a town in northern Bohemia (now in the Czech Republic), it became a walled ghetto for Jews in 1941. After the small non-Jewish population was evacuated in 1942, Jewish captives were shipped there from Germany, Austria, Czechoslovakia, Denmark, and The Netherlands. Of the approximately 144,000 Jews sent to Theresienstadt, some 33,000 died in the dense crowding of the ghetto, and 88,000 were shipped on to extermination camps, especially AUSCHWITZ. By the end of World War II, only 19,000 were alive. After the war, the town was resurrected under its Czech name, Terezín.

thermae \'thər-mē\ Public bathing complex of ancient Rome, designed for relaxation and social activity as well as bathing. The Romans developed public baths to a high degree of sophistication and standardization. They consisted of a large open garden surrounded by subsidiary club rooms and a main block that contained three large bath chambers—hot room, steam room, and warm room—and smaller bathrooms, cold room, and courts for exercise. Imperial thermae, such as the Baths of Caracalla (AD 216), were immense and opulently furnished. Service was supplied by slaves moving through underground passageways. Heating was accomplished by circulating heated air from a fire under the floor. Lighting of the enormous rooms was provided by an ingenious system of CLERESTORY windows.

thermal conduction Transfer of HEAT energy resulting from differences in temperature between adjacent bodies or adjacent parts of a body. In the absence of a HEAT PUMP, the energy will flow from a region of higher temperature to a region of lower temperature. The transfer of energy occurs as a result of collision among the particles of the matter involved. The rate of transfer of energy is proportional to the cross-sectional area of contact and to the difference in temperature between the two regions. A substance of high thermal conductivity, such as copper, is a good thermal CONDUCTOR; one with low thermal conductivity, such as wood, is a poor thermal conductor. See also CONVECTION, RADIATION.

thermal energy Internal energy of a system in thermodynamic equilibrium (see THERMODYNAMICS) by virtue of its temperature. A hot body has more thermal energy than a similar cold body, but a large tub of cold water may have more thermal energy than a cup of boiling water. Thermal energy can be transferred from one body, usually hotter, to a second body, usually colder, in three ways: conduction (see THERMAL CONDUCTION), CONVECTION, and RADIATION.

thermal expansion Increase in volume of a material as its temperature is increased, usually expressed as a fractional change in dimensions per unit temperature change. When the material is a solid, thermal expansion is usually described in terms of change in length, height, or thickness. If a crystalline solid has the same structural configuration throughout, the expansion will be uniform in all dimensions. Otherwise, there may be different expansion coefficients and the solid will change shape as the temperature increases. If the material is a fluid, it is more useful to describe the expansion in terms of a change in volume. Because the bonding forces among atoms and molecules vary from material to material, expansion coefficients are characteristic of elements and compounds.

© 2006 Encyclopædia Britannica, Inc.

thermal radiation Process by which energy is emitted by a warm surface. The energy is ELECTROMAGNETIC RADIATION and so travels at the speed of light and does not require a medium to carry it. Thermal radiation ranges in FREQUENCY from infrared rays through visible light to ultraviolet rays. The intensity and frequency distribution of the emitted rays are determined by the nature and temperature of the emitting surface; in general, the hotter the object, the shorter the wavelength. A hotter object is a better emitter than a cooler one, and a blackened surface is a better emitter than a silvered one. An example of thermal radiation is the heating of the Earth by the Sun.

thermal spring See HOT SPRING

Thermidorian Reaction (1794) Revolt in the FRENCH REVOLUTION against the REIGN OF TERROR that was initiated on 9 Thermidor (July 27). Weary of the mounting executions (1,300 in June alone), deputies in the NATIONAL CONVENTION decreed the arrest of MAXIMILIEN ROBESPIERRE, LOUIS DE SAINT-JUST, and other members of the COMMITTEE OF PUBLIC SAFETY. They and others were guillotined, inaugurating a brief "White Terror" against the radical JACOBIN CLUB. The DIRECTORY period followed soon afterward.

thermocouple *or* **thermal junction** *or* **thermoelectric thermometer** Temperature-measuring instrument consisting of two wires of different metals joined at each end. One junction is placed where the temperature is to be measured, and the other is kept at a constant lower (reference) temperature. A measuring instrument is connected in the electrical circuit. The temperature difference causes the development of an ELECTROMOTIVE force that is approximately proportional to the difference between the temperatures of the two junctions. Temperature can be read from standard tables, or the instrument can be calibrated to display temperature directly.

thermodynamics Study of the relationships among HEAT, WORK, TEMPERATURE, and ENERGY. Any physical system will spontaneously approach an EQUILIBRIUM that can be described by specifying its properties, such as PRESSURE, temperature, or chemical composition. If external constraints are allowed to change, these properties generally change. The three laws of thermodynamics describe these changes and predict the equilibrium state of the system. The first law states that whenever energy is converted from one form to another, the total quantity of energy remains the same. The second law states that, in a closed system, the ENTROPY of the system does not decrease. The third law states that, as a system approaches ABSOLUTE ZERO, further extraction of energy becomes more and more difficult, eventually becoming theoretically impossible.

thermoluminescence Emission of light from certain heated substances as a result of previous exposure to high-energy RADIATION. The radiation causes displacement of ELECTRONS within the CRYSTAL LATTICE of the substance. Upon heating, the trapped electrons return to their normal, lower-energy positions, releasing energy in the process. The longer the substance is exposed to radiation, the greater is the energy released. By measuring the amount of light given off, the duration of exposure to radiation can be determined; thus, thermoluminescence has been used to determine the age of various minerals and archaeological artifacts.

thermometry \thər-'mä-mə-trē\ Science of measuring the TEMPERATURE of a system or the ability of a system to transfer HEAT to another system. Temperature measurement is important to a wide range of activities, including manufacturing, scientific research, and medicine.

thermonuclear bomb See HYDROGEN BOMB

thermonuclear weapon See NUCLEAR WEAPON

Thermopylae \thər-'mä-pə-lē**, Battle of** Battle in northern Greece (480 BC) in the PERSIAN WARS. The Greek forces, mostly Spartan, were led by LEONIDAS. After three days of holding their own against the Persian king XERXES I and his vast southward-advancing army, the Greeks were betrayed, and the Persians were able to outflank them. Sending the main army in retreat, Leonidas and a small contingent remained behind to resist the advance and were killed to the last man.

thermoreception Sensory capacity (see SENSE) to detect the temperature of the environment and the body. It helps keep body temperature stable by regulating autonomic responses to temperature changes (see HOMEOSTASIS). Temperature sensations are generated by separate heat and cold receptors (nerve endings) in the skin. Blood-sucking insects and some snakes (e.g., the PIT VIPER) locate prey by its thermal radiation.

thermostat Device that detects TEMPERATURE changes for the purpose of maintaining the temperature of an enclosed area essentially constant. The thermostat generates signals, usually electrical, to activate relays, valves, switches, and so on when the temperature rises above or falls below the desired value. Thermostats are used to control the flow of fuel to a burner, of electric current to a heating or cooling unit, or of a heated or cooled gas or liquid into the area it serves. They are also used in fire-detection warning systems.

theropod \'thir-ə-ˌpäd\ Any species of bipedal, carnivorous SAURISCHIAN in the suborder Theropoda. The chicken-sized *Compsognathus*,the smallest known adult dinosaur, probably weighed 2–4 lb (1–2 kg); the TYRANNOSAURS weighed tons. The theropods also included ALLOSAURUS, DEINONYCHUS, Megalosaurus, Oviraptor, and VELOCIRAPTOR. Theropod remains recovered have been from the Late TRIASSIC through the Late CRETACEOUS Epoch (227–65 million years ago) from all continents except Antarctica. Their well-developed hind legs provided support and locomotion; their short forelimbs had mobile hands, probably for grasping and tearing prey. Despite the group's name, which means "beast (i.e., mammal) foot," theropod feet usually resembled those of birds. It is widely believed that all modern birds are descended from one line of small theropods.

Theseum \thi-'sē-əm\ Temple in Athens dedicated to HEPHAESTUS and ATHENA as patrons of the arts and crafts. Built c. 450 BC, it is slightly older than the PARTHENON. Some of its sculptures represent the exploits of THESEUS (the source of its traditional name), though reconstructed fragments of its ornamentation reveal that its theme was actually the apotheosis of HERACLES. It is surrounded by a single row of Doric columns, with 13 at the sides and six at the ends. It is the world's best-preserved ancient Greek temple, largely because of its medieval conversion to a Christian church.

Theseus \'thē-sē-əs, 'thēs-ˌyüs\ Hero of ancient Greek legend. He was the son of Aegeus, king of Athens. On his journey to Athens, he slew many legendary villains, including Sinis, Sciron, and Procrustes. In Athens he found Aegeus married to MEDEA; she recognized him before her husband did and tried to poison him but failed, and Aegeus declared him heir to the throne. In CRETE Theseus met ARIADNE and slew the MINOTAUR; on returning to Athens, he forgot to replace the ship's black sail with a white one signaling his victory, and Aegeus threw himself from the Acropolis in grief. Theseus went on to unite and extend the borders of ATTICA. He captured the AMAZON princess Antiope (Hippolyte), with the result that the Amazons attacked Athens and Antiope was killed while defending it. He abducted the child HELEN and attempted to steal PERSEPHONE from HADES, but he was confined in the underworld until his rescue by HERACLES. He died when the king of Scyros threw him from a cliff.

Theseus killing the Minotaur, detail of a vase painting by the Cleophrades Painter, 6th century BC; in the British Museum.

thesis play See PROBLEM PLAY

Thesmophoria \ˌthez-mə-'fōr-ē-ə\ In GREEK RELIGION, a festival held in honor of Demeter Thesmophoros. The celebrants were free married women who had observed chastity for several days and abstained from certain foods. Pigs were thrown into an underground chamber, where they were eaten by snakes. The uneaten, rotted remains were brought up and laid on an altar; if mixed with seeds they were believed to ensure a good crop.

Thespiae \'thes-pē-ˌē\ Ancient town, BOEOTIA, eastern central Greece. It was the site of temples and festivals of the MUSES and of PRAXITELES' famous statue of Eros. It is important in Greek history chiefly as an enemy of nearby THEBES. Its citizens fought the Persians with Spartan forces under LEONIDAS at the battles of THERMOPYLAE in 480 BC and PLATAEA in 479. It served SPARTA as a base against Thebes 379–372 BC. The Thebans destroyed it in 371 BC, but it was soon rebuilt. It was an important Boeotian town under the Roman empire.

Thespis \'thes-pəs\ (fl. 6th century BC, Athens) Greek poet, often considered the "inventor of TRAGEDY." He is the first recorded winner (c. 534

© 2006 Encyclopædia Britannica, Inc.

BC) of a prize for tragedy at the Great Dionysia, a drama festival. According to the rhetorician Themistius, ARISTOTLE said that tragedy in its earliest stage was entirely choral until the prologue and speeches were first introduced by Thespis. Thespis, according to Themistius's account, was thus the first "actor," and tragic dialogue began when he exchanged words with the leader of the chorus.

Thessaloníki \ˌthe-sä-lō-ˈnē-kē\ *formerly* **Salonika** \sə-ˈlä-ni-kə\ Seaport (pop., 2001: 363,987), Macedonia, Greece. Founded in 316 BC, it became the capital of the Roman province of Macedonia in 146 BC and grew to great importance. The apostle Paul (see St. PAUL) visited c. AD 49–50, and he later addressed epistles to converts there. During the time of the Byzantine Empire, it prospered despite repeated attacks by Avars and Slavs. It was part of the Ottoman Empire from 1430 to 1912. Thessaloníki was the headquarters of the YOUNG TURK movement in 1908 and was returned to Greece in 1913. It was an important Allied base in World War I and was occupied by the Germans in World War II. It is Greece's second largest city.

Thessaly \ˈthe-sə-lē\ Historical region and current administrative region (pop., 2001: 754,893), east-central Greece. The ancient region corresponded roughly to the modern one. Mount OLYMPUS rises in the northeast. Thessaly is drained by the PINIÓS RIVER. It was the site of many cultures in the 3rd–2nd millennia BC; by c. 1000 BC Greeks had established power there. Incorporated into the Roman province of Macedon in the 2nd century BC, it was made a separate Roman province in the 4th century AD. In the 7th–13th centuries it was controlled by Slavs, Saracens, Bulgars, and Normans. In the late 14th century it passed to the Turks; it was returned to Greece in 1881. It saw heavy fighting between Allied and Axis forces in 1941.

Thetis \ˈthē-təs\ In GREEK MYTHOLOGY, a NEREID loved by both ZEUS and POSEIDON. When it was revealed that Thetis was destined to bear a son who would be mightier than his father, the two gods gave her to Peleus, king of the Myrmidons. Unwilling to wed a mortal, Thetis resisted Peleus' advances by changing into various shapes, but Peleus finally captured and married her. Their child was ACHILLES. Some legends relate that she bore seven children, all of whom perished either when she tried to render them immortal or when she killed them as the offspring of a forced marriage.

thiamin \ˈthī-ə-mən\ *or* **vitamin B_1** Organic compound, part of the VITAMIN B COMPLEX, necessary in carbohydrate metabolism. It carries out these functions in its active form, as a component of the COENZYME thiamin pyrophosphate. Its molecular structure includes a substituted PYRIDINE ring and a thiazole ring. Thiamin is found most abundantly in whole cereal grains and certain other seeds. Deficiency leads to BERIBERI.

Thiers \tē-ˈer**, (Louis-) Adolphe** (b. April 18, 1797, Marseille, France—d. Sept. 3, 1877, Saint-Germain-en-Laye, near Paris) French politician and historian. He went to Paris in 1821 as a journalist and cofounded the opposition newspaper *National* in 1830. In the JULY REVOLUTION he supported LOUIS-PHILIPPE and served as minister of the interior (1832, 1834–36) and premier and foreign minister (1836, 1840). A leader of the conservative moderates, he crushed all insurrections. Following the FEBRUARY REVOLUTION, he helped elect Louis-Napoléon (later NAPOLEON III) president of the SECOND REPUBLIC. As a leader of the opposition (1863–70), he attacked Napoleon III's imperial policies. As president of the THIRD REPUBLIC (1871–73), he negotiated the end of the FRANCO-PRUSSIAN WAR and restored domestic order by crushing the PARIS COMMUNE. He also wrote major historical works, most importantly the huge *History of the French Revolution* (10 vol., 1823–27) and *History of the Consulate and the Empire* (20 vol., 1845–62).

Thimann \ˈthī-mən**, Kenneth V(ivian)** (b. Aug. 5, 1904, Ashford, Kent, Eng.—d. Jan. 15, 1997, Haverford, Pa., U.S.) British-born U.S. plant physiologist. He received his Ph.D. from Imperial College in London. In 1934 he obtained and isolated pure AUXIN, an important plant-growth hormone and, with several coworkers, proved that auxin promotes cell elongation, formation of roots, and growth of buds, discoveries that led to the development of a widely used synthetic auxin, 2,4-D. Use of this and similar chemicals can prevent the premature falling of fruit and stimulate cut stems to grow abundant roots; because high concentrations of auxins are toxic to most plants, synthetic auxins are also effective weed killers.

Thimphu \thim-ˈpü\ Town (pop., 1999 est.: 28,000), capital of Bhutan. It lies on the Raidak River in the HIMALAYAS. It was designated the official seat of government in 1962. The Tashi Chho castle, a traditional fortified monastery and one of the finest examples of traditional Bhutanese architecture, houses the offices of the royal government. The local economy is based on agriculture and lumbering.

thin-layer chromatography (TLC) Type of CHROMATOGRAPHY using as the stationary phase a thin layer (0.01 inch [0.25 mm]) of a special finely ground matrix (silica gel, alumina, or similar material) coated on a glass plate or incorporated in a plastic film. Solutions of the mixtures to be analyzed are spotted near one edge. Solutions of reference compounds are similarly applied. The edge of the plate is then dipped in a SOLVENT. The solvent travels up the matrix by CAPILLARITY, moving the components of the samples at various rates because of their different degrees of attachment to the matrix and solubility in the developing solvent. The components, visible as separated spots, are identified by comparing the distances they have traveled with those of the known reference materials. TLC is useful for biological mixtures, especially LIPIDS in animal or vegetable tissues and ISOPRENOIDS and ESSENTIAL OILS found in flowers and other parts of plants. The matrices withstand strong solvents and developers better than the paper used in PAPER CHROMATOGRAPHY.

think tank Institute, corporation, or group organized for interdisciplinary research, usually conducted for governmental and commercial clients. Projects for government clients often involve social policy planning and national defense. Commercial projects include developing and testing new technologies and new products. Funding sources include endowments, contracts, private donations, and sales of reports. See also RAND CORP.

thinking *or* **thought** Action of using one's mind to produce thoughts, or covert symbolic responses to stimuli. Theories of thought and thought processes have concentrated largely on directed thinking, including PROBLEM SOLVING. At the beginning of the 20th century, researchers focused on studying mental ASSOCIATIONS. Theorists of GESTALT psychology in the 1920s and '30s believed the elements of thought to be in the nature of patterns elicited from experience. Today these elements are often regarded as bits of information undergoing processing. See also COGNITIVE PSYCHOLOGY, INFORMATION PROCESSING.

Thíra \ˈthē-rä\ *ancient* **Thera** \ˈthir-ə\ *formerly* **Santorini** Island, southern CYCLADES, Greece. The remaining half of an exploded volcano, it surrounds a lagoon with volcanic cliffs rising to almost 1,000 ft (300 m). It was settled in the Bronze Age; MINOAN remains date to before 2000 BC. One of the largest known volcanic eruptions occurred on the island c. 1500 BC, depositing ash and pumice as far away as Egypt and Israel. The eruption has been linked to such phenomena as the miracles of the EXODUS and the sinking of ATLANTIS. Excavations have revealed a rich Minoan city buried under the volcanic debris. It was resettled by Dorian invaders c. 1000 BC.

Third Estate *French* **Tiers État** In French history, one of the three orders (with the nobility and the clergy) of the ESTATES-GENERAL before the FRENCH REVOLUTION. The unprivileged order, it represented the great majority of the people. Its transformation with the TENNIS COURT OATH into a NATIONAL ASSEMBLY in 1789 marked the beginning of the Revolution.

Third International See COMINTERN

Third Reich \ˈrīk\ Official designation for the NAZI PARTY's regime in Germany from January 1933 to May 1945. The name reflects ADOLF HITLER's conception of his expansionist regime—which he predicted would last 1,000 years—as the presumed successor of the HOLY ROMAN EMPIRE (800–1806, the First Reich) and the German empire under the HOHENZOLLERN dynasty (1871–1918, the Second Reich).

Third Republic French government (1870–1940). After the fall of the SECOND EMPIRE and the suppression of the PARIS COMMUNE, the new CONSTITUTIONAL LAWS OF 1875 were adopted, establishing a regime based on parliamentary supremacy. Despite its series of short-lived governments, the Third Republic was marked by social stability (except for the ALFRED DREYFUS affair), industrialization, and establishment of a professional civil service. It ended with the fall of France to the Germans in 1940. Presidents of the Third Republic included ADOLPHE THIERS (1871–73), MAURICE DE MACMAHON (1873–79), JULES GRÉVY (1879–87), SADI CARNOT (1887–94), FÉLIX FAURE (1895–99), Émile Loubet (1899–1906), Armand Fallières (1906–13), RAYMOND POINCARÉ (1913–20), ALEXANDRE MILLERAND (1920–24), Gaston Doumergue (1924–31), and ALBERT LEBRUN (1932–40). Other notable leaders included LÉON BLUM, GEORGES BOULANGER, ARISTIDE BRIAND, GEORGES CLEMENCEAU, ÉDOUARD DALADIER, JULES FERRY, LÉON GAMBETTA, ÉDOUARD HERRIOT, JEAN JAURÈS, PIERRE LAVAL, PHILIPPE PÉTAIN, and PAUL REYNAUD.

Third Section *or* **Third Department** Office created in 1826 by Tsar Nicholas I to conduct secret police operations. Designed and headed (1826–44) by Count Aleksandr Benckendorff (1783–1844), it gathered information on political dissidents and banished suspected political criminals to remote regions. It collaborated with the Corps of Gendarmes (formed in 1836), a military force that operated throughout Russia, and with a network of spies and informers. The department grew increasingly repressive, and in the 1870s it arrested many Narodniks (Populists) who agitated among the peasantry. It was abolished in 1880, and its functions were transferred to the police of the interior ministry.

third world Political designation originally used (1963) to describe those states not part of the first world—the capitalist, economically developed states led by the U.S.—or the second world—the communist states led by the Soviet Union. The third world principally consists of the developing world, former colonies of Africa, Asia, and Latin America. With the end of the Cold War and the increased economic competitiveness of some developing countries, the term has lost its analytic clarity.

Thirteen Articles of Faith *or* **Thirteen Principles of Faith** Summary of the basic tenets of Judaism. It was formulated by Moses Maimonides in his commentary on the Mishna, in an effort to put forth true concepts of God and faith as a tool in avoiding error. Though presented as dogma, his statement was a personal concept and has been much debated and revised. The articles state various doctrines concerning the nature of God, the law, and Moses, and they affirm that the messiah is coming and that the dead will rise. All versions include the hymn "Yigdal," which is part of most Jewish prayer services.

Thirty Tyrants (404–403 BC) Spartan-imposed oligarchy that ruled Athens after the Peloponnesian War. Thirty commissioners were appointed to the oligarchy, which had an extremist conservative core, led by Critias. Their oppressive regime fostered a bloody purge, in which perhaps 1,500 residents were killed. Many moderates fled the city; gathering a force, they returned to defeat the tyrants' forces in a battle at Piraeus in 403. The 30 fled and were killed off over the next few years.

Thirty Years' War (1618–48) Series of intermittent conflicts in Europe fought for various reasons, including religious, dynastic, territorial, and commercial rivalries. The overall war was mainly a struggle between the Habsburg-controlled Holy Roman Empire and the Protestant principalities that relied on the chief anti-Catholic powers of Sweden and the Netherlands. It also involved the rivalry of France with the Habsburg powers, which formed anti-French alliances. The conflicts began in 1618 when the future Emperor Ferdinand II tried to impose Roman Catholicism on his domains and the Protestant nobles rebelled; the war was sparked by the Defenestration of Prague. The battlefield centred on the principalities in Germany, which suffered severely from plundering armies. Early successes by the Catholic League were countered by military gains by Sweden. When the bloodshed ended with the Peace of Westphalia (1648), the balance of power in Europe had been radically changed. France emerged as the chief Western power, and states of the Holy Roman Empire were granted full sovereignty, establishing a framework for a modern Europe of sovereign states.

Thiruvananthapuram *formerly* **Trivandrum** \trə-'van-drəm\ Seaport (pop., 2001: 744,983), capital of Kerala state, southwestern India. The community became prominent when it was made capital of the kingdom of Travancore in 1745. A large fort contains several palaces and a Vaishnava temple, which is a noted pilgrimage centre. Its cultural amenities include the University of Kerala (1937).

thistle Weedy species of *Cirsium*, *Carduus*, *Echinops*, *Sonchus*, and other plant genera of the composite family. The term usually refers to prickly leaved species of *Carduus* and *Cirsium*, which have dense heads of small, usually pink or purple flowers. Because they have spiny stems and flower heads without ray flowers, *Carduus* species are called plumeless thistles. Canadian thistle (*Cirsium arvense*) is an attractive but troublesome weed in agricultural areas of North America. The thistle is the national emblem of Scotland.

Thjórsá River \'thyôr-ˌsaù\ River, Iceland. Carrying meltwater from several glaciers, it flows southwest for 143 mi (230 km) to discharge into the Atlantic Ocean. It is the country's longest river; its lower third flows through an extensive farming region. It is Iceland's main source of hydroelectric power.

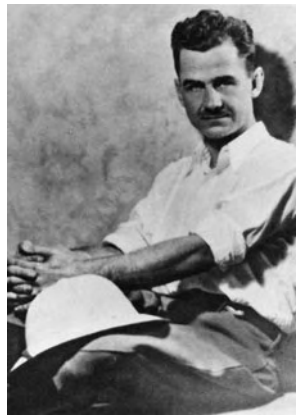
Thocmectony See Sarah Winnemucca Hopkins

Thomas, Clarence (b. June 23, 1948, Pinpoint, near Savannah, Ga., U.S.) U.S. jurist. He graduated from Yale Law School and served as assistant attorney general in Missouri (1974–77), lawyer for Monsanto Co. (1977–79), legislative assistant to Sen. John Danforth (1979–81), assistant secretary in the U.S. Department of Education (1981–82), and chairman of the Equal Employment Opportunity Commission (EEOC) (1982–90). Pres. George Bush appointed him to the U.S. Court of Appeals in 1990 and then to the Supreme Court of the United States; he thereby became the second African American justice on the court, after Thurgood Marshall. His 1991 confirmation hearings attracted enormous public interest and media attention, largely because of accusations of sexual harassment by Anita Hill, a law professor and former colleague of Thomas at the EEOC. Thomas denied the charges, and the Senate narrowly voted to confirm him. A quiet presence on the court, he generally follows a predictable pattern in his opinions—conservative, restrained, and suspicious of the reach of the federal government into the realm of state and local politics.

Thomas, Dylan (Marlais) (b. Oct. 27, 1914, Swansea, Wales—d. Nov. 9, 1953, New York, N.Y., U.S.) Welsh poet and prose writer. He left school at age 16 to work as a reporter. His early verse, as in *The Map of Love* (1939), with rich metaphoric language and emotional intensity, made him famous. In the more accessible *Deaths and Entrances* (1946), with "Fern Hill," he often adopts a bardic, oracular voice. *In Country Sleep* (1952), containing "Do Not Go Gentle into That Good Night," and *Collected Poems* (1952) followed. Thomas's prose includes the comic *Portrait of the Artist as a Young Dog* (1940); a play for voices, *Under Milk Wood* (1954); and the reminiscence *A Child's Christmas in Wales* (1955). His sonorous recitations contributed greatly to his fame. Debt and heavy drinking began taking their toll in the late 1930s, and he died of an alcohol overdose while on tour.

Dylan Thomas, 1952.
ROLLIE MCKENNA

Thomas, George H(enry) (b. July 31, 1816, Southampton county, Va., U.S.—d. March 28, 1870, San Francisco, Calif.) U.S. general. He was a graduate of West Point. When the American Civil War broke out, he remained loyal to the Union despite his Southern birth. He commanded an independent force in eastern Kentucky, where he won the first important Union victory in the west in 1862. At the Battle of Chickamauga he organized an unyielding defense, earning promotion to brigadier general and the nickname "the Rock of Chickamauga." In 1864 he defeated the Confederate forces of Gen. John B. Hood (1831–79) in the Battle of Nashville, earning another promotion and the gratitude of Congress.



Thomas, Helen (b. Aug. 4, 1920, Winchester, Ky., U.S.) U.S. journalist. Born to Lebanese immigrant parents, she grew up in Detroit and joined the UPI news agency in Washington, D.C., in 1943. A pioneer in overcoming the limitations on women in the news media, she became known for her bold and tireless pursuit of information. Assigned to the White House in 1961, she became UPI bureau chief there in 1974. She is best known as the reporter traditionally first recognized at presidential press conferences.

Thomas, Isiah (Lord), III (b. April 30, 1961, Chicago, Ill., U.S.) U.S. basketball player, coach, and executive. He led Indiana University to a national collegiate title in 1981. As a guard for the Detroit Pistons (1981–94), he amassed 9,061 career assists and helped the team win two NBA championships (1989, 1990); he is regarded as one of the greatest point guards of all time. He subsequently worked as general manager for the Toronto Raptors and New York Knicks and coached the Indiana Pacers.

Thomas, Lewis (b. Nov. 25, 1913, Flushing, N.Y., U.S.—d. Dec. 3, 1993, New York City) U.S. physician and author. He attended medical school at Harvard and later taught at various universities. He was president of New York's Memorial Sloan-Kettering Cancer Center (1973–83). He translated his passionate interest in and wonder at the intricate mysteries of biology into lucid meditations and reflections on biology in award-winning essays. The best-known of his widely read books is *The Lives of a Cell* (1974, National Book Award).

© 2006 Encyclopædia Britannica, Inc.

Thomas, Lowell (Jackson) (b. April 6, 1892, Woodington, Ohio, U.S.—d. Aug. 29, 1981, Pawling, N.Y.) U.S. radio commentator, journalist, and author. A war correspondent in Europe and the Middle East while in his 20s, Thomas helped make T.E. Lawrence famous with his exclusive coverage and later with the book *With Lawrence in Arabia* (1924). He was a preeminent broadcaster with CBS from 1930; his radio nightly news was an American institution for nearly two generations, and he appeared on television from its earliest days. Out of his lifelong globetrotting came lectures, travelogues, and more than 50 books of adventure and comment, including *Kabluk of the Eskimo* (1932) and *The Seven Wonders of the World* (1956).

Lowell Thomas
BROWN BROTHERS

Thomas, Norman (Mattoon) (b. Nov. 20, 1884, Marion, Ohio, U.S.—d. Dec. 19, 1968, Huntington, N.Y.) U.S. social reformer and politician. He was ordained a Presbyterian minister and became pastor of New York's East Harlem Church. He joined the Socialist Party in 1918 and left his parish post to become secretary of the pacifist Fellowship of Reconciliation. He helped found the American Civil Liberties Union and served as codirector of the League for Industrial Democracy (1922–37). He was the Socialist Party's candidate for governor (1924), for mayor of New York (1925, 1929), and for U.S. president (1928–48), and he headed the party from 1926. After World War II, as chairman of the Postwar World Council, he campaigned for nuclear disarmament.

Thomas, Saint (b. probably Galilee—d. c. AD 53, Madras, India; Western feast day December 21, feast day in Roman and Syrian Catholic churches July 3, in the Greek church October 6) One of the Twelve Apostles of Christ. He is best known for requiring physical proof of Jesus' Resurrection before he could believe it, hence the phrase "doubting Thomas." When Jesus reappeared and had Thomas touch his wounds, Thomas became the first person to explicitly acknowledge Jesus' divinity, saying "My Lord and my God." His subsequent history is uncertain; he is said to have evangelized Parthia (modern Khorāsān) and even India.

Thomas à Becket See Saint Thomas Becket

Thomas à Kempis *orig.* **Thomas Hemerken** (b. 1379/80, Kempen, near Düsseldorf, Rhineland—d. Aug. 8, 1471, Agnietenberg, near Zwolle, Bishopric of Utrecht) Christian theologian and probable author of *The Imitation of Christ*. He went to Deventer, Neth., c. 1392 and joined the Brethren of the Common Life, a community devoted to the care and education of the poor. In 1387 he entered the Augustinian monastery of canons regular at Agnietenberg. He was ordained a priest in 1413 and devoted himself to copying manuscripts and directing novices. He is credited with writing *The Imitation of Christ*, the most influential devotional work in Christian literature after the Bible. Noted for its simple language and style, it emphasizes spiritual over materialistic life and affirms the rewards of a life centred on Christ. The *Imitation* and his other treatises and sermons are the best representation of the *devotio moderna*, a new form of religious devotion that arose at the end of the 14th century.

Thomas Aquinas, Saint See Aquinas, Saint Thomas

Thomism \ˈtō-ˌmi-zəm\ Philosophical and theological system developed by St. Thomas Aquinas. It holds that the human soul is immortal and is a unique subsistent form, that human knowledge is based on sensory experience but also depends on the mind's reflective capacity, and that all creatures have a natural tendency to love God that can be perfected and elevated by grace and application. In the 20th century, Thomism was developed by Étienne Gilson (1884–1978) and Jacques Maritain. After World War II, Thomists faced three major tasks: to develop an adequate philosophy of science, to account for phenomenological and psychiatric findings, and to evaluate the ontologies of existentialism and naturalism.

Thompson, Dorothy (b. July 9, 1894, Lancaster, N.Y., U.S.—d. Jan. 30, 1961, Lisbon, Port.) U.S. journalist. After World War I she became a freelance correspondent in Europe. Her reporting on the Nazis so infuriated Adolf Hitler that in 1934 she became the first U.S. correspondent expelled from Germany. Her column "On the Record" was exceedingly popular and was syndicated from 1941 to 1958 in as many as 170 daily newspapers. Her many books include *I Saw Hitler!* (1932), *Refugees* (1938), *Let the Record Speak* (1939), and *The Courage to Be Happy* (1957). From 1928 to 1942 she was married to the novelist Sinclair Lewis.

Dorothy Thompson, 1934.
AP/WIDE WORLD PHOTOS

Thompson, E(dward) P(almer) (b. Feb. 3, 1924—d. Aug. 28, 1993, Upper Wick, Worcester, Eng.) British historian. He served in Italy in World War II and taught at the universities of Leeds (1948–65) and Warwick (1965–71). He left the Communist Party in 1956 when Soviet troops crushed the Hungarian uprising but remained a Marxist and socialist all his life. His best-known work is *The Making of the English Working Class* (1963), an acclaimed study of the period 1780–1832. Among his other books is *Whigs and Hunters* (1975). From the late 1970s he devoted much of his time to the antinuclear movement.

Thompson, Emma (b. April 15, 1959, London, Eng.) British actress and screenwriter. After graduating from the University of Cambridge, she acted on stage and television and won acclaim in the miniseries *Fortunes of War* (1987). While married to Kenneth Branagh (1989–94), she appeared in several of his films, including *Henry V* (1989), *Dead Again* (1991), and *Much Ado About Nothing* (1993). She later starred in *Howards End* (1992, Academy Award), *The Remains of the Day* (1993), *Sense and Sensibility* (1995), for which she won an Academy Award for best screenplay, and *Primary Colors* (1998).

Thompson, Hunter S(tockton) (b. July 18, 1937, Louisville, Ky., U.S.—d. Feb. 20, 2005, Woody Creek, Colo.) U.S. journalist. He had run-ins with the law as a young man and served in the U.S. Air Force. In 1965 he infiltrated the Hell's Angels motorcycle gang and published his account, *Hell's Angels*, in 1967. His psychedelic-drug romp, *Fear and Loathing in Las Vegas* (1972), is considered a contemporary classic; it was made into a film in 1998. Other books include *Fear and Loathing: On the Campaign Trail '72* (1973), *The Great Shark Hunt* (1979), and *Better Than Sex* (1994). He created the genre known as "gonzo journalism," a style created from (by his own account) accident and desperation, and his writing—idiosyncratic and subjective in the extreme, and often wildly funny—gained him a large underground following. Thompson died of a self-inflicted gunshot wound.

Thomson, J(ohn) Edgar (b. Feb. 10, 1808, Springfield Township, Pa., U.S.—d. May 27, 1874, Philadelphia, Pa.) U.S. civil engineer and railroad executive. He joined the Pennsylvania engineer corps at age 19. In 1847 he was hired as chief engineer of the newly incorporated Pennsylvania Railroad Co., which aimed to compete with trade lines to the west originating in New York and other eastern states. He became its president in 1852 and oversaw construction of a railway that crossed the Alleghenies without using inclined grades. Over the next 22 years, Thomson consolidated a network of lines from Philadelphia to Chicago, expanding the company's track from 250 to 6,000 mi (400–10,000 km).

Thomson, Sir J(oseph) J(ohn) (b. Dec. 18, 1856, Cheetham Hill, near Manchester, Eng.—d. Aug. 30, 1940, Cambridge, Cambridgeshire) English physicist. Educated at the University of Cambridge, he taught there at the Cavendish Laboratory (1884–1918), which he developed into a world-renowned institution, and was master of Trinity College (1918–40). In 1897 he showed that cathode rays are rapidly moving particles, and, by measuring their displacement by electric and magnetic fields, he determined that these particles were nearly 2,000 times less massive than the lightest known atomic particle. Originally called corpuscles by Thomson, the particles are now known as electrons. His discovery helped revolutionize the knowledge of atomic structure. In 1903 he suggested a discontinuous theory of light, foreshadowing Albert Einstein's later theory

© 2006 Encyclopædia Britannica, Inc.

of photons. He later discovered isotopes and invented MASS SPECTROMETRY. In 1906 Thomson received a Nobel Prize for his research into the electrical conductivity of gases. Throughout his life he was noted as an outstanding teacher, and seven of his assistants also became Nobel laureates.

Thomson (of Fleet), Roy (Herbert) Thomson, 1st Baron (b. June 5, 1894, Toronto, Ont., Can.—d. Aug. 4, 1976, London, Eng.) Canadian-British publisher. Thomson began acquiring radio stations and newspapers in Ontario in the 1930s; later he expanded his interests to Britain and the U.S. and added television holdings. In 1952 he bought *The Scotsman* newspaper and went to Edinburgh to run it. In 1959 he purchased the Kemsley group of newspapers, the largest in Britain, which included the *Sunday Times*. In 1967 he made his most important purchase, *The* TIMES of London, and thereafter made a major investment in it, providing it with financial stability. In the 1970s Thomson joined a consortium that was successful in discovering two oil fields. It sold *The Times* in 1981 and divested interests in U.K. newspapers in 1995. The acquisition of various publishing and other interests continued into the 21st century, and the Thomson Corp. is today one of the largest publishing conglomerates in the world.

Thomson, Virgil (b. Nov. 25, 1896, Kansas City, Mo., U.S.—d. Sept. 30, 1989, New York, N.Y.) U.S. composer and critic. He attended Harvard University, intending to become a pianist and organist. Studying in Paris with NADIA BOULANGER (1921), he met the French composers known as Les SIX and their circle and began to compose. While residing in Paris (1925–40), he met GERTRUDE STEIN, with whom he wrote the operas *Four Saints in Three Acts* (1928) and *The Mother of Us All* (1946), affecting a charmingly naïve style. Back in New York City, he served as music critic of the *Herald Tribune* (1940–54); his gracefully written criticism was respected for its concern with music rather than performers. His other works include the film scores *The Plow That Broke the Plains* (1936) and *The Louisiana Story* (1949, Pulitzer Prize).

Thonet \'tō-net**, Michael** (b. July 2, 1796, Boppard, Trier —d. March 3, 1871, Vienna, Austria) German Austrian pioneer in the industrialization of furniture manufacture. He developed a system of steam-bent veneers c. 1830 and created light, curvilinear chairs. By 1856 he had perfected the bending of solid beechwood with heat and began mass production of BENTWOOD FURNITURE. He set up factories in Hungary and Moravia and opened salons from Moscow to Chicago. By 1870 he was producing furniture in hitherto unheard-of quantities. His furniture is still being manufactured today.

Thor Deity, common to all the early Germanic peoples, who appeared as a great, red-bearded warrior of tremendous strength. The son of ODIN (according to some legends) and Jord, the earth goddess, he was the implacable foe of the harmful race of giants but was benevolent toward humans. His name is the Germanic word for thunder. His great weapon was his hammer, MJOLLNIR. His greatest enemy was the world serpent Jörmungand, which he was destined to kill, and be killed by, in the RAGNARÖK. Thursday is named for Thor.

Thor with his hammer, Mjollnir, on his knees, bronze statuette from northern Iceland, c. AD 1000; in the National Museum of Iceland, Reykjavík.

Thor rocket MISSILE initially developed by the U.S. Air Force as an intermediate-range ballistic missile. It became operational in 1958 and was later modified to serve as the first stage of LAUNCH VEHICLES for several spacecraft. The Thor missile force was withdrawn in 1963. For space launching, three small auxiliary motors were strapped to a Thor rocket, and this resulted in a thrust nearly twice as powerful as the original.

thoracic \thə-'ra-sik\ **cavity** *or* **chest cavity** Second largest hollow space of the body, enclosed by the ribs, VERTEBRAL COLUMN, and breastbone and separated from the ABDOMINAL CAVITY by the DIAPHRAGM. It contains the LUNGS and bronchi, part of the ESOPHAGUS and TRACHEA, and the HEART and major blood vessels. A membrane called the pleura lines the cavity (parietal pleura) and continues over the lung (visceral pleura) and the rest of the cavity's contents, defining a space called the mediastinum. Disorders include blood (hemothorax) or air (pneumothorax, which can lead to ATELECTASIS) in the pleural cavity and inflammation of the pleura (pleurisy).

Thoreau \thə-'rō**, Henry David** (b. July 12, 1817, Concord, Mass., U.S.—d. May 6, 1862, Concord) U.S. thinker, essayist, and naturalist. Thoreau graduated from Harvard University and taught school for several years before leaving his job to become a poet of nature. Back in Concord, he came under the influence of RALPH WALDO EMERSON and began to publish pieces in the Transcendentalist magazine *The Dial*. In the years 1845–47, to demonstrate how satisfying a simple life could be, he lived in a hut beside Concord's Walden Pond; essays recording his daily life were assembled for his masterwork, *Walden* (1854). His *A Week on the Concord and Merrimack Rivers* (1849) was the only other book he published in his lifetime. He reflected on a night he spent in jail protesting the Mexican-American War in the essay "Civil Disobedience" (1849), which would later influence such figures as MOHANDAS K. GANDHI and MARTIN LUTHER KING, JR. In later years his interest in TRANSCENDENTALISM waned, and he became a dedicated abolitionist. His many nature writings and records of his wanderings in Canada, Maine, and Cape Cod display the mind of a keen naturalist. After his death his collected writings were published in 20 volumes, and further writings have continued to appear in print.

Henry David Thoreau, portrait by Samuel Worcester Rowse, 1854; in the Concord Free Public Library, Massachusetts.

Thorez \tō-'rez**, Maurice** (b. April 28, 1900, Noyelles-Godault, France—d. July 11, 1964, at sea en route to Yalta) French communist politician. He began working as a coal miner at age 12. He joined the FRENCH COMMUNIST PARTY c. 1920 and was arrested several times for agitation. After becoming local party secretary (1923), he rose to secretary-general of the party (1930). He served in the Chamber of Deputies (1932–39, 1945–60) and helped form the POPULAR FRONT government in 1936. He lived in the Soviet Union (1943–44), then returned to France and served as a minister of state (1945) and deputy premier (1946, 1947). He remained a dedicated Stalinist even after NIKITA KHRUSHCHEV denounced Joseph Stalin in 1956.

thorium Metallic chemical ELEMENT, chemical symbol Th, atomic number 90. One of the ACTINIDE series of elements, natural thorium is a mixture of radioactive ISOTOPES, predominantly thorium-232 (HALF-LIFE of more than 10 billion years). It is a dense metal that is silver-white in pure form but turns gray or black on prolonged exposure to air. Although not a NUCLEAR REACTOR fuel itself, thorium-232 can be used in breeder reactors because, on capturing slow-moving NEUTRONS, it decays into fissionable uranium-233. Thorium is added to MAGNESIUM and its alloys to improve their high-temperature strength. Added to glass, it yields glasses with a high refractive index, useful for specialized optical applications. It was formerly in great demand as a component of mantles for gas and kerosene lamps and has been used in the manufacture of TUNGSTEN filaments for lightbulbs and VACUUM TUBES.

Thorndike, Edward L(ee) (b. Aug. 31, 1874, Williamsburg, Mass., U.S.—d. Aug. 9, 1949, Montrose, N.Y.) U.S. psychologist. He trained under WILLIAM JAMES and JAMES MCKEEN CATTELL and later taught at Columbia University (1904–40). A pioneer in the fields of animal learning and educational psychology, he developed a form of behaviourism known as connectionism, which holds that learning takes place through associative bonds. He contributed significantly to the development of quantitative experimental methods and to more efficient and scientifically based methods of teaching. Among his writings are *Introduction to the Theory of Mental and Social Measurements* (1904), *Principles of Teaching Based on Psychology* (1906), *Animal Intelligence* (1911), and *The Psychology of Wants, Interests, and Attitudes* (1935).

Thorndike, Dame (Agnes) Sybil (b. Oct. 24, 1882, Gainsborough, Lincolnshire, Eng.—d. June 9, 1976, London) British actress. As a member of the Old Vic company in London (1914–18), she became a leading tragic actress. Noted for her versatility in modern and classic plays, she originated the title role in George Bernard Shaw's *Saint Joan* (1924). She managed several London theatres, and she often costarred with her husband, the actor-director Lewis Casson, in her more than five decades in the theatre.

Thoroughbred Light breed of racing and jumping horse descended from three desert stallions brought to England between 1689 and 1724. Thoroughbreds have a delicate head, slim body, broad chest, and short back. Most are bay, chestnut, brown, black, or gray. They stand about 16 hands (64 in., 163 cm) high and weigh about 1,000 lbs (450 kg). They are sensitive and high-spirited and are often used to improve other stock.

Thorp, John (b. 1784, Rehoboth, Mass., U.S.—d. Nov. 15, 1848, Providence, R.I.) U.S. inventor. He invented the ring spinning machine in 1828. By the 1860s it had largely replaced Samuel Crompton's spinning mule in the world's textile mills because of its greater productivity and simplicity.

Thorpe, Jim *in full* **James Francis Thorpe** (b. May 28, 1888, near Prague, Indian Territory—d. March 28, 1953, Lomita, Calif., U.S.) U.S. athlete. Of predominantly American Indian (Sauk and Fox) descent, he trained as a football halfback under Pop Warner while attending the Indian Industrial School in Carlisle, Pa. (1908–12), where he also excelled at baseball, basketball, boxing, lacrosse, swimming, and hockey. In 1912 he won the Olympic decathlon and pentathlon by wide margins, but he was deprived of his medals in 1913 after it was discovered he had played semiprofessional baseball. He later played professional baseball and football, and in 1920–21 he served as first president of what would become the National Football League. His Olympic medals were restored posthumously in 1983. Thorpe is generally regarded as the greatest American athlete of the 20th century.

Jim Thorpe demonstrating the drop kick.
THE BETTMANN ARCHIVE

Thorvaldsen \'tȯr-ˌwȯl-sən, 'tůr-ˌväl-sən**, Bertel** (b. Nov. 19, 1770, or Nov. 13, 1768, Copenhagen, Den.—d. March 24, 1844) Danish sculptor. Son of an Icelandic wood carver, he studied in Copenhagen and won a scholarship for travel to Rome, where he would remain for over 40 years and pursue one of the most successful sculpting careers of the 19th century. His return to Copenhagen in 1838 was celebrated as a national event. Most of his sculptures are reinterpretations of Classical figures and themes; he also did religious statues and portrait busts.

Thoth \'tōth, 'thōth, 'tōt\ *Egyptian* **Djhuty** *also spelled* **Djhowtey** Egyptian god of the moon and of reckoning, learning, and writing. He was the inventor of writing, the creator of languages, the representative of Re, and the scribe, interpreter, and adviser of the gods. In the myth of Osiris, Thoth protected the pregnant Isis and healed the eye of her son Horus. He judged the deceased and reported the results to Osiris. His sacred animals were the ibis and the baboon, millions of which were mummified in his honour. He was often represented in human form with the head of an ibis. The Greeks identified Thoth with Hermes; as Hermes Trismegistos he was regarded as the author of the Hermetic writings.

thought, laws of Traditionally, the three fundamental laws of logic: (1) the law of contradiction, (2) the law of excluded middle (or third), and (3) the principle of identity. That is, (1) for all propositions p, it is impossible for both p and not p to be true (symbolically, $\neg(p \wedge \neg p)$); (2) either p or not p must be true, there being no third or middle true proposition between them (symbolically $p \vee \neg p$); and (3) if a propositional function F is true of an individual variable x, then F is true of x (symbolically, $(\forall x)\ [F(x) \supset F(x)]$). Another formulation of the principle of identity asserts that a thing is identical with itself, or $(\forall x)\ (x = x)$.

Thousand and One Nights, The *or* **Arabian Nights' Entertainment** *Arabic* **Alf laylah wa laylah** Collection of Oriental stories of uncertain date and authorship. The frame story, in which the vengeful King Shahryar's plan to marry and execute a new wife each day is foiled by the resourceful Scheherazade, is probably Indian; the tales with which Scheherazade beguiles Shahryar, postponing and eventually averting her execution, come from India, Iran, Iraq, Egypt, Turkey, and possibly Greece. It is now believed that the collection is a composite work originally transmitted orally and developed over a period of several centuries. The first published version was an 18th-century European translation; Sir Richard Burton's *Book of the Thousand Nights and a Night* (1885–88) has become the best-known English translation.

Thousand Islands Group of about 1,500 small islands extending 80 mi (128 km) in the Saint Lawrence River between New York state, U.S., and Ontario, Canada. Some islands belong to Canada and some to the U.S. The Thousand Islands include summer resort facilities and the Canadian St. Lawrence Islands National Park, which was established in 1904 and covers 988 ac (400 ha). The Thousand Islands International Bridge, which contains five spans linking some of the islands and is 8.5 mi (13.7 km) long, connects New York and Ontario.

Thrace Ancient and modern region, southeastern Balkan Peninsula. Its borders have varied at different periods. In ancient Greek times it was bounded by the Danube River, the Aegean Sea, and the Black Sea. Modern Thrace corresponds to southern Bulgaria, the Greek province of Thrace, and European Turkey, including the Gallipoli peninsula. The Thracians were Indo-Europeans who settled in the region in the 2nd millennium BC; their culture was noted for its poetry and music, and their soldiers were known as superior fighters. Later colonized by Greeks in the 7th century BC, it became subject to Persia in the 6th century BC and to Macedon in the 4th century BC. Reduced to a Roman province in the 1st century AD, its northern part was annexed to Moesia. It later became part of the Byzantine empire, and in 1453 part of the Ottoman empire. The northern part was annexed by Bulgaria in 1885; the eastern part passed to Turkey in 1923. The region harvests corn, rice, grapes, oysters, and eels; the chief cash crop is Turkish tobacco.

thrasher Any of 17 species (family Mimidae) of New World songbirds that have a downcurved bill and are noted for noisily foraging on the ground in dense thickets and for loud, varied songs. Thrashers occur from northern Canada to central Mexico and the Caribbean. The brown thrasher (*Toxostoma rufum*), of North America east of the Rocky Mountains, is about 12 in. (30 cm) long and has red-brown plumage with streaked underparts. Long-tailed drab species are found in the arid southwestern U.S. and in Mexico.

Brown thrasher (*Toxostoma rufum*).
THASE DANIEL

thread Tightly twisted yarn consisting of several strands that has a circular cross-section and is used in commercial and home sewing machines and for hand sewing. Thread is usually wound on spools, with thread size (degree of fineness) indicated on the spool end. Cotton thread can be used with fabrics made from yarn of plant origin, such as cotton and linen, and with rayon (made from cellulose, a plant substance). Silk thread is suitable for silks and wools, both of animal origin. Nylon and polyester threads are appropriate for synthetics and for knits with a high degree of stretch.

thread cross Object made typically of two sticks bound together in the shape of a cross, with coloured threads wound around their ends to resemble a cobweb, used in Tibetan magical rituals to entrap evil spirits. Similar devices have been found in South Africa, Peru, Australia, and Sweden. They vary from simple diamond shapes to complex wheel- or box-shaped combinations reaching 11 ft (3 m) high. They are often highly decorated, with wool, feather, and bits of paper.

Three Emperors' League *German* **Dreikaiserbund** Diplomatic alignment of the empires of Germany, Austria-Hungary, and Russia devised by Otto von Bismarck in 1872. Its aim was to neutralize disagreement between Austria-Hungary and Russia over spheres of influence in the Balkans and to isolate Germany's enemy France. After the first Three Emperors' League (1872–78) collapsed, Bismarck succeeded in renewing it (1881, 1884). When Russia declined a third renewal, Bismarck negotiated a separate accord with Russia, the Reinsurance Treaty (1887). See also Austro-German Alliance.

Three Gorges Dam Project Dam designed to span China's Yangtze River (Chang Jiang). On completion, scheduled for 2009, it would be the largest dam in the world, producing a vast quantity of hydroelectricity from 26 generators. It would also create an immense deepwater reservoir that would allow 10,000-ton freighters to navigate 1,400 mi (2,250 km) inland from the East China Sea. The extremely controversial project would require displacement of more than a million people and destruction of magnificent scenery and archaeological sites. Critics also fear potential pollution and silting of the reservoir and the possibility of the dam's collapse. Though construction began in 1993, a third of the National People's Congress either abstained or opposed it, and the World Bank would not advance funds, citing environmental and other concerns. Critics have contended that smaller dams on Yangtze tributaries could accomplish the same purpose with fewer risks.

Three Henrys, War of the (1587–89) Last of the Wars of Religion in France, fought between King Henry III, the ultra-Catholic Henri I de Lorraine, duke de Guise, and the Huguenot leader Henry of Navarra (later Henry IV). Early conflicts were won by the Holy League led by Guise, who forced Henry III to sign the Edict of Union in 1588, naming him lieutenant general of the kingdom. Humiliated, Henry III had Guise assassinated, but the Holy League continued to wield power, and Henry called for help from his cousin, Henry of Navarra. The royalist-Huguenot coalition forced the Holy Leaguers to retreat, but Henry III was assassinated, and, before he died, he exhorted the future Henry IV to become a Roman Catholic.

Three Kingdoms (AD 220–80) Trio of warring Chinese states that followed the demise of the Han dynasty. Cao Cao put his son on the throne of the kingdom of Wei, which controlled northern China. The kingdom of Shu-Han was established in present-day Sichuan by Liu Bei and his adviser Zhuge Liang, and the kingdom of Wu was established in the south, with its capital at Nanjing. They were all subsumed into the Jin dynasty by AD 280. The 60 years of the Three Kingdoms have inspired Chinese literature, and especially historical fiction, ever since.

Three Mile Island Nuclear power station near Harrisburg, Pa., site of the most serious accident in the history of the U.S. nuclear power industry (March 28, 1979). Mechanical failures and human errors caused a partial meltdown of the nuclear core and the release of radioactive gases. Despite assurances that there had been little risk to people's health, the accident increased public fears about the safety of nuclear power and strengthened public opposition to its use, effectively stopping construction of nuclear reactors and further development of U.S. nuclear power plants.

Three Stooges U.S. comedy team. It was originally formed as a vaudeville team in 1923 by brothers Moe and Shemp Howard (1897–1975, 1900–55), who performed with "Ted Healy and His Stooges." In 1928 the brothers added Larry Fine (1911–74) to the act, which appeared in Broadway revues. After Shemp left the act (1930), he was replaced by his brother Curly (1906–52). They appeared in several feature films, and in 1934 they began a series of comedy shorts that numbered more than 200 when they ceased in 1958. Their films were characterized by violent slapstick.

3M Co. U.S. corporation headquartered in St. Paul, Minn., manufacturing a wide range of products. It was incorporated as Minnesota Mining and Manufacturing Co. in 1902; its first product was sandpaper. It grew steadily, adding the original cellophane tape, Scotch tape, as well as masking tape to its product line. Other innovations included the widely used Post-it notes, introduced in 1980. 3M's products include photographic film, videocassettes, computer-synthesized graphics, and health-care products. It is notable among diversified U.S. corporations in that its growth has been primarily by internal means rather than by large-scale acquisitions.

threonine \'thrē-ə-ˌnēn\ One of the essential amino acids. It occurs in the proteins of egg, milk, gelatin, and other biological substances and may be synthesized or obtained by hydrolyzing casein. It is used in nutritional and biochemical research and as a dietary supplement.

thresher shark Any of five species (family Alopiidae) of sharks with a long, scythelike tail that may constitute almost half their total length. They are found in tropical and temperate seas worldwide. They eat squid and schooling fishes, attacking after circling and herding their prey into small groups. They sometimes use their tail to stun their prey or, by thrashing the water, to frighten them. They are not considered dangerous to humans. The long-tailed thresher, or fox shark (*Alopias vulpinus*), is a big, dark fish that grows about 20 ft (6 m) long.

thrips Any of some 5,000 species (order Thysanoptera) of tiny winged insects that feed chiefly on plants, inhabiting temperate and tropical areas worldwide. Many species damage cultivated plants, by either sucking the sap or transmitting viral plant diseases. A few species are predators. Thrips reach a maximum length of about half an inch (15 mm). Most have two pairs of long, narrow, hair-fringed wings.

thrombocyte See platelet

thrombosis \thräm-'bō-səs\ Formation of a blood clot (thrombus) in the heart or a blood vessel. Contributing factors include injury to a blood vessel's lining from inflammation (thrombophlebitis) or atherosclerosis, blood flow that is turbulent (e.g., from an aneurysm) or sluggish (e.g., from prolonged bed rest), or coagulation abnormalities (e.g., from high numbers of platelets or excessive fats in the blood). Thrombosis, especially in deep veins of the leg, is a particular danger after major surgery. A thrombus can block blood flow at the point of clot formation or break free to block it elsewhere (embolism).

throne Chair of state set on a dais and often surmounted by a canopy, representing the power of the dignitary who sits on it and sometimes conferring that power. In Greek history, thrones were identified as seats of the gods; soon the meaning of the word included the symbolic seats of those who held religious or secular power, a meaning common to virtually all cultures. The oldest surviving throne was built into the walls of Knossos (c. 1800 BC). Probably the most magnificent was the jewel-studded Peacock Throne of the rulers of Delhi, stolen from India by Persia in 1739 and thereafter the symbol of the Persian/Iranian monarchy. In the late 17th and 18th century, thrones were often made of silver, but later versions tend to be of gilded wood.

So-called throne of King Dagobert I, bronze, from the treasury of Saint-Denis, Paris, probably 8th century with 12th-century additions

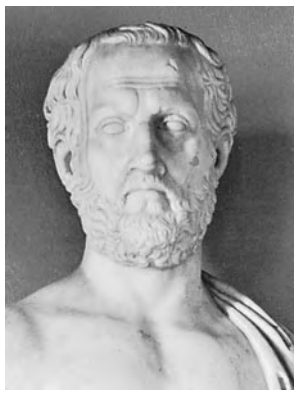
throttle Valve for regulating the supply of a fluid (as steam) to an engine, especially the valve controlling the volume of vaporized fuel delivered to the cylinders of an internal-combustion engine. In an automobile engine, gasoline is held in a chamber above the carburetor. Air flows down through the throat of the carburetor, past the throttle valve, and into the intake manifold. A throat is formed by the reduced diameter, and acceleration of the air through this smaller passage causes a decrease in pressure related to the amount of air flowing. This decrease in throat pressure results in fuel flow from the jet into the airstream. Any increase in airflow caused by change in engine speed or throttle position increases the pressure differential acting on the fuel and causes more fuel to flow. See also venturi tube.



thrush Any of about 300 species of songbirds (family Turdidae) that usually have a slender bill and "booted" lower legs (i.e., covered in front with one long scale instead of many short ones). Thrushes are 5–12 in. (13–30 cm) long. Most have dull plumage, often with patches of bright yellow, red, or blue. They are found virtually worldwide but are most diverse in the Old World, especially in Africa. The northern species are strong migrants. Occupying a wide range of arboreal and terrestrial habitats, thrushes eat insects and fruit; a few eat snails or earthworms. They lay three to six eggs in an open cup-shaped nest; a few occupy cavities. Some of the thrushes,

including the hermit thrush and WOOD THRUSH, have notably beautiful songs. See also BLACKBIRD, BLUEBIRD, CHAT, OUZEL, REDSTART, ROBIN.

Thuan Thien See LE LOI

Thucydides \thü-'si-də-ˌdēz\ (b. c. 460—d. c. 404 BC) Greatest of ancient Greek historians. An Athenian who commanded a fleet in the PELOPONNESIAN WAR, Thucydides failed to prevent the capture of the important city of Amphipolis and consequently was exiled for 20 years. During that period he wrote his *History of the Peloponnesian War*; evidently he did not live to complete it, for it stops abruptly in 411 BC. It presents the first recorded political and moral analysis of a nation's war policies, treating the causes of the conflict, the characters of the two states, and the technical aspects of warfare in a carefully drawn, strictly chronological narrative of events, including some in which he took an active part.

Thucydides, detail of a Roman bust after a Greek original; in Holkham Hall, Norfolk, England

Thugga \'thə-gə\ *modern* **Dougga** \'dü-gə\ Ancient city, North Africa. It was an important Punic city when the Romans assimilated it c. AD 200. It is the best-preserved Roman site in Tunisia; its ruins include an arch in honour of the Roman emperor SEPTIMIUS SEVERUS, a forum, baths, villas, an aqueduct, a theatre, and a temple of Jupiter, Juno, and Minerva. There is also a pre-Roman ruin of a 2nd-century-BC mausoleum.

thumb piano See MBIRA

Thunder Bay City (pop., 2001: 109,016), west-central Ontario, Canada. It is located on the northwestern shore of Lake SUPERIOR. Its first settlement was a French fur-trading post c. 1678. In the 1870s and '80s silver strikes and the arrival of the Canadian Pacific Railway brought prosperity to the twin towns of Port Arthur and Fort William that had grown up there. Their rivalry was resolved with the unification of their harbour facilities in 1906; the towns merged in 1970 and created the city of Thunder Bay. It is one of Canada's busiest ports, with grain storage and transshipment depots; other industries include shipbuilding.

thunderbird In North American Indian mythology, a powerful spirit in the form of a bird that watered the earth and made vegetation grow. Lightning was believed to flash from its eyes or beak, and the beating of its wings was thought to represent rolling thunder. The thunderbird was often portrayed with an extra head on its abdomen, particularly on TOTEM poles, and it was frequently accompanied by lesser bird spirits. Though it is best known in North America, evidence of similar figures has been found throughout Africa, Asia, and Europe.

Wooden thunderbird of the Haida Indians, northwest coast of North America, 19th century; in the British Museum
COURTESY OF THE TRUSTEES OF THE BRITISH MUSEUM

Thunderbolt See P-47

thunderstorm Violent, short-lived atmospheric disturbance, almost always associated with cumulonimbus clouds (very tall, dense rain clouds) and accompanied by thunder and LIGHTNING. Such storms usually generate strong, gusty winds and heavy rain, and occasionally HAIL or TORNADOES. Thunderstorms have been known to occur in almost every part of the world, although they are rare in the polar regions. In the U.S. the areas of maximum thunderstorm activity are the Florida peninsula and the coast of the Gulf of Mexico (70–80 days per year).

Thünen \'tü̅-nən**, Johann Heinrich von** (b. June 24, 1783, Jever, Oldenburg—d. Sept. 22, 1850, Tellow, Mecklenburg) German economist and agriculturalist. After carrying out research on his own estate into the relationship between the costs of commodity transportation and the location of production, he set forth his theories in *The Isolated State* (1826). He used an imaginary city, isolated in the middle of a fertile plain, to create a model of concentric zones of agricultural production. Heavy products and perishables would be produced close to the town, lighter and durable goods on the periphery; returns on the land would diminish as transport costs to the city increased. Thünen's model influenced many later writers on the subject.

Thurber, James (Grover) (b. Dec. 8, 1894, Columbus, Ohio, U.S.—d. Nov. 2, 1961, New York, N.Y.) U.S. writer and cartoonist. He attended Ohio State University before moving to New York City in 1926. He was on *The New Yorker* staff from 1927 to 1933 and thereafter remained a leading contributor. His drawings illustrated his first book, *Is Sex Necessary?* (1929; with E.B. WHITE), and his cartoons became some of the most popular and recognizable in America. In 1940 his failing eyesight forced him to curtail his drawing; by 1952 he had to give it up altogether as his blindness became nearly total. His writings include *My Life and Hard Times* (1933), *Fables for Our Time* (1940), and the children's book *The 13 Clocks* (1950). He is noted for his vision of the befuddled urban man who, like the hero of his short story "The Secret Life of Walter Mitty" (1939; film, 1946), escapes into fantasy.

Thuringia \thù-'rin-jē-ə\ *German* **Thüringen** \'tü̅-riŋ-ən\ Historic region and state (pop., 2002 est.: 2,411,000), Germany. It includes the land around the Thuringian Forest in what was formerly southwestern EAST GERMANY and covers 6,244 sq mi (16,171 sq km). The capital is ERFURT. The Germanic Thuringians appeared after c. AD 350 and were conquered by the Huns in the mid-5th century. In 1485 Thuringia became part of SAXONY and was divided into several states; they joined the German Empire in 1871 and were reunited after World War I. Following the partition of Germany in 1945, the state became part of East Germany; it was reconstituted as a state of reunified Germany in 1990. The economy is largely industrial.

Thurmond, (James) Strom (b. Dec. 5, 1902, Edgefield, S.C., U.S.—d. June 26, 2003, Edgefield) U.S. politician and senator (1954–2003). He served as a South Carolina state senator (1933–38) and circuit court judge (1938–41). As governor (1947–51), he expanded the state educational system. At the 1948 Democratic convention Thurmond led the bolt of Southern delegates who objected to the civil-rights plank in the party platform; the so-called DIXIECRATS nominated Thurmond as their presidential candidate, and he won 39 electoral votes. In 1954 he was elected to the U.S. Senate, and in 1964 he switched party affiliation to the Republican Party. He became the Senate's longest-serving member in 1997. An arch conservative, he advocated states' rights, opposed civil-rights legislation, and supported increases in military spending.

Thurstone, L(ouis) L(eon) (b. May 29, 1887, Chicago, Ill, U.S.—d. Sept. 29, 1955, Chapel Hill, N.C.) U.S. psychologist. He taught primarily at the University of Chicago (1927–52). Concerned with the measurement of people's attitudes and intelligence, he was instrumental in the development of psychometrics. His principal work, *The Vectors of the Mind* (1935; revised as *Multiple-Factor Analysis*, 1947), presented the technique of multiple-factor analysis to explain correlations between results in psychological tests.

Thutmose \thüt-'mō-sə\ **III** (d. 1426 BC) Egyptian king of the 18th dynasty (r. 1479–1426 BC), often regarded as the greatest PHARAOH of ancient Egypt. He ascended the throne around the age of 10, but his aunt, HATSHEPSUT, ruled first as his regent and then in her own right for the next 20 years. On her death he began military campaigns to reestablish Egyptian supremacy in Syria and Palestine. Later he attacked and defeated the kingdom of MITANNI, a powerful Mesopotamian rival of Egypt. He subdued the Nubian tribes to the south and employed them in the gold mines that became the basis of Egypt's wealth. He consolidated his victories with more campaigns and established a system whereby native rulers would pay yearly tribute to Egypt and send their heirs as hostages to Egypt, where they would be educated at court. At home he enlarged the temple of Amon at KARNAK. His mummy was discovered in 1889 and his mortuary temple in 1962.

thyme \'tīm\ Pungent herb (*Thymus vulgaris*) of the MINT family, native to southern Europe, the Mediterranean, Asia Minor, and Central Asia, and

© 2006 Encyclopædia Britannica, Inc.

cultivated in North America. A small, low-growing shrub, it has small, curled leaves that give off a fragrant odour when crushed. The dried leaves and flowering tops are used to flavour a wide range of foods. Bees are fond of thyme, and Sicily's thyme honey has been famous for centuries. The essential oil has antiseptic and anesthetic properties and is used as an internal medicine; it is also used in perfumes and toothpastes.

Thyme (*Thymus vulgaris*)
WALTER CHANDOHA

thymine \'thī-ˌmēn\ Organic compound of the PYRIMIDINE family, often called a base, consisting of a ring containing both nitrogen and carbon atoms, and a methyl group. It occurs in combined form in many important biological molecules, particularly DNA (where its complementary base is ADENINE). It or its corresponding NUCLEOSIDE or NUCLEOTIDE may be prepared from DNA by selective techniques of HYDROLYSIS.

thymus \'thī-məs\ Pyramid-shaped lymphoid organ (see LYMPHOID TISSUE) between the breastbone and the heart. Starting at puberty, it shrinks slowly. It has no lymphatic vessels draining into it and does not filter lymph; instead, stem cells in its outer cortex develop into different kinds of T CELLS (see LYMPHOCYTES). Some migrate to the inner medulla and enter the bloodstream; those that do not may be destroyed to prevent autoimmune reactions. This process is most active during infancy. If a newborn's thymus is removed, not enough T cells are produced, the SPLEEN and LYMPH NODES have little tissue, and the immune system fails, causing a gradual, fatal wasting disease. Thymus removal in adults has little effect.

thyroid gland Endocrine gland in the throat that secretes HORMONES vital to metabolism and growth. Secretion of thyroid hormones—mostly thyroxine (T_4)—is controlled by thyroid-stimulating hormone (TSH), released by the PITUITARY GLAND when the level of thyroid hormones in the blood drops below a certain threshold (see ENDOCRINE SYSTEM). These hormones' primary action in adults is to regulate cellular oxygen consumption (metabolic rate). They also lower blood CHOLESTEROL and are necessary for normal growth and development in children. The thyroid also produces calcitonin, a hormone that stimulates deposition of calcium from the blood into the bones, balancing the action of parathyroid hormone. See also GOITRE; GRAVES DISEASE; IODINE DEFICIENCY.

thyroxine \thī-'räk-ˌsēn\ *or* **l-tetraiodothyronine** \'el-ˌte-trə-ī-ˌō-dō-'thī-rə-ˌnēn\ *or* **T_4** One of the two major HORMONES (along with the closely related l-triiodothyronine, or T_3) secreted by the THYROID GLAND. Its principal function is to stimulate OXYGEN consumption and thus METABOLISM in all cells and tissues in the body. Thyroxine is formed by the addition of IODINE to the amino acid TYROSINE while the latter is in a protein-bound form. Thyroxine secretion is excessive in hyperthyroidism and deficient in hypothyroidism.

Thyssen \'tīə-sən**, Fritz** (b. Nov. 9, 1873, Mülheim, Ger.—d. Feb. 8, 1951, Buenos Aires, Arg.) German industrialist and financial backer of ADOLF HITLER. Thyssen entered the family iron, steel, and coal business and inherited his father's fortune and empire in 1926 (see THYSSEN KRUPP STAHL). He created a family business trust that came to control more than 75% of Germany's ore reserves and employ 200,000 workers. Distressed by the rise of socialism in Germany, he supported Hitler and helped finance his rise to chancellor. But Thyssen opposed Hitler's later policies and fled to Switzerland in 1939, enabling Hitler to confiscate Thyssen's fortune (about $88 million). Thyssen was arrested in France (1941) and imprisoned by the Nazis. After the war, he was convicted as a "minor Nazi" and ordered to pay 15% of his property in restitution.

ThyssenKrupp AG German steel company. The Krupp firm began in 1811 when Friedrich Krupp (1787–1826) founded a steel plant in Essen, and it remained in family hands for a century and a half. Known for its high-quality steel and its cannons and other armaments, Krupp prospered with the rise of the German navy. It enjoyed a monopoly on arms manufacturing during World War I; one of its most potent weapons was "BIG BERTHA." After the war, Germany was forbidden to manufacture arms, and parts of the Krupp works were dismantled, though it remained a vast industrial empire. Krupp's factories were central to Germany's illegal rearmament under ADOLF HITLER in the 1930s. After World War II, Alfried Krupp (1907–67) was convicted of war crimes for using slave labour and ordered to forfeit all his property, but with the outbreak of the Korean War he was granted amnesty and his property restored. In 1968, after his son renounced the Krupp name and fortune, the company went public. In 1992 it merged with Hoesch AG to become Fried Krupp AG Hoesch-Krupp. Thyssen AG originated as a rolling mill founded by August Thyssen (1842–1926). It merged with seven other steelworks to become Vereinigte Stahlwerke AG, but reassumed its own identity in 1953. After the steel divisions of the rival companies were joined in 1997 to form Thyssen Krupp Stahl, the remaining segments of each company merged in 1999, creating ThyssenKrupp AG. Its products include steel, construction and automotive components, elevators, and engineering services.

Tiamat \'tē-ä-ˌmät\ In Mesopotamian mythology, a primal goddess who is a personification of salt water and the mother of the gods. When conflict between her husband, Apsu, and the other gods resulted in Apsu's death, Tiamat waged war on the other divinities, backed by an army of demons she had created. Her battle with, and defeat at the hands of, MARDUK forms the substance of the Babylonian creation epic *Enuma elish*. From her body Marduk fashioned the heavens and the earth.

Tian *or* **T'ien** \'tyen\ *Chinese* **"Heaven"** In indigenous Chinese religion, the supreme power reigning over humans and lesser gods. The term refers to a deity, to impersonal nature, or to both. As a god, Tian is an impersonal power, in contrast to the supreme ruler Shangdi, but the two are closely identified and their names are sometimes used synonymously. In later references, Tian is likened to nature or fate. Scholars generally agree that Tian was the source of moral law, but they long debated whether Tian responded to pleas and rewarded and punished human actions or whether events merely followed Tian's order and principles.

Tian Shan See TIEN SHAN

Tiananmen \'tyän-'än-'men\ **Square** One of the largest public squares in the world, originally designed and built in Beijing in 1651 and enlarged in 1958. It is named for the massive stone "Gate of Heavenly Peace" (Tiananmen) at its northern end. It contains and is surrounded by halls, museums, and monuments, including the Mao Zedong Memorial Hall, where Mao's body rests in state. Tiananmen Square has been the rallying point for political demonstrations since 1919, including the large protests in May–June 1989 that were forcibly repressed. See also FANG LIZHI.

Tiancong See HONGTAIJI

Tianjin \'tyen-'jin\ *or* **T'ien-chin** *conventional* **Tientsin** Seaport and municipality with provincial status (pop., 2003 est.: city, 4,933,100; 2002 est.: municipality, 10,070,000), northeastern CHINA. The municipality, on the BO HAI, is bordered by HEBEI province and BEIJING municipality and has an area of 4,400 sq mi (11,300 sq km). The city, China's third largest, lies at the head of the short Hai River, which flows into the Bo Hai; Tianjin is connected to the YANGTZE RIVER (Chang Jiang) by the GRAND CANAL. It has been a major transportation and trading centre since the YUAN DYNASTY in the 13th century. It was a garrison town during the MING DYNASTY (1368–1644). The British and French occupied it during the Second OPIUM WAR (1856–60); a treaty signed there in 1858 opened 11 Chinese ports to foreign trade. As a treaty port, it developed rapidly. It was the scene of heavy fighting during the BOXER REBELLION (1900), after which it was placed under an international commission and its walls razed. It is the leading port in northern China and the country's second largest manufacturing centre. Educational institutions include Tianjin University (1895) and Nankai University (1919).

Tianshi Dao See FIVE PECKS OF RICE

Tiantai \'tyän-'dī\ *Japanese* **Tendai** \'ten-'dī\ Buddhist sect founded by ZHIYI in the 6th century AD. Its chief scripture is the LOTUS SUTRA, and the school is thus known as the Lotus school. Its basic philosophical doctrine is summarized as the Triple Truth: All DHARMAS lack ontological reality; nevertheless, they have a temporary existence; and they are simultaneously unreal and temporarily existing—an absolute truth that surpasses the others. In Tiantai, all Buddhist learning is arranged in a grand hierarchical scheme. In Japan, SAICHO attempted to incorporate ZEN meditation, monastic discipline, and esoteric cults. Amalgamation of SHINTO and Buddhism was also encouraged.

Tibbett \'tib-ət**, Lawrence** *orig.* **Lawrence Mervil Tibbet** (b. Nov. 16, 1896, Bakersfield, Calif., U.S.—d. July 15, 1960, New York,

© 2006 Encyclopædia Britannica, Inc.

N.Y.) U.S. baritone. He performed as a singing actor before moving into opera. After his 1923 Metropolitan Opera debut, his first major success came in 1925, when he played Ford in Giuseppe Verdi's *Falstaff*. Over the next several years he sang most of the leading baritone roles at the Metropolitan, continuing with the company for 27 seasons. He also starred in several musical films and appeared on the popular radio show *Your Hit Parade*.

Tiber River \'tī-bər\ *Italian* **Tevere** \'tā-vā-rā\ River, Italy. The country's second-longest river, it rises in the Tuscan Apennines, and flows south for 252 mi (405 km), ultimately passing through the city of Rome before entering the Mediterranean at Ostia. It was an important navigation route for trade in Roman times. Despite sporadic dredging over the centuries, its persistent silting has limited its use in modern times.

Tiberias \tī-'bir-ē-əs\ *Hebrew* **Teverya** \tə-'ver-yə\ Town (pop., 2004 est.: 40,100) and resort, northeastern Israel. Located on Lake Tiberias (Sea of Galilee), at 689 ft (210 m) below sea level, it is one of the lowest-lying towns in the world. It was founded c. AD 20 by Herod Antipas and named for the Roman emperor Tiberius. After the destruction of Jerusalem by the Romans in AD 70, it became a centre of Jewish learning and later the seat of the Sanhedrin and rabbinical schools. The Talmud was edited there in the 3rd–6th centuries. Saladin took the town from the Crusaders in 1187. The modern town was refounded under the British mandate in 1922 and became part of independent Israel in 1948. Historic sites include the tomb of the great Jewish scholar Moses Maimonides. Along with Hebron, Jerusalem, and Ẕefat, it is one of the four holy cities of Judaism.

Tiberius *in full* **Tiberius (Julius) Caesar Augustus** *orig.* **Tiberius Claudius Nero** (b. Nov. 16, 42 BC—d. March 16, AD 37, Capreae, near Naples) Second Roman emperor (AD 14–37). He was raised by Augustus, who had married his mother, Livia Drusilla. In his first military command, at age 22, he recovered Roman legionary standards lost for decades in Parthia and returned to great acclaim. He was forced to give up his beloved wife to marry Augustus's daughter Julia (12 BC). Despite becoming tribune, he went into self-imposed exile on Rhodes (6 BC), becoming an angry recluse. By 4 BC Julia was exiled for promiscuity by Augustus, who recalled Tiberius and named him his heir. As emperor he initially ran the state efficiently and instituted some reforms, with only occasional severity, such as exiling Rome's Jewish population on a pretext. When his son Drusus died mysteriously, he gave his trust to Sejanus and was persuaded to move to Capri (27). He became increasingly violent, killing and torturing at a whim. After Sejanus became coconsul in 31, Tiberius became suspicious of his ambition and executed him, then named Caligula his heir. In 37 the Praetorian Guard declared its support for Caligula and killed Tiberius when he was on his sickbed.

Tiberius as a young man, marble bust found in Egypt in 1896; in the Ny Carlsberg Glyptotek, Copenhagen.
COURTESY OF THE NY CARLSBERG GLYPTOTEK, COPENHAGEN

Tiberias, Lake *or* **Sea of Galilee** Freshwater lake, northern Israel. It is 13 mi (21 km) long and 7 mi (11 km) wide; it lies about 700 ft (212 m) below sea level and receives most of its inflow from the Jordan River. The region has been inhabited for millennia: archaeological finds dating to some 500,000 years ago are among the oldest in the Middle East. In the 1st century AD, the region was rich and populated; Christians know it as the scene of many episodes in the life of Jesus. Today the lake's waters irrigate the surrounding agricultural region. Modern health resorts have grown up, and the baths at Tiberias are among Israel's winter resort attractions.

Tibet \ti-'bet\ *Tibetan* **Bod** \'bōd\ *Chinese* **Xizang** \'shē-'dzäŋ\ *or* **Hsitsang** Autonomous region (pop., 2002 est.: 2,670,000), western China. It is bordered by India (including the Kashmir region), Nepal, Bhutan, and Myanmar, the provinces of Yunnan, Sichuan, and Qinghai, and Xinjiang autonomous region. It has an area of 471,700 sq mi (1,221,600 sq km), and its capital is Lhasa. Before the 1950s it was a unique entity, with its own Buddhist culture and religion, that sought isolation from the rest of the world. Situated on a plateau averaging 15,000 ft (4,500 m) above sea level, it is the highest region in the world. Its surrounding mountain ranges include the Kunlun Mountains and the Himalayas; Mount Everest rises on its border with Nepal. Tibet emerged as a powerful Buddhist kingdom in the 7th–9th century AD. It came under the control of the Mongols in the 13th century and the Qing (Manchu) dynasty in the 18th century. After the 1911–12 Chinese revolution it gained a measure of autonomy. The Chinese People's Liberation Army entered Tibet in 1950, and Chinese authority was subsequently established over the region. The 14th Dalai Lama, Bstan-'dzin-rgya-mtsho, led an abortive rebellion in 1959, after which he fled to India and set up a government-in-exile. The Tibet Autonomous Region was established in 1965. Many of Tibet's cultural treasures were destroyed or badly damaged during the Cultural Revolution, but restoration work has been underway since then.

Tibetan Buddhism Form of Mahayana Buddhism that evolved from the 7th century in Tibet. Based on Madhyamika and Yogacara philosophies, it incorporates the rituals of Vajrayana, the monastic disciplines of early Theravada, and the shamanistic features of Bon. The predominant Tibetan sect for the past three centuries has been Dge-lugs-pa. Its spiritual head is the Dalai Lama. The Tibetan canon is divided into the *Bka'-'gyur* ("Translation of the Word"), consisting of canonical texts translated mostly from Sanskrit, and *Bstan-'gyur* ("Transmitted Word"), consisting of commentaries by Indian masters. After the Chinese communist takeover in 1959, Tibetans began a massive emigration that has spread Tibetan Buddhism around the globe.

Tibetan language Sino-Tibetan language spoken by more than five million people in Tibet (Xizang), Qinghai, Sichuan, and Gansu provinces in China; Bhutan; northern Nepal; and the Kashmir region of India and Pakistan. Since the occupation of Tibet by China in 1959, enclaves of Tibetan speakers have dispersed to India and other parts of the world. Spoken Tibetan comprises a very diverse range of dialects, conventionally divided into several groups: Western, including Balti and Ladakhi in Jammu and Kashmir; Central, including the speech of Lhasa and most of the Nepalese dialects (including Sherpa); Southern, including the dialects of Sikkim and Bhutan; Khams, or Southeastern, including the dialects of the interior plateau, southern Qinghai, eastern Tibet, and parts of western Sichuan; and Amdo or Northeastern, including the dialects of northern Qinghai, southern Gansu, and northern Sichuan. Most Tibetans share a common literary language, written in a distinctive script of disputed origin first attested in the 8th century AD.

tic Sudden rapid, recurring muscle contraction—usually a blink, sniff, twitch, or shrug—always brief, irresistible, and localized. Frequency decreases from head to foot. Unlike a spasm, a cramp, or the movements of chorea or epilepsy, it does not interfere with other movement and can be held off for a time. It can become ingrained as a habit of which the person (most often a nervous child 5–12 years old) is unaware. Most tics are probably psychological, but similar movements occur in some physical disorders (e.g., late-stage encephalitis). People with tics have some control over the movement but feel impelled to go through with it to feel better. Tension increases the movement's likelihood, and distraction reduces it. Psychotherapy, relaxation training, and biofeedback training have had some success in treating tics.

Ticino River \tē-'chē-nō\ River, Switzerland and Italy. It rises on the slopes of the St. Gotthard range, winds south through Ticino canton, traverses Lake Maggiore, and continues south to the Po River, for a total course of 154 mi (248 km). It is navigable below Lake Maggiore, and is an important source of hydroelectric power for Switzerland. Hannibal defeated the Romans on its banks in 218 BC.

Cattle tick (*Boophilus*)
E.R. DEGGINGER/EB INC.

tick Any of some 825 parasitic arachnid species (suborder Ixodida, order Parasitiformes), found worldwide. Adults may be slightly more than an inch (30 mm) long, but most species are much smaller. Hard ticks start and end each developmental

© 2006 Encyclopædia Britannica, Inc.

stage—egg, larva, nymph, adult—on the ground; at the completion of each stage, they attach to a host (usually a MAMMAL), engorge on blood, then drop to the ground. Soft ticks feed intermittently, pass through several nymphal stages, and live in the host's den or nest. Hard ticks may draw large amounts of blood, secrete paralyzing or lethal neurotoxins, and transmit diseases. Soft ticks may also carry diseases. The deer tick is the principal vector of LYME disease.

Ticonderoga \ˌtī-ˌkän-də-ˈrō-gə\ Town (pop., 2000: 5,167) on Lake GEORGE, northeastern New York, U.S. In 1755 the French built Fort Carillon on nearby Lake CHAMPLAIN. Captured by the British in 1759, the fort was renamed Ticonderoga. In 1775, at the start of the AMERICAN REVOLUTION, it was seized by ETHAN ALLEN and his Green Mountain Boys. The British retook it in 1777 but abandoned it after the Battle of SARATOGA. The restored fort and the area around the town are now tourist attractions.

Ticonderoga, Battle of (1775) Engagement in the AMERICAN REVOLUTION. Held by the British since 1759, Fort Ticonderoga (in New York) was overrun on the morning of May 10, 1775, in a surprise attack by the Green Mountain Boys under ETHAN ALLEN, assisted by BENEDICT ARNOLD. The artillery seized there was moved to Boston, Mass., by HENRY KNOX for use against the British.

Ticunas See TUCUNAS

tidal flat Level muddy surface bordering an ESTUARY, alternately submerged and exposed to the air by changing tidal levels. In addition to the alternating submergence and exposure, the varying influences of fresh river water and salty marine waters cause physical conditions to vary more widely than in any other marine environment. The mud of a tidal flat is usually rich in dissolved nutrients, PLANKTON, and organic debris, and it supports large numbers of small animals such as crabs and worms. Vegetation is generally sparse, but mats of blue or blue-green algae (see CYANOBACTERIA) may be present.

tidal power Electricity produced by TURBINES operated by TIDE flow. Large amounts of power are potentially available from the tides in certain locations, such as Canada's Bay of FUNDY, where the tidal range reaches more than 50 ft (15 m), but this potential power is not continuous and varies with the seasons. The first working modern tidal power plant was built in France in 1961–67 and has 24 power units of 10,000 kilowatts each.

tidal wave See TSUNAMI

tide Regular, periodic rise and fall of the surface of the sea, occurring in most places twice a day. Tides result from differences in the gravitational forces exerted at different points on the Earth's surface by another body (such as the Moon). Although any celestial body (e.g., Jupiter) produces minute tidal effects, the majority of the tidal forces on the Earth are raised by the Sun (because of its enormous mass) and the Moon (because of its proximity to Earth). In fact, the tidal forces from the Moon are about twice as strong as those from the Sun. The largest tides (spring tides, exhibiting very large change in sea level between high and low tides) occur at the new and full moon, when the Earth, the Moon, and the Sun are aligned and the Sun's tidal forces are added to those of the Moon. The smallest tides (neap tides) occur when the Sun and Moon are at right angles (from Earth), when the tidal forces from the Sun partially cancel those from the Moon. The geometry of the coastline and of the water's basin also affects the range of the tides.

Tieck \ˈtēk**, (Johann) Ludwig** (b. May 31, 1773, Berlin, Prussia—d. April 28, 1853, Berlin) German writer and critic. He was educated at the universities of Halle, Göttingen, and Erlangen. His first works are associated with early Romanticism, the best appealing to the emotions rather than the intellect. *Volksmärchen* (1797) includes one of his best short novels, *Blond Eckbert*. This period culminated in the grotesque, lyrical plays *Life and Death of St. Genevieve* (1800) and *Emperor Octavian* (1804). Later his writing moved toward realism. While he was an adviser and critic at the Dresden theatre (1825–42), he became a great literary authority.

Tiepolo \tē-ˈā-pə-lō**, Giovanni Battista** *or* **Giambattista Tiepolo** (b. March 5, 1696, Venice—d. March 27, 1770, Madrid) Italian painter and etcher. In the 1730s and '40s the Venetian clergy and nobility vied for his works. In 1750 he went to Würzburg with his sons and collaborators, GIOVANNI DOMENICO TIEPOLO and Lorenzo Tiepolo, to decorate the prince-archbishop's palace. His Würzburg frescoes and canvases are his most boldly luminous works. In 1762 he escaped the political disequilibrium of the Seven Years' War by accepting an invitation to paint ceilings in the royal palace in Madrid, again with his sons, his last great undertaking; he remained in Spain until his death. Although he initially used a melancholic chiaroscuro style, his later work is full of bright colour and bold brushwork. His luminous, poetic frescoes both extend the tradition of Baroque ceiling decoration and epitomize Rococo lightness and elegance.

Tiepolo \ˈtye-pō-lō**, Giovanni Domenico** *or* **Giandomenico Tiepolo** (b. Aug. 30, 1727, Venice—d. March 3, 1804, Venice) Italian painter and printmaker. He was apprenticed to his father, GIOVANNI BATTISTA TIEPOLO, in Venice in the early 1740s and worked with him in Madrid from 1762 until the elder's death in 1770. His most notable early works are the chinoiserie decorations of the Villa Valmarana in Vicenza (1757). Back in Venice, he executed several frescoes and paintings of scenes from the commedia dell'arte. A talented genre painter and caricaturist, he was famous for his many engravings and etchings after his own and his father's designs.

Tierra del Fuego \tē-ˌer-ə-thel-ˈfwā-gō\ Archipelago at the southern extremity of South America. It is separated from the Antarctic Archipelago by the DRAKE PASSAGE. The southern and western parts are an extension of the ANDES MOUNTAINS, with peaks exceeding 7,000 ft (2,100 m). About two-thirds of the islands are in Chile, and the remainder are in Argentina. The main island, Tierra del Fuego, is divided roughly equally between Chile (west) and Argentina (east); the city of Ushuaia, Arg., there is the southernmost city in the world. Indigenous peoples were the sole occupants until 1880, when colonization by Chilean and Argentine nationals was prompted by the discovery of gold. Chile's only oil field is there. The region's name (Spanish: "Land of Fire") refers to its many volcanoes.

Tietê \tyā-ˈtā\ **River** River, southeastern Brazil. Rising in the mountains near the Atlantic Ocean coast, it flows northwest about 700 mi (1,130 km) through central São Paulo state to join the PARANÁ RIVER. Several of the state's large cities, including SÃO PAULO, are located on or near it, but navigation on the river is impeded by its many falls and rapids.

Tiffany, Louis Comfort (b. Feb. 18, 1848, New York, N.Y., U.S.—d. Jan. 17, 1933, New York City) U.S. painter, craftsman, philanthropist, decorator, and designer. The son of the famous jeweler Charles Louis Tiffany (1812–1902), he studied painting with American painter GEORGE INNESS and in Paris; he was a recognized painter before he began to experiment with stained glass in 1875. He founded a glassmaking factory in Queens, N.Y., in 1878. There he developed an iridescent glass he

called Favrile, which achieved widespread popularity in Europe. After 1900 Tiffany's firm ventured into lamps, jewelry, pottery, and bibelots. He is internationally recognized as one of the greatest forces of the Art Nouveau style.

Tiflis See Tbilisi

tiger Reddish tan, striped great cat (*Panthera tigris*) of forests, grasslands, and swamps in eastern Russia, South Asia, Sumatra, and a few small parts of China. Tigers are solitary, nocturnal hunters, preying on medium-sized mammals (e.g., deer). Locality and subspecies determine size, colour, and stripes. Southern tigers, such as the Bengal tiger (*P. tigris tigris*), are smaller and more brightly coloured than northern ones, such as the rare Siberian tiger (*P. tigris altaica*). Males grow to more than 3 ft (1 m) high and 7 ft (2.2 m) long, excluding the 3-ft (1-m) tail, and may weigh 350–640 lb (160–290 kg). Tigers live about 11 years. The persistent use of tiger parts as tonics or medicines, despite evidence refuting their efficacy, is rooted in the awe that the cat has inspired for millennia. Although internationally protected, tigers are seriously endangered; their populations shrank by more than 90% in the last century, and three subspecies are now extinct.

Bengal tiger (*Panthera tigris tigris*).
© SILVESTRIS/AUSTRALASIAN NATURE TRANSPARENCIES

tiger beetle Any of some 2,000 species (family Cicindelidae) of voracious beetles, found worldwide but mostly in the tropics and subtropics. The larva waits at the top of its burrow (up to 2 ft, or 0.7 m, deep) and grasps approaching insect prey with sicklelike jaws. Hooks on the abdomen anchor it so that the struggling victim cannot pull away, and the prey is dragged into the burrow and eaten. The slender, long-legged adults, less than an inch (25 mm) long, have long jaws that can inflict a painful bite. Many are iridescent blue, green, orange, or scarlet.

Tiger beetle (*Cicindela*).
WILLIAM E. FERGUSON

tiger moth Any of more than 3,500 species (family Arctiidae) of moths, many with furry or hairy larvae called woolly bears. Most adults have a thick body and white, orange, or green wings. At rest, the wings are folded rooflike over the body. The fall webworm (*Hyphantria cunea*) is a serious pest. The caterpillars construct webs over leaves, sometimes covering large areas with silken sheets. They pupate aboveground in a cocoon made of larval hairs and silk. The Isabella tiger moth (*Isia isabella*) attains a wingspan of 1.5–2 in. (37–50 mm). Black spots mark its abdomen and yellow wings.

tiger shark Potentially dangerous shark (*Galeocerdo cuvieri*, family Carcharhinidae), found worldwide in warm oceans, from the shoreline to the open sea. Up to 18 ft (5.5 m) long, the grayish tiger shark has a long, pointed upper tail lobe, and its large teeth are deeply notched along one side. This voracious shark eats fishes, other sharks, turtles, mollusks, birds, carrion, and garbage, including coal, tin cans, and clothing. It is a source of leather and liver oil. See also sand shark.

tiger swallowtail Any of several North American species of black-and-yellow swallowtail butterflies. The eastern tiger swallowtail (*Papilio glaucus*) is a large, widely distributed species. The yellow male has black margins and black stripes on the wings. The female is similarly marked in the north, where the black and distasteful pipevine swallowtail (*Battus philenor*) does not occur; in the south, where the two coexist, the female tiger swallowtail is very often all or mostly black.

tigereye *or* **tiger's-eye** Semiprecious quartz gem displaying chatoyancy, a vertical luminescent band like that of a cat's eye. Bands of parallel, blue asbestos (crocidolite) fibres are first altered to iron oxides and then replaced by silica. The gem has a rich yellow to yellow-brown or brown colour and a fine golden lustre when it is polished. The best stones come from South Africa. See also cat's-eye.

Tiglath-pileser \ˈtig-ˌlath-pī-ˈlē-zər\ **III** (fl. 8th century BC) King of Assyria (r. 745–727 BC) who led the last and greatest phase of Assyrian expansion. On taking the throne, he immediately set about strengthening Assyria. He subdivided large provinces to quash independence movements, had officials report directly to him, and resettled tens of thousands of people to ensure loyalty. He defeated his northern neighbour, Urartu (743 BC), then subjugated Syria and Palestine (734) and took over the throne of Babylon. See also Ashurbanipal; Sargon II.

Tiglath-pileser III, relief from Calah (Nimrud), 8th century BC; in the British Museum.
COURTESY OF THE TRUSTEES OF THE BRITISH MUSEUM

tigon \ˈtī-gən\ *or* **tiglon** \ˈtī-glən\ Zoo-bred offspring of a tiger and a lioness. The opposite cross, of a lion and a tigress, produces a liger. Differences in behavior and habitat make interbreeding of the tiger and lion unlikely in the wild. The tigon and the liger have features of both parents, in variable proportions, but are generally larger and darker than either. It is thought that most, if not all, male tigons and ligers are sterile; the females may be able to produce young.

Tigray \ˈti-ˌgrā\ Historic region of northern Ethiopia. Its dramatic landscape includes plateau regions more than 10,000 ft (3,000 m) high and plains below sea level. Though vegetation is sparse, the population engages in agriculture and stock raising. Tigray contains the core of the ancient Aksum kingdom, as well as Ethiopia's oldest known town, the 3,000-year-old Yeha. It formerly controlled trade routes from the Red Sea to the empire in the south. Its status declined when it lost control of the coast in the 16th century; it was subsequently dominated by the south and was later threatened by the Egyptian, Sudanese, British, and Italian armies. A rebellion begun in 1975 against the Ethiopian government aggravated the effects of a disastrous drought and famine in 1984–85. In 1999 Ethiopia's border war with Eritrea led to the displacement of more than 300,000 people in Tigray, and famine is a persistent threat.

Tigris \ˈtī-grəs\ **River** *Arabic* **Dijlah** \ˈdij-lə\ *Turkish* **Dicle** *biblical* **Hiddekel** River, Turkey and Iraq. It originates in the Taurus Mountains at Lake Hazar and flows 1,180 mi (1,900 km) southeast through Turkey and past Baghdad to unite with the Euphrates River at Al-Qurnah in southeastern Iraq; there it forms the Shatt al-Arab. With the Euphrates it defined the ancient region of Mesopotamia. Important for its irrigation capacity, it gave rise to sustained civilization. The ruins of many ancient cities lie on its banks, including those of Nineveh, Calah, Ashur, Ctesiphon, and Seleucia.

Tijuana \tē-ˈhwä-nä\ City (pop., 2000: 1,148,681), northwestern Baja California, Mexico. It lies on the Tecate River near the Pacific Ocean, 12 mi (19 km) south of San Diego, Calif., U.S. It originated as a ranch settlement on a land grant in 1862 and developed as a border resort with gambling casinos. In the 20th century it became the main entry point to Mexico for U.S. tourists. It has many U.S.-owned assembly plants as well as food-processing plants and breweries.

Tikal \tē-ˈkäl\ Ancient Maya city, northern Guatemala. First occupied as a small village in a tropical rainforest (c. 900–300 BC), it grew into an important ceremonial centre. It flourished c. AD 600–900, when its great

© 2006 Encyclopædia Britannica, Inc.

plazas, pyramids, and palaces were built and when Maya art flowered in monumental sculpture. At its height it was the largest urban centre in the southern Maya lowlands; the core city had a population of perhaps 10,000 residents with an outlying population of about 50,000. Its main structures covered about 1 sq mi (2.5 sq km). It was abandoned by the 10th century. Major excavation began in 1956; it is now a central part of Tikal National Park, which was designated a UNESCO World Heritage site in 1979.

Tikhomirov \ˌtik-əm-ˈyir-ef**, Vasily (Dmitrievich)** (b. March 30, 1876, Moscow, Russia—d. June 20, 1956, Moscow) Russian ballet dancer and teacher. After training at the Bolshoi school, he joined the Bolshoi Ballet in 1893. He soon became its principal dancer and created roles in a vigorous, athletic style that he later taught to students at the Bolshoi school. He was influential there as a teacher (from 1896) and as director (1924–37). With his wife, Yekaterina Geltzer, he helped preserve the classic ballets and techniques after the Russian Revolution of 1917.

Tikunas See Tucunas

Tilak \ˈtē-läk**, Bal Gangadhar** (b. July 23, 1856, Ratnagiri, India—d. Aug. 1, 1920, Bombay) Indian scholar and nationalist. Born to a middle-class Brahman family, Tilak taught mathematics and in 1884 founded the Deccan Education Society to help educate the masses. Through two weekly newspapers, he voiced his criticisms of British rule in India, hoping to widen the popularity of the nationalist movement beyond the upper classes. In response to the Partition of Bengal (1905) he initiated a boycott of British goods and passive resistance, two forms of protest later adopted by Mohandas K. Gandhi. He left the Indian National Congress in 1907 when he was deported for sedition but rejoined in 1916, in time to sign a Hindu-Muslim accord with Mohammed Ali Jinnah. Though militant in his opposition to foreign rule, late in life Tilak advocated a measure of cooperation with the British in order to achieve reforms.

tilapia \tə-ˈlä-pē-ə\ Any of numerous, mostly freshwater, fish species (genus *Tilapia*, family Cichlidae), native to Africa. They resemble North American sunfishes; one species grows to 20 lbs (9 kg). *Tilapia* species are easy to raise and harvest for food; they grow rapidly, resist disease, and eat readily abundant algae and zooplankton. They have been used in warm-water aquaculture systems since the early Egyptian civilization and have been introduced into many freshwater habitats. See also cichlid.

Tilden, Bill *in full* **William Tatem Tilden** (b. Feb. 20, 1893, Philadelphia, Pa., U.S.—d. June 5, 1953, Hollywood, Calif.) U.S. tennis player. The dominant player of the 1920s, he won seven U.S. men's singles championships (1920–25, 1929), three Wimbledon singles championships (1920–21, 1930), and two professional titles. He also won many doubles and mixed-doubles titles and 21 of 28 Davis Cup matches. His overpowering play and temperamental personality made him one of the most colourful sports figures of his time.

Bill Tilden
CULVER PICTURES

Tilden, Samuel J(ones) (b. Feb. 9, 1814, New Lebanon, N.Y., U.S.—d. Aug. 4, 1886, Greystone, N.Y.) U.S. politician. He was a leader of New York's Democratic Party, and, as state party chairman (1865–75), he effected the overthrow of the Tammany Hall boss William Marcy Tweed. As governor (1875–76) he continued his reforms, exposing the Canal Ring, a group of politicians and contractors who had defrauded the state. In 1876 he was the Democratic nominee for president. The bitterly fought campaign ended in a popular-vote victory for Tilden, but Republicans contested the results in four states. To settle the controversy, Congress appointed the Electoral Commission, which decided in favour of the Republican candidate Rutherford B. Hayes (see also electoral college). Unwilling to cause further conflict, Tilden accepted the decision and returned to his prosperous law practice. On his death he left his large fortune to establish a free public library for New York City.

tile Thin, flat slab or block used structurally or decoratively in building. Tiles traditionally have been made of glazed or unglazed fired clay, but modern tiles are also made of plastic, glass, asphalt, and even cork. Ceramic tiles, used for walls, floors, and countertops, are usually machine-pressed, made of fine clays, and very hard. Quarry tiles (used for flooring) and terra-cotta, made of natural clays, are less hard and more porous but very popular for economic and aesthetic reasons. Structural tile, made of fired clay, is a hollow tile containing parallel cells or cores and is used for building partitions. Roof tiles of baked clay and of marble were used in ancient Greece. Tiles came to be widely used in Islamic architecture. Multicoloured, glazed tiles were common in Spain from an early period (see azulejo), and from there spread to Portugal and Latin America. By the 15th century, tilework was used widely in northern Europe; blue-painted tiles from Delft, Holland, were especially renowned. Modern clay roofing tiles may be flat or curved; in the Mediterranean countries, S-shaped tiles (pantiles), laid with alternate convex and concave surfaces uppermost, are common. Modern wall tiles may be highly glazed and semivitreous.

tilefish *or* **blanquillo** \blāŋ-ˈkē-ˌyō\ Any of 24 species (family Branchiostegidae, or Malacanthidae) of slender marine fishes found in shallow tropical and warm temperate seas. Tilefish are used as food, especially the large *Lopholatilus chamaeleonticeps*, a deepwater fish of the Atlantic and Gulf of Mexico with a fleshy appendage on the head and yellow spots on its upper body and some of its fins. Tilefish have a large oblique mouth with strong canines and one rather long dorsal fin with weak spines.

till In geology, the unsorted material deposited directly by glacial ice and showing no stratification. Till is sometimes called boulder clay because it is composed of clay, boulders of intermediate size, or both. The rock fragments are usually angular and sharp rather than rounded, because they are deposited from ice and have undergone little water transport. The pebbles and boulders may be faceted and striated from grinding while lodged in the glacier.

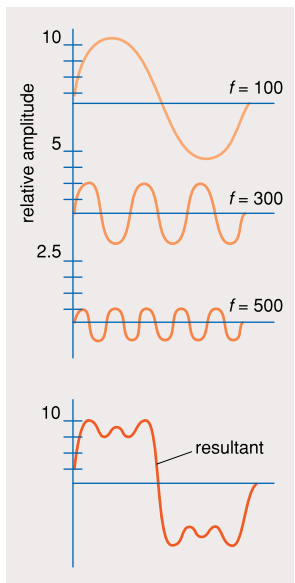
till-less agriculture See no-till farming

Tillich \ˈti-likˌ\ *English* \ˈti-lik**, Paul (Johannes)** (b. Aug. 20, 1886, Starzeddel, Brandenburg, Ger.—d. Oct. 22, 1965, Chicago, Ill., U.S.) German-born U.S. Protestant theologian. He studied at Berlin, Tübingen, and Halle and was a chaplain with the German army during World War I. He taught successively at Marburg, Dresden, and Frankfurt am Main. In 1933 the Nazi takeover prompted him to immigrate to the U.S. With the aid of Reinhold Niebuhr, he joined the faculty of New York's Union Theological Seminary. He became respected for his lucid preaching and his *Systematic Theology*, 3 vol. (1951–63). He moved to Harvard University in 1955 and to the University of Chicago in 1962. His theological system was an unusual combination of biblical, existentialist, and metaphysical elements, and he attempted to convey an understanding of God that depended neither on revelation nor on science. His other works include *The Courage to Be* (1952) and *Dynamics of Faith* (1957).

Tillman, Benjamin R(yan) (b. Aug. 11, 1847, Edgefield county, S.C., U.S.—d. July 3, 1918, Washington, D.C.) U.S. politician. He worked as a farmer and in the 1880s was a spokesman for poor rural whites. As governor (1890–94), he introduced populist reforms that expanded public education, shifted the tax burden to the wealthy, and regulated the railroads. He also supported enactment of Jim Crow laws and considered lynching an acceptable law-enforcement measure. In the U.S. Senate (1895–1918), he pressed for agrarian reform. His attacks on his opponents earned him the nickname "Pitchfork Ben."

Tilly, Johann Tserclaes, count von (b. February 1559, Tilly, Brabant, Spanish Netherlands—d. April 30, 1632, Ingolstadt, Bavaria) Bavarian general in the Thirty Years' War. He gained military experience in the Spanish Army of Flanders fighting under Alessandro Farnese (1585) against the Dutch and in 1594 joined the emperor Rudolf II's army against the Turks. Appointed by Maximilian I of Bavaria to reorganize the Bavarian army (1610), Tilly created an efficient force that became the spearhead of the Catholic League in the Thirty Years' War. He led the League's forces to victories in the Battle of White Mountain (1620) and at Lutter (1626). In 1630 he added the imperial forces to his command. In 1631 he besieged the Protestant city of Magdeburg, but its destruction proved disastrous for him. Failing to stop the Swedish advance into Germany, he was defeated at Breitenfeld (1631) and was fatally wounded in a later battle.

Tilsit \ˈtil-zit**, Treaties of** (1807) Agreements that France signed separately with Russia and Prussia at Tilsit, northern Prussia (now Sovetsk, Russia). The treaties followed Napoleon's victories in the Napoleonic



© 2006 Encyclopædia Britannica, Inc.

Wars and established his supremacy in western and central Europe. France and Russia became allies and divided Europe between them, reducing Prussia and Austria to helplessness. In secret provisions, Russia joined the Continental System against British trade. By 1810 Russian trade was hampered and the tsar opened Russian ports to neutral ships, causing the alliance to fail and paving the way for Napoleon's invasion of Russia in 1812.

tilth Physical condition of soil, especially in relation to its suitability for planting or growing a crop. Factors that determine tilth include the formation and stability of aggregated soil particles, moisture content, degree of aeration, rate of water infiltration, and drainage. The tilth of a soil can change rapidly, depending on environmental factors such as changes in moisture. The objective of tillage (mechanical manipulation of the soil) is to improve tilth, thereby increasing crop production; in the long term, however, conventional tillage, especially plowing, often has the opposite effect, causing the soil to break down and become compacted.

timber framing Construction of frame or post-and-beam structures using large, heavy, wood members, specifically lumber 5 in. (13 cm) or more in the least dimension. The term implies stylistic features of a heavy nature. Half-timber work, in which the spaces between the heavy visible frames of interior and exterior walls are filled in with (nonstructural) material such as brick, plaster, or mud, was common in Asia and Europe. Half-timbering found its highest expression in the Tudor style. See also framed structure, post-and-beam system.

timbre \'tam-bər\ Quality of sound that distinguishes one instrument, voice, or other sound source from another. Timbre largely results from a characteristic combination of overtones produced by different instruments. This distinctive combination (which usually varies across the range of pitches) is what principally permits a listener to distinguish a clarinet from a flute, an alto from a tenor, or even a Stradivarius violin from a Guarneri violin, when both are sounding the same pitch. One element of timbre results from the differing methods of producing the sounds (blowing, bowing, striking, etc.), especially audible at the moment a note begins.

A mixture of three pure tones (top) yields a complex resultant tone (bottom), such as might be produced by an actual instrument, whose perceived quality, or "colour," is its timbre. The strong fundamental tone (top)—which would be perceived by the listener as the only tone played—has a frequency of 100. The other tones shown, with frequencies of 300 and 500, are weaker overtones of the fundamental; their relative loudness (amplitude), reflected in the complex resultant wave form, constitutes an essential aspect of the unique timbre the wave form represents.

© MERRIAM-WEBSTER INC.

Timbuktu *French* **Tombouctou** Town (pop., 1998: 32,000), Mali, on the southern edge of the Sahara near the Niger River. Founded c. AD 1100 by Tuareg nomads, it became an important post on the trans-Saharan caravan routes. After it was incorporated within the Mali empire, probably in the late 13th century, it became a centre of Islamic culture (c. 1400–1600). It reached its apex as a commercial and cultural centre under Songhai rule c. 1500 but declined rapidly after being conquered by Moroccan forces in the late 16th century. The French captured it in 1894. It became part of independent Mali in 1960. The city was designated a UNESCO World Heritage site in 1988.

time Measured or measurable period. More broadly, it is a continuum that lacks spatial dimensions. Philosophers have sought an understanding of time by focusing on the broad questions of the relation between time and the physical world and the relation between time and consciousness. Those who adopt an absolutist theory of time regard it as a kind of container within which the universe exists and change takes place, and believe that its existence and properties are independent of the physical universe. According to the rival relationist theory, time is nothing over and above change in the physical universe. Largely because of Albert Einstein, it is now held that time cannot be treated in isolation from space (see space-time). Some argue that Einstein's theories of relativity vindicate relationist theories, others that they vindicate the absolutist theory. The primary issue concerning the relation between time and consciousness is the extent, if any, to which time or aspects of time depend on the existence of conscious beings. Events in time are normally thought of in terms of notions of past, present, and future, which some philosophers treat as mind-dependent; others believe that time is independent of perception and hold that past, present, and future are objective features of the world. See also geologic time, Greenwich Mean Time, standard time, Universal Time.

Time Major U.S. weekly newsmagazine, published in New York City. It was founded in 1923 by Henry R. Luce (as business manager) and Briton Hadden (as editor). It became the most influential newsmagazine in the U.S., with a format of short articles arranged in subject "departments," which became the standard for later general newsmagazines. After Hadden's death in 1929, Luce was long the magazine's guiding force, and it reflected his moderately conservative political viewpoint. By the 1970s it had assumed a more neutral, centrist stance in its reportage. In addition to the U.S. circulation, editions are published in Canada, Europe, Asia, and the Pacific.

time-and-motion study Analysis of the time spent in going through the different motions of a job or series of jobs in the evaluation of industrial performance. Such studies were first instituted in offices and factories in the U.S. in the early 20th century. They were widely adopted as a means of improving work methods by subdividing the different operations of a job into measurable elements, and they were in turn used as aids in standardization of work and in checking the efficiency of workers and equipment.

time dilation In the theory of special relativity, the "slowing down" of a clock as perceived by an observer in relative motion with respect to that clock. Time dilation becomes noticeable only at speeds approaching that of light and has been accurately confirmed by the apparent increased lifetime of unstable subatomic particles traveling at nearly the speed of light and by the precise timing of atomic clocks carried on airplanes. See also Lorentz-FitzGerald contraction.

Time of Troubles See Time of Troubles

Time Warner Inc. Largest media and entertainment conglomerate in the world. The corporation resulted from the merger of media giant Time Warner Inc. and the online company America Online, Inc., in 2001; originally named AOL Time Warner, the corporation dropped AOL from its name in 2003. Major media outlets include the magazines *Time*, *Sports Illustrated*, and *People* and the cable and broadcast television networks HBO, CNN, TBS, and WB. From its start as a bulletin-board system in 1985, AOL grew to become the world's largest Internet service provider by the mid 1990s. The Internet "stock bubble" of the late 1990s enabled it to acquire the much larger Time Warner Inc. See also Warner Bros.

Times, The Daily newspaper published in London, one of Britain's oldest and most influential, and one of the world's greatest newspapers. Founded by John I. Walter in 1785 as *The Daily Universal Register*, it became *The Times* in 1788, publishing commercial news and notices along with some scandal. By the mid-1800s it had developed into a widely respected national journal and daily historical record. Late in the 19th century its reputation and circulation declined, but it returned to financial security after being bought by Alfred Harmsworth, 1st Viscount Northcliffe (1908), and its preeminence in editorial matters and news coverage was reestablished under the editorship of William Haley (1952–67). In 1981 it was bought by Rupert Murdoch's News Corporation.

Times Literary Supplement (TLS) Weekly literary journal long famous for its coverage of all aspects of literature. Founded in 1902 as a supplement to *The Sunday Times* of London, the TLS sets the tone and standards of excellence in the field of literary criticism. It presents reviews of major books of fiction and nonfiction published in several languages, and its essays are written with sophistication and scholarly authority and in a lively style. It is also noted for its bibliographic thoroughness, for its topical essays by the world's leading scholars, and for the erudition of its readers' published letters to the editor. See also *The* Times.

© 2006 Encyclopædia Britannica, Inc.

Timiş \'tē-ˌmēsh\ **River** *Serbo-Croatian* **Tamiš** \'te-ˌmesh\ River, western Romania and northeastern Serbia and Montenegro. Rising at the western end of the Southern Carpathians, it flows in an arc to enter the Danube River just east of Belgrade after a course of 211 mi (340 km).

Timişoara \ˌtē-mē-'shwä-rä\ City (pop., 2002: 317,651), western Romania. Located near the Timiş River, it was first settled in Neolithic and Roman times. It was sacked by the Tatars in the 13th century. Its citadel was rebuilt in the 14th century and for a few years became the residence of Charles I of Hungary. The Turks held the town from 1552 until the Austrians took it in 1716. Occupied by Serbia in 1919, Timişoara was allotted to Romania by the 1920 Treaty of Trianon. Antigovernment demonstrations there in 1989 led to the execution of Pres. Nicolae Ceauşescu and the end of communist rule in Romania. It is a manufacturing, commercial, and cultural centre.

Timoleon \ti-'mō-lē-ən\ **of Corinth** (d. after 337 BC) Greek statesman and general. When the city of Syracuse called to its mother city, Corinth, for help in overthrowing its tyrant, Dionysius the Younger, Timoleon was chosen to lead the liberation force. By shrewd tactics he defeated the combined forces of the oppressor and his Carthaginian allies, who he confined to the western end of the island. He introduced constitutional safeguards and invited more Greek immigration. He retired in 337.

Timor \'tē-ˌmȯr, tē-'mȯr\ Island, southern Malay Archipelago. It is the easternmost of the Lesser Sunda Islands. Indonesian-Malay peoples live along the coast and Melanesian aboriginals in the mountains. They speak dozens of Papuan and Malayan languages, as well as Portuguese in the east and Indonesian in the west. The Portuguese began trading with Timor c. 1520. In 1613 the Dutch settled at the island's southwestern tip, and the Portuguese moved to the north and east. Treaties in 1860 and 1914 divided the island between them. Netherlands Timor (West Timor) was occupied by the Japanese in World War II; in 1950 the Dutch transferred it to Indonesia. East Timor was held by the Portuguese until 1975, when Indonesian troops invaded and annexed the area; it achieved full sovereignty in 2002 (see East Timor).

timothy Perennial grass (*Phleum pratense*) of the family Poaceae (or Gramineae), native to Europe and widely cultivated as a hay and pasture grass in North America. The stems grow in large clumps, are 1.5–3 ft (0.5–1 m) tall, and have swollen, bulblike bases. The flower clusters are long, dense, and cylindrical. Alpine, or mountain, timothy (*P. alpinum*) is about half as tall and occurs in wet areas from Greenland to Alaska, and at high altitudes in many other parts of North America and Europe.

timpani \'tim-pə-nē\ *or* **kettledrums** Large bowl-shaped drums with pedal mechanisms for altering their pitch by changing the membrane's tension. The timpani are the principal orchestral percussion instruments. Each drum usually has a range of a fifth; they are classically used in pairs. Until c. 1800 each drum was tuned to a single pitch (usually tonic or dominant) that could not be altered in performance. Primitive kettledrums, or *naker*s, were played on horseback by Middle Eastern cavalry. In Europe they were primarily associated, in tandem with the trumpets, with court ceremony and the military. They entered the orchestra in the mid-17th century.

Modern timpani with pedal-controlled tension

Timpanogos Cave National Monument \ˌtim-pə-'nō-gəs\ Cave system, Utah, U.S. Located on the northwestern slope of Mount Timpanogos (11,750 ft [3,581 m]), the second highest peak of the Wasatch Mountains, it was established in 1922; it occupies 0.4 sq mi (1 sq km). It centres around a three-chambered limestone cave noted for its pink and white crystal-filigreed walls and tinted formations.

Timur \tē-'mür\ *or* **Tamerlane** \'ta-mər-ˌlān\ *or* **Tamburlaine** (b. 1336, Kesh, near Samarkand, Transoxania—d. Feb. 19, 1405, Otrar, near Chimkent) Turkic conqueror of Islamic faith whose conquests reached from India and Russia to the Mediterranean Sea. Timur took part in campaigns in Transoxania with Chagatai, a descendant of Genghis Khan. (Timur Lenk, or Tamerlane, means "Timur the Lame," reflecting the battle wounds he received.) Through machinations and treachery he took over Transoxania and proclaimed himself the restorer of the Mongol empire. In the 1380s he began his conquest of Iran (Persia), taking Khorāsān and eastern Iran in 1383–85 and western Iran as far as Mesopotamia and Georgia in 1386–94. He occupied Moscow for a year. When revolts broke out in Iran, he ruthlessly suppressed them, massacring the populations of whole cities. In 1398 he invaded India, leaving a trail of carnage. Next he marched on Damascus and Baghdad, deporting the artisans of the former to Samarkand and destroying all the monuments of the latter. In 1404 he prepared to march on China but died early in the march. Although Timur strove to make Samarkand the most splendid city in Asia, he himself preferred to be always on the move. His most lasting memorials are the architectural monuments of Samarkand and the dynasty he established, under which Samarkand became a centre of scholarship and science.

tin Metallic chemical element, chemical symbol Sn, atomic number 50. It is a soft, silvery white metal with a bluish tinge, employed since antiquity in the traditional form of bronze, its alloy with copper. It occurs chiefly as the dioxide (stannic oxide, SnO_2) in cassiterite. Since it is nontoxic, ductile, malleable, and easily worked, it is used to plate steel cans ("tin cans") for use as food containers and to coat and plate other items. Pure tin is too weak to be used alone, but its many alloys include soft solder, pewter, bronze, and low-temperature casting alloys. It has valence 2 or 4 in compounds, including stannous chloride (used in tin galvanizing and manufacturing polymers and dyes), stannous oxide (used to make tin salts for chemical reagents and plating), stannous fluoride (used as an anticavity ingredient in toothpastes), stannic chloride (a stabilizer for perfumes and a source of other tin salts), and stannic oxide (a catalyst and a polishing powder for steel). Tin bonds with carbon to form organotin compounds, used to stabilize PVC and in biocides and fungicides.

Tin Pan Alley Genre of U.S. popular music that arose in New York in the late 19th century. The name was coined by the songwriter Monroe Rosenfeld as the byname of the street on which the industry was based—28th Street between Fifth Avenue and Broadway in the early 20th century, around Broadway and 32nd Street in the 1920s, and ultimately on Broadway between 42nd and 50th Streets. "Tin pan" referred to the sound of pianos furiously pounded by "song pluggers" demonstrating tunes to publishers. The genre comprised the commercial music of writers of ballads, dance music, and vaudeville songs, and its name eventually became synonymous with U.S. popular music. Its demise resulted from the rise of film, audio recording, radio, and TV, which created a demand for more and different kinds of music, and the growth of commercial songwriting centres in cities such as Hollywood and Nashville.

Tinbergen \'tin-ˌber-kən**, Jan** (b. April 12, 1903, The Hague, Neth.—d. June 9, 1994, The Netherlands) Dutch economist noted for his development of econometric models. For 40 years (1933–73) he taught at The Netherlands School of Economics. As economic adviser to the League of Nations (1936–38), he studied the economic development of the U.S. from 1919 to 1932, work that provided a basis for his development of business cycle theory and methods of economic stabilization. In 1969 he shared with Ragnar Frisch the first Nobel Prize in Economic Sciences. Nikolaas Tinbergen was his brother.

Tinbergen, Nikolaas (b. April 15, 1907, The Hague, Neth.—d. Dec. 21, 1988, Oxford, Eng.) Dutch-born British zoologist, a founder (with Konrad Lorenz) of the science of ethology. Brother of Jan Tinbergen, he received his Ph.D. from the University of Leiden and taught there until 1949, when he took a position at Oxford University. He emphasized the importance of both instinctive and learned behaviour to survival and used animal behaviour as a basis for speculation on human violence and aggression. His observations of seagulls led to important generalizations on courtship and mating behaviour. From the 1970s he and his wife, Elizabeth, studied human behavioral disorders, particularly autism. With Lorenz and Karl von Frisch he shared a Nobel Prize in 1973.

Tinguely \ta^{n}-'glē**, Jean** (b. May 22, 1925, Fribourg, Switz.—d. Aug. 30, 1991, Bern) Swiss sculptor and experimental artist. As a student of

© 2006 Encyclopædia Britannica, Inc.

painting and sculpture in Basel, he showed interest in movement as an artistic medium, and in 1953 he moved to Paris and began to construct sophisticated KINETIC SCULPTURES. He created a sensation when his self-destroying *Homage to New York* (1960) failed to self-destruct at the Museum of Modern Art, New York City; his *Study for an End of the World* (1961) detonated successfully. Tinguely's art satirized the mindless overproduction of material goods in advanced industrial society and expressed his conviction that the essence of both life and art consists of continuous change, movement, and instability.

tinplating Applying a coating of TIN to thin STEEL sheet either by dipping in molten metal or by electrolytic deposition (ELECTROPLATING); almost all tinplate is now produced by the latter process, in which the tin coating is applied without heat. Essentially a sandwich in which the core is strip steel, tinplate has the strength and formability of steel combined with the noncorrosive and nontoxic properties of tin, and additionally is easy to solder. It is used for containers for food and beverages, paints, oils, tobacco, and numerous other products, as well as in toys, baking equipment, and parts for radio and other electronic equipment. Modern materials, including stainless steel and plastics, have replaced tinplate in many common applications.

Tintoretto *orig.* **Jacopo Robusti** (b. c. 1518, Venice, Republic of Venice—d. May 31, 1594, Venice) Italian painter. His father was a silk dyer (*tintore*); hence the nickname Tintoretto ("Little Dyer"). His early influences include MICHELANGELO and TITIAN. In *Christ and the Adulteress* (c. 1545) figures are set in vast spaces in fanciful perspectives, in distinctly Mannerist style. In 1548 he became the centre of attention of artists and literary men in Venice with his *St. Mark Freeing the Slave*, so rich in structural elements of post-Michelangelo Roman art that it is surprising to learn that he had never visited Rome. By 1555 he was a famous and sought-after painter, with a style marked by quickness of execution, great vivacity of colour, a predilection for variegated perspective, and a dynamic conception of space. In his most important undertaking, the decoration of Venice's Scuola Grande di San Rocco (1564–88), he exhibited his passionate style and profound religious faith. His technique and vision were wholly personal and constantly evolving. Historians of modern art recognize him as the greatest representative of MANNERISM, interpreted in accordance with the great tradition of Venice.

Tipitaka See TRIPITAKA

Tippecanoe \ˌti-pə-kə-ˈnü**, Battle of** (Nov. 7, 1811) Victory by U.S. troops over the SHAWNEE. Gen. WILLIAM H. HARRISON led a U.S. force in pursuit of the Shawnee to destroy an intertribal alliance promoted by TECUMSEH and his brother, The PROPHET. At the Indian capital of Prophetstown on the Tippecanoe River in Indiana, the Indians attacked the troops but were repulsed. Both sides suffered equal losses, but the battle was considered a victory for Harrison and helped establish him as a national figure.

Tippett \ˈtip-ət**, Sir Michael (Kemp)** (b. Jan. 2, 1905, London, Eng.—d. Jan. 8, 1998, London) British composer. Tippett studied composition (1923–28) at the Royal College of Music. His early music was conservative, but in the late 1930s he developed a personal, modernistic idiom that was marked by rhapsodic lyricism, intricate COUNTERPOINT, and polyphonic rhythms that have a lilting, bounding quality. He devoted most of his energies to compositions with words (generally his own), including the cantatas *A Child of Our Time* (1941) and *The Mask of Time* (1984), and the operas *The Midsummer Marriage* (1952), *King Priam* (1961), *The Knot Garden* (1969), and *The Ice Break* (1976). Beginning with *King Priam*, his surging rhythms and lush harmonies gave way to a starker, more taut style. His instrumental works include symphonies and string quartets.

Tiranë *or* **Tirana** \ti-ˈrä-nə\ City (pop., 1999 est.: 279,000), capital of Albania. Founded in the early 17th century by a Turkish general, it gradually became a trading centre at the junction of roads and caravan trails. It was named the capital of Albania in 1920. In World War II Tiranë was occupied by Axis forces (1939–44). It is Albania's largest city and main industrial and cultural centre, home to the national library and theatre and site of the University of Tiranë (1957).

tire Rubber cushion that fits around a wheel and usually contains compressed air. Solid-rubber tires were used on road vehicles until they were replaced by air-filled pneumatic tires, which, although first patented by Robert Thomson (1822–1873) in 1845, came into common use only when John Dunlop (1840–1921) put them on bicycles in 1888 and the French manufacturer Michelin began to produce them for motor vehicles. The tire consisted of an inner tube containing compressed air that was covered by an outer rubber casing to provide traction. In the 1950s tubeless tires became standard on most automobiles. Improved tire construction produced the radial-ply tire.

Tiresias \tī-ˈrē-sē-əs\ In GREEK MYTHOLOGY, a blind Theban seer. In HOMER's *Odyssey* he retained his prophetic gifts even in the underworld, where ODYSSEUS was sent to consult him. His prophecy led to the tragedy of OEDIPUS. It was said that Tiresias lived for seven generations and that he was once turned into a woman for killing the female of two mating snakes; upon thereafter killing the male, he reverted to male. According to one legend, he was blinded by HERA for arguing, on the basis of his unique experience, that women derive greater pleasure from sex than men do; his gift of prophecy was a compensatory gesture from ZEUS.

Tirol *or* **Tyrol** \tə-ˈrōl, ˈtī-ˌrōl\ State (pop., 2001: 673,504), western Austria. Covering 4,883 sq mi (12,647 sq km), it consists of North Tirol and East Tirol, separated by the state of Salzburg and the Italian region of TRENTINO–ALTO ADIGE. Tirol is a mountainous area bordered by the Bavarian Alps and the Ötztaler Alps. Its capital is INNSBRUCK. Tirol came under Roman control in the 1st century BC. In the Middle Ages it was ruled by various counts and bishops until it passed to the HABSBURGS in 1363. It was the scene of revolts in 1525 during the REFORMATION, and again in 1809 against French and Bavarian rule. The southern Tirol was transferred to Italy in 1919. Renowned for its skiing, it attracts many tourists.

Tirpitz \ˈtir-pəts**, Alfred von** (b. March 19, 1849, Küstrin, Prussia—d. March 6, 1930, Ebenhausen, near Munich, Ger.) German naval commander. The son of a Prussian civil servant, he enlisted in the Prussian Navy in 1865, attended the Kiel Naval School, and was commissioned in 1869. As commander of a torpedo-boat flotilla, he devised new tactical principles. Promoted to rear admiral, he commanded a cruiser squadron in East Asia (1896–97). In 1897 he became secretary of state of the imperial navy department and reorganized the German navy into a formidable high-seas fleet. Promoted to grand admiral (1911), he favoured unlimited submarine warfare in World War I, but opposition to his policy led to his resignation in 1916. In 1917 he cofounded the patriotic Fatherland Party.

Tirso de Molina \ˈtir-sō-dā-mə-ˈlē-nə\ *orig.* **Gabriel Téllez** (b. March 9?, 1584, Madrid, Spain—d. March 12, 1648, Soria) Spanish playwright. As a friar of the Mercedarian Order from 1601, he wrote its official history (1637). Inspired by LOPE DE VEGA, he drew upon a wide range of sources and styles for his dramas. Tirso wrote a vast number of works, of which only about 80 have survived. His best-known play, the tragedy *The Seducer of Seville* (1630), introduced the legendary hero-villain DON JUAN. Noted for portraying the psychological conflicts of his characters, he also wrote the tragedy *The Doubted Damned* (1635) and *Antona García* (1635), which analyzed mob emotion. Though he also excelled in comedy, he was the greatest Spanish tragedian of his time.

tirtha \ˈtir-tə\ In HINDUISM, a holy river, mountain, or other place made sacred through association with a deity or saint. Such sites are often the destination of pilgrims and the venue for large religious festivals. A Hindu will make such a pilgrimage as an act of devotion, to carry out a vow, to appease a deity, or to seek prosperity. On reaching a tirtha, the pilgrim will usually bathe, circle the temple or shrine, make an offering, have his name recorded by the tirtha priests, and listen to evening music and religious discourses.

Tirthankara \tir-ˈtəŋ-kə-rə\ *or* **Jina** \ˈji-nə\ In JAINISM, a saviour who has succeeded in crossing over life's stream of rebirths and has made a path for others to follow. Each cosmic age produces 24 Tirthankaras; the first are giants, but, as the age proceeds, they decrease in stature and appear after shorter intervals of time. Of the 24 Tirthankaras of the present age, each of whom is represented by a symbolic colour and emblem, only PARSHVANATHA and MAHAVIRA are considered actual historical figures. The Tirthankaras are not worshiped as gods but rather honoured as exemplars. See also ARHAT; BODHISATTVA; SAMSARA.

Tiryns \ˈtir-ənz, ˈtīr-ənz\ Ancient city, eastern PELOPONNESE, southern Greece. Inhabited from Neolithic times, it developed as an important MYCENAEAN centre in the Bronze Age, reaching its height c. 1400 BC. It declined as ARGOS grew in power after 1100 BC. The Argives destroyed it c. 468 BC. Ruins of its palace and massive walls date from the 15th–12th centuries BC. The term *cyclopean masonry* derives from the huge stones used in its construction, supposedly by the CYCLOPS for PROTEUS. The city is also connected with PERSEUS and HERACLES.

© 2006 Encyclopædia Britannica, Inc.

Tishtrya \'tish-trē-ə\ Ancient Iranian god identified with the star Sirius. His principal myth involves a battle with a demonic star named Apausha over rainfall and water. As one of the stars that cause rain, Tishtrya was intimately connected with agriculture.

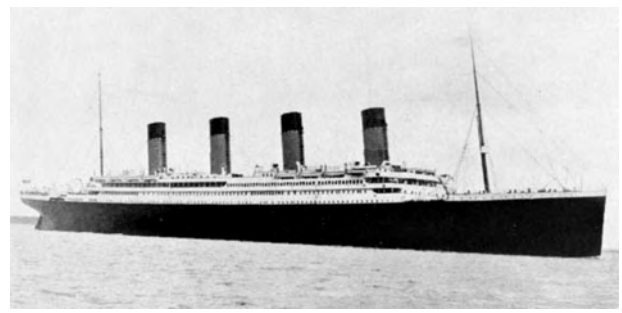
tissue culture Biological research method in which tissue fragments (a cell, a population of cells, or all or part of an organ) are sustained in an artificial environment for examination and manipulation of cell behaviour. It has been used to study normal and abnormal cell structure; biochemical, genetic, and reproductive activity; metabolism, functions, and aging and healing processes; and reactions to physical, chemical, and biological agents (e.g., drugs, viruses). A tiny sample of the tissue is spread on or in a culture medium of biological (e.g., blood serum or tissue extract), synthetic, or mixed origin having the appropriate nutrients, temperature, and pH for the cells being incubated. The results are observed with a microscope, sometimes after treatment (e.g., staining) to highlight particular features. Some viruses also grow in tissue cultures. Work with tissue cultures has helped identify infections, enzyme deficiencies, and chromosomal abnormalities; classify brain tumours; and formulate and test drugs and vaccines.

Tisza \'ti-sä**, István, Count** (b. April 22, 1861, Budapest, Hung., Austrian Empire—d. Oct. 31, 1918, Budapest) Hungarian politician. He entered the Hungarian parliament in 1886 and joined his father, Tisza Kálmán, as a leader of the Liberal Party. A defender of the Austro-Hungarian dualist system of government and of Hungary's landed interests, he served as prime minister (1903–05, 1913–17). He opposed voting franchise reform and resigned over the king's 1917 decree for such reform. A supporter of the alliance with Germany in World War I, he was held responsible for his country's suffering and was assassinated by Magyar leftists.

Tisza, Kálmán (b. Dec. 16, 1830, Geszt, Hung., Austrian Empire—d. March 23, 1902, Budapest) Hungarian politician and premier (1875–90). A member of an old landowning family, he took part in the struggle for Hungarian national autonomy within the Austro-Hungarian system of dual government. After the Compromise of 1867 he formed a coalition of the nobility, business interests, and small landowners into the new Liberal Party (1875) and became prime minister. His social, political, economic, and legal reforms helped Hungary develop into a modern state. He resigned over interference from the Austrian emperor but continued as leader of the Liberal Party, with his son, István Tisza.

Tisza River *or* **Tisa** \'ti-sä\ **River** River, western Ukraine, eastern Hungary, and northern Serbia and Montenegro. Rising in the Carpathian Mountains of western Ukraine, it flows west, forming a section of the Ukraine-Romania border, then continues southwest across Hungary and into Serbia and Montenegro to empty into the Danube River above Belgrade. It is 619 mi (996 km) long. The Tiszalök Dam (1954) forms the largest reservoir in Hungary. The Tisza is navigable for light-draft boats for about 450 mi (727 km).

tit Any of several woodland and garden songbird species in the genus *Parus* (family Paridae) having a rather stout, pointed bill. The great tit (*P. major*), found in Europe, North Africa, and Asia nearly to Java, is about 6 in. (14 cm) long. It has a white face, a black head, and a black center line on its underparts, which are yellow or buffy. The best-known North American species of crested tit is the tufted titmouse (*P. bicolor*), a 7-in. (17-cm) bluish gray bird with pinkish brown flanks. See also chickadee.



Tufted titmouse (*Parus bicolor*).
DAN SUDIA-THE NATIONAL AUDUBON SOCIETY COLLECTION

Titan \'tī-tən\ In Greek mythology, any of the children of Uranus and Gaea and their descendants. There were 12 original Titans: the brothers Coeus, Crius, Cronus, Hyperion, Iapetus, and Oceanus, and the sisters Mnemosyne, Phoebe, Rhea, Tethys, Thea, and Themis. Encouraged by Gaea, the Titans rebelled against their father. Cronus deposed Uranus by castrating him, and became king himself. Cronus' son Zeus rebelled against his father, launching a struggle in which most of the Titans sided with Cronus. Zeus and his siblings finally won after 10 years, and Zeus imprisoned the Titans in a cavity below Tartarus.

Titan \'tī-tᵊn\ Largest moon of Saturn. Titan is the only satellite in the solar system known to have clouds and a dense atmosphere. It makes one rotation on its axis (about every 16 days) for each revolution around Saturn, thus always keeping the same hemisphere toward the planet. With a diameter of 3,200 mi (5,150 km), Titan is the second largest moon in the solar system; only Jupiter's Ganymede is larger. Its density (about 1.9 times that of water) implies that its interior is a mixture of rocky and icy materials, the latter likely being mostly water ice mixed with frozen ammonia and methane. Its atmosphere is about 95% nitrogen. Its surface, veiled in a thick brownish red haze, was largely a mystery until the arrival at Saturn in 2004 of the Cassini-Huygens spacecraft, which revealed a complex topography shaped by rains, winds, flowing liquids, and other processes similar to those acting on Earth's surface.

Titan rocket Any of a series of U.S. liquid-fueled rockets originally developed as intercontinental ballistic missiles (ICBMs) but also used as space launch vehicles. Titan I missiles (used 1962–65), designed to deliver a four-megaton nuclear warhead over 5,000 mi (8,000 km) to targets in the former Soviet Union, were stored in underground silos but had to be raised to ground level and fueled for launch. By 1965 they had been replaced by the much larger Titan II, which could be launched directly from its silo. With a nine-megaton warhead, Titan II was the principal weapon in the land-based U.S. nuclear arsenal until the 1980s, when it was replaced by solid-fueled ICBMs (e.g., Minuteman missiles). NASA used the Titan II to launch Gemini spacecraft in the 1960s; deactivated Titan II missiles refurbished as space launchers continued to be used into the 21st century. The Titan IV, developed in the late 1980s, has larger engines to lift heavy space cargo such as that carried by the space shuttle. Coupled with the Centaur upper-stage vehicle, it is the largest and most powerful expendable launch vehicle in the U.S.

Titanic British luxury passenger liner that sank on April 15, 1912, en route to New York from Southampton, England, on its maiden voyage. Over 1,500 of its 2,200 passengers were lost. The largest and most luxurious ship afloat, it had a double-bottomed hull divided into 16 watertight compartments. Because four of these could be flooded without endangering its buoyancy, it was considered unsinkable. Shortly before midnight on April 14, it collided with an iceberg southeast of Cape Race, Newfoundland; five compartments ruptured and the ship sank. As a result, new rules were drawn up requiring that the number of places in lifeboats equal the number of passengers (the *Titanic* had only 1,178 lifeboat places for 2,224 passengers) and that all ships maintain a 24-hour radio watch for distress signals (a ship less than 20 mi [32 km] away had not heard the *Titanic*'s distress signal because no one had been on duty). The International Ice Patrol was established to monitor icebergs in shipping lanes. In 1985 the wreck was found lying upright in two pieces at a depth of 13,000 ft (4,000 m) and was explored by American and French scientists using an unmanned submersible (see Robert Ballard).

The *Titanic*.
THE BETTMANN ARCHIVE

titanium \tī-'tā-nē-əm\ Metallic chemical element, one of the transition elements, chemical symbol Ti, atomic number 22. A silvery gray, lightweight, high-strength, low-corrosion structural metal, it is found combined in almost all rocks and soils and in plants and animals, natural waters, and deep-sea dredgings. Its chief commercial ores are ilmenite and rutile. Its alloys are used for parts for high-speed aircraft, spacecraft, missiles, and ships; in electrodes; in chemical, desalination, and food-handling equipment; and in prostheses. Its compounds, in which it has valence 2, 3, or 4, include titanium trichloride (used as a catalyst in polypropylene pro-

© 2006 Encyclopædia Britannica, Inc.

duction), titanium dioxide (extensively used as a PIGMENT—with the greatest hiding power of all white pigments—in paints, enamels, and lacquers), and titanium tetrachloride (used in skywriting, smoke screens, and as a catalyst).

Titchener, Edward Bradford (b. Jan. 11, 1867, Chichester, Sussex, Eng.—d. Aug. 3, 1927, Ithaca, N.Y., U.S.) British-U.S. psychologist. Trained in Leipzig under WILHELM WUNDT, he later taught at Cornell University (1892–1927). He helped establish experimental psychology in the U.S., and he also became the foremost proponent of structural psychology, a field concerned with the components and arrangement of mental states and processes. His principal work is *Experimental Psychology* (1901–05).

tithe Contribution of a tenth of one's income for religious purposes. The practice of tithing was established in the Hebrew scriptures and was adopted by the Western Christian church. It was enjoined by eccesiastical law from the 6th century and enforced in Europe by secular law from the 8th century. After the Reformation, tithes continued to be imposed for the benefit of both the Protestant and Roman Catholic churches. Tithes were eventually repealed in France (1789), Ireland (1871), Italy (1887), and England (1936). In Germany support for churches is collected through the personal income tax and distributed according to the individual's religious affiliation. Tithing was never part of U.S. law, but members of certain churches (e.g., the MORMONS) are required to tithe, and members of other churches may tithe voluntarily. Tithing was never accepted by the Eastern Orthodox churches.

Titian \'ti-shən\ *orig.* **Tiziano Vecellio** (b. 1488/90, Pieve di Cadore, Republic of Venice—d. Aug. 27, 1576, Venice) Italian painter active in Venice. As a young man he was taught by THE BELLINI FAMILY and worked closely with GIORGIONE. His early works are so similar in style to Giorgione's as to be indistinguishable, but soon after Giorgione's early death Titian established himself as the leading painter of the Republic of Venice. Among his most important religious paintings is the revolutionary and monumental *Assumption* (1516–18) for Santa Maria dei Frari, in which the Virgin ascends to heaven in a blaze of colour accompanied by a semicircle of angels. Titian was also interested in mythological themes, and his many depictions of Venus display his work's sheer beauty and inherent eroticism. *Bacchus and Ariadne* (1520–23), with its pagan abandon, is one of the greatest works of Renaissance art. Titian was sought after for his psychologically penetrating portraits, which include portrayals of leading Italian aristocrats, religious figures, and Emperor Charles V. He reached the height of his powers in *The Rape of Europa* (c. 1559–62), one of several paintings done for PHILIP II of Spain. He was recognized as supremely gifted in his lifetime, and his reputation has never declined.

Titicaca \ˌtē-tē-'kä-kä**, Lake** South American lake, the world's highest lake navigable to large vessels. Located in the ALTIPLANO, a high basin of the ANDES MOUNTAINS, and on the border between Peru and Bolivia, it lies at an elevation of about 12,500 ft (3,810 m). The second largest lake in South America, it covers some 3,200 sq mi (8,300 sq km) and is 120 mi (190 km) long by 50 mi (80 km) wide. A narrow strait joins the lake's two bodies of water, which have 41 islands, some densely populated. The remains of one of the oldest known American civilizations have been found in the area. Temple ruins on Titicaca Island mark the spot where, according to legend, the founders of the INCA were sent down to earth by the sun.

Tito \'tē-tō**, Josip Broz** *orig.* **Josip Broz** (b. May 7, 1892, Kumrovec, near Zagreb, Croatia, Austria-Hungary—d. May 4, 1980, Ljubljana, Yugos.) Yugoslav politician, premier (1945–53), and president (1953–80). Born to a peasant family, he fought in the Austro-Hungarian army in World War I and was captured by the Russians in 1915. While in Russia, he took part in the JULY DAYS demonstrations (1917) and joined the BOLSHEVIKS. In 1920 he returned to Croatia, where he became a local leader of the Communist Party of Yugoslavia. He rose in the party hierarchy, interrupted by a prison term (1928–34), to become its secretary-general in 1939. In World War II, Tito (a pseudonym he adopted about 1935) proved an effective leader of Yugoslav Partisans. As marshal from 1943, he strengthened communist control of Yugoslavia. As premier and president, he developed an independent form of socialist rule in defiance of the Soviet Union, pursued a policy of nonalignment, built ties with other nonaligned states, and improved relations with the Western powers. Within Yugoslavia, he established a system of "symmetrical federalism" (1974) that created equality among the six republics and Serbia's autonomous provinces (including Kosovo), while maintaining tight control to prevent separatist movements. After his death, resentment of Serbian domination led gradually to a dissolution of the federal system.

Titograd See PODGORICA

titration \tī-'trā-shən\ Process of chemical ANALYSIS in which the quantity of some constituent of a dissolved sample is determined by adding an exactly measured quantity of another dissolved substance with which it reacts in a definite, known proportion. The solution of known concentration is gradually added to the unknown solution from a burette (a long measuring tube with a valve at the bottom) until the equivalence point (end point) is reached. The amount of the unknown substance can then be calculated. The equivalence point is determined by a detectable change, for instance, of colour in an indicator substance (e.g., LITMUS) or in an electrical property. Reactions used in titration include ACID-BASE reactions, precipitations (see SOLUTION), formation of complexes, and OXIDATION-REDUCTION reactions. See also PH.

Titus *in full* **Titus Vespasianus Augustus** *orig.* **Titus Flavius Vespasianus** (b. Dec. 30, AD 39—d. Sept. 13, 81) Roman emperor (79–81). He commanded a Roman legion in Judaea under his father, VESPASIAN. After Vespasian became emperor (69), he gave Titus full command in Judaea, whereupon Titus captured and destroyed Jerusalem (70). He later took charge of the empire's general military operations. As emperor he developed goodwill in Rome for his extravagant spending; his projects included the completion of the Colosseum. He died suddenly, probably from natural causes, though there were rumours that he was poisoned by DOMITIAN.

Tiv People living along the Benue River in Nigeria. They number more than 2.5 million and speak a Benue-Congo language of the NIGER-CONGO family. The Tiv cultivate yams, millet, and sorghum. A family occupies a cluster of round huts; brothers usually live next to one another. Some Tiv have converted to Christianity, and a few have adopted Islam, but the traditional religion based on a creator-god remains strong.

Tivoli \'tē-vō-lē\ *ancient* **Tibur** Town (pop., 2001 prelim.: 46,364), LAZIO, central Italy. The site has been occupied continuously since prehistoric times. Originally an independent member of the Latin League and a rival of nearby ROME, Tivoli came under Roman influence in the 4th century BC. It received Roman citizenship in 90 BC and attained prosperity as a summer resort under the early empire. Many wealthy Romans built villas and erected temples in the vicinity, and the buildings' remains are among the most impressive to survive from antiquity. They include HADRIAN'S VILLA and the poet HORACE's Sabine farm. Tivoli is also the site of the Villa d'Este (begun AD 1550), with its magnificent gardens and unrivaled Renaissance fountains.

Tiwanaku \ˌtē-ä-wä-'nä-kō\ *or* **Tiwanacu** *Spanish* **Tiahuanaco** Major pre-Columbian ANDEAN CIVILIZATION known from the ruins of the same name near the southern shore of Lake TITICACA in Bolivia. The Tiwanaku civilization spread throughout large areas of Bolivia and Peru and parts of Argentina and Chile. The main site's earliest remains may date from c. 200 BC–c. AD 200 and its major buildings from c. AD 600 to c. 1000. Surviving artifacts include stelae, decorated pottery, and the famous Gateway of the Sun (Puerta del Sol), an ornamented doorway carved from a massive stone slab. Much of the culture's success derived from its raised-field farming technique, in which elevated planting surfaces were separated by canals that retained the sun's heat during the cold nights and kept the crops from freezing. Algae that grew in the canals was used for fertilizer. The Tiwanaku culture vanished by 1200.

tjurunga *or* **churinga** \tyu̇-'rəŋ-gə\ In native AUSTRALIAN RELIGION, a ritual object that is a representation or manifestation of a mythical being. They are symbols of communication between humans and the DREAMING. Most tjurunga are used in men's secret and sacred rituals, though some small objects figure in women's rituals and still smaller objects in men's love magic. At initiation, a boy is introduced to the rituals and tjurunga of his local descent group. Later, he receives his own tjurunga, with which he has a personal bond. At a person's death, the tjurunga is sometimes buried with the corpse.

tlachtli \'tläch-tlē\ Ball court or field used for the ritual ball game *ollama*, played throughout pre-Columbian Mesoamerica. Some myths mention the game as a symbolic contest between day and night deities. The object of the game, played in teams, was to use elbows, knees, and hips to drive the ball through the opponent's goal. The game was accompanied by heavy betting. It was extremely violent, and severe injuries were frequent,

© 2006 Encyclopædia Britannica, Inc.

despite the players' protective clothing. Losing players were apparently sometimes sacrificed, and the ball may sometimes have consisted of a human head wrapped in latex.

Tlaloc \'tlä-lōk\ Aztec rain god, highly revered and feared for his ability to bestow or withhold prosperity. Five of the 18 months of the ritual year were dedicated to him, and children were sacrificed to him during two of the months. He could send out rain, provoke drought and hunger, and cause lightning and hurricanes. Dropsy, leprosy, and rheumatism were said to be caused by Tlaloc and his fellow deities. Those who died of such illnesses, or who had been killed by lightning, were granted an eternal and blissful life in his paradise, Tlalocan.

Tlaxcala *in full* **Tlaxcala de Xicohténcatl** Town (pop., 2000: 73,213), capital of Tlaxcala state, Mexico. It is located in a mountainous region at the foot of La Malinche volcano. Settled by a Nahua people around the 14th century, it vied for power in the 15th–16th century with the Aztec city of Tenochtitlán (modern Mexico City). Though the inhabitants initially opposed Hernán Cortés, they later became his allies and aided him in his defeat of Azetec leader Montezuma II. It was a refuge for the Spaniards when they were driven out of Tenochtitlán in 1520. Cortés established the first Christian church (San Francisco) in the Americas there in 1521. The sanctuary of Our Lady of Ocotlán and archaeological ruins are nearby.

Tlaxcala \tlä-'skä-lä\ State (pop., 2000: 962,646), central Mexico. The smallest Mexican state, it consists largely of plateau and covers 1,551 sq mi (4,016 sq km); the capital is Tlaxcala town. It occupies roughly the same area as the Indian principality of Tlaxcala, which was the main Indian ally of Hernán Cortés in his conquest of Mexico. Almost exclusively agricultural, it produces cereals, raises both dairy cows and fighting bulls, and has numerous handicrafts, notably the weaving of serapes and woolen cloth.

Tlazoltéotl \ˌtlä-sōl-'tē-ō-tˀl\ Important and complex Aztec earth-mother goddess. She was known in four guises, each associated with a different stage in life. As a young woman, she was a carefree temptress. In her second form, she was the destructive goddess of gambling and uncertainty. In middle age, she was able to absorb human wrongdoing. In her final manifestation, she was a terrifying hag preying on youths. She was thought to provoke carnal lust and illicit sexual activity, but she could also grant absolution and remove corruption from the world by eating sexual filth.

Tlingit \'tliŋ-gət\ Northernmost group of Northwest Coast Indian peoples who inhabit the islands and coast of southern Alaska, U.S. The Tlingit language is thought to be related to Athabaskan. The basic social unit was the lineage, based on maternal lines of descent; clans and larger units (moieties) were also important. Each lineage had its own chief, owned and exploited lands of economic importance, and functioned as a ceremonial unit. The economy was based on salmon fishing, though sea and land mammals were also hunted. Wood, often decorated with stylized designs, was used for houses, totem poles, canoes, dishes, and other objects. The potlatch marked a cycle of rituals mourning the death of a chief. The Tlingit number about 20,000.

TM See Transcendental Meditation

TNT *in full* **trinitrotoluene** \ˌtrī-ˌnī-trō-'täl-yə-ˌwēn\ Pale yellow, solid organic compound made by adding nitrate ($-NO_2$) groups to toluene. Because TNT melts below the boiling point of water but explodes only above 464 °F (240 °C), it can safely be melted and poured into casings. It is relatively insensitive to shock and, for practical purposes, cannot be exploded without a detonator, making it the preferred chemical explosive, used in munitions and for demolition.

To-wang \'tō-'wäŋ\ *or* **Togtokhtör** \'tȯg-ˌtōk-'tůr\ (fl. 19th century) Mongolian prince who opposed Manchu rule and supported Mongolia's independence from China. Concerned with education, he set up a primary school open to commoners, had Buddhist scriptures translated into Mongol, and codified practical advice for herdspeople in a book he circulated among them. To diversify the economy, he encouraged agriculture and the production of textiles and woolen goods. His plan to build a central temple to replace 11 local temples turned his people against him; higher authorities decided in his favour, but the temple project was canceled.

toad Any member of 26 genera (order Anura) of mainly terrestrial, nocturnal, tailless amphibians. Toads have a squat body, short legs, external fertilization, and teeth in the upper jaw. They eat insects or small animals. The more than 300 species of true toads (*Bufo*) are found almost worldwide. They are 1–10 in. (2–25 cm) long and have thick, dry, often warty skin. Poison secreted by glands on the back and warts irritates the eyes and mucous membranes of predators. Some species' poison can paralyze or kill animals as large as dogs, but toads do not cause warts. Toads reproduce by laying in water two long jelly tubes containing 600–30,000 eggs. The genus *Nectophrynoides* contains the only anurans that bear live young. See also frog, horned toad.

American toad (*Bufo americanus*).
GEORGE PORTER—THE NATIONAL AUDUBON SOCIETY COLLECTION/PHOTO RESEARCHERS

toadfish Any of about 45 species (family Batrachoididae) of heavy-bodied, carnivorous, bottom-living fishes, found chiefly in the New World and mostly in warm seas. Toadfishes, up to 16 in. (40 cm) long, have a broad, flattened head, a large mouth, strong teeth, and small scales (if any). Most produce grunting or croaking sounds. The oyster toadfish (*Opsanus tau*) is common in shallow eastern North American coastal waters. Venomous toadfishes (genera *Thalassophryne* and *Daector*), of Central and South America, have venom-injecting spines on their dorsal fins and gill covers. Midshipmen (genus *Porichthys*), shallow-water American fishes, have rows of 600–840 buttonlike light organs along the body.

Oyster toadfish (*Opsanus tau*).

toadstool See mushroom

Toba dynasty See Northern Wei dynasty

tobacco Any of numerous species of plants in the genus *Nicotiana*, or the cured leaves of several of the species, used after processing in various ways for smoking, snuffing, chewing, and extracting of nicotine. Native to South America, Mexico, and the West Indies, common tobacco (*N. tabacum*) grows 4–6 ft (1–2 m) high and bears usually pink flowers and huge leaves, as long as 2–3 ft (0.6–1 m) and about half as wide. When Christopher Columbus reached the Americas, he reported natives using tobacco as it is used today, as well as in religious ceremonies. Believed to have medicinal properties, tobacco was introduced into Europe and the rest of the world, becoming the chief commodity that British colonists exchanged for European manufactured articles. Awareness of the numerous serious health risks posed by tobacco, including various cancers and a range of respiratory diseases, has led to campaigns against its use, but the number of tobacco users worldwide continues to rise. The World Health Organization estimates that smoking now causes three million deaths annually and within two decades will cause more deaths than any single disease.

Tobago See Trinidad and Tobago

Tobey, Mark (b. Dec. 11, 1890, Centerville, Wis., U.S.—d. April 24, 1976, Basel, Switz.) U.S. painter. He studied at the Art Institute of Chicago. In 1918 he converted to the Bahā'ī religion and his work became inspired by Asian art and thought. In the 1930s he achieved notoriety with his "white writing" paintings, consisting of a web of calligraphic marks painted in white on a gray or coloured ground (e.g., *Broadway*, 1936), which soon displaced his representational work. His style is distinguished by his use of the small format and a refined execution in watercolour, tempera, or pastel. In the 1950s he exerted much influence abroad, especially on French Tachism.

Tobit \'tō-bət\ Main character in the Bible's apocryphal book of Tobit. Tobit, a pious Jew living in exile in Nineveh, gives alms and buries the dead in accordance with Hebrew law but is struck blind in spite of his good works. Sarah, daughter of a close relative, has had seven husbands, each of whom was killed by a demon on their wedding night. The two pray for

© 2006 Encyclopædia Britannica, Inc.

deliverance, and the angel Raphael intercedes for them. Tobit regains his sight, and Sarah marries Tobit's son Tobias. The book is an effort to reconcile the evil in the world with God's justice. See also Apocrypha.

tobogganing Sport of sliding down a snow-covered hill on a toboggan, a long, flat-bottomed sled made of thin boards curved up at the front end. The word is of Algonquian origin and probably refers to a towing sled. Tobogganing as a sport appears to have originated on the slopes of Mount Royal in Montreal in the late 19th century. In the early 20th century many tobogganing chutes (3-ft-wide wood- or ice-sided channels) were built.

Tobruk *ancient* **Antipyrgos** Port city (pop., latest est.: 110,000), northeastern Libya. The site of an ancient Greek agricultural colony, it later had a Roman fortress guarding the frontier of Cyrenaica. For centuries it served as a way station on the coastal caravan route. An Italian military post by 1911, it was the scene of prolonged fighting during World War II (see North Africa campaigns). The British captured it from the Italians in 1941; it fell to a German siege in 1942 but was recaptured by the British the same year. Rebuilt after the war, it was expanded in the 1960s to include a port terminal linked by pipeline to the Sarīr oil field.

Tocantins \ˌtō-kän-ˈtēⁿs\ **River** River, east-central and northeastern Brazil. It rises in several headstreams, including the Paraná River, and flows north and west to join the Araguaia River. It again turns north and flows into the Pará River after a course of 1,677 mi (2,699 km). Frequently interrupted by rapids and waterfalls, it is mainly unnavigable.

Tocharian \tō-ˈkar-ē-ən\ **languages** *or* **Tokharian languages** Two extinct Indo-European languages, Tocharian A and Tocharian B, formerly spoken in the Tarim River Basin in China. Documents date back to ad 500–700. Tocharian literature, written in a northern Indian syllabary derived from Brahmi (see Indic writing systems), was preserved in Buddhist monasteries. Spoken at the eastern frontier of the Indo-European world, Tocharian shows the influence of Indo-Aryan and Iranian languages but seems closer to western Indo-European languages in vocabulary and grammar.

tocopherol See vitamin E

Tocqueville \ˈtōk-ˌvil, tȯk-ˈvēl**, Alexis (-Charles-Henri-Maurice Clérel) de** (b. July 29, 1805, Paris, France—d. April 16, 1859, Cannes) French political scientist, historian, and politician. Born into an aristocratic family, he entered government service by choice. After the July Revolution of 1830, his position became precarious because of his family's ties to the ousted king, and he undertook a nine-month study trip to the U.S. with his friend Gustave de Beaumont. Out of it came his best-known work, *Democracy in America*, 4 vol. (1835–40), a highly perceptive and prescient analysis of the American political and social system, as well as of the vitality, excesses, and potential future of democracy, with attention to the situation in France. He was elected to the Chamber of Deputies in 1839 and held various political offices after the Revolution of 1848. *The Old Regime and the Revolution* (1856), a pessimistic analysis of French political tendencies, was the first volume of his unfinished study of the French Revolution.

Alexis de Tocqueville, detail of an oil painting by T. Chassériau; in the Versailles Museum.
H. ROGER-VIOLLET

Tōdai Temple \ˈtō-ˌdī\ *Japanese* **Tōdai-ji** Monumental temple of the Kegon sect of Japanese Buddhism, located in Nara, Japan. The main buildings were constructed in 745–752 under the emperor Shōmu, marking the adoption of Buddhism as a state religion. The Great Buddha Hall, built within a 2-sq-mi (5-sq-km) enclosure, measured about 288 by 169 ft (88 by 52 m) and, as restored today, is the largest wooden building in the world. The 53-ft (16-m) Great Sun Buddha was installed in 752. The Shōsōin is a repository for more than 9,000 works of art from the Nara period and more than 600 personal effects of Shōmu.

Todos los Santos, Lake Lake, south-central Chile. It is located north of Puerto Montt. With neighbouring Lake Llanquihue, it is the best-known of Chilean lakes and is in a popular resort area.

tofu Soft, bland, custardlike food product made from soybeans. Believed to date from China's Han dynasty (206 bc–ad 220), tofu is today an important source of protein in the cuisines of East and Southeast Asia. It is made from dried soybeans that are soaked in water, crushed, and boiled to produce a solid pulp and liquid soy "milk." Coagulants are then added to the milk to separate the curds from the whey. The resulting soft cakes are cut into squares and stored in water.

toga Loose, draped outer garment adopted by the Romans from the Etruscans. It was originally worn by both sexes of all classes, but was gradually abandoned by women, then by labourers, and finally by patricians, but throughout the history of the empire it remained the state dress, the garment of the emperor and high officials. Made from an oval piece of fabric, the toga had voluminous folds that made activity difficult and thus became the distinctive garment of the upper classes. The colour of the toga worn depended on class, age, and the character of such special events as mourning and triumphs.

Imperial Roman toga on Tiberius (reigned ad 14–37); in the Louvre, Paris
GIRAUDON/ART RESOURCE, NEW YORK

togavirus \ˌtō-gə-ˈvī-rəs\ Any of three genera of arboviruses: *Alphavirus*, *Rubivirus* (which causes rubella), and *Pestivirus* (which infects only animals). Some *Alphavirus* species produce a severe equine encephalitis that has a mortality rate of up to 90% in horses and 10% in humans.

toggle mechanism Combination of solid, usually metallic links (bars), connected by pin (hinge) joints arranged so that a small force applied at one point can create a much larger force at another point. See also linkage.

Toghrïl Beg \tȯg-ˈrēl-ˈbeg\ (b. c. 990—d. Sept. 4, 1063, Rayy, Iran) Founder of the Seljūq dynasty. He and his brother Chagrï took refuge in Khwārezm in Central Asia after being defeated by Maḥmūd of Ghazna. Later they entered Khorāsān (northeastern Iran), where they gradually built a power base, returning to defeat Maḥmūd's son (1040). Chagrï took over Khorāsān, and Toghrïl prepared to conquer the rest of Iran. In the 1040s he extended his authority to Rayy, Hamadān, and Eṣfahān, and in 1055 he entered Baghdad, where he had been commissioned by the caliph of the ʿAbbāsid dynasty to overthrow the Shïʿite Fāṭimid dynasty. In 1060 Toghrïl crushed a rebellion in Baghdad.

Toghto \ˈtȯg-ˌtō\ (fl. 1340–55, China) High government official during the later years of China's Yuan dynasty (1206–1368). He followed his uncle as minister of the right (1340–44) and favoured a centralized approach to government. Under him, positions that had been closed to the Chinese were reopened, many literati returned to the capital, and the Chinese examination system was restored. He was called back to office for another term (1349–55), during which time he oversaw projects to reroute the Huang He (Yellow River) and to develop an apparatus for quelling the many popular uprisings of the 1350s.

Togliatti \tōl-ˈyä-tē**, Palmiro** (b. March 26, 1893, Genoa—d. Aug. 21, 1964, Yalta, Ukraine, U.S.S.R.) Italian communist leader. After serving in World War I, in 1919 he helped found the left-wing weekly *L'Ordine Nuovo* ("New Order"), which became a rallying point for the breakaway communist wing of the Socialist Party (1921). He edited the Communist Party newspaper and was a member of the party's central committee from 1924. He was in Moscow when the party was banned in Italy (1926); he remained in exile and became a member of the Comintern secretariat (1935). He returned to Italy in 1944 and served in a coa-

© 2006 Encyclopædia Britannica, Inc.

lition government as vice premier (1945). He advocated a national, democratically oriented form of communism and made the Italian Communist Party the largest in western Europe. See also DEMOCRATIC PARTY OF THE LEFT.

Togo *officially* **Togolese Republic** Republic, western Africa. Area: 21,925 sq mi (56,785 sq km). Population (2005 est.): 5,400,000. Capital: LOMÉ. It has some 30 ethnic groups; the EWE is the largest. Languages:

French (official), Ewe, other indigenous languages. Religions: Christianity (mostly Roman Catholic), traditional beliefs, Islam. Currency: CFA franc. Togo occupies a strip of land about 70 mi (115 km) wide that extends about 320 mi (515 km) inland from the GULF OF GUINEA. Regions include a swampy coastal plain, a northern savanna, and a central mountain range. The developing economy is based largely on agriculture. Chief crops are cassava, yams, corn, cotton, coffee, and cocoa. It is one of the world's leading producers of phosphates; food products, beverages, and cement are also important. Togo is a republic with one legislative house; its chief of state is the president, supported by the military, and the head of government is the prime minister. Until 1884 what is now Togo was an intermediate zone between the states of ASANTE and DAHOMEY, and its various ethnic groups lived in general isolation from each other. In 1884 it became part of the TOGOLAND German protectorate, which was occupied by British and French forces in 1914. In 1922 the League of Nations assigned eastern Togoland to France and the western portion to Britain. In 1946 the British and French governments placed the territories under UN trusteeship. Ten years later British Togoland was incorporated into the GOLD COAST, and French Togoland became an autonomous republic within the French Union. Togo gained independence in 1960. It suspended its constitution from 1967 to 1980. A constitution providing for multiparty government was approved in 1992, but the political situation remained unstable.

Togoland Former German protectorate, western Africa. Now divided between Togo and Ghana, it covered an area between the British GOLD COAST colony and French Dahomey (now Benin). It was inhabited by a mixture of EWE and other peoples. Its coastal area became a political unit of Germany in 1884; hinterland boundaries were established in 1897. In 1914 it was captured by Anglo-French forces and later divided into two administrative zones. The British zone was placed under control of the Gold Coast (now Ghana), with which it merged in 1957. The French zone became the independent Republic of Togo in 1960. Lingering sentiment for the reunification of Togoland, especially among Ewe people in Ghana, has occasionally strained relations between Togo and Ghana since independence.

Togtokhtör See TO-WANG

Tōjō Hideki \'tō-jō-hē-'dā-kē\ (b. Dec. 30, 1884, Tokyo, Japan—d. Dec. 23, 1948, Tokyo) Army general and prime minister of Japan (1941–44) during most of World War II. Under his direction, great victories were initially scored throughout Southeast Asia and the Pacific, but prolonged reverses in the Pacific and the successful U.S. invasion of the Mariana Islands resulted in his removal from office in 1944. He attempted suicide after Japan's surrender but was nursed back to health to be tried and executed as a war criminal. See also WAR CRIME.

tokamak \'tō-kə-ˌmak\ Device used in NUCLEAR-FUSION research for magnetic confinement of PLASMA. It consists of a complex system of MAGNETIC FIELDS that confine the plasma of reactive charged particles in a hollow, doughnut-shaped container. The tokamak (an acronym from the Russian words for toroidal magnetic confinement) was developed in the mid-1960s by Soviet plasma physicists. It produces the highest plasma temperatures, densities, and confinement durations of any confinement device.

Tokelau \'tō-kə-ˌlaù\ *formerly (1916–46)* **Union Group** Island territory (pop., 2000 est.: 1,458) of New Zealand, South Pacific Ocean. Located north of SAMOA, Tokelau consists of three coral atolls—Fakaofu, Nukunono, and Atafu—each with numerous low-lying islets. Originally settled by Samoans, the islands were first visited by Europeans in the 18th century. In 1863 Peruvian slave raiders abducted many islanders; the abductions and outbreaks of disease reduced the population to about 200. The British established a protectorate there in 1889. Under the name Union Islands they were part of the GILBERT AND ELLICE ISLANDS colony from 1916 to 1925, after which New Zealand was granted jurisdiction. The islands became part of New Zealand in 1948. The name Tokelau Islands was adopted in 1946; this was shortened to Tokelau in 1976. In 1994 the powers that had been held by the territory's New Zealand administrator were transferred to the local government on Tokelau.

Tokharian languages See TOCHARIAN LANGUAGES

tokonoma \ˌtō-kə-'nō-mə\ In a Japanese room, an alcove with a low platform, used for the display of a flower arrangement and hanging scroll or other art objects. A feature of the SHOIN-ZUKURI style, the tokonoma is the focal point and spiritual centre of the interior of almost every traditional Japanese house. It finds its origins in the private altar space of the ZEN Buddhist monk, which contained a hanging Buddhist scroll and a narrow wooden table with an incense burner and votive candles.

Tokugawa Ieyasu \ˌtō-kù-'gä-wä-yā-'yä-sù\ (b. Jan. 31, 1543, Okazaki, Japan—d. June 1, 1616, Sumpu) Founder of the Tokugawa shogunate (see TOKUGAWA PERIOD) and ruler of Japan (1603–16). Along with ODA NOBUNAGA and TOYOTOMI HIDEYOSHI, Ieyasu was one of the three unifiers of premodern Japan. He allied himself initially with Nobunaga; that alliance allowed Ieyasu to survive the vicissitudes of endemic warfare in Japan at that time and to slowly build up his territory. By the 1580s he had become an important DAIMYO in control of a fertile and populous HAN (domain). When Nobunaga died, Ieyasu offered a vow of fealty to Hideyoshi, who was extending his control over southwestern Japan; Ieyasu, meanwhile, enlarged his vassal force and increased his domain's productivity. In the 1590s he avoided participating in Hideyoshi's disastrous expeditions to Korea, instead consolidating his position at home. When Hideyoshi died, Ieyasu had the largest and most reliable army and the most productive and best-organized domain in Japan; he emerged as victor from the ensuing power struggle. He confiscated his enemies' lands and gave them new domains away from Japan's heartland, much of which became Tokugawa property. He received the title of SHOGUN and two years later passed the title to his son, thereby establishing it as hereditary among the Tokugawa.

Tokugawa period (1603–1867) In Japanese history, period of the military government established by TOKUGAWA IEYASU with his assumption of the title of SHOGUN in 1603. The structures Ieyasu set in place were effective for governing Japan for the next 264 years. He established his capital at Edo (modern Tokyo) and assigned DAIMYO HAN (domains) according to their friendliness or hostility toward the Tokugawa: hostile daimyo received domains on the nation's periphery, while allies and collateral houses were given domains nearer to Edo. SANKIN KOTAI, a system whereby daimyo alternated residency between Edo and their domain, also helped the shogunate keep control of the daimyo. To protect Japan from outside influences, particularly Christian missionaries, a new policy of national seclusion forbade Japanese to travel abroad and forbade foreigners to visit Japan (except for Chinese and Dutch traders, who were allowed to trade

© 2006 Encyclopædia Britannica, Inc.

only at the port of Nagasaki). Toyotomi Hideyoshi's division of society into four fixed classes was preserved, and the samurai (military) class became the civil bureaucrats, its members paid with stipends of rice. Increased travel to Edo and other cities stimulated urban development and urban culture (see Edo culture; Genroku period); the merchant class flourished. By the mid-18th century the shogunate began to suffer financially, as attempts at fiscal reform proved largely unsuccessful. During its last 30 years there were numerous peasant uprisings (see ikki) and evidence of samurai unrest. The shogunate was overthrown by the domains of Satsuma and Chōshū in 1867. See also Meiji Restoration; Oda Nobunaga.

Tokyo *Japanese* **Tōkyō** *formerly (until 1868)* **Edo** City (pop., 2003 est.: city, 8,083,980; metro. area, 12,310,000), capital of Japan. The country's largest city, it is located in east-central Honshu at the head of Tokyo Bay. The site has been inhabited since ancient times, and the small fishing village of Edo existed there for centuries before it became the capital of the Tokugawa shogunate in 1603 (see Tokugawa period). By the 19th century it was one of the largest cities in the world, with a population exceeding 1,000,000. Under the Meiji Restoration, in 1868 it replaced Kyōto as the imperial capital, and Edo was renamed Tokyo ("Eastern Capital"). A massive earthquake in the region in 1923 destroyed most of the city and killed at least 100,000 people, but most of it had been rebuilt by 1930. Much of it was again devastated by U.S. bombing during World War II and had to be reconstructed. The Summer Olympic Games were held there in 1964. Tokyo is the administrative, cultural, financial, commercial, and educational centre of Japan and the focus of an extensive urban complex that includes Kawasaki and Yokohama. Attractions include the Imperial Palace, encircled by stone-walled moats and broad gardens, and numerous temples and shrines. There are some 150 institutions of higher learning, including the University of Tokyo (1877).

Tokyo, University of State-financed university in Tokyo, the largest and most prestigious university in Japan. It was founded in 1877 and modeled on Western universities. It was destroyed in the great earthquake and fire of 1923 and reorganized following World War II. Today it has faculties of agriculture, economics, education, engineering, law, letters, medicine, pharmacology, and science, as well as a college of arts and sciences and a graduate school. Among its many research units are centres for the study of molecular and cellular biology, earthquakes, solid-state physics, cosmic radiation, oceanography, and Asian culture.

Tokyo Bay Inlet, western Pacific Ocean. Located off the east-central coast of Honshu, Japan, it is about 30 mi (48 km) long and 20 mi (32 km) wide. It provides a spacious harbour area for several Japanese cities, including Tokyo, Yokohama, and Kawasaki. A highway connecting Kawasaki with Kisarazu (pop., 2000: 122,766) on the opposite side of the bay was opened in 1997; it includes a bridge and an undersea tunnel that is 5.9 mi (9.5 km) long.

Tokyo Rose *orig.* **Ikuko Toguri** (b. July 4, 1916, Los Angeles, Calif., U.S.) U.S. broadcaster. She was visiting Japan when she was stranded at the outbreak of World War II. In 1943 she began radio announcing for a propaganda program beamed at U.S. troops, and eventually she became one of 13 women announcers, all native speakers of American English, collectively known as Tokyo Rose. After the war she was convicted of treason and served six years in a U.S. prison. Mitigating information later came to light, and she was pardoned in 1977.

Tokyo Stock Exchange Main stock market of Japan, located in Tokyo. It opened in 1878 to provide a market for the trading of government bonds newly issued to former samurai. Government bonds and gold and silver currencies initially formed the bulk of trade on the exchange, but the trading of stocks came to predominate by the 1920s and '30s. It was closed from 1945 to 1949, when it opened after being reorganized by the occupying U.S. authorities. Today it accounts for more than 90% of all securities transactions in Japan, and it is one of the world's largest marketplaces for securities. The Nikkei index is the key stock-market index in Tokyo.

Toland \'tō-lənd**, Gregg** (b. May 29, 1904, Charleston, Ill., U.S.—d. Sept. 28, 1948, Hollywood, Calif.) U.S. cinematographer. He got his start in the film industry at the age of 15, working as an office boy at the Fox studio, and he soon became a cameraman, working for Samuel Goldwyn and others in the 1930s and '40s. As director of photography for *Dead End* (1937), *Wuthering Heights* (1939, Academy Award), *The Grapes of Wrath* (1940), *Citizen Kane* (1941), and *The Best Years of Our Lives* (1946), he was noted for his brilliant use of chiaroscuro and his deep-focus camera work. He codirected the war documentary *December 7th* (1943, Academy Award) with John Ford.

Toledo City (pop., 2000: 313,619), northwestern Ohio, U.S. It is the principal Great Lakes port, located at the southwestern end of Lake Erie. The area was opened to white settlement after the 1794 Battle of Fallen Timbers. Formed by the consolidation of two villages in 1833, it figured in the so-called Toledo War of 1835–36, a bloodless dispute between Michigan Territory and Ohio over the location of their common boundary. Industrial development was spurred in the 1830s and '40s by the arrival of canals and railroads. Glassmaking, now a major industry, was introduced in the late 1880s. A major commercial, industrial, and transportation centre, it handles considerable foreign commerce, and its port is one of the world's largest shippers of bituminous coal. Its educational institutions include the University of Toledo (1872).

Toledo \tə-'lē-dō,\ *Spanish* \tō-'lā-thō\ *ancient* **Toletum** City (pop., 2001: 68,382), capital of Castile–La Mancha autonomous community, south-central Spain. On the Tagus River, it was the stronghold of the Carpentini, a powerful Iberian tribe, when it was conquered by Rome in 193 BC. In the 6th century AD it became the Visigoths' capital in Spain. Under the Moors (712–1085) it became a centre of Hebrew and Arabic culture, and it was noted for the manufacture of swords. Taken by Alfonso VI in 1085, it became the capital of New Castile and, in 1230, of the united kingdom of Castilla y León. Toledo was noted for its policy of religious tolerance toward Jews and Arabs during the 11th–15th centuries. It lost importance after Philip II moved the capital to Madrid in 1560. The French occupied Toledo during the Peninsular War (1808–14), and Nationalist forces besieged it (1936) in the Spanish Civil War. Known for its great wealth of notable architecture, the entire urban area is a national monument. It was the home of El Greco.

Toledo, councils of Eighteen councils of the Visigothic church held in Toledo, Spain, from c. 400 to 702. Most attending were bishops, with some members of the lower clergy and the nobility. The decisions often affected civil and political affairs, and nearly all were convoked by kings. At the third Council of Toledo in 589, King Recared rejected his Arian faith and accepted Catholicism, an event that led to the unification of Visigothic Spain with Catholicism as the state religion.

Toleration Act (1689) Act of the British Parliament that granted freedom of worship to Nonconformists, allowing them their own places of worship and their own teachers and preachers. The act did not apply to Catholics and Unitarians and continued the existing social and political prohibitions, such as exclusion from political office, that applied to dissenters from the Church of England.

Tolkien \'täl-ˌkēn,\ *commonly* \'tōl-ˌkin**, J(ohn) R(onald) R(euel)** (b. Jan. 3, 1892, Bloemfontein, S.Af.—d. Sept. 2, 1973, Bournemouth, Hampshire, Eng.) South African-born English novelist and scholar. A professor of Anglo-Saxon and of English language and literature at Oxford (1925–59), Tolkien achieved fame for his heroic epic *The Lord of the Rings* (1954–56), consisting of *The Fellowship of the Ring* (film, 2001), *The Two Towers* (film, 2002), and *The Return of the King*. *The Hobbit* (1937) serves as an introduction to the series, *The Silmarillion* (1977) as a "prequel." Set in the mythical past, the richly inventive tale chronicles the struggle between good and evil kingdoms to possess a magic ring that controls the balance of power in the world. In the 1960s its popularity with young people made it a sociocultural phenomenon, and starting in 2001 the release of a series of critically acclaimed films renewed interest in the epic.

toll Sum levied on users of certain roads, canals, bridges, tunnels, and other such travel and transportation infrastructure, primarily to pay for construction and maintenance. Tolls were known in the ancient world and were widely used in medieval Europe as a means of supporting bridge construction. Canal building, which became extensive in Europe in the 18th–19th centuries, was financed chiefly by tolls, and many major roads were built by private companies with the right to collect tolls. In the U.S. the National Road, built beginning in 1806, was initially financed through the sale of public land, but maintenance problems led Congress to authorize tolls. Toll roads diminished in the latter part of the 19th century, but the idea was revived with the Pennsylvania Turnpike in the 1930s, and after World War II many states built toll expressways. In many countries tolls are also used to finance long-span bridges, major tunnels, and highways. They have also been blamed for both reducing, and abetting, rush-hour traffic congestion. Canal tolls are still charged in some parts of the world, notably on the Suez and Panama canals.

Tolly, Mikhail Barclay de See Mikhail, Prince Barclay de Tolly

Tolman, Edward C(hace) (b. April 14, 1886, West Newton, Mass., U.S.—d. Nov. 19, 1959, Berkeley, Calif.) U.S. psychologist. He taught at the University of California at Berkeley (1918–54). Although he was a behaviourist, he considered classical behaviourism too reductive, and he therefore emphasized behavioral wholes and unmeasurable "intervening variables" over a strict focus on isolated reflexes. He also advanced the concept of "latent learning" (implicit, indirect learning). His major work was *Purposive Behavior in Animals and Men* (1932).

Tolstoy, Aleksey (Konstantinovich), Count (b. Sept. 5, 1817, St. Petersburg, Russia—d. Oct. 10, 1875, Krasny Rog) Russian poet, novelist, and dramatist. A distant relative of Leo Tolstoy, he held various court posts. In the 1850s he began to publish comic verse, often satirizing government bureaucracy. Among his popular historical novels is *Prince Serebrenni* (1862). His dramatic trilogy about the 16th and 17th centuries—*The Death of Ivan the Terrible* (1866), *Tsar Feodor Ioannovich* (1868), and *Tsar Boris* (1870)—is written in blank verse and contains some of Russia's best historical dramatic writing. His lyric poetry includes many love and nature poems, as well as *Ioann Damaskin* (1859), a paraphrase of St. John of Damascus's prayer for the dead.

Tolstoy, Aleksey (Nikolayevich), Count (b. Jan. 10, 1883, Nikolayevsk, Russia—d. Feb. 23, 1945, Moscow) Russian writer. Distantly related to the great novelist Leo Tolstoy, he supported the anti-Bolshevik White Army in the Russian Civil War, then emigrated to western Europe, where he wrote one of his finest works, the nostalgic, partly autobiographical *Nikita's Childhood* (1921). In 1923 he returned to Russia as a supporter of the Soviet regime. He wrote many works that are purely entertaining and, in wartime, patriotic articles. He won three Stalin Prizes, for the novel trilogy *The Road to Calvary* (1920–41), the novel *Peter the First* (1929–45), and the play *Ivan the Terrible* (1943).

Tolstoy, Leo *Russian* **Lev Nikolayevich, Count Tolstoy** (b. Sept. 9, 1828, Yasnaya Polyana, Tula province, Russian Empire—d. Nov. 20, 1910, Astapovo, Ryazan province) Russian writer, one of the world's greatest novelists. The scion of prominent aristocrats, Tolstoy spent much of his life at his family estate of Yasnaya Polyana. After a somewhat dissolute youth, he served in the army and traveled in Europe before returning home and starting a school for peasant children. He was already known as a brilliant writer for the short stories in *Sevastopol Sketches* (1855–56) and the novel *The Cossacks* (1863) when *War and Peace* (1865–69) established him as Russia's preeminent novelist. Set during the Napoleonic Wars, the novel examines the lives of a large group of characters, centring on the partly autobiographical figure of the spiritually questing Pierre. Its structure, with its flawless placement of complex characters in a turbulent historical setting, is regarded as one of the great technical achievements in the history of the Western novel. His other great novel, *Anna Karenina* (1875–77), concerns an aristocratic woman who deserts her husband for a lover and the search for meaning by another autobiographical character, Levin. After its publication Tolstoy underwent a spiritual crisis and turned to a form of Christian anarchism. Advocating simplicity and nonviolence, he devoted himself to social reform. His later works include *The Death of Ivan Ilich* (1886), often considered the greatest novella in Russian literature, and *What Is Art?* (1898), which condemns fashionable aestheticism and celebrates art's moral and religious functions. He lived humbly on his great estate, practicing a radical asceticism and in constant conflict with his wife. In November 1910, unable to bear his situation any longer, he left his estate incognito. During his flight he contracted pneumonia, and he was dead within a few days.

Toltec Nahuatl-speaking people who held sway over what is now central Mexico from the 10th to the 12th century. Whether their urban centre was Tula or Teotihuacán is a matter of dispute. In the 10th century they formed a number of small states of various ethnic origins into an empire. They introduced the cult of Quetzalcóatl, and other Toltec religious and military influences spread through the Yucatán region and were absorbed by the Maya. They were noted as builders and craftsmen; artifacts include fine metalwork, gigantic statues, and carved human and animal standard-bearers. They were succeeded by the Aztec. See also Mesoamerican civilization.

Toluca \tō-'lü-kä\ *in full* **Toluca de Lerdo** City (pop., 2000: 435,125), capital of México state, central Mexico. At an elevation of about 8,800 ft (2,680 m), it is one of the highest cities in North America. The site of the modern city, founded in 1530, was inhabited by the Otomi Indians by the 13th century. It is a commercial and communications centre in an agriculture and livestock region. Its oldest church was founded soon after the Spanish conquest and rebuilt in 1585. There are many archaeological sites in the area, including some Aztec and Toltec ruins.

toluene \'täl-yə-ˌwēn\ Colourless, flammable, toxic liquid hydrocarbon aromatic compound ($C_6H_5CH_3$), the methyl derivative of benzene. Found in coal-tar light oil and in petroleum, it is obtained chiefly from the processing of petroleum fractions. It is used as a solvent, diluent, and thinner; as an antiknock additive in airplane gasoline; and as a raw material for TNT, benzoic acid and its derivatives, saccharin, dyes, photographic chemicals, and pharmaceuticals.

tomato Any fruit of the numerous cultivated varieties of *Lycopersicon esculentum*, a plant of the nightshade family. The plant is generally much branched and has hairy, strongly odorous, feathery leaves. The drooping, clustered, yellow flowers are followed by red, scarlet, or yellow fruits, which hang from the many branches of one weak stem. The tomato fruit varies in shape from spherical to elongate and in size from 0.6 in. (1.5 cm) across to more than 3 in. (7.5 cm) across. The Spanish were bringing tomatoes from South America to Europe by the early 16th century; they were introduced to North America from Europe by the 1780s. Tomatoes are used raw, cooked as a vegetable or puree, and pickled, canned, and sun-dried. The term also applies to the fruit of *L. pimpinelli folium*, the tiny currant tomato.

Tomato (*Lycopersicon esculentum*). GRANT HEILMAN

tomato fruitworm See corn earworm

tomb Home or house for the dead. The term is applied loosely to all kinds of graves, funerary monuments, and memorials. Prehistoric tomb burial mounds, or barrows (artificial hills of earth and stones piled over the remains), were usually built around a hut containing personal effects for use in the afterlife. Burial mounds were a prominent feature of the Tumulus period in Japan (3rd–6th century); these often spectacular monuments consisted of earthen keyhole-shaped mounds surrounded by moats. Burial mounds, sometimes shaped like animals, were characteristic also of Indian cultures of eastern central North America c. 1000 BC–AD 700. With more advanced technology, brick and stone tombs appeared, often of imposing size. In Egypt tombs assumed great importance, especially in the form of pyramids. In medieval Christian thought, the tomb became a symbol of a heavenly home; this concept appeared in the Roman catacombs, whose walls display scenes of paradise. Since the Renaissance, the idea of the tomb as a home has died out in the West, except as a faint reminiscence in the mausoleums or vaults of modern cemeteries. See also beehive tomb, cenotaph, mastaba, stele.

Tomba, Alberto (b. Dec. 19, 1966, San Lazzaro di Savena, Italy) Italian Alpine skier. Tomba was born near Bologna and learned to ski there. He won three Olympic gold medals (1988, slalom and giant slalom; 1992, giant slalom), one Alpine World Cup championship (1995), and two World Championship of Skiing gold medals (1996, slalom and giant slalom). He had no success at the 1998 Olympics but won a slalom event at the World Cup in March of that year and then retired from skiing. He achieved a level of fame unusual for an Alpine skier because of his flamboyance on and off the slopes.

Tombigbee \täm-'big-bē\ **River** River, Alabama, U.S. Formed by the confluence of the river's eastern and western forks near Amory, Miss., it crosses the Alabama border west of Carrollton and flows south nearly 525 mi (845 km) to join the Alabama River and form the Mobile and Tensaw rivers. It is linked to the Tennessee River by the Tennessee-Tombigbee Waterway.

Tombstone City (pop., 2000: 1,504), southeastern Arizona, U.S. The site was named by Ed Schieffelin, who discovered silver there in 1877 after being told that all he would find would be his tombstone. By 1881 a silver rush had drawn prospectors such as Doc Holliday and Johnny

© 2006 Encyclopædia Britannica, Inc.

Ringo, who brought the town a reputation for lawlessness. Feuds were common, including the 1881 gun battle at the O.K. Corral between the Earp (see Wyatt Earp) and Clanton families. Tombstone was declared a national historic landmark in 1962.

tomography \tō-'mä-grə-fē\ Radiological technique for obtaining clear X-ray images of internal structures by focusing on a specific plane within the body to produce a cross-sectional image. It allows the examination of structures that are obscured by overlying organs and soft tissues and do not show up clearly on conventional X-ray images. See also computed axial tomography.

Tompion \'täm-pē-ən**, Thomas** (baptized July 25, 1639, Northill, Bedfordshire, Eng.—d. Nov. 20, 1713, London) British clockmaker. Working closely with Robert Hooke and Edward Barlow, he made one of the first English watches with a balance spring and patented the cylinder escapement. The most famous clockmaker of his time, he is remembered as the father of British clockmaking.

Bracket clock with oak case, ebony veneer, and gilt bronze mounts by Tompion, *c.* 1690; in the Victoria and Albert Museum, London
COURTESY OF THE VICTORIA AND ALBERT MUSEUM, LONDON

Tompkins, Daniel D. (b. June 21, 1774, Scarsdale, N.Y., U.S.—d. June 11, 1825, Staten Island, N.Y.) U.S. politician. He served on the state supreme court (1804–07). As governor (1807–17), he initiated education and penal-code reforms and helped secure state legislation outlawing slavery. An opponent of banking interests, he blocked the chartering of a bank by calling an end to the legislature's session, the only such occurrence in New York history. He was twice elected vice president with Pres. James Monroe (1817–25).

tonality Organization of music around a single pitch; more specifically, the Western system of keys that grew out of the modal music of the Renaissance in the 17th century. The term is often used to refer to the network of relationships implicit in the seven principal tones of a given key, each of which has the potential to become the tonic temporarily by means of modulation, whereby a new network of relationships arises. Because of its capacity to extend pitch relationships to remote lengths in an audibly comprehensible way, the tonal system permits the composition of music of great complexity.

Tonatiuh \tō-'nä-tē-ü\ Sun deity of the Aztecs and Nahuas. According to most myths, there were four eras that preceded the era of Tonatiuh, each of which ended by cataclysm. He was viewed as a god constantly threatened by the awesome tasks of his daily birth at sunrise, arduous journey across the sky, and death at each sunset. He was the object of human sacrifice, which was thought necessary to sustain him. Generally represented by a colorful disk, he was depicted in the center of the Aztec calendar, with his eagle's claw hands clutching human hearts.

tone In linguistics, a variation in the pitch of the voice while speaking. The term is usually applied to languages (called tone languages) in which pitch differentiates words with an identical sequences of consonants and vowels. For example, *man* in Mandarin Chinese may mean either "deceive" or "slow," depending on its pitch. In tone languages, what matters is not absolute pitch but the pitch of one word relative to another or how pitch changes within a word.

tone See pitch, timbre

Tone, (Theobald) Wolfe (b. Jan. 20, 1763, Dublin, Ire.—d. Nov. 19, 1798, Dublin) Irish republican and rebel. In 1791 he cofounded the Society of United Irishmen to work for parliamentary reform. He organized a Catholic convention of elected delegates that forced Parliament to pass the Catholic Relief Act in 1793. In 1796, seeking to overthrow English rule in Ireland, he convinced France to send an invasion force of 43 ships and 14,000 men, but the ships were dispersed by a storm. Tone again brought an Irish invasion plan to Paris in October 1797, but the principal French military leader, Napoleon Bonaparte, took little interest. In 1798, with only 3,000 men, he again attempted an invasion; captured and sentenced to hang, he committed suicide.

tone poem See symphonic poem

Tone \'tō-nā\ **River** River, central Honshu, Japan. It rises in the volcanic area of northwestern Kantō region and flows 200 mi (320 km) southeast to enter the Pacific Ocean at Chōshi. No other river in Japan has been so modified by human activity; its course has been altered and its entire length is confined by dikes. It is an indispensable source for irrigation, industry, and hydroelectricity.

Tonga *officially* **Kingdom of Tonga** Island country, South Pacific Ocean. Area: 290 sq mi (750 sq km). Population (2005 est.): 98,600. Capital: Nuku'alofa. The people are of Polynesian ancestry. Languages: Tongan, English (both official). Religions: Christianity (mostly Protestant; also Roman Catholic, other Christians); also Bahā'ī. Currency: pa'anga. Tonga comprises an archipelago of some 170 islands that extends north-south in two parallel chains for roughly 500 mi (800 km). The eastern islands are low and formed of coral limestone; those in the west are mountainous and of volcanic origin, and four of the western islands are active volcanoes. The country has a developing free-market economy based mainly on agriculture. Chief products include fish, coconuts, sweet potatoes, and bananas. Tourism also is important. Tonga is a constitutional monarchy with one legislative house; the head of state and government is the king, assisted by the privy council. Tonga was inhabited at least 3,000 years ago by people of the Lapita culture. The Tongans developed a stratified social system headed by a paramount ruler whose dominion by the 13th century extended as far as the Hawaiian Islands. The Dutch visited in the 17th century, but effective European contact dates from 1773, when Capt. James Cook arrived and named the archipelago the Friendly Islands. The modern kingdom was established during the reign (1845–93) of King George Tupou I. It became a British protectorate in 1900. This was dissolved in 1970 when Tonga, the only ancient kingdom surviving from the pre-European period in Polynesia, achieved complete independence within the Commonwealth. Tonga was at the centre of a financial scandal in the early 21st century when money in a government trust fund was lost while under the management of an American investor. This added to the country's ongoing financial problems.

Tonghak See Ch'ondogyo

Tonghak Uprising (1894) Korean peasant rebellion that sparked the Sino-Japanese War. Despite being persecuted for it, impoverished peasants turned increasingly to Tonghak ("Eastern Learning"; see Ch'ŏndogyo), a syncretic, nationalistic religion that opposed Western culture and espoused equality of all people. When demonstrations staged by Tonghak followers calling for social reform met with a negative government response, the peasantry united with them in a rebellion that succeeded in defeating government troops in southern Korea. The government called on China for aid; Japan sent in troops without being asked, and China and Japan clashed. The rebels laid down their arms to defuse tensions; nevertheless, the Sino-Japanese War ensued. The leaders of the uprising, including Ch'oe Si-hyŏng, were executed.

tongue Muscular organ on the floor of the mouth. It is important in motions of eating, drinking, and swallowing, and its complex movements shape the sounds of speech. Its top surface consists of thousands of raised projections (papillae). The receptors of taste (taste buds) are embedded in the papillae and are sensitive to four basic flavours: sweet, salty, sour, and bitter. More specific flavours are influenced by the sense of smell. The tongue's appearance (e.g., coated or red) can give clues to disease elsewhere. Disorders of the tongue include cancer (often caused by smokeless tobacco), leukoplakia (white patches), fungal infection, and congenital disorders. Different animals use the tongue to serve varied functions; for example, frogs have an elongated tongue adapted to capturing prey, the snake's tongue collects and transfers odours to a specialized sensory structure to help locate prey, and cats use their tongues for grooming and cleaning.

tongues, speaking in *or* **glossolalia** Utterances approximating words and speech that are nonetheless generally unintelligible, usually produced during states of trance or delirium. The religious interpretation of the phenomenon is that the speaker is possessed by a supernatural spirit, is in conversation with divine beings, or is the channel of a divine proclamation. Speaking in tongues occurred in ancient Greek religion and is

© 2006 Encyclopædia Britannica, Inc.

mentioned in the New Testament. According to The Acts of the Apostles, it first occurred among followers of Jesus at Pentecost and reappeared wherever conversion to Christianity occurred. St. Paul claimed to have been adept at it but urged restraint in the practice. Today it is mainly associated with charismatic Protestant movements such as Pentecostalism.

Tonkin Former French protectorate, mainland Southeast Asia, now constituting the greater part of northern Vietnam. It was part of China from the 2nd century BC until the Vietnamese won independence in the 10th century AD. The French seized the area in 1883, making it a protectorate; it was joined with other regions controlled by France in 1887 to form French Indochina. It was the chief focus in the area of anti-French fighting after World War II.

Tonkin, Gulf of Arm of the South China Sea, between northern Vietnam and Hainan Island, China. It is 300 mi (500 km) long and 150 mi (250 km) wide. In 1964 the Vietnamese reportedly fired on U.S. ships there, leading the U.S. Congress to adopt the Gulf of Tonkin Resolution that supported increased U.S. involvement in the Vietnam War.

Tonkin Gulf Resolution See Gulf of Tonkin Resolution

Tonle Sap \tōn-'lā-'sap\ Lake, western Cambodia. The largest freshwater body in mainland Southeast Asia, it receives several tributaries as well as the floodwaters of the Mekong River. During the rainy season its area increases from 1,000 sq mi (2,600 sq km) to about 9,500 sq mi (25,000 sq km). At low water it is little more than a reed-infested swamp, with channels for fishing craft. A large carp-breeding and carp-harvesting industry there supports numerous floating fishing villages. The ruins of Angkor lie near its northwestern shore.

Tönnies \'tœn-yəs**, Ferdinand (Julius)** *or* **Ferdinand (Julius) Toennies** (b. July 26, 1855, near Oldenswort, Schleswig—d. April 9, 1936, Kiel, Ger.) German sociologist. From 1881 he taught principally at the University of Kiel. In *Gemeinschaft und Gesellschaft* (1887; "Community and Society"), he explored the differences between the organic conception of society, or *Gemeinschaft* ("community," a social union based on traditional rules and a shared sense of solidarity), and the social-contract conception of society, or *Gesellschaft* ("society," a social union held together by rational self-interest). In practice, he argued, all societies show elements of both kinds of organization, because human conduct is neither wholly instinctive nor wholly reasoned.

tonsil Small mass of lymphoid tissue in the wall of the pharynx. The term usually refers to the palatine tonsils on each side of the oropharynx. They are thought to produce antibodies to help prevent respiratory and digestive tract infection but often become infected themselves (see tonsillitis), mostly in children. There are also pharyngeal tonsils, better known as adenoids, and lingual tonsils, at the base of the tongue. The last have more effective drainage than the others and are rarely infected.

tonsillitis Inflammatory infection of the tonsils, usually with hemolytic streptococci (see streptococcus) or viruses. The symptoms are sore throat, trouble in swallowing, fever, and enlarged lymph nodes on the neck. The infection, which usually lasts about five days, is treated with bed rest and antiseptic gargling. Sulfa drugs or other antibiotics are prescribed in severe bacterial infections to prevent complications. Streptococcal infection can spread to nearby structures. Complications may include abscess, nephritis, and rheumatic fever. Tonsils that become chronically inflamed and enlarged require surgical removal (tonsillectomy).

Tony Awards Annual awards for distinguished achievement in the U.S. theatre. Named for the actress-producer Antoinette (Tony) Perry (1888–1946), the annual awards were established in 1947 by the American Theatre Wing and are intended to recognize excellence in plays and musicals staged on Broadway. Awards are given for best play, best musical, best play revival, and best musical revival, and in categories such as acting, directing, music, choreography, set design, and costume design.

tool Device for making material changes on other objects, as by cutting, shearing, striking, rubbing, grinding, squeezing, measuring, or other process. A hand tool is a small manual instrument traditionally operated by the muscular strength of the user; a machine tool is a power-driven mechanism used to cut, shape, or form materials such as wood and metal. Tools are the main means by which human beings control and manipulate their physical environment.

tool and die making Industrial art of manufacturing stamping dies, plastics molds, and jigs and fixtures to be used in the mass production of solid objects. The making of dies for punch presses constitutes most of the work done in tool and die shops, and most such pressworking dies are used in the manufacture of sheet-metal parts such as the panels of an automobile body. See also machine tool.

tool steel Specialty steels that are produced in small quantities, contain expensive alloys, and are often sold only by the kilogram and by their individual trade names. They are generally very hard, wear-resistant, tough, nonreactive to local overheating, and frequently engineered to particular service requirements. They must be dimensionally stable during hardening and tempering. They contain strong carbide formers such as tungsten, molybdenum, vanadium, and chromium in different combinations, and often cobalt or nickel to improve high-temperature performance. See also high-speed steel.

Toombs, Robert A(ugustus) (b. July 2, 1810, Wilkes county, Ga., U.S.—d. Dec. 15, 1885, Washington, Ga.) U.S. politician. He was a plantation owner and a lawyer. He served in the U.S. House of Representatives (1845–53) and the Senate (1853–61), but he resigned his Senate seat to help form the Confederate States of America. Disappointed at not being chosen its president, he served briefly as secretary of state (1861). He criticized Jefferson Davis's extralegal policies during the American Civil War and after the war fled to England. He returned to Georgia in 1867 to rebuild his law practice and to help revise the state constitution and restore white supremacy.

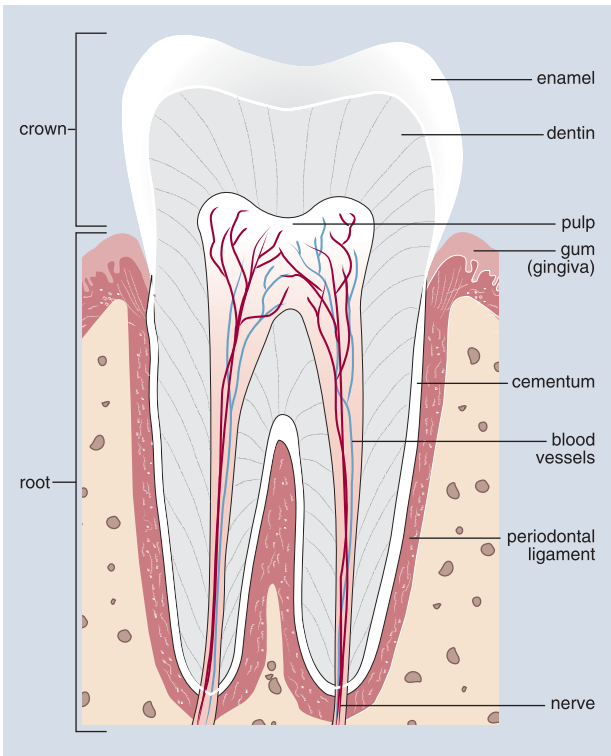
Toomer, Jean *orig.* **Nathan Eugene Toomer** (b. Dec. 26, 1894, Washington, D.C., U.S.—d. March 30, 1967, Doylestown, Pa.) U.S. poet and novelist of the Harlem Renaissance. He taught briefly before turning to writing. *Cane* (1923), considered his best work, is an experimental novel that depicts the experience of being black in the U.S.; it had a strong influence on younger black writers. He also wrote for *The Dial* and other small magazines. He visited the Gurdjieff Institute in France in 1926 and led Gurdjieff groups in Harlem and Chicago. He became a Quaker in 1940. Ambivalent about his mixed racial background and preoccupied with spiritual matters, he avoided race issues in subsequent works.

tooth Any of the hard structures in the mouth used for biting and chewing and in speech. Each consists of a crown above the gum and one or more roots below it, embedded in the jaw. Its inner pulp contains the blood and nerve supply for the bonelike dentin, covered in the crown by enamel, the hardest tissue in the body. Twenty primary (baby) teeth come in by age 2 1/2 and fall out between ages 5 and 13 to be replaced by 32 permanent teeth. The incisors, in front, are shaped mostly for biting, the pointed canines for tearing, and the premolars and molars for grinding food. The teeth are subject to caries (decay), caused by acid from bacteria in plaque, a yellowish film that builds up on teeth. Misalignment of teeth between the upper and lower jaws can grind down the teeth and cause problems in chewing. Elsewhere, it is a cosmetic problem. Both can be treated with braces. See also dentistry. See illustration on opposite page.

tooth decay See caries

toothed whale Common term for members of the cetacean suborder Odontoceti. Toothed whales have slicing teeth and a throat large enough to swallow chunks of giant squid, cuttlefish, and fish of all kinds. Included in this group are the beluga, killer whale, pilot whales, sperm whale, and mammalian dolphins, porpoises, and narwhals.

Topa See Northern Wei dynasty



topaz Aluminum silicate mineral, $Al_2SiO_4(F,OH)_2$, that is valued as a gemstone. It is formed by fluorine-bearing vapours given off during the last stages of the crystallization of igneous rocks. Pure topaz may be colourless and, when brilliant-cut, has been mistaken for diamond. It may also be various shades of yellow, blue, or brown. Imperial topaz, with vivid reddish orange colour, from Minas Gerais, Braz., is very highly valued.

Topaz from Minas Gerais state, Brazil
LEE BOLTIN

Topeka \tə-'pē-kə\ City (pop., 2000: 122,377), capital of Kansas, U.S. Situated on the Kansas River,

Cross section of an adult molar. The crown (the part of the tooth above the gum) is protected by a hard outer layer of enamel. The roots sit in a socket in the jawbone and are covered with cementum, a bonelike material. The periodontal ligament anchors the cementum in the jaw and cushions the tooth from the pressures of chewing. The tooth's main portion, the dentin, surrounds the soft pulp, which carries the blood vessels and nerves. Specialized cells of the pulp project threadlike extensions into the dentin through narrow channels and serve to form new dentin from minerals in the blood.

© MERRIAM-WEBSTER INC.

Topeka was founded in 1854 by a group of antislavery colonists and was prominent in the political conflict between proslavery groups and the antislavery Free Soil Party. In 1859 it was the headquarters for the building of the Atchison, Topeka, and Santa Fe Railway system. It has been the state capital since Kansas was admitted to the Union in 1861. The economy is based on agriculture, manufacturing, and governmental services. The Menninger family established its clinics there, making Topeka a national centre for the treatment of mental illness.

Topeka Constitution (1855) Resolution to establish an antislavery territorial government in Kansas. To counter the proslavery government established after passage of the Kansas-Nebraska Act, antislavery settlers met in Topeka to draft a constitution that banned slavery. In January 1856 they elected a free-state governor and legislature, which created two governments. Pres. Franklin Pierce condemned the Topeka document and supported the proslavery government. The U.S. House of Representatives voted to admit Kansas under the Topeka Constitution, but the Senate blocked the move. The unresolved situation led to the conflict known as Bleeding Kansas.

topiary Art of training living trees and shrubs into artificial, decorative shapes. Topiary is known to have been practiced in the 1st century AD. The earliest topiary was probably the simple development of edgings, cones, columns, and spires to accent a garden scene. This architectural use gave way to elaborate shapes such as ships, hunters, and hounds. The fashion reached its height in Britain in the late 17th and early 18th century but was displaced by the so-called natural garden.

topology \tə-'pä-lə-jē\ In mathematics, the study of the properties of a geometric object that remains unchanged by deformations such as bending, stretching, or squeezing but not breaking. A sphere is topologically equivalent to a cube because, without breaking them, each can be deformed into the other as if they were made of modeling clay. A sphere is not equivalent to a doughnut, because the former would have to be broken to put a hole in it. Topological concepts and methods underlie much of modern mathematics, and the topological approach has clarified very basic structural concepts in many of its branches. See also algebraic topology.

Torah \tō-'rä, 'tō-rə, 'tȯr-ə\ *or* **Pentateuch** \'pen-tə-ˌtük\ In Judaism, the divine revelations to Israel; specifically, the first five books of the Bible: Genesis, Exodus, Leviticus, Numbers, and Deuteronomy. By tradition their authorship has been ascribed to Moses, but biblical scholarship has shown that they were written and compiled at a much later date, probably in the 9th–5th century BC, though drawing on much older traditions. The Scroll of the Torah (Sefer Torah) is kept in the Synagogue Ark. The term Torah (but not Pentateuch) is often applied to the whole Hebrew Scripture (i.e., the later books of the Old Testament), or, even more generally, to that and other Jewish sacred literature and oral tradition.

torana \'tōr-ə-nə\ Indian gateway, usually of stone, marking the entrance to a Buddhist shrine or stupa or to a Hindu temple. Toranas typically consist of two pillars carrying two or three transverse beams that extend beyond the pillars on either side. Strongly reminiscent of wooden construction, toranas are often covered from top to bottom with exquisite sculpture. The four toranas of the Great Stupa at Sanchi (see Sanchi sculpture) are superb examples. See also torii.

Tordesillas \ˌtȯr-dā-'sēl-yäs**, Treaty of** (June 7, 1494) Agreement between Spain and Portugal aimed at settling conflicts over lands explored by voyagers of the late 15th century. In 1493 Pope Alexander VI had granted Spain all the lands west of a line 100 leagues (about 320 miles) west of the Cape Verde Islands, in return for an agreement to Christianize the peoples of the New World; Portuguese expeditions were to keep to the east. At Tordesillas (a village in Spain), ambassadors from Spain and Portugal moved that line west, thereby allowing Portugal to claim Brazil when it was discovered in 1500.

Bronze triad of Shaka with attendant figures (left figure lost) in the Tori style, Asuka period, 623; in the Hōryū-ji, Nara, Japan

COURTESY OF THE HORYU-JI, NARA, JAPAN

Tori style In Japanese art, a style of sculpture that emerged during the Asuka period (552–645) and lasted into the Nara period (710–784). Derived from the style of the Chinese Northern Wei dynasty (AD 386–534), Tori was named after a sculptor of Chinese descent whose only known piece is a Buddhist triad (623). Works in the Tori style are characterized by slender, elegant bodies, a strong linear interest in drapery, and a tendency toward squatness in the proportion of the faces and also in the relation of the body to the feet.

torii \'tȯr-ē-ˌē\ Symbolic gateway marking the entrance to Shintō shrines or other sacred spots in Japan. It has many variations, but it characteristically consists of two cylindrical posts topped by a crosswise rectangular beam extending beyond the posts on either side and a second crosswise beam a short distance below. The top beam often curves upward. Some authorities relate the torii to the Indian torana, others to Manchurian and Chinese gates. Often painted red, the torii demarcates the boundary between sacred and ordinary space.

Torii at Itsuku Island, Japan.

Tormé \'tȯr-ˌmā**, Mel(vin Howard)** (b. Sept. 13, 1925, Chicago, Ill., U.S.—d. June 5, 1999, Los Angeles, Calif.) U.S. singer, composer, and actor. Tormé began his career playing drums and singing with Chico Marx's band (1942–43). In 1943 he made his film debut in *Higher and Higher*; the same year he formed a quintet, Mel Tormé and His Mel-Tones. "Blue Moon," which he sang in the film *Words and Music* (1948), became his first solo hit and one of his signature tunes. Tormé was one of the great interpreters of ballads in JAZZ, capable of inspired improvised scat singing. As a songwriter, he is best known for "The Christmas Song." His smooth vocal timbre is reflected in his sobriquet, "the Velvet Fog."

tornado Violent, low-pressure storm, relatively small in diameter but with very rapidly rotating winds and an intense updraft near the centre. The relatively low pressure at the centre of a tornado's funnel-like vortex causes cooling and condensation, making the storm visible as a revolving column of cloud, called the funnel. Tornadoes normally travel at 30–40 mph (50–65 kph). The winds around the vortex average nearly 300 mph (500 kph) and have been known to reach 500 mph (800 kph). Tornadoes often occur in groups.

Torne River \'tȯr-nə\ *Swedish* **Torneälv** \ˌtȯr-nē-'elv\ Northernmost river of Sweden. Issuing from Torne Lake near the Norwegian border, it flows southeast and south for 354 mi (570 km) to the Gulf of BOTHNIA. The lower course, strewn with rapids and mostly non-navigable, forms a section of the Sweden-Finland boundary. It is known for its salmon.

Toronto City (pop., 2001: city, 2,481,494; metro. area, 4,682,897), capital of ONTARIO, Canada. Canada's most populous metropolitan area, it lies on the northern shore of Lake ONTARIO. Originally inhabited by SENECA tribes, its site was occupied by a tiny French fort in the mid-18th century. It was founded in 1793 as York by American colonists loyal to the British. U.S. troops pillaged it during the WAR OF 1812. In 1834 it received its city charter and current name. It became the capital of Ontario in 1867. In 1953–54 it joined neighbouring villages, towns, and townships to form the Municipality of Metropolitan Toronto. In 1967 those 13 municipalities were reduced to six (Toronto, ETOBICOKE, NORTH YORK, SCARBOROUGH, YORK, and the borough of EAST YORK), which amalgamated to form the City of Toronto in 1998. It is Canada's financial and commercial centre, the seat of the Toronto Stock Exchange, and a major international trading centre, with access to Atlantic shipping via the SAINT LAWRENCE SEAWAY and to major U.S. ports via the GREAT LAKES. It produces more than half of Canada's manufactured goods. Extensive immigration (1950s–70s) brought a variety of foreign cultures that transformed it into one of the liveliest cities on the continent. It is the site of the CN Tower (the world's tallest self-supporting man-made structure), the Hockey Hall of Fame, and the annual Canadian National Exhibition. Its educational institutions include the University of TORONTO (1827).

Toronto, University of Public university in Toronto, Ontario, Canada. It was founded in 1843 and reorganized in 1853 and 1887. It comprises nine undergraduate colleges, three formerly independent but now federated universities, four affiliated theological colleges, and numerous other academic units. It offers undergraduate, graduate, and professional degrees in all major disciplines. Notable among its research units are centres for the study of medieval culture and society, religion, Russia and eastern Europe, international relations, drama, comparative literature, biomedical engineering, history of science and technology, and aerospace science.

Toronto Star, The Canadian newspaper, generally ranked as the country's largest. Established in 1892 by 25 printers who had lost their jobs in a labour dispute, it became prosperous after its purchase in 1899 by a group of leading citizens and maintained a liberal editorial outlook, pressing for social change while promoting stronger Canadian nationhood and a greater presence in international affairs. It established its own radio station in 1922. Its outspoken opposition to Nazism made it the first North American newspaper to be banned in Nazi Germany.

torpedo Cigar-shaped, self-propelled underwater MISSILE, launched from a SUBMARINE, surface vessel, or airplane and designed to explode on contact with the hulls of surface vessels and submarines. It contains devices to control depth and direction as well as a detonator for the explosive-filled warhead. Originally the word referred to any explosive charge, including the weapon now known as a SUBMARINE MINE. The first modern torpedo (1866) carried an 18-lb (8-kg) charge of dynamite in its nose and was powered by a compressed-air engine driving a single propeller; its range was 200–700 yards (180–640 m). Torpedoes were used successfully by submarines in both world wars, when many merchant ships were sunk, mostly by German U-BOATS. Torpedoes are now usually propelled by battery-powered electric motors.

torque *or* **moment** In physics, the tendency of a force to rotate the body to which it is applied. Torque is always specified with regard to the axis of rotation. It is equal to the magnitude of the component of the force lying in the plane perpendicular to the axis of rotation, multiplied by the shortest distance between the axis and the direction of the force component. Torque is the force that affects rotational motion; the greater the torque, the greater the change in this motion.

Torquemada \ˌtōr-kā-'mä-thä**, Tomás de** (b. 1420, Valladolid, Castile—d. Sept. 16, 1498, Ávila, Castile) First grand inquisitor in Spain (1487–98). A DOMINICAN prior, he became confessor and adviser to FERDINAND V and ISABELLA I. He guided the Spanish INQUISITION, directing its persecution of Jews, Moors, and others identified as heretics, sorcerers, or criminals. Torture was used to obtain evidence, and about 2,000 people were burned at the stake during Torquemada's tenure. He probably influenced Ferdinand and Isabella in their decision to expel the Jews from Spain (1492). His name has become synonymous with the cruel fanaticism of the Inquisition.

Torre, Víctor Raúl Haya de la See Víctor Raúl HAYA DE LA TORRE

Torres Bodet \'tōr-ās-bō-'det**, Jaime** (b. April 17, 1902, Mexico City, Mex.—d. May 13, 1974, Mexico City) Mexican poet, novelist, educator, and statesman. He held various diplomatic and government posts, including minister of public education (1943–46) and foreign minister (1946–48). His verse, which early on revealed the influence of MODERNISMO, often returned to the themes of loneliness, a search for identity, and a longing for death. *Cripta* (1937) is considered to include his most important poems. His poetry was collected in *Obra poética* (1967). Of six novels published between 1927 and 1937, *Sombras* (1937) is considered his best. Afflicted by cancer, he took his own life.

Torres Strait \'tȯr-iz\ Passage between the island of NEW GUINEA and Australia's Cape YORK Peninsula. It connects the CORAL SEA and the Arafura Sea. It was discovered in 1606 by Spanish navigator Luis Vaez de Torres. About 80 mi (130 km) wide, it has many reefs, shoals, and islands, including the TORRES STRAIT ISLANDS, and is treacherous to navigate.

Torres Strait Islands Island group, in the TORRES STRAIT between AUSTRALIA and NEW GUINEA. The inhabitants are a mixture of Polynesians, Melanesians, and Aboriginals. Administratively part of QUEENSLAND, Australia, they consist of three clusters: Western (high, rocky, and barren), Central (coral), and Eastern (volcanic, with dense vegetation); each has its own local government. The islands may be remnants of a land bridge that once linked Asia and Australia. They were annexed by Queensland in the 1870s. Pearls, fishing, and tourism are the main sources of income.

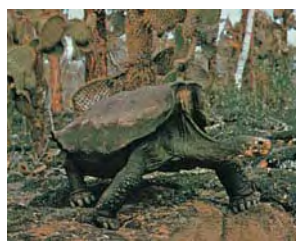
Torricelli \ˌtōr-rē-'chel-lē**, Evangelista** (b. Oct. 15, 1608, Faenza, Romagna—d. Oct. 25, 1647, Florence) Italian physicist and mathematician, inventor of the BAROMETER. He served as secretary to GALILEO during the last three months of the latter's life and was appointed to succeed him at the Florentine Academy. Two years later, pursuing a suggestion by Galileo, he filled a glass tube 4 ft (1.2 m) long with mercury and inverted the tube into a dish. He observed that some of the mercury did not flow out and that the space above the mercury in the tube was a vacuum. After much observation, he concluded that the variation of the height of the mercury from day to day was caused by changes in ATMOSPHERIC PRESSURE. He never published his findings. His work in geometry aided in the eventual development of integral calculus.

Torrijos \tōr-'ē-hōs\ **(Herrera), Omar** (b. Feb. 13, 1929, Santiago de Veragua, Pan.—d. Aug. 1, 1981, near Penonomé) Virtual dictator of Panama (1968–78). He entered the national guard in 1952 after military studies in Venezuela and the U.S., rose to the rank of general, and came

© 2006 Encyclopædia Britannica, Inc.

to power in 1968 in a coup d'état. A nationalist and populist, he was one of the few Latin American heads of state to visit Fidel Castro in Cuba, though he suppressed leftist labour agitators and students at home. In 1977 he achieved his supreme goal when U.S. Pres. Jimmy Carter signed two treaties agreeing to transfer the Panama Canal and Canal Zone to Panamanian sovereignty in 1999. He died in a plane crash while on a military inspection tour.

Tórshavn \'tȯrs-ˌhaùn\ Port town (pop., 2000: 16,673), capital of the Faeroe Islands, Denmark. Located on Strømø Island, it was founded in the 13th century. During World War II the British occupied Tórshavn as a defense against German forces in Denmark. It is home to about one-third of the population of the Faeroe Islands. Its main industries are fishing and knitwear.



torsion \'tȯr-shən\ **balance** Device used to measure the gravitational acceleration at the Earth's surface. It consists essentially of two small masses at different elevations that are supported at opposite ends of a beam. The latter is suspended from a wire that twists because the masses are affected differently by the force of gravity. When the wire is twisted, an optical system indicates the angle of deflection, and the torque, or twisting force, can be calculated. The torque is correlated with the gravitational force at the point of observation. Torsion balance may also refer to a device used in weighing, a type of equal-arm balance.

torsion bar Rod or bar that resists twisting (see torque) and has a strong tendency to return to its original position when twisted. In an automobile, a torsion bar is a long spring-steel element with one end held rigidly to the frame and the other end twisted by a lever connected to the axle. It thus provides a spring action for the vehicle.

torsk See cusk

tort Wrongful act, other than a breach of contract, that injures another and for which the law permits a civil (noncriminal) action to be brought. Relief may be obtained in the form of damages or an injunction. The term derives from Latin *tortum*, meaning "something twisted, wrung, or crooked." Assault, defamation, malpractice, negligence, nuisance, product liability, property damage, and trespass are all (apart from their potentially criminal and contractual aspects) torts.

tortoise Any of some 40 species (family Testudinidae) of slow-moving, terrestrial, herbivorous turtles, found in the Old and New Worlds but chiefly in Africa and Madagascar. Tortoises have a high, domed shell, heavy elephantlike hind legs, and hard-scaled forelegs. The four North American species (genus *Gopherus*) have a brown shell, about 8–14 in. (20–35 cm) long, and flattened forelimbs adapted for burrowing. The common, or European, tortoise (*Testudo graeca*) has a shell about 7–10 in. (18–25 cm) long. Most species of giant tortoises on the Galápagos and other islands are now rare or extinct. One captive Galápagos tortoise had a shell 4.25 ft (1.3 m) long and weighed 300 lbs (140 kg).

Galápagos tortoise (*Geochelone elephantopus*).
FRANCISCO ERIZE-BRUCE COLEMAN LTD.

torture Infliction of intolerable physical or psychological pain. Torture has been used by governments throughout history for punishment, coercion, and intimidation and for extracting confessions and information. A common practice in ancient times, it was defended by Aristotle but eloquently opposed by Cicero, Seneca, and St. Augustine. Beginning in the 12th century, torture was increasingly used in Europe; from the mid-14th through the 18th century it was a common part of the legal proceedings of most European countries. The Roman Catholic church supported its use by the Inquisition in cases of heresy. Common instruments of torture were the strappado (for repeatedly hoisting the body by the wrists behind the back and dropping it), the rack (for stretching the limbs and body), and the thumbscrew (for crushing the thumbs). By 1800 torture was illegal in many European countries, but it became common again in the 20th century, notably in Nazi Germany and the Soviet Union, and it is still widely practiced in Latin America, Africa, and the Middle East. In 1984 the United Nations adopted an international convention against torture and other forms of cruel, inhuman, and degrading treatment. By the early 21st century some 130 countries were party to the convention. The belief that only sadists are capable of committing torture was challenged by a study in the 1960s that found that ordinary people could be easily persuaded to inflict pain on others.

Tory Member of a political group in England, especially in the 18th century. Originally an Irish term for an outlaw, the name was applied as a term of abuse to those who supported the hereditary right of James, the Catholic duke of York (later James II), to succeed to the throne of England. They were opposed by the Whigs in that struggle (1679), but the Tories later modified their doctrine of divine-right absolutism. They came to represent the resistance, mainly by the country gentry, to religious toleration and foreign entanglements. The Tories' political power diminished after Viscount Bolingbroke, a leading Tory, fled to France in 1715; Tory sentiment subsequently survived in the unsuccessful Jacobite movement. After 1784, William Pitt the Younger emerged as the leader of a new Tory party, representing the country gentry, merchants, and administrators. After 1815, the party gradually evolved into the Conservative Party, whose members are still referred to as Tories.

Tosa \'tō-sä\ Historic region of the Japanese island of Shikoku. It dates at least to the Heian period, when Ki no Tsurayuki (868?–945?), editor of Japan's first imperially commissioned poetry anthology, wrote a fictional diary drawing on his experiences as governor of Tosa. In 1571 it became a unified domain (han) whose daimyo opposed Tokugawa Ieyasu when he consolidated his control of Japan in the early 17th century; this historical enmity became important at the time of the Meiji Restoration (1868), when samurai from Tosa, like those from Satsuma and Chōshū, helped overthrow the Tokugawa shogunate. See also Itagaki Taisuke; Tokugawa period.

Toscanini \ˌtäs-kə-'nē-nē**, Arturo** (b. March 25, 1867, Parma, Italy—d. Jan. 16, 1957, New York, N.Y., U.S.) Italian conductor. Toscanini entered a conservatory at age nine, studying cello, piano, and composition. He began his professional life as a cellist. After substituting for an indisposed conductor in Giuseppe Verdi's *Aïda* (Buenos Aires, 1886), he conducted in various Italian opera houses, giving the premieres of *I Pagliacci* (1892) and *La Bohème* (1896). He was appointed musical director of La Scala, Milan, in 1898, and of the Metropolitan Opera, New York City, in 1908. Principally known for his readings of Verdi's operas and Beethoven's symphonies, he also gave remarkable performances of the music of Richard Wagner. Toscanini conducted the New York Philharmonic-Symphony Orchestra from 1928 to 1936. In 1930 he became the first non-German to conduct at Bayreuth, but he stopped performing in Germany to protest Nazi policies. The NBC Orchestra was formed for him in 1937, and he conducted it until his retirement in 1954.

Tosefta \ˌtō-sef-'tä, tō-'sef-tə\ Supplements to the Mishna compiled c. AD 300. The Tosefta consists of laws attributed to the authorities named in the Mishna and generally follows the topical program and organization of the Mishna. Both works were the effort of Jewish scholars, working mostly in Palestine, who gathered, evaluated, and correlated the most important traditions from a vast and heterogeneous mass of material that had developed since the time of Ezra (c. 450 BC). The Tosefta may have been meant to complement the Mishna by preserving material that appeared marginal or contradictory.

Tostig \'täs-tig\ (d. Sept. 25, 1066, Stamford Bridge, Yorkshire, Eng.) Anglo-Saxon earl of Northumbria. He had strong ties with Norway and became earl of Northumbria in 1055; his severity in subduing the wild northern district stirred revolt in 1065. The rebels won the support of Tostig's brother Earl Harold (later Harold II) at Oxford, and Tostig went into exile. He gave his services to William I (the Conqueror) and harried the English coast, then joined Norway's king Harald III Sigurdsson in his invasion of England. Tostig was killed when his brother Harold defeated the invading army at Stamford Bridge.

total internal reflection Complete reflection of a ray of light in a medium such as water or glass, from the surrounding surfaces back into the medium. It occurs when the angle of incidence is greater than a certain limiting angle, called the critical angle. In general, it takes place at the boundary between two transparent media when a ray of light in a medium of higher index of refraction approaches another medium of lower index of refraction at more than the critical angle. At all angles less than the critical angle, both reflection and refraction occur. Total internal reflection is responsible for rainbows, atmospheric halos, the sparkle of a diamond, and the path of light through optical fibres.

© 2006 Encyclopædia Britannica, Inc.

Total Quality Control (TQC) System for optimizing production based on ideas developed by Japanese industries from the 1950s on. The system, which blends Western and Eastern ideas, began with the concept of quality circles, in which groups of 10–20 workers were given responsibility for the quality of the products they produced. It gradually evolved into various techniques involving both workers and managers to maximize productivity and quality, including close monitoring of staff and excellent customer service. The concept of *kaizen*, the notion that improvement must involve all members of a company, is central to TQC. See also PRODUCTION MANAGEMENT.

Total Quality Management (TQM) Management practices designed to improve the performance of organizational processes in business and industry. Based on concepts developed by statistician and management theorist W. EDWARDS DEMING, TQM includes techniques for achieving efficiency, solving problems, imposing standardization and statistical control, and regulating design, housekeeping, and other aspects of business or production processes. See also INTERNATIONAL ORGANIZATION FOR STANDARDIZATION (ISO); TOTAL QUALITY CONTROL (TQC).

total war Military conflict in which the contenders mobilize all of their civilian and military resources in order to obtain a complete victory. It is distinguished from the partial commitment of lives and resources in limited war. The modern concept of total war is traced to CARL VON CLAUSEWITZ, who stressed the importance of crushing the adversary's forces in battle and described wars as tending constantly to escalate in violence toward a theoretical absolute. The classic 20th-century work is ERICH LUDENDORFF's *The Total War* (1935). World Wars I and II are usually regarded as total wars. After World War II, especially during the COLD WAR, the prospect of an all-out nuclear war made the major powers reluctant to engage in full-scale international warfare or allow their client states to do so.

totalitarianism Form of government that subordinates all aspects of its citizens' lives to the authority of the state, with a single charismatic leader as the ultimate authority. The term was coined in the early 1920s by BENITO MUSSOLINI, but totalitarianism has existed throughout history throughout the world (e.g., QIN DYNASTY China). It is distinguished from DICTATORSHIP and AUTHORITARIANISM by its supplanting of all political institutions and all old legal and social traditions with new ones to meet the state's needs, which are usually highly focused. Large-scale, organized violence may be legitimized. The police operate without the constraint of laws and regulations. Where pursuit of the state's goal is the only ideological foundation for such a government, achievement of the goal can never be acknowledged. HANNAH ARENDT's *Origins of Totalitarianism* (1951) is the standard work on the subject.

totem pole Carved and painted vertical log, constructed by many NORTHWEST COAST INDIAN peoples. The poles display mythological images, usually animal spirits, whose significance is their association with the lineage. Each figure represents a type of family crest. Some poles relate a family legend in the form of pictographs. Poles are erected to identify the owner of a house or other property, welcome visitors, indicate a portal or passageway, mark a gravesite, and even to ridicule an important person who failed in some way. See also SYMBOL; TOTEMISM.

totemism Complex of ideas and practices based on the belief in kinship or mystical relationship between a group (or individual) and a natural object, such as an animal or plant. The term derives from the Ojibwa word *ototeman*, signifying a blood relationship. A society exhibits totemism if it is divided into an apparently fixed number of CLANS, each of which has a specific relationship to an animate or inanimate species (totem). A totem may be a feared or respected hunted animal or an edible plant. Very commonly connected with origin MYTHS and with instituted morality, the totem is almost always hedged about with TABOOS of avoidance or of strictly ritualized contact. Totem, taboo, and EXOGAMY seem to be inextricably intertwined. See also TOTEM POLE.

Totonac \ˌtō-tə-ˈnäk\ North American Indians of east-central Mexico. Some live on cool, rainy high mesas, others in the hot, humid lowlands. Both groups are farmers, but the highlanders sometimes engage in peddling and wage labour as well and often work on lowland farms in the off-season. Most farm their own land and also perform required labour on land collectively owned by the village. They profess Roman Catholicism but have adapted it to their traditional beliefs.

toucan \ˈtü-ˌkan\ Any of about 40 species (family Ramphastidae) of large-billed, long-tailed Central and South American birds. Many species are black with a bold breast colour; their thick, saw-edged bills are brightly and distinctively coloured. Bands of toucans emit loud barks, bugling calls, and harsh croaks. They eat fruit, insects, lizards, and nestling birds. Toucans deposit two to four eggs in an unlined natural tree cavity or an abandoned woodpecker hole. *Ramphastos* species are up to 24 in. (60 cm) long, a third of which may be the bill. Smaller species (toucanets) are 10–14 in. (25–35 cm) long.

Gray-breasted mountain toucan (*Andigena hypoglauca*).
PAINTING BY JOHN P. O'NEILL

touch-me-not Either of two North American IMPATIENS, also known as jewelweed or snapweed, growing in moist areas. *Impatiens capensis*, also called *I. biflora*, typically has crimson-spotted orange flowers; *I. pallida* has yellow to white flowers, sometimes spotted with brownish-red. They are common weeds native to extensive regions of eastern North America. Their juice is said to be a remedy for POISON-IVY rashes.

touch reception See MECHANORECEPTION

touchstone Black, silica-containing stone used in ASSAYING to determine the purity of GOLD and SILVER. The metal to be assayed is rubbed on the touchstone, and then a sample of metal of known purity is rubbed on the stone right next to it. The streaks of metal on the stone are treated with nitric acid, which dissolves impurities, thus increasing the contrast between the two samples when compared. Because other metals, such as copper, can be alloyed to silver without changing its colour significantly, the touchstone method is not usually used now to assay silver, though it is still used to assay gold and provides a reasonably accurate guide to quality.

Toulon \tü-ˈlōⁿ**, Siege of** (Aug. 28–Dec. 19, 1793) Military engagement in the FRENCH REVOLUTIONARY WARS. French royalists handed over the naval base and arsenal at Toulon, France, to an Anglo-Spanish fleet in August. The French Revolutionary army began a siege to recapture the port city and, after months of preparations, successfully assaulted the allied-held forts commanding the anchorage. A battery of French guns, commanded by the young NAPOLEON BONAPARTE, fired on the British fleet and forced it to evacuate the inner harbour, though British and Spanish troops blew up the arsenal and burned 42 French ships before leaving. For his key role in the victory, Napoleon was promoted to brigadier general.

Toulouse \tü-ˈlüz\ *ancient* **Tolosa** City (pop., 2004 est.: 426,700), on the GARONNE RIVER in southern France. Founded in ancient times, it was taken from its Celtic inhabitants by the Romans in the 1st century BC. After AD 778 it became the seat of the feudal countship of Toulouse. Protestants were massacred there during the 16th-century Wars of RELIGION. In 1814 it was the scene of the British victory over the French in the last battle of the PENINSULAR WAR. A rail junction and canal port, Toulouse is a centre of the French aviation industry. It has many historic buildings, including a Gothic cathedral and a Romanesque basilica, and the tomb of St. THOMAS AQUINAS. The university, founded in 1229, is one of the oldest in the world.

Toulouse-Lautrec \tü-ˈlüz-lō-ˈtrek\ **(-Monfa), Henri (-Marie-Raymond) de** (b. Nov. 24, 1864, Albi, France—d. Sept. 9, 1901, Malromé) French painter and graphic artist. Born to an old aristocratic family, he developed his interest in art during lengthy convalescence after both his legs were fractured in separate accidents (1878, 1879) that left them permanently stunted and made walking difficult. In 1881 he resolved to become an artist; after taking instruction, he established a studio in the Montmartre district of Paris in 1884 and began his lifelong association with the area's cafés, cabarets, entertainers, and artists. He captured the effect of the movement of dancers, circus performers, and other entertainers by simplifying outlines and juxtaposing intense colours; the result was an art throbbing with life and energy. His lithographs were among his most powerful works, and his memorable posters helped define the

© 2006 Encyclopædia Britannica, Inc.

possibilities of the genre. His pieces are often sharply satirical, but he was also capable of great sympathy, seen most poignantly in his studies of prostitutes (e.g., *At the Salon*, 1896). His extraordinary style helped set the course of avant-garde art for decades to come. A heavy drinker, he died at 36.

Toungoo \'taůŋ-ˌgü\ **dynasty** Ruling house in Myanmar (Burma) from the 15th or 16th century to the 18th century. The founder of the empire is considered to be either King Minkyinyo (r. 1486–1531) or his son Tabinshwehti (r. 1531–50), who expanded the empire and welded it together. Tabinshwehti's brother-in-law Bayinnaung (r. 1551–81) extended the dynasty's reach to include much of Laos and Siam (Thailand). No ruler ever managed to conquer Arakan (in southern Myanmar), though Tabinshwehti, Bayinnaung, and others tried. The empire slowly disintegrated after Bayinnaung's death, but the dynasty continued until 1752.

Tour, Georges de La See Georges de La Tour

Tour de France \ˌtür-də-'frä^{n}s\ World's most prestigious and difficult bicycle race. Staged for three weeks each July—usually in some 20 day-long stages—the Tour typically comprises 20 professional teams of nine riders each and covers some 3,600 km (2,235 miles) of flat and mountainous country, mainly in France, with occasional and brief visits to Belgium, Italy, Germany, and Spain. Each stage of the race is timed, and the rider with the lowest aggregate time for all stages is the winner. Established in 1903 by Henri Desgrange (b. 1865—d. 1940), a French cyclist and journalist, the race has been run every year except during the world wars.

Touraine \tü-'ren\ Historical region, northwestern central France. It encompassed the former province of Touraine; its capital was at Tours. In Roman times it was inhabited by the Gallic Turones. In the 5th century AD it was incorporated in the Visigothic kingdom, and it passed to the Franks in 507. Contested by various powers over the succeeding centuries, it came under French influence in the early 13th century. It began to decline c. 1700, and the province was abolished in 1789 during the French Revolution. The region, which includes the Loire River valley, known for its magnificent chateaus, is sometimes called the Garden of France.

Touré \tü-'rā**, (Ahmed) Sékou** (b. Jan. 9, 1922, Faranah, French Guinea—d. March 26, 1984, Cleveland, Ohio, U.S.) First president of Guinea (1958–84) and a leading African politician. Touré, who claimed to be descended from Samory, helped lead Guinea's campaign for independence in 1958. He actively supported Kwame Nkrumah's program for African unity and gave Nkrumah asylum when he was deposed in 1966. A member of the Organization of African Unity (now African Union), he was viewed internationally as a moderate Islamic leader. After an unsuccessful invasion from neighbouring Portuguese Guinea (now Guinea-Bissau) in 1971, he imposed harsh domestic measures and ruled with an iron hand.

Tourette \tů-'ret\ **syndrome** Rare neurological disease that causes repetitive motor and vocal tics. Named for Georges Gilles de la Tourette, who first described it in 1885, it occurs worldwide, is usually inherited, generally begins at ages 2–15, and is three times more common in males. Motor tics occur first in about 80% of cases, compulsions to utter abnormal sounds in the rest. A compulsion to utter obscenities, once thought characteristic, is often absent. Repetition of words heard and spontaneous repetition of one's own words are two distinctive symptoms. Other vocal tics may include meaningless sounds. Motor tics may be virtually unnoticeable; more complex ones may appear intentional (e.g., hopping, clapping). Sleep, intense concentration, and exertion tend to suppress the tics; emotional stress worsens them. Unlike psychiatric compulsive disorders, Tourette syndrome has a neurological origin and may improve with psychogenic drugs. Brain neurotransmitter abnormalities may be involved, but the underlying cause remains uncertain.

tourmaline \'tər-mə-lən, 'tər-mə-ˌlēn\ Complex silicate mineral that is often used as a gemstone. Three types of tourmaline, distinguished by the presence of certain elements, are usually recognized: iron tourmaline (schorl) is black, magnesium tourmaline (dravite) is brown, and alkali tourmalines may be pink, green, blue, or colourless. Tourmaline is most common in granite pegmatites. Gem-quality stones are found especially in the U.S., Brazil, Russia, and Madagascar.

Tourneur \'tər-nər**, Cyril** (b. c. 1575—d. Feb. 28, 1626, Kinsale, County Cork, Ire.) English dramatist. His early years were devoted to literature; after c. 1613 he served in the government. His reputation rests largely on *The Atheist's Tragedie* (1611), a verse drama rich in macabre imagery. He may be the author of *The Revenger's Tragedie* (1607), but most recent scholarship attributes it to Thomas Middleton; though earlier than *The Atheist's Tragedie*, it is more mature in its structure and sombre brilliance. Tourneur also wrote the poetical satire *The Transformed Metamorphosis* (1600).

Tours \'tür\ City (pop., 1999: 132,820), northwest-central France. Gallic tribes inhabited the site before the Roman conquest. In the 3rd century AD it was made an episcopal see, but the Christian community remained small until St. Martin became bishop in the 4th century; a magnificent basilica was raised above his tomb in the late 5th century, attracting pilgrims for hundreds of years. In the 5th century Tours became part of the Frankish dominion; Charles Martel defeated Moorish invaders nearby at the Battle of Tours/Poitiers in 732. Under Alcuin it developed as a centre of learning. Though it prospered in the Middle Ages, it declined with the 17th-century emigration of the Protestant Huguenots. It was the seat of French government during the siege of Paris (1870) in the Franco-Prussian War. The chief tourist hub for the Loire valley, Tours still has the remains of the basilica of St. Martin. Tours is the birthplace of Honore de Balzac.

Tours/Poitiers \pwä-'tyā**, Battle of** (October 732) Victory won by the Frankish mayor of the palace Charles Martel over Muslim invaders from Spain. Charles led Frankish troops against a Muslim army seeking to gain control of Aquitaine. The Arab leader, ʿAbd-al-Raḥmān al-Ghafiqi, was killed, and the Arabs retreated. The battle itself was part of Charles's campaign against the Muslims in the south and was not decisive. It did, however, mark the end of the Muslim invasions of Frankish territory and contributed to Frankish consolidation of the region. The Frankish victory greatly enhanced Charles's prestige and that of his family, the Carolingians.

Toussaint-Louverture \'tü-ˌsa^{n}-'lü-vər-ˌtůr\ *orig.* **François Dominique Toussaint** (b. c. 1743, Bréda, near Cape François, Saint-Domingue—d. April 7, 1803, Fort-de-Joux, Fr.) Leader of the Haitian independence movement during the French Revolution. Born a slave, he was freed in 1777. In 1791 he joined a slave rebellion and soon assembled an army of his own, which he trained in guerrilla warfare. When France and Spain went to war in 1793, he and other black commanders joined the Spaniards, but in 1794 he switched his allegiance to the French because France, unlike Spain, had recently abolished slavery. His revolt created the first independent nation in Latin America. He rose from lieutenant governor to governor-general of Saint-Domingue and gradually rid himself of nominal French superiors. Treaties with the British secured their withdrawal, and he began trade with them and the U.S. In 1801 he turned his attention to Santo Domingo, the Spanish-controlled portion of Hispaniola, driving out the Spanish and freeing the slaves there. He made himself governor-general for life. He was deposed by the French in 1802 and died in custody in France. See also Jean-Jacques Dessalines.

Toutates See Teutates

Towada \tō-'wä-dä**, Lake** Lake, northern Honshu, Japan. It occupies a volcanic crater and is 27 mi (44 km) in circumference. The third deepest lake in Japan, it is 1,096 ft (334 m) deep at its centre. It lies in Towada-Hachimantai National Park, a popular recreation area.

tower Any freestanding or attached structure that is relatively tall in proportion to its base. The Romans, Byzantines, and medieval Europeans built defensive towers as part of the fortifications of their city walls (e.g., the Tower of London). Indian temple architecture uses towers of various types (e.g., the *sikhara*). Towers were an important feature of churches and cathedrals built in the Romanesque and Gothic periods. Some Gothic church towers were designed to carry a spire; others had flat roofs. The Italian campanile could either be attached to a church or freestanding. The use of towers declined somewhat during the Renaissance but reappeared in Baroque architecture. The use of steel frames enabled buildings to reach unprecedented heights; the Eiffel Tower in Paris was the first structure to reveal the true vertical potential of steel construction.

Tower, Joan (b. Sept. 6, 1938, New Rochelle, N.Y., U.S.) U.S. composer. She studied piano as a child, attended Bennington College, and completed her music studies at Columbia University. In 1969 she formed the Da Capo Chamber Players, for which she played piano and wrote many pieces; she left the group in 1984. She is chiefly known for her colourful and often whimsical orchestral compositions, including *Sequoia*

© 2006 Encyclopædia Britannica, Inc.

(1981), *Fanfare for the Uncommon Woman* (1987), and *Silver Ladder* (1987). Since 1972 she has taught at Bard College.

Tower of London Royal fortress on the northern bank of the River Thames. The central keep, or donjon, known as the White Tower because of its limestone, was begun c. 1078 by WILLIAM I the Conqueror inside the Roman city wall. In the 12th–13th century the fortifications were extended beyond the wall, the White Tower becoming the nucleus of a series of concentric defenses. The only entrance from the land is at the southwestern corner; when the river was still a major highway, the 13th-century water gate was much used. Its nickname, Traitors' Gate, derives from the prisoners brought through it to the Tower, long used as a state prison; many were murdered or executed there.

towhee \'tō-ˌhē, 'tō-ˌē,\ Any of several North American songbirds (PASSERINE family Fringillidae, sometimes Emberizidae), long-tailed thicket-dwellers that noisily scratch the ground for food. The name is from the call of the rufous-sided towhee (*Pipilo erythrophthalmus*), known as chewink in the southeastern U.S.; it ranges from Canada to Central America. About 8 in. (20 cm) long, it has a dark hood, white-cornered tail, and rusty flanks; western subspecies have white-spotted wings. The brown towhee (*P. fuscus*) of the western U.S. is a plain-looking bird. The green-tailed towhee (*Chlorura chlorura*), also western, is gray, white, and greenish, with a red-brown cap.

Rufous-sided towhee (*Pipilo erythrophthalmus*)

town meeting Legislative assembly of a U.S. town in which all or some voters are empowered to conduct the community's affairs. Town meetings first took place in New England in the colonial era and are still largely a New England phenomenon, partly because the region's towns tend to hold powers that are granted to counties elsewhere. The meetings are normally held annually. Executive authority is usually held by a three- or five-member board. Open town meetings, which are widely regarded as an exceptionally pure form of democracy, allow all registered voters to vote on articles listed on the agenda, or warrant; representative town meetings allow only elected members to vote.

Townes, Charles H(ard) (b. July 28, 1915, Greenville, S.C., U.S.) U.S. physicist. He studied at Furman University, Duke University, and the California Institute of Technology and worked for Bell Labs before joining the faculty of Columbia University (1948). In the early 1950s he and his students constructed the first MASER and showed that a similar device producing visible light was also possible. For his role in the invention of the maser and later the LASER, he shared a 1964 Nobel Prize with Aleksandr M. Prokhorov (b. 1916) and Nikolay G. Basov (b. 1922).

Townsend family U.S. cabinetmakers in Newport, R.I., of the 17th–18th century. The brothers Job (1699–1765) and Christopher (1701–1773) were the first generation involved in furniture making. Job's daughter married his apprentice John Goddard (see GODDARD FAMILY). Five of Job's sons and two of Christopher's sons became cabinetmakers. The Goddard-Townsend group was best known for case furniture characterized by block fronts (divided into three panels, with the central panel recessed) and decorative carved shell motifs, frequently in the graceful and somewhat ornate style developed by THOMAS CHIPPENDALE.

Townshend \'taůn-zənd\ **(of Rainham), Charles Townshend, 2nd Viscount** (b. April 18, 1675, Raynham Hall, Norfolk, Eng.—d. June 21, 1738, Raynham) British politician. He succeeded to his father's title in 1687, married the sister of ROBERT WALPOLE, and served as secretary of state (1714–16). With Walpole, Townshend led the Whig Party and became president of the privy council (1720). Again secretary of state (1721–30), he formed the League of Hanover (1725), which allied Britain, France, and Prussia against Austria and Spain. He resigned when Walpole, by then the dominant minister, opposed an aggressive policy against Austria. Also interested in agricultural reform, Townshend developed the use of turnips in crop rotation, earning the nickname Turnip Townshend.

Townshend Acts (1767) British parliamentary measures to tax the American colonists. The series of four acts imposed duties on imports of lead, paint, glass, paper, and tea and established a board of customs commissioners to enforce collection. Colonial quartering of British troops was also revived. The colonists protested the new measures as taxation without representation and resisted compliance. Nonimportation agreements among colonial merchants cut British imports in half by 1769. In 1770 all the duties except the tax on tea were repealed.

toxic shock syndrome BACTERIAL DISEASE caused by a TOXIN produced by the bacterium *Staphylococcus aureus*. It was first recognized in 1978 in women using superabsorbent tampons. High fever, diarrhea, vomiting, and rash may progress to abdominal tenderness, drop in BLOOD PRESSURE, SHOCK, respiratory distress, and KIDNEY FAILURE. The syndrome also has other causes, including postsurgical infection. ANTIBIOTICS are not effective. With intensive supportive therapy, most patients recover in 7–10 days, but 10–15% die. Many patients have a milder recurrence within eight months.

toxicology Study of POISONS and their effects, particularly on living systems. It overlaps with BIOCHEMISTRY, HISTOLOGY, PHARMACOLOGY, PATHOLOGY, and other fields. Its functions have expanded from identifying poisons and searching for treatments to include forensic toxicology (see FORENSIC MEDICINE) and testing and detection of a fast-growing number of new potentially toxic substances used in workplaces, in agriculture (e.g., INSECTICIDES, other PESTICIDES, fertilizers), in COSMETICS, as food additives, and as DRUGS (see DRUG POISONING). Perhaps the area of largest expansion is the study of toxic waste in the air, water, and soil, including CHLOROFLUOROCARBONS, ACID RAIN, DIOXIN, and radioactive ISOTOPES.

toxin Any substance poisonous to an organism; often restricted to POISONS produced by living organisms. In addition to those from such microorganisms as BACTERIA (see BACTERIAL DISEASES), DINOFLAGELLATES, and ALGAE, there are toxins in fungi (MYCOTOXINS; see AFLATOXIN; MUSHROOM POISONING), higher plants (phytotoxins), and animals (zootoxins, or VENOMS). The plants include nightshade (see NIGHTSHADE FAMILY), POISON HEMLOCK, FOXGLOVE, MISTLETOE, and POISON IVY. Many plant toxins (e.g., pyrethrins, NICOTINE, rotenone) apparently protect their producers against certain animals (especially insects) or fungi. Similar defensive secretions in animals may be widely distributed or concentrated in certain tissues, often with some sort of delivery system (e.g., spines, fangs). Animals such as spiders and snakes use venoms to catch prey and often for defense. Many normally edible fishes and shellfishes become poisonous after feeding on toxic plants or algae. See also ANTIDOTE; FOOD POISONING.

toxoid \'täk-ˌsȯid\ Bacterial TOXIN that has been made inactive but can still combine with or stimulate formation of ANTIBODIES. In many BACTERIAL diseases, the bacteria produce a toxin that causes the disease manifestations. Heating the toxin or treating it chemically converts it into a harmless toxoid that can be injected into a human or a nonhuman animal to confer IMMUNITY from subsequent INFECTION. The VACCINES for TETANUS and DIPHTHERIA are toxoids.

toy Plaything for a child or infant. Toys survive from the remote past and from a great variety of cultures. They range from the simple to the complex, from a stick or piece of string that becomes a toy in a child's hands to complex mechanical and electronic devices. Perennial favorites include balls, jump ropes, dolls, drums, whistles, dice, jackstones, board games, marbles, play weapons, and costumes. In the modern era the toy industry has grown tremendously, especially with the advent of computer games.

toy dog Any of several breeds of DOGS that were bred to be small, portable, good-natured companions. Toy dogs were traditionally pampered and treasured by aristocracy around the world, and several breeds are ancient. They range from hairless (e.g., the Chinese crested dog) to profusely coated (e.g., the SHIH TZU). Some breeds, such as the PEKINGESE, could be owned only by royalty. The Cavalier King Charles spaniel was a favourite of English royalty. English toy spaniels and toy POODLES are popular in the U.S. The miniature pinscher resembles the DOBERMAN pinscher but has a different ancestry. Other toy dogs include the AFFENPINSCHER, MALTESE, PAPILLON, POMERANIAN, and YORKSHIRE TERRIER.

Toynbee, Arnold (Joseph) (b. April 14, 1889, London, Eng.—d. Oct. 22, 1975, York, North Yorkshire) English historian. Long a professor at the University of London and the Royal Institute of International Affairs, Toynbee also held positions with the British Foreign Office. He is best known for his 12-volume *A Study of History* (1934–61), which put forward a philosophy of history, based on an analysis of the development and

© 2006 Encyclopædia Britannica, Inc.

decline of 26 civilizations. Criticisms of his *Study* include his use of myths and metaphors as being of comparable value to factual data and his reliance on a view of religion as a regenerative force. His other works include *Civilization on Trial* (1948), *East to West* (1958), and *Hellenism* (1959).

Toyota Motor Corp. Largest Japanese automobile manufacturer and one of the largest automotive companies in the world. It was established in 1933 as a division of the Toyoda Automatic Loom Works, Ltd., and in 1937 it was incorporated as the Toyota Motor Co., Ltd. Toyota later established many related companies, including Toyoda Machine Works, Ltd. (1941), and Toyota Auto Body, Ltd. (1945). In the 1960s and '70s the company expanded rapidly, exporting large numbers of cars to foreign markets. Following consolidations among many of its business units, the company took the name Toyota Motor Corp. in 1982. It has assembly plants and distributors in many foreign countries, and it owns subsidiaries that produce cars and car parts, trucks, steel, synthetic resins, and industrial equipment. Its brands include Toyota and Lexus.

Toyotomi Hideyoshi \ˌhē-de-ˈyō-shē\ (b. 1536/37, Nakamura, Owari province, Japan—d. Sept. 18, 1598, Fushimi) One of the three unifiers of premodern Japan (with ODA NOBUNAGA and TOKUGAWA IEYASU) who brought the nation out of its WARRING STATES period. He began life as a peasant but was raised to the rank of samurai (warrior) while a soldier for Nobunaga. After Nobunaga's death, he was appointed *kampaku* (chancellor to the emperor). Having concluded an alliance with his former rival Ieyasu, he became in 1590 the head of an alliance of DAIMYO that constituted a government of national unification. To stabilize society, he imposed the division of society into warriors, farmers, artisans, and tradesmen (an adaptation of ancient Chinese social divisions) and confiscated swords from all but the warriors. With visions of empire, he made two destructive but unsuccessful attempts to invade Korea (1592, 1597). After his death, power passed to Ieyasu.

TQM See TOTAL QUALITY MANAGEMENT

tracery In architecture, bars or ribs used decoratively in windows, especially the ornamental openwork in Gothic windows. In the earliest phase, two or three narrow, arched windows were placed close together under a single large arch, with the section of wall between the small and large arches pierced by a circular or four-lobed opening. The complexity of this plate tracery increased, reaching a climax in the magnificent windows of CHARTRES CATHEDRAL. After c. 1220 windows began to be subdivided by mullions, or upright bars, that continued at the head of the window to branch and form the patterns of bar tracery. Elaborate bar tracery soon became one of the most important elements of GOTHIC ARCHITECTURE and one of its finest achievements, as in the ROSE WINDOWS of the French RAYONNANT style. The bar tracery of the parallel English Decorated style formed netlike patterns based on the circle, arch, trefoil, and quatrefoil. By the late 14th century, the PERPENDICULAR style replaced curvilinear tracery with straight mullions extending to the top of the main arch, connected at intervals by horizontal bars.

trachea \ˈtrā-kē-ə\ *or* **windpipe** Tube in the throat and upper THORACIC cavity through which air passes in RESPIRATION. It begins at the LARYNX and splits just above heart level into the two main bronchi, which enter the LUNGS. In adults it is about 6 in. (15 cm) long and 1 in. (2.5 cm) in diameter. Its structure—a membrane strengthened by 16–20 CARTILAGE rings open in the back, with their free ends connected by muscle bands—allows the trachea to stretch and contract in breathing. An inner mucous membrane has cilia (see CILIUM) that project inward to trap particles. Muscle fibres over and alongside the trachea contract in response to cold air or irritants in inhaled air; in coughing, the airway narrows to about one-sixth of its normal size to increase the speed and force of exhalation and to dislodge foreign bodies. Such diseases as DIPHTHERIA, SYPHILIS, TUBERCULOSIS, and TYPHOID often involve the trachea.

tracheitis \ˌtrā-kē-ˈī-təs\ INFLAMMATION and infection of the TRACHEA. Inhaled irritants can injure the tracheal lining and increase the chance of infection (bacterial or viral). Acute infections, usually bacterial, produce fever, fatigue, and swelling of the tracheal lining but generally do no great damage. Chronic infections, promoted by irritants such as heavy smoking and alcohol abuse, cause progressive tissue degeneration and scarring.

tracheophyte See VASCULAR PLANT

trachyandesite See LATITE

trachyte \ˈtra-ˌkīt, ˈtrā-ˌkīt\ Light-coloured, very fine-grained IGNEOUS ROCK composed chiefly of ALKALI FELDSPAR with only minor mafic minerals (BIOTITE, HORNBLENDE, or PYROXENE). Trachyte is commonly found in volcanic regions; like many volcanic rocks, it shows a streaked or banded structure due to flowing of the congealing lava.

track and field *or* **athletics** Variety of sport competitions held on a running track and on the adjacent field. It is the oldest form of organized sports, having been a part of the ancient OLYMPIC GAMES from c. 776 BC to AD 393. Modern events include various sprint and middle- and long-distance races, RELAY races, HURDLING, STEEPLECHASE, HIGH JUMP, POLE VAULT, LONG JUMP, TRIPLE jump, SHOT put, DISCUS throw, HAMMER THROW, JAVELIN throw, DECATHLON, PENTATHLON, and HEPTATHLON. CROSS-COUNTRY RUNNING, MARATHONS, and speed WALKING, which are rarely held on a track, are usually considered adjuncts of track-and-field athletics. Events are held indoors and outdoors, and records are kept separately; some events are modified or eliminated for indoor competition.

Tractarian movement See OXFORD MOVEMENT

tractor High-power, low-speed traction vehicle. The two main types are wheeled and continuous-track. Most modern tractors are powered by internal-combustion engines running on gasoline or diesel fuel. Tractors are used in agriculture, construction, and road building, for pulling equipment such as plows and cultivators, for pushing implements such as bulldozers and diggers, and for operating stationary devices such as saws and winches. The first tractors grew out of the STEAM ENGINES used on farms in the late 19th century; in 1892 an Iowa blacksmith, John Froehlich, built the first farm vehicle powered by a gasoline engine. The tractor revolutionized farming, displacing draft animals and many farm workers. By World War I the tractor inspired the TANKS built by the British and French.

Tracy, Benjamin F(ranklin) (b. April 26, 1830, near Owego, N.Y., U.S.—d. Aug. 6, 1915, New York, N.Y.) U.S. public official. He served as a county district attorney (1853–59) and, after fighting in the American Civil War, as U.S. attorney (1866–73). Appointed secretary of the navy (1889–93) by Pres. BENJAMIN HARRISON, he continued the expansion of the navy begun by WILLIAM C. WHITNEY, authorizing construction of new battleships and cruisers. His departmental reforms and modernization contributed to eventual U.S. naval superiority.

Tracy, Spencer (Bonaventure) (b. April 5, 1900, Milwaukee, Wis., U.S.—d. June 10, 1967, Beverly Hills, Calif.) U.S. film actor. He enrolled in the American Academy of Dramatic Arts in New York City in 1922 and was soon earning roles on Broadway. He first starred on Broadway in *The Last Mile* (1930) and on film in *Up the River* (1930). Noted for his craggy features and his sincere performances, he became one of the top stars of the 1930s and '40s, winning Academy Awards in *Captains Courageous* (1937) and *Boys Town* (1938)—the first actor to win consecutive Oscars for best actor—and being nominated for seven other roles, including *Inherit the Wind* (1960) and *Judgment at Nuremberg* (1961). He had a long relationship with KATHARINE HEPBURN, with whom he costarred in nine films, including *Woman of the Year* (1942), *Adam's Rib* (1949), and *Guess Who's Coming to Dinner* (1967).

trade, balance of See BALANCE OF TRADE

Trade, Board of Organized market for the exchange of commodity contracts (see COMMODITY EXCHANGE). The Toronto Board of Trade, one of the earliest, was incorporated in 1845. The first grain-futures exchange in the U.S. was organized in Chicago in 1848. The Chicago Board of Trade (CBOT) began as a voluntary association of prominent Chicago grain merchants and was chartered by the Illinois legislature in 1859. Initially it sold grain by sample; later it introduced a system of inspection and grading to standardize the market and facilitate trading. By 1858 access to the trading floor was limited to members with seats on the exchange. It became the world's largest commodity exchange in terms of volume and value of business.

Trade, Board of *in full* **Lords Commissioners of Trade and Plantations** Advisory body that supervised American colonial affairs. Established in 1696 to replace the Lords of Trade (1675–96), it examined colonial legislation to ensure maximum benefit to British trade policies. The board nominated colonial governors, recommended laws affecting the colonies to Parliament, and heard complaints from the colonies about its administrators. It lacked executive or legislative powers, but it became the primary colonial policy-making body of the British government. It was abolished in 1782.

© 2006 Encyclopædia Britannica, Inc.

trade, restraint of See RESTRAINT OF TRADE

trade, terms of Relationship between the prices at which a country sells its exports and the prices paid for its imports. If a country's export prices rise relative to import prices, its terms of trade are said to have moved in a favourable direction, since, in effect, it now receives more imports for each unit of goods exported. The terms of trade, which depend on the world supply of and demand for the goods involved, indicate how the gains from international trade will be distributed among trading countries. An abrupt change in a country's terms of trade (e.g., a drastic fall in the price of its main export) can cause serious problems in its BALANCE OF PAYMENTS. See also COMPARATIVE ADVANTAGE.

trade agreement Any contractual arrangement between STATES concerning their trade relations. Trade agreements may be bilateral or multilateral, that is, between two states or more than two. For most countries international trade is regulated by unilateral barriers, including TARIFFS, nontariff barriers, and government prohibitions. Trade agreements aim to reduce such barriers and thus provide all parties with the benefits of increased trade. RECIPROCITY is a necessary feature of trade agreements, since neither state will be willing to sign the agreement unless it expects to gain as much as it loses. Another common feature is a MOST-FAVOURED-NATION clause, which provides against the possibility that one of the parties to the current agreement will later offer lower tariffs to another country. Agreements often include clauses providing for "national treatment of nontariff restrictions," meaning that both states promise not to duplicate the properties of tariffs with nontariff restrictions such as discriminatory regulations, selective excise taxes, QUOTAS, and special licensing requirements. General multilateral agreements are sometimes easier to reach than separate bilateral agreements, since the gains to efficient producers from worldwide tariff reductions are large enough to warrant substantial concessions. The most important modern multilateral trade agreement was the GENERAL AGREEMENT ON TARIFFS AND TRADE (GATT), which reduced world tariff levels and greatly expanded world trade. Such agreements continue under the aegis of the WORLD TRADE ORGANIZATION (WTO), which replaced GATT in 1995. See also NAFTA.

trade show *or* **trade fair** Temporary market organized to promote trade, where buyers and sellers gather to transact business. Trade fairs are organized at regular intervals, generally at the same location and time of year. They are especially common in Europe and Asia, where nearly every country has at least one major annual international exposition. They range in scope from those dealing with one industry or branch of industrial production to general exhibits of goods and merchandise. Trade shows and conventions confined to a single industry or even to a specialized segment of an industry have become increasingly common.

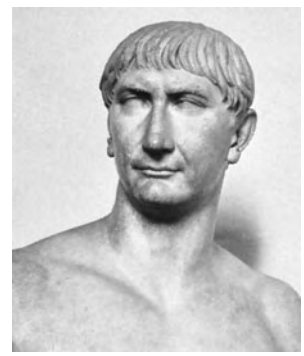
trademark Mark used by a manufacturer or merchant to identify the origin or ownership of goods and to distinguish them from others. Trademarks may be words or groups of words, letters, numerals, devices, names, the shape or other presentation of products or their packages, or combinations of colours. A trademark (indicated by ™ or, when registered, by the symbol ®) is considered the property of the holder and is protected by law from unauthorized use by others. In most countries, registration is a prerequisite for ownership and protection of the mark. In the U.S., however, the trademark right is granted by the mere use of the mark, though registration often proves legally advantageous. See also COPYRIGHT.

Trades Union Congress (TUC) National organization of British labour unions. It was founded in 1868 to hold annual conferences of independent unions. It included only skilled workers until 1889, when unions of unskilled workers were admitted. In 1900 the TUC helped found a separate labour organization, the Labour Representation Committee, renamed the LABOUR PARTY in 1906. After World War I the TUC was governed by a General Council, which had powers to deal with interunion conflicts and intervene in disputes with employers. In the 1930s and '40s, it was the spokesman for industrial labour in dealings with the government. The organization continued to help formulate economic policy until 1979, when a Conservative government came to power, leading to a decline in TUC membership in the 1980s. In the late 1990s, under Labour prime minister TONY BLAIR, the TUC was encouraged to back "workplace partnerships" between unions and employers.

Trafalgar \trə-ˈfal-gər**, Battle of** (Oct. 21, 1805) Naval engagement in the NAPOLEONIC WARS that established British naval supremacy in Europe. It was fought west of Cape Trafalgar, Spain, between a Franco-Spanish fleet of 33 ships under Pierre de Villeneuve (1763–1806) and a British fleet of 27 ships under HORATIO NELSON. As Villeneuve tried to slip out of the besieged port of Cádiz, he was caught by Nelson. The French ships formed a single line and were attacked by the English at two points. After sending the famous signal "England expects that every man will do his duty," Nelson broke through the centre of the French line and in the pell-mell battle captured Villeneuve and 20 ships. Near the end of the battle, Nelson was mortally wounded by a sniper. No British ships were lost, and NAPOLEON abandoned his plan to invade England.

tragedy Drama of a serious and dignified character that typically describes the development of a conflict between the protagonist and a superior force (such as destiny, circumstance, or society) and reaches a sorrowful or disastrous conclusion. Tragedy of a high order has been created in three periods and locales, each with a characteristic emphasis and style: Attica, in Greece, in the 5th century BC; Elizabethan and Jacobean England (1558–1625); and 17th-century France. The idea of tragedy also found embodiment in other literary forms, especially the novel. See also COMEDY.

tragicomedy Literary genre consisting of dramas that combine elements of TRAGEDY and COMEDY. PLAUTUS coined the Latin word *tragicocomoedia* to denote a play in which gods and mortals, masters and slaves reverse the roles traditionally assigned to them. In the Renaissance and after, tragicomedy was mainly comic, though Elizabethan and Jacobean tragedies almost always include some comic or grotesque elements. Modern tragicomedy is sometimes used synonymously with absurdist drama, which suggests that laughter is the only response left to people faced with an empty and meaningless existence.



Traherne \trə-ˈhərn**, Thomas** (b. 1637, Hereford, Eng.—d. 1674, Teddington) English mystical poet and religious writer. He was ordained in the Anglican church in 1660. Most of his works were unknown for centuries. The discovery in 1896 in a London street bookstall of the manuscripts of *Poetical Works* (1903) and the prose *Centuries of Meditations* (1908) created a literary sensation. Later the manuscript of *Poems of Felicity* (1910) was discovered in the British Museum. His poetry, though sometimes original and intense, is overshadowed by his vivid prose.

Trail of Tears Forced migration of the CHEROKEE Indians in 1838–39. In 1835, when gold was discovered on Cherokee land in Georgia, a small minority of Cherokee ceded all tribal land east of the Mississippi for $5 million. The U.S. Supreme Court invalidated the deal, but the ruling was ignored by state officials and Pres. ANDREW JACKSON refused to enforce it. The subsequent eviction and 116-day forced march of thousands of Cherokee to Oklahoma was badly mismanaged, and inadequate food supply, frigid weather, and the cruelty of escorting troops led to the death of about 4,000 Cherokee.

trailing arbutus \är-ˈbyü-təs\ *or* **mayflower** Trailing evergreen plant (*Epigaea repens*) of the HEATH family, native to sandy or boggy, acidic woodlands of eastern North America. Its leaves are oblong and hairy, and its white, pink, or rosy flowers grow in dense clusters. It is grown in shady wildflower gardens and as ground cover in terraria.

training, transfer of In psychology, the effect of having learned one activity on an individual's execution of other activities. Positive transfer occurs when a previously acquired skill enhances one's performance of a new one. Negative transfer occurs when the previously acquired skill impairs one's attempt to master the new one.

Trajan \ˈtrā-jən\ *in full* **Caesar Divi Nervae Filius Nerva Traianus Optimus Augustus** *or* **Caesar Nerva Traianus Germanicus** *orig.* **Marcus Ulpius Traianus** (b. Sept. 15?, AD 53, Italica, Baetica—d. Aug. 8/9, 117, Selinus, Cilicia) Roman emperor (98–117), the first born outside Italy. He had military commands in Asia and Europe before being named CONSUL in 91. In 97 he was adopted by NERVA as his successor. After Nerva's death in 98, he deified the former emperor and named himself Jupiter's repre-

Trajan, detail of a marble bust; in the British Museum.

sentative on earth. He strengthened defenses along the northern frontier and weakened the PRAETORIAN GUARD at Rome. He gave the SENATE new authority, reduced taxes, supported the poor with government welfare, reformed provincial administration, and built public works, including a forum with Trajan's Column, a structure commemorating his Dacian Wars. He added Dacia, Mesopotamia, and Parthia to the empire. He was campaigning in Asia when revolts broke out in conquered territories. Discouraged and ill, he died on his journey to Rome.

trampoline Resilient sheet or web (often of nylon) supported by springs in a metal frame and used as a springboard and landing area in tumbling. Trampolining is an individual sport of acrobatic movements performed after rebounding into the air from the trampoline. As a competitive sport, it was included in the Pan-American Games for the first time in 1955, and a world championship was established in 1964; competitors are scored on difficulty, execution, and form.

tranquilizer DRUG used to reduce anxiety, fear, tension, agitation, and related disturbed mental states. Major tranquilizers (antipsychotic agents, or neuroleptics) are used to treat SCHIZOPHRENIA and other PSYCHOSES; phenothiazines, including chlorpromazine, are the best known. They are thought to block the activity of the NEUROTRANSMITTER DOPAMINE in the brain. Minor tranquilizers (antianxiety agents, or anxiolytics) are used to treat anxiety and tension; they are usually benzodiazepines, including diazepam (Valium) and chlordiazepoxide (Librium). They have a calming effect and reduce both physical and psychological effects of anxiety, fear, and stress by enhancing the action of the neurotransmitter gamma-aminobutyric acid (GABA) in the brain.

Trans-Alaska Pipeline *or* **Alaska Pipeline** Oil pipeline running 800 mi (1,300 km) north-south across Alaska, U.S. Completed in 1977, it transports crude oil from the oil fields of PRUDHOE BAY on the Arctic Ocean to an ice-free port at Valdez. To avoid thawing the adjacent PERMAFROST, about half of the line is elevated.

Trans-Canada Highway World's longest national road, extending east-west for 4,860 mi (7,821 km) between Victoria, British Columbia, and St. John's, Newfoundland. Completed in 1965, it links many major Canadian cities and provides access to important national and provincial parks.

Trans-Siberian Railroad Longest single rail system in Russia, running from Moscow to Vladivostok, a distance of 5,778 mi (9,198 km). Conceived by Tsar ALEXANDER III, its construction began in 1891 and proceeded simultaneously along its entire length, which traversed a section of Manchuria. It was completed in 1904, but the impending Japanese takeover of Manchuria compelled construction of a parallel section within Russian territory, completed in 1916. The railroad opened large areas of Siberia to settlement and industrialization by means of spur lines linking outlying areas with the main line. The complete trip takes about eight days.

Trans World Airlines, Inc. (TWA) Former U.S. airline acquired by the AMR Corp. Formed in 1930 as Transcontinental & Western Air, Inc., from two smaller airlines, the company established the first coast-to-coast service that same year, flying from Newark, N.J., to Los Angeles in 36 hours. In 1946 TWA began flights between New York City and Paris, and it expanded by the 1950s to routes through Europe, the Middle East, Africa, and Asia. It adopted its present name in 1950. HOWARD R. HUGHES was its principal stockholder and guiding genius from 1939 to 1960–61, when he lost control to a group of investors. Financially troubled since the 1980s, TWA continued to operate despite twice landing in bankruptcy court in the 1990s. It was acquired by AMR, the parent company of American Airlines, in 2001.

transcendental argument In philosophy, a form of argument that is supposed to proceed from a fact to the necessary conditions of its possibility. A transcendental argument is simply a form of deduction, with the typical pattern: Only if p then q; q is true; therefore, p is true. As this form of argument appears in philosophy, the interest, and the difficulty, reside not in the movement from premises to conclusions, which is routine, but in the setting up of the major premises—that is, in the kinds of things that are taken as starting points. For example, IMMANUEL KANT tried to prove the principle of causality by showing that it is a necessary condition of the possibility of making empirically verifiable statements in natural science.

transcendental function In mathematics, a FUNCTION not expressible as a finite combination of the algebraic operations of addition, subtraction, multiplication, division, raising to a power, and extracting a root. Examples include the functions $\log x$, $\sin x$, $\cos x$, e^x and any functions containing them. Such functions are expressible in algebraic terms only as INFINITE series. In general, the term *transcendental* means nonalgebraic. See also TRANSCENDENTAL NUMBER.

Transcendental Meditation (TM) Spiritual development technique developed and promoted by MAHARISHI MAHESH YOGI, a former Hindu ascetic. A movement that became popular in the West in the 1960s, it is based on specific MEDITATION techniques and is not strictly connected with any religious tradition, though the perspective behind it has roots in VEDANTA. Practice entails the mental repetition of a MANTRA in order to still the activity of thought and experience a deeper level of consciousness. Through this process, the practitioner finds deep relaxation, which can lead to inner joy, vitality, and creativity.

transcendental number Number that is not algebraic, in the sense that it is not the solution of an ALGEBRAIC EQUATION with rational-number coefficients. The numbers e and π, as well as any algebraic number raised to the power of an IRRATIONAL number, are transcendental numbers.

Transcendentalism Movement of 19th-century New England philosophers and writers. The Transcendentalists were loosely bound together by adherence to an idealistic system of thought based on a belief in the essential unity of all creation, the innate goodness of humankind, and the supremacy of vision over logic and experience for the revelation of the deepest truths. Part of the Romantic movement (see ROMANTICISM), it developed around Concord, Mass., attracting individualistic figures such as RALPH WALDO EMERSON, HENRY DAVID THOREAU, MARGARET FULLER, and BRONSON ALCOTT. Transcendentalist writers and their contemporaries signaled the emergence of a new national culture based on native materials, and they were a major part of the AMERICAN RENAISSANCE in literature. They advocated reforms in church, state, and society, contributing to the rise of free religion and the abolition movement and to the formation of various utopian communities, such as BROOK FARM. Some of the best writings by minor Transcendentalists appeared in *The Dial* (1840–44), a literary magazine.

transducer Device that converts one form of energy to another. A MICROPHONE is an acoustic transducer, converting sound waves into electrical signals. Different types of transducers act on heat, radiation, sound, strain, vibrations, pressure, and acceleration; they may output mechanical, electrical, pneumatic, or hydraulic signals. Examples include STRAIN GAUGES, LOUDSPEAKERS, PHOTOCELLS, TRANSFORMERS, and THERMOCOUPLES.

transept Area of a cruciform (cross-shaped) church lying at right angles to the principal axis. The bay at which the transept intersects the NAVE is called the crossing. The nave of a church with a cruciform plan usually extends west from the crossing, the choir and sanctuary east. The arms of the transept are designated by direction, as northern transept and southern transept.

transform See FOURIER TRANSFORM, INTEGRAL TRANSFORM, LAPLACE TRANSFORM

transformation In mathematics, a rule for changing a geometric figure or algebraic expression into another, usually accompanied by a rule for transforming it back. In geometry and TOPOLOGY, a transformation (e.g., flipping horizontally or vertically, rotating, or stretching vertically or horizontally) moves each point in a figure or graph to another position. A graph also undergoes a transformation when its COORDINATE system is changed. For example, the equations that establish a correspondence between the rectangular and polar coordinate systems constitute a transformation. In ANALYSIS, a transformation is a procedure that changes one function into another. Of special interest in many fields of mathematics are transformations forming a group, in which any two transformations applied successively produce the same result as another transformation in the group and each transformation has an inverse transformation (which undoes it) in the group. See also GROUP THEORY, INTEGRAL TRANSFORM, LINEAR TRANSFORMATION.

transformer Device that transfers electric energy from one ALTERNATING-CURRENT CIRCUIT to one or more other circuits, either increasing (stepping up) or reducing (stepping down) the voltage. Uses for transformers include reducing the line voltage to operate low-voltage devices (doorbells or toy electric trains) and raising the voltage from electric GENERATORS so that electric power can be transmitted over long distances.

© 2006 Encyclopædia Britannica, Inc.

Transformers act through ELECTROMAGNETIC INDUCTION; current in the primary coil induces current in the secondary coil. The secondary voltage is calculated by multiplying the primary voltage by the ratio of the number of turns in the secondary coil to that in the primary.

transfusion See BLOOD TRANSFUSION

transistor SOLID-STATE SEMICONDUCTOR device for amplifying, controlling, and generating electrical signals. Invented at Bell Labs (1947) by JOHN BARDEEN, WALTER H. BRATTAIN, and WILLIAM B. SHOCKLEY, it displaced the VACUUM TUBE in many applications. Transistors consist of layers of different semiconductors produced by addition of impurities (such as arsenic or boron) to SILICON. These impurities affect the way electric current moves through the silicon. Transistors were pivotal in the advancement of electronics because of their small size, low power requirements, low heat generation, modest cost, reliability, and speed of operation. Single transistors were superseded in the 1960s and '70s by INTEGRATED CIRCUITS; present-day COMPUTER CHIPS contain millions of transistors. Today transistors perform many different functions in nearly every type of electronic equipment.

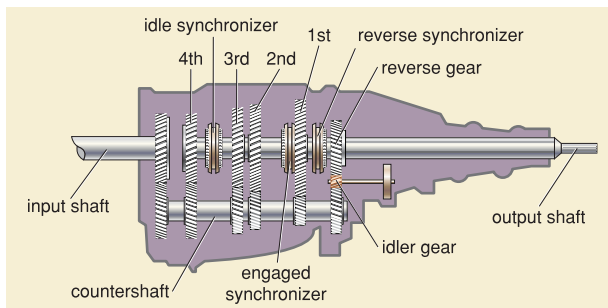
transition element Any chemical ELEMENT with VALENCE electrons in two shells instead of only one. This structure gives them their outstanding ability to form IONS containing more than one ATOM (complex ions, or coordination compounds), with a central atom or ion (often of a transition metal) surrounded by LIGANDS in a regular arrangement. Theories on the BONDING in these ions are still being refined. The elements in the PERIODIC TABLE from scandium to COPPER (atomic numbers 21–29), yttrium to SILVER (39–47), and lanthanum to GOLD (57–79, including the LANTHANIDE series) are frequently designated the three main transition series. (Those in the ACTINIDE series and beyond, 89–111, also qualify.) All are METALS, many of major economic or industrial importance (e.g., IRON, GOLD, NICKEL, TITANIUM). Most are dense, hard, and brittle, conduct heat and electricity well, have high melting points, and form ALLOYS with each other and other metals. Their electronic structure lets them form compounds at various valences. Many of these compounds are coloured and paramagnetic (see PARAMAGNETISM) and (as do the metals themselves) often act as CATALYSTS. See also RARE EARTH METAL.

transitive law Property of relationship that states that if A is in a given relation to B and B is in the same relation to C, then A is also in that relation to C. Equality, for example, is a transitive relation.

Transkei \'trans-'kā, 'trans-'kī\ Administrative region, South Africa. It borders the Indian Ocean and Lesotho. It was created by South Africa in 1959 as the first Bantu homeland, a nonindependent black state designated (together with CISKEI) for the Xhosa-speaking peoples (see XHOSA). It was made a nominally independent republic in 1976, and all black Africans with language ties to Transkei (whether or not they lived there) lost their South African citizenship and became citizens of the new country. Existing only as an element of the APARTHEID system, it never received international recognition. The region was reincorporated into South Africa in 1994 as part of Eastern Cape and KwaZulu-Natal provinces.

transmigration of souls See REINCARNATION

transmission System in an engine that transmits power generated by the engine to the point where it is to be used. Most mechanical transmissions function as rotary speed changers; the ratio of the output speed to the input speed may be either constant (as in a gearbox) or variable. On variable-speed transmissions, the speeds may be variable in individual steps (as on an automobile or some machine-tool drives) or continuously variable within a range. Step-variable transmissions, with some slip, usually use either GEARS or chains and provide fixed speed ratios with no slip; stepless transmissions use belts, chains, or rolling-contact bodies. See illustration opposite.



transpiration Loss of water from a plant, mainly through the stomata (see STOMA) of leaves. Darkness, internal water deficit, and extremes of temperature tend to close stomata and decrease transpiration; illumination, ample water supply, and optimum temperature cause stomata to open and increase transpiration. Its exact significance is disputed; its roles in providing the energy to transport water in the plant and in aiding dissipation of the sun's heat (by cooling through evaporation of water) have been challenged. Since stomatal openings are necessary for the exchange of gases, transpiration has been considered by some to be merely an unavoidable phenomenon that accompanies the real functions of the stomata.

transplant *or* **graft** Partial or complete organ or other body part removed from one site and attached at another. It may come from the same or a different person or an animal. One from the same person—most often a skin graft—is not rejected. Transplants from another person or, especially, an animal are rejected unless they are unusually compatible or have no blood vessels (e.g., the cornea), or if the recipient's immune reaction is suppressed by lifelong drug treatment. Transplanted tissues must match (by blood tests) more closely than BLOOD TRANSFUSIONS. Monoclonal ANTIBODIES targeting the cells that cause rejection hold great promise. Tests are now under way with monoclonal antibodies that react with antigens present only on T CELLS that are participating in rejection, sparing the rest. Rejection matters less in skin grafts, which may need to last only weeks, and bone grafts, whose structure remains after the cells die. In BONE-MARROW transplants, the donor's marrow cells may attack the recipient's tissues, often fatally. Lung transplants have greater chance of success as part of a heart-and-lung transplant. See also HEART TRANSPLANT, KIDNEY TRANSPLANT.

transport In biochemistry, the movement of MOLECULES and particles across a cell membrane, a selective barrier that allows some substances (FAT-soluble molecules and some small molecules) to pass and blocks others (IONS and large, water-soluble molecules). Transport of these vital substances occurs via several systems. Open channels allow DIFFUSION (passive transport) of ions directly into cells; facilitators use a chemical change to help substances diffuse past the membrane; "pumps" force dilute substances through even when their concentration on the other side is higher (a form of active transport). Primary active transport is powered directly by energy released in cell METABOLISM (see ATP, adenosine triphosphate). In secondary active transport, a molecule is linked to a different molecule that carries it across the membrane (cotransport) or is exchanged for a different molecule crossing in the other direction (countertransport). The membrane itself opens and closes to let larger particles in or out.

Transport and General Workers' Union (TGWU) British labour union. The Dockers' Union (founded 1889) took the lead in the merger of 14 unions to form the TGWU in 1922. The union grew rapidly under the leadership of ERNEST BEVIN (1922–40). As a general union it was able to enroll workers excluded by the craft unions, and its membership included workers engaged in transportation industries (except the railroads) as well as in the automotive, construction, chemical, and textile industries. It exerted a strong influence on British labour policy and was the largest British union during much of the 20th century, reaching a peak of more than two million members in the 1970s, though its membership declined thereafter. See also LABOUR PARTY; TRADES UNION CONGRESS.

transsexualism Self-identification with one sex by a person who has the external genitalia and secondary sexual characteristics of the other sex. Early in life, such a person adopts the behaviour characteristic of the opposite sex. Surgery and hormone therapy now allow permanent sex change, a procedure first performed in 1952. The male-to-female operation is more common because the genital reconstruction is more satisfactory. The male transsexual's penis and testes are removed and an artificial vagina created; breasts are created with implants or female sex hormones.

A four-speed manual transmission. Power from the rotating input shaft turns the countershaft (or layshaft), which meshes with all four forward gears and the reverse gear on the output shaft. Which gear drives the output shaft is determined by the positions of the synchronizer assemblies, which are controlled by the gearshift stick (here, first gear is engaged). The unengaged gears simply revolve around the output shaft without transmitting power.

© MERRIAM-WEBSTER INC.

© 2006 Encyclopædia Britannica, Inc.

Female transsexuals may undergo mastectomy and hormone treatments to produce male secondary sexual characteristics, but attempts to create an artificial penis have not been satisfactory.

transubstantiation In Christianity, the change by which the bread and wine of the Eucharist become in substance the body and blood of Jesus, though their appearance is not altered. This transformation is thought to bring the literal truth of Christ's presence to the participants. The doctrine was first elaborated by theologians in the 13th century and was incorporated into documents of the Council of Trent. In the mid-20th century, some Roman Catholic theologians interpreted it as referring to a change of meaning rather than a change of substance, but in 1965 Paul VI called for the retention of the original dogma.

transuranium element Any of the chemical elements after uranium in the periodic table (with atomic numbers greater than 92). All are radioactive (see radioactivity), with half-lives ranging from tens of millions of years to fractions of a millisecond. Only two, neptunium (93) and plutonium (94), occur in nature, and only as traces in uranium ores as a result of neutron irradiation. Transuranium elements with atomic numbers through 112, along with 114 and 116, have been produced in laboratories. Each appears to resemble the elements above it in the periodic table; in particular, the actinides, thorium (90) through lawrencium (103), are similar to the lanthanides, cerium (58) through lutetium (71). The naming of the transuranium elements has been fraught with controversy regarding which laboratory first made the discovery and should propose the name and whether elements should be named for living persons. See also Glenn Seaborg.

Transvaal \trans-'väl\ *formerly (1856–77, 1881–1902)* **South African Republic** Former province, northeastern South Africa. Located between the Limpopo and Vaal rivers, the region was inhabited c. 1800 chiefly by various Bantu-speaking peoples. The Boers (Afrikaners) began migrating there during the Great Trek of the 1830s. They established the short-lived South African Republic in 1856. Discoveries of diamonds and gold deposits (1868–74) heightened British interest in the region, and the British annexed the republic in 1877. A Boer rebellion restored it in 1881. Further discovery of gold in 1886 brought more foreigners, who eventually outnumbered the Boers. In 1895 Leander Starr Jameson attempted to incite them to overthrow the Boer government. In 1899 Transvaal joined with Orange Free State against Britain in the South African (Boer) War. It was taken in 1900, and in 1902, following the British victory, it became a crown colony. It was granted self-government in 1906 and joined the Union (now Republic) of South Africa in 1910. In 1994 the Transvaal was split into four provinces. The region is extremely rich in mineral and agricultural resources.

Transylvania Historic region, northwestern and central Romania. It comprises a plateau surrounded by the Carpathian Mountains and the Transylvanian Alps. It formed the nucleus of the Dacian kingdom and was included in the Roman province of Dacia in the 2nd century AD. The Magyars (Hungarians) conquered the area at the end of the 9th century. When Hungary was divided between the Habsburgs and the Turks in the 16th century, Transylvania became an autonomous principality within the Ottoman Empire. It was attached to Habsburg-controlled Hungary at the end of the 17th century. Transylvania was the scene of severe fighting in the Hungarian revolution against Austria in 1848. When Austria-Hungary was defeated in World War I, the Romanians of Transylvania proclaimed the land united with Romania. Hungary regained the northern portion during World War II, but the entire region was ceded to Romania in 1947.

Trapp family Austrian singers. Maria Augusta Kutschera (1905–87), the family's best-known member, was an orphan and novitiate in a Benedictine convent in Salzburg. Later, as a governess, she won the hearts of the seven children of the widower Baron Georg von Trapp (1880?–1947) and of the baron himself. They married in 1927, had three children, and later began singing German and liturgical music under the Reverend Franz Wasner, with whom the family fled in 1938 from Nazi-dominated Austria to Italy, and finally to Stowe, Vt., U.S. They toured the world to great acclaim, disbanding in 1955. Their story was the subject of the musical *The Sound of Music* (1959; film, 1965).

trapshooting Shooting sport with moving targets. A shotgun (usually 12-gauge) is used. The targets are clay disks (called pigeons) that are sprung into the air from a trap. A later variant is skeet shooting. Trapshooting's origins date to the 18th century, when marksmen shot at live pigeons released from cages or box traps. The modern clay-pigeon variety has been included in Olympic Games competition since 1900. A single trap throws 25 targets at varying angles; each competitor fires four 25-target rounds.

Trasimeno \,trä-zē-'mā-nō\, Lake Lake, Umbria, central Italy. The largest lake of the Italian peninsula, it has an area of 49 sq mi (128 sq km) and is shallow, with a maximum depth of 20 ft (6 m). It is fed by small streams and has an artificial subterranean outlet (opened 1898) to the Tiber River. In 217 BC Hannibal defeated a Roman army led by Flaminius there in the Second Punic War. In World War II it was the scene of severe fighting (1944) between the British and German armies.

Travancore \'tra-vən-,kōr\ Former princely state, southwestern India. Now part of Kerala state, it was part of the kingdom of Kerala in the early centuries AD. In the 11th century it fell under the Cola empire; the Hindu kings of the Vijayanagar empire held it briefly in the 16th century, after which it came under Muslim rule. In the mid-18th century it became the independent state of Travancore; then it was under British protection from 1795. After Indian independence, it merged with Cochin to form the state of Travancore-Cochin; boundaries were redrawn, and it was renamed Kerala in 1956.

Traven \'trā-vən**, B.** (b. March 5, 1890?, Chicago, Ill., U.S.?—d. March 27, 1969, Mexico City, Mex.) German-Mexican novelist. A recluse, he refused to disclose to publishers his parentage, nationality, and general identity, but he may have been forced to leave Germany for his participation in its short-lived communist revolution in 1919. Most of his books were written in German. He is noted for adventure stories and as a chronicler of rural life in Mexico, where he settled in the 1920s. Among his novels are *The Treasure of the Sierra Madre* (1927; film, 1948) and a series tracing the lives of impoverished Indians in southern Mexico, including *The Carreta* (1931) and *The Rebellion of the Hanged* (1936). His works are harsh and his themes compelling, and his lean prose has a hypnotic immediacy. Much confusion remains about both his life and his authorship.

travertine \'tra-vər-,tēn\ Dense, banded rock composed of calcium carbonate, $CaCO_3$. Formed by rapid chemical precipitation of calcium carbonate from solution in surface and ground waters, it is a variety of limestone that has a light colour and takes a good polish. It is often used for walls and interior decorations in public buildings and as a paving stone. Travertine is mined extensively in Italy; in the U.S., Yellowstone's Mammoth Hot Springs are actively depositing travertine. It also occurs in limestone caves in the form of stalactites and stalagmites.

Travis, Merle (Robert) (b. Nov. 29, 1917, Rosewood, Ky., U.S.—d. Oct. 20, 1983, Tahlequah, Okla.) U.S. country music singer and songwriter. Travis learned banjo as a youth, later applying banjo technique to the guitar. He worked on radio in Cincinnati in the 1930s. Moving to California in 1944, he quickly rose to prominence on the strength of his guitar style and for writing and recording honky-tonk classics such as "Divorce Me C.O.D." and "No Vacancy" and the coal-mining protest songs "Sixteen Tons" and "Dark as a Dungeon."

treason Offense of attempting to overthrow the government of one's country or of assisting its enemies in war. In the U.S., the framers of the Constitution defined treason narrowly—as the levying of war against the U.S. or the giving of aid and comfort to its enemies—in order to lessen the possibility that those in power might falsely or loosely charge their political opponents with treason. See also sedition.

treasury bill Short-term U.S. government security with maturities ranging from one month to 26 weeks. Treasury bills are usually sold at auction on a discount basis with a yield equal to the difference between the purchase price and the maturity value. Because they are highly liquid (money not being tied up in them for long periods of time), their yield rate is normally lower than that of longer-term securities. Their prices do not usually fluctuate as much as those of other government securities but may be influenced by the purchase or sale of large quantities of bills by the central bank. First used extensively during World War I, treasury bills were initially regarded as an emergency source of revenue, but their flexibility and relatively low interest led to their adoption as a permanent element in the national debt. From 1970 to 1998 the minimum order for treasury bills was $10,000, after which it was reduced to $1,000. In 2001 the U.S. Treasury stopped offering treasury bills with maturities of 52 weeks.

treaty Contract or other written instrument binding two or more states under international law. The term is generally reserved for the more

© 2006 Encyclopædia Britannica, Inc.

important international agreements, usually requiring, in addition to the signatures of authorized persons, ratification by the governments involved. A treaty may be bilateral or multilateral; it usually contains a preamble, an enumeration of the issues agreed on, and clauses that discuss its ratification procedures, lifespan, and terms for termination. Treaties may be political, commercial, constitutional, or administrative, or they may relate to criminal and civil justice or codify international law.

Trebbia River \'treb-byä\ River, Emilia-Romagna region, northern Italy. Rising northeast of Genoa, it flows 71 mi (115 km) northeast across the northern Apennines and the Po lowland to enter the Po River. It was the scene of two notable battles: a Roman defeat by Hannibal in 218 BC, and a French defeat by a Russo-Austrian army in 1799.

Treblinka \tre-'bliŋ-kä\ German Nazi concentration camp during World War II. Located near the village of Treblinka, Pol., it opened in 1941 as a forced-labour camp. A larger and ultrasecret second camp a mile away, called T.II, opened in 1942 as an extermination camp for Jews. Victims were stripped and marched into "bathhouses," where they were gassed with carbon monoxide from ceiling pipes. Ukrainian guards and up to 1,500 Jewish prisoner-workers performed the executions. The total number killed has been estimated at 700,000 to 900,000. In 1943 a group of prisoner-workers rose in revolt and escaped, but most were soon killed or recaptured. The T.II camp was closed in October 1943, the labour camp in July 1944.

tree Woody perennial plant. Most trees have a single self-supporting trunk containing woody tissues, and in most species the trunk produces secondary limbs called branches. Trees provide many valuable products, especially wood, one of the world's chief building materials, and wood pulp, used in papermaking. Wood is also a major fuel source. Trees supply edible fruits and nuts. In addition, trees take in carbon dioxide and release oxygen during photosynthesis. Their root systems help retain water and soil, preventing floods and erosion. Trees and forests provide habitats for a wide variety of animals, and they beautify both natural and altered landscapes. Growth rings in the trunk indicate the age of most trees. The tallest trees are the Pacific coast redwoods; the oldest are the bristlecone pines, some of which are over 4,000 years old. See also conifer; deciduous tree; evergreen; forest; shrub; softwood.

Tree, Sir Herbert (Draper) Beerbohm (b. Dec. 17, 1853, London, Eng.—d. July 2, 1917, London) British actor-manager. A romantic actor with a gift for character roles and comedy, he made his London debut in 1878 and won favourable notice in *The Private Secretary* (1884). As manager of the Haymarket Theatre (1887–97), he directed and acted in lavish Shakespearean productions, which he continued as actor-manager of Her Majesty's Theatre (1897–1915). He produced notable stage versions of Charles Dickens's works. In 1904 he founded the Royal Academy of Dramatic Art.

tree fern Any of various ferns (especially those of the families Cyatheaceae and Marattiaceae) of treelike habit with a woody stem. Many attain heights over 50 ft (15.2 m). They are natives of humid mountain forests in the tropics and subtropics and of warm temperate regions of the Southern Hemisphere. The family Marattiaceae contains six genera; one species, *Angiopteris evecta*, has leaves (fronds) 15 ft (4.5 m) or more in length and stems of 2–6 ft (60–180 cm). Now-extinct members of the family date to the Carboniferous Period (354–290 million years ago). Members of the family Cyatheaceae are very large, terrestrial ferns with trunklike, upright rhizomes; the nearly 1,000 species are grouped into seven genera.

European green tree frogs (*Hyla arborea*).
JANE BURTON/BRUCE COLEMAN LTD.

tree frog *or* **tree toad** Any of some 550 species (family Hylidae) of mostly arboreal frogs, found worldwide but primarily in the New World. Most species are small, slender, and long-legged and have suckerlike adhesive disks on the finger and toe tips. Some do not climb well and live in water, on land, or in a burrow. Most species lay eggs in water. Young marsupial frogs (genus *Gastrotheca*), of South America, develop in a brood pouch on the female's back.

tree of heaven Rapid-growing tree (*Ailanthus altissima*) in the quassia family (Simaroubaceae), native to China and widely naturalized elsewhere, with several known varieties. Because of its resistance to pollution, freedom from insect predation and disease, and ability to grow in almost any soil, the tree of heaven is planted as a yard and street tree in urban centres. It grows to 60 ft (18 m) or more, producing long, compound leaves that emit an unpleasant odour when bruised. Male trees bear flowers with unpleasant scents. Female trees produce winged fruits which are tannish orange when ripe.

Treitschke \'trīch-kə**, Heinrich von** (b. Sept. 15, 1834, Dresden, Saxony—d. April 28, 1896, Berlin) German historian and political writer. Son of a Saxon general, Treitschke studied at Bonn and Leipzig and then taught history and politics at a number of German universities. A member of the Reichstag (1871–84), he advocated authoritarian rulers unchecked by a parliament and disparaged western European liberalism and American democracy. In 1886 he succeeded Leopold Ranke as official historiographer of Prussia. His major work is *Treitschke's History of Germany in the Nineteenth Century* (1879–94).

trematode See fluke

trench warfare Warfare in which the opposing sides attack, counterattack, and defend from sets of trenches dug into the ground. It was developed by Sébastien Le Prestre de Vauban in the 17th century for laying siege to fortresses. Its defensive use was first institutionalized as a tactic during the American Civil War. It reached its highest development in World War I. Little used in World War II, it reappeared in the Iran-Iraq War in the 1980s. A typical construction consisted of two to four parallel trenches, each dug in a zigzag, protected by sandbags, and floored with wooden planks. The parallel trenches were connected by a series of communication trenches dug roughly perpendicular to them. The first row was fronted by barbed wire and contained machine-gun emplacements; the rear trenches housed most of the troops. Increased use of tanks marked the end of trench warfare, since tanks were invulnerable to the machine-gun and rifle fire used by entrenched soldiers.

Trent, Council of (1545–63) 19th ecumenical council of the Roman Catholic church, which made sweeping reforms and laid down dogma clarifying nearly all doctrines contested by the Protestants. Convened by Pope Paul III at Trento in northern Italy, it served to revitalize Roman Catholicism in many parts of Europe. In its first period (1545–47) it accepted the Nicene Creed as the basis of Catholic faith, fixed the canon of the Old and New Testaments, set the number of sacraments at seven, and defined the nature and consequences of original sin; it also ruled against Martin Luther's doctrine of justification by faith. In its second period (1551–52) it confirmed the doctrine of transubstantiation and issued decrees on episcopal jurisdiction and clerical discipline. In the final period (1562–63) it defined the mass as a true sacrifice and issued statements on several other doctrinal issues. By the end of the 16th century, many of the abuses that had motivated the Protestant Reformation had disappeared, and the church had reclaimed many of its European followers.

Trent, River River, central England. It rises in Staffordshire and flows northeast 168 mi (270 km) to unite with the River Ouse west of Hull to form the River Humber. It is navigable by barge for over half its length.

Trent Canal Canal, southeastern Ontario, Canada. Linking Lake Huron with Lake Ontario, the canal extends from the southeastern shore of Georgian Bay up the Severn River to Lake Simcoe, connects several lakes of the Kawartha Lake region to Rice Lake, and passes down the Trent River to the Bay of Quinte and Lake Ontario. Its 242-mi (389-km) main course consists of 33 mi (53 km) of man-made channels and 42 locks. Construction began in 1833. The waterway once served a busy lumber trade; it is now a popular tourist attraction.

Trentino–Alto Adige \tren-'tē-nō-ˌäl-tō-'ä-dē-jā\ *formerly (until 1947)* **Venezia Tridentina** Autonomous region (pop., 2001 prelim.: 937,107), northeastern Italy. Its capital is Trento. A mountainous area covering 5,258 sq mi (13,618 sq km), Trentino–Alto Adige has some of the

© 2006 Encyclopædia Britannica, Inc.

highest peaks in Europe, cut through by passes into Switzerland and Austria. Historically it included the medieval ecclesiastical principalities of Trento and Bressanone. Austria annexed it in 1815. It was the scene of much fighting during World War I, and it was ceded to Italy at the end of the war. The population is a mix of German speakers in the north and Italian speakers in the south; the regional parliament alternates German-speaking and Italian-speaking chairmen. The region grows grain and grapes, raises cattle, and mines zinc, lead, and other minerals. Tourism is a major industry.

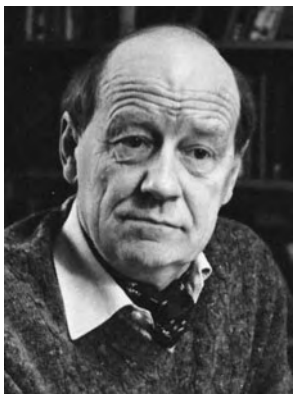
Trento *English* **Trent** *ancient* **Tridentum** City (pop., 2001 prelim.: 104,844), capital of Trentino–Alto Adige region, on the Adige River in northern Italy. Reportedly founded by the Raetians c. 4th century BC, it later became a Roman colony on the road to the Brenner Pass in the Alps. In the Christian era Trento came under the Ostrogoths, Lombards, and Franks. It was the site of the Council of Trent (1545–63). It came under the Napoleonic kingdom of Italy in the early 19th century and passed to Austria in 1814 and to Italy in 1918. An agricultural market centre, it also has some light industry.

Trenton City (pop., 2000: 85,403), capital of New Jersey, U.S. It lies at the head of navigation on the Delaware River. Settled c. 1679 by English Quakers, it was incorporated in 1745. On Dec. 25, 1776, George Washington led his army across the ice-choked Delaware River to attack Hessian troops quartered at Trenton (see battles of Trenton and Princeton). It served as temporary capital of the U.S. in 1784 and 1799 and was made the state capital in 1790. The completion of a canal and railroad line in the 1830s spurred Trenton's industrial development, and it remains an industrial city.

Trenton and Princeton, Battles of (1776–77) Engagements won by the Continental Army in the American Revolution. Defeats in New York forced the army under George Washington to retreat through New Jersey into Pennsylvania. On Dec. 25, 1776, Washington led a force of 6,000 troops across the ice-filled Delaware River to surprise the 1,400-man British-Hessian force at Trenton, N.J., and captured 900 troops. A British force of 7,000 troops under Charles Cornwallis arrived to force the American army into retreat. At night Washington led his men around the British to defeat an outpost at Princeton, causing Cornwallis to retreat to New Brunswick and enabling Washington to lead his troops into winter quarters near Morristown. The victories restored American morale and renewed confidence in Washington.

trespass In law, unlawful entry onto land. Trespass was formerly defined as wrongful conduct causing injury or loss; today it is generally confined to issues involving real property (see real and personal property). Once a trespass is proved, the trespasser is usually held liable for any damages resulting, regardless of whether the trespasser was negligent or the damage was foreseeable. Criminal trespass, trespass to property that is forbidden by statute, is punishable as a crime.

Trevelyan \tri-'vel-yən**, G(eorge) M(acauley)** (b. Feb. 16, 1876, Welcombe, Warwickshire, Eng.—d. July 21, 1962, Cambridge, Cambridgeshire) English historian. He is known for books accessible to general readers that often show an appreciation of the Whig tradition in English thought and reflect a keen interest in the Anglo-Saxon element in the English constitution. They include three on Giuseppe Garibaldi (1907, 1909, 1911), *England in the Age of Wycliffe* (1899), *British History in the Nineteenth Century (1782–1901)* (1922), *History of England* (1926), and *The Seven Years of William IV* (1952).



Trevino \trə-'vē-nō**, Lee (Buck)** (b. Dec. 1, 1939, near Dallas, Tex., U.S.) U.S. golfer. Of Mexican American descent, Trevino received a grade-school education, served in the U.S. Marine Corps, and worked as an odd-job man and assistant professional at golf courses in his native Texas. In 1967 he unexpectedly came in fifth in the U.S. Open, then won it the next year. In 1971 Trevino became the first player to win the U.S., British, and Canadian Open championships in a single year. He won the British Open in 1972 and the U.S. PGA Championship in 1974. He then underwent several back surgeries but returned to win the PGA again in 1984.

Trevithick \'trev-ə-ˌthik**, Richard** (b. April 13, 1771, Illogan, Cornwall, Eng.—d. April 22, 1833, Dartford, Kent) British inventor of the first steam locomotive. With little formal education, in 1790 he became an engineer for several ore mines in Cornwall. In 1797 his experiments with high-pressure steam led him to develop a small, light engine to replace the large, low-pressure mine engines then used for hoisting ore. In 1801 he built the first steam carriage, which he later drove in London. In 1803 he built the first steam railway locomotive for an ironworks in Wales. He abandoned his locomotive projects in 1808 because the iron rails were too fragile to carry their weight. He adapted his engine to produce the first steam dredger in 1806. In 1816 he traveled to South America to deliver engines to Peruvian silver mines, hoping to become wealthy, but returned to England in 1827 penniless.

Richard Trevithick, detail of an oil painting by John Linnell, 1816; in the Science Museum, London.

Trevor, William *orig.* **William Trevor Cox** (b. May 24, 1928, Mitchelstown, County Cork, Ire.) Irish writer. Educated at Trinity College, Dublin, he worked as a teacher, sculptor, and advertising copywriter before moving to England to write fiction full-time. His works, noted for their exquisite characterizations and finely tuned irony, focus largely on the psychology of eccentrics and outcasts. Trevor's second novel, *The Old Boys* (1964), tells the story of an "old boys" committee whose aging members plot against each other. His later novels include *Felicia's Journey* (1994) and *Death in Summer* (1998). He is perhaps best known for his acclaimed collections of wry and often macabre short stories.

William Trevor, 1982.
MARK GERSON

Triad Term used variously for secret societies in Qing-dynasty China (and sometimes earlier), for modern Chinese crime gangs, and for crime gangs of other Asian nationals operating in their own countries or abroad. A secret society with the name Triad started operating in the early 19th century in southern China, where it took root and spread. In the 1850s Triad rebellions threatened Shanghai and Xiamen (Amoy) and contributed to the revolution of 1911. Chinese secret societies have in common the swearing of an oath to join, strict rules, a family relationship among members, the duty of mutual help, a hierarchy of functions, and hereditary membership within families.

triage \'trē-ˌäzh, trē-'äzh\ Division of patients for priority of care, usually into three categories: those who will not survive even with treatment; those who will survive without treatment; and those whose survival depends on treatment. If triage is applied, the treatment of patients requiring it is not delayed by useless or unnecessary treatment of those in the other groups. Triage originated in military medicine, when limited resources faced many wounded soldiers. It is used in civilian settings during disasters or epidemics and in emergency rooms. Triage decisions are made after relatively quick examination; patients in lower-priority groups should be reexamined periodically.

trial In law, a judicial examination of issues of fact or law for the purpose of determining the rights of the parties involved. Attorneys for the plaintiff and the defendant make opening statements to a judge or jury, then the attorney for the plaintiff makes his case by calling witnesses, whom the defense attorney may cross-examine. Unless the case is then dismissed for lack of sufficient evidence, the defense attorney next takes a turn calling witnesses, whom the plaintiff's attorney cross-examines. Both sides make closing arguments. In a trial before a jury, the judge instructs the jury on the applicable laws, and the jury retires to reach a verdict. If the defendant is found guilty, the judge then hands down a sentence.

trial by ordeal See ordeal

triangle Geometric figure with three sides and three angles. Each two sides meet at a point called a vertex, and the three angles sum to 180°. A triangle with one 90° (right) angle is a right triangle. A triangle with all sides (and thus all angles) equal is equilateral, one with two sides equal is isosceles, and one with no two sides equal is scalene. Triangles are particularly useful in surveying, astronomy, and navigation. Two observation points (sight lines) form a triangle with a reference object serving as one vertex and the observation points as the other two. Knowing the angles of the sight lines and the distance between the observation points allows the calculation of the lengths of the other sides using the methods of TRIGONOMETRY.

Triangle Shirtwaist Co. fire (March 25, 1911) Industrial disaster that led to the enactment of many safety and labour laws. The fire, which started in the garment factory on the eighth floor of the Asch Building in New York City, resulted in the deaths of 146 people, mostly young immigrant women. Fire truck ladders, then able to reach only six stories, were of little help. The sweatshop had few fire escapes, and its doors were locked to prevent theft, forcing panicked workers to leap from upper-floor windows. Public outcry also led to new fire codes and child-labour laws and greater influence for the INTERNATIONAL LADIES' GARMENT WORKERS UNION.

Trianon \ˌtrē-ə-ˈnōn**, Treaty of** (June 4, 1920) Treaty at the end of WORLD WAR I between Hungary and the Allied Powers, signed at the Trianon Palace at Versailles, France. By its terms, Hungary lost two-thirds of its former territory, which was divided among Czechoslovakia, Austria, the future Yugoslavia, and Romania. Hungary's armed forces were restricted to 35,000 lightly armed men, to be used only to maintain internal order.

Triassic \trī-ˈa-sik\ **Period** Interval of geologic time, c. 248–206 million years ago, that marks the beginning of the MESOZOIC ERA. Many new vertebrates emerged during the Triassic, heralding the major changes that were to occur in both terrestrial and marine life forms during the Mesozoic Era. The seas became inhabited by large marine reptiles. On land, ancestral forms of various modern amphibians arose, as did reptiles such as turtles and crocodilians. By the Late Triassic, ARCHOSAURS were becoming more and more dominant, and the first true mammals, small shrewlike omnivores, evolved. Seed ferns dominated the flora of southern GONDWANA, and GYMNOSPERMS, including conifers, cycads, and ginkgos, were common throughout much of PANGEA.

triathlon Endurance contest involving swimming, cycling, and running. Triathlons originated in California in the 1970s and became an Olympic event in 2000. Olympic and world championship triathlons consist of a 1.5-km open water swim, a 40-km bicycle ride, and a 10-km run. The sport's most famous event, the Ironman triathlon, is held annually in Hawaii and consists of a 3.8-km (2.4-mi) swim, a 180-km (112-mi) bicycle ride, and a 42.2-km (26.2-mi) MARATHON run.

tribe Any of a variety of social units, including some defined by unilineal descent and some defined by ethnic origin. Cultural anthropologists now usually apply the term to a unit of social organization that is culturally homogeneous and consists of multiple kinship groups—such as the FAMILY, lineage, or CLAN—that prohibit marriages within themselves but endorse or require marriages with persons of the other kinship groups. (See EXOGAMY AND ENDOGAMY.) Most tribes are organized as unitary political entities, within which people share a common language and culture. Some tribes are spread across large territories, and individual members may never meet or know all of the others. Some are small groups, confined to a limited territory, sometimes a single small island, within which everyone knows everyone else very well. What unites societies of such diverse scales as being "tribal" is their own internal sense of "being a single people," but—anthropologists would add—a people that lacks the equipment of citizenship, a constitution, or a formalized legal system that would define them as a nation-state. Throughout most of the history of modern cultural anthropology, the terms *tribe* and *primitive* were usually linked; however, in recent years *primitive* has been avoided by most anthropologists because it appears to carry with it an unintended judgment of the moral or technological development of a people. See also ETHNIC GROUP.

tribe (Greek, *phylai*; Roman, *tribus*) In ancient Greece and Rome, any of a group of political and demographic subdivisions of the population. In Greece the groups divided into tribes were distinct by location, dialect, and tradition, and they included the IONIANS, DORIANS, ACHAEANS, and Aetolians. In Attica, CLEISTHENES replaced the 4 Ionian tribes with 10 new tribes, each of which was named after a local hero; these came to develop political and civic functions, including the election of magistrates. The DEMES developed out of the tribal system. In Rome the tribes formed the 3 (later 4, and still later 35) original divisions of Roman citizens. These were the basis of military levies, property tax, census taking, and voting units in political assemblies.

tribology \trī-ˈbä-lə-jē\ Study of the interactions of sliding surfaces. It includes three subjects: FRICTION, wear, and LUBRICATION. Many manifestations of tribology are beneficial and make modern life possible. Many others are serious nuisances, and careful design is necessary to overcome problems caused by excessive friction or wear. Friction uses up, or wastes, a substantial amount of the energy generated by humans; in addition, a great deal of productive capacity is devoted to replacing objects that have worn out.

tribune In ancient Rome, any of various military and civil officials. Military tribunes were originally infantry commanders. In the early republic there were six to a LEGION; some were appointed by CONSULS or military commanders, others elected by the people. During the Roman empire (from 27 BC), the emperor nominated military tribunes, the office of which was considered preliminary to a senatorial or equestrian career (see *EQUES*). Of the civil tribunes, the most important were the tribunes of the plebs (see PLEBEIAN), who were elected in the plebeian assembly. By 450 BC there were 10 plebeian tribunes, who were elected annually with the right to intervene in cases of unjust acts of consuls or magistrates by saying "Veto" (meaning "I forbid it"). The office became powerful; its powers were curtailed by SULLA but restored by POMPEY. Under the empire the powers of the plebeian tribunes passed to the emperor.

tricarboxylic \ˌtrī-ˌkär-bäk-ˈsil-ik\ **acid cycle** *or* **Krebs cycle** *or* **citric-acid cycle** Last stage of the chemical processes by which living cells obtain energy from foodstuffs. Described by HANS ADOLF KREBS in 1937, the reactions of the cycle have been shown in animals, plants, microorganisms, and fungi, and it is thus a feature of cell chemistry shared by all types of life. It is a complex series of reactions beginning and ending with the compound oxaloacetate. In addition to re-forming oxaloacetate, the cycle produces carbon dioxide and the energy-rich compound ATP. The enzymes that catalyze each step are located in mitochondria in animals, in CHLOROPLASTS in plants, and in the cell MEMBRANE in microorganisms. The hydrogen atoms and electrons that are removed from intermediate compounds formed during the cycle are channeled ultimately to oxygen in animal cells or to carbon dioxide in plant cells.

Triceratops \trī-ˈser-ə-ˌtäps\ genus of large, plant-eating ORNITHISCHIAN DINOSAURS of the Late CRETACEOUS Epoch (99–65 million years ago). *Triceratops* had a very long skull (some more than 6 ft [1.8 m] long); a large bony frill about the neck; a relatively short, pointed horn on the nose; a beaklike mouth; and two pointed horns, more than 3.3 ft (1 m) long, above the eyes. Adults weighed 4–5 tons (3.6–4.5 metric tons) and grew up to 30 ft (9 m) long. The limbs were very stout, and the hind limbs were more massive than the forelimbs.

trichina \tri-ˈkī-nə\ Species (*Trichinella spiralis*) of parasitic NEMATODE, found worldwide, that causes the disease TRICHINOSIS. Trichinae (or trichinas), 0.06–0.2 in. (1.5–4 mm) long, mate in the host's small intestine. Fertilized females penetrate the intestinal wall and release larvae, which the blood carries throughout the body. The larvae grow, mature, and become encysted within muscle tissue. The digestive juices of an animal that eats the muscle tissue break down the cyst, liberating the larvae for further development; the worms mature, and the cycle begins again.

Trichina encysted in muscle
RUSS KINNE-PHOTO RESEARCHERS/EB INC.

trichinosis \ˌtri-kə-ˈnō-səs\ Disorder caused by the roundworm TRICHINA, commonly acquired from undercooked infested PORK. Larval worms invade the small intestine, maturing within a week. Fertilized females deposit new larvae, which are carried by the blood, notably to the muscles (most often the diaphragm, eyes, throat, and tongue), where they encapsulate and may remain alive for years. Though trichinosis usually eventually subsides, it may be fatal if the heart and brain are involved. Few infected persons have sufficient parasites to produce symptoms (including diarrhea, nausea, and fever, followed by pain, stiffness, and swelling

© 2006 Encyclopædia Britannica, Inc.

of various muscular structures). Anti-inflammatory drugs can relieve symptoms; thiabendazole may effectively destroy parasites in the intestine. There is no practical way to detect trichinous pork; the surest safeguard remains thorough cooking.

trichomonad \ˌtri-kə-'mō-ˌnad\ Any PROTOZOAN of the zooflagellate order Trichomonadida. Trichomonads have three to six flagella, and they may have one or multiple nuclei. Most inhabit the digestive systems of animals. Three species occur in humans: *T. hominis* in the intestine, *T. vaginalis* in the vagina, and *T. buccalis* in the mouth.

trickster tale In oral traditions worldwide, a story of deceit, magic, and violence perpetrated by a mythical animal-human (trickster). The trickster-hero is both creator god and innocent fool, evil destroyer and childlike prankster. Coyote, the trickster of tales from American Indian peoples in California and the Southwest, is one of the most widely known. In the Pacific Northwest, the trickster is Raven. Many African peoples also have tales about tricksters (hare, spider, tortoise, etc.), which slaves brought to the New World. Tales involving the trickster Brer Rabbit were given literary form by JOEL CHANDLER HARRIS.

Trident missile U.S.-made SUBMARINE-launched ballistic missile. The most advanced Trident missiles, deployed by the U.S. Navy since 1990 and by the Royal Navy since 1994, are more accurate than most land-based ballistic missiles. Their extended range (up to 7,000 mi [11,300 km]) allows the submarines that carry them to patrol almost anywhere, making detection extremely difficult. Each missile is capable of carrying more than 10 multiple independently targeted reentry vehicles (see MIRV), though arms-control considerations limit the actual number to as few as three.

Trieste \trē-'es-tā, trē-'est\ *in full* **Free Territory of Trieste** Former region, western ISTRIA, southern Europe, surrounding and including the city of TRIESTE. It was occupied by Yugoslavia in 1945. The UN established it as a free territory in 1947. It was divided for administrative purposes into two zones: Zone A in the north, including the city, was under the British and Americans; Zone B in the south was under the Yugoslavs. In 1954 most of the northern zone was incorporated into Italy; the southern zone went to Yugoslavia.

Trieste *ancient* **Tergeste** Seaport city (pop., 2001 prelim.: 209,520), capital of FRIULI–VENEZIA GIULIA region, northeastern Italy. It lies at the head of the ADRIATIC SEA on the Gulf of Trieste. It was under Roman control from the 2nd century BC until the collapse of the empire; then it was under episcopal rule (948–1202). It placed itself in 1382 under HABSBURG protection and later became the prosperous main port of the AUSTRO-HUNGARIAN EMPIRE. After World War I Trieste was ceded to Italy. Occupied by Germany in World War II and seized by Yugoslavia in 1945, it became the centre of the Free Territory of TRIESTE in 1947. Returned to Italy in 1954, it became the regional capital in 1963.

triggerfish Any of about 30 species (family Balistidae) of shallow-water marine fishes, found worldwide in tropical seas. Triggerfishes are deep-bodied, usually colourful fishes with large scales, high-set eyes, and three dorsal-fin spines, which they use for protection. When a triggerfish is threatened, it darts into a coral crevice and erects its large and strong first spine, which it locks in place with the second (the "trigger"); when the trigger is later withdrawn, the first snaps back down. Though generally considered edible, some cause food poisoning. The largest grow 2 ft (60 cm) long.

Triggerfish (*Balistes conspicillus*).
DOUGLAS FAULKNER

triglyceride \trī-'gli-sə-ˌrīd\ Any of an important class of naturally occurring LIPIDS, ESTERS in which three molecules of FATTY acids are linked to GLYCEROL. The three fatty acids may be all the same kind or different kinds. The types of triglycerides in animals vary with the species and the fats in their food. In mammals they are stored in ADIPOSE tissue until needed and then broken down to the glycerol and fatty acids. Many vegetable triglycerides (OILS) are liquid at room temperature, unlike those of animals, and tend to contain a greater variety of fatty acids. In ALKALI, triglycerides break down to form glycerol and three molecules of SOAP (saponification).

trigonometric function \ˌtri-gə-nə-'me-trik\ In mathematics, one of six functions (sine, cosine, tangent, cotangent, secant, and cosecant) that represent ratios of sides of right triangles. They are also known as the circular functions, since their values can be defined as ratios of the x and y coordinates (see COORDINATE system) of points on a circle of radius 1 that correspond to ANGLES in standard positions. Such values have been tabulated and programmed into scientific calculators and computers. This allows TRIGONOMETRY to be easily applied to surveying, engineering, and navigation problems in which one of a right triangle's acute angles and the length of a side are known and the lengths of the other sides are to be found. The fundamental trigonometric identity is $\sin^2\theta + \cos^2\theta = 1$, in which θ is an angle. Certain intrinsic qualities of the trigonometric functions make them useful in mathematical ANALYSIS. In particular, their DERIVATIVES form patterns useful for solving DIFFERENTIAL EQUATIONS.

trigonometry Mathematical discipline dealing with the relationships between the sides and ANGLES of triangles. Literally, it means triangle measurement, though its applications extend far beyond geometry. It emerged as a rigorous discipline in the 15th century, when the demand for accurate surveying techniques and navigational methods led to its use for the "solution" of right triangles, or the calculation of the lengths of two sides of a right triangle given one of its acute angles and the length of one side. The solution can be found by using ratios in the form of the TRIGONOMETRIC functions.

Trilling, Lionel (b. July 4, 1905, New York, N.Y., U.S.—d. Nov. 5, 1975, New York, N.Y.) U.S. literary critic and teacher. He taught at Columbia University from 1931 until his death. His collections of literary essays include *The Liberal Imagination* (1950), *Beyond Culture* (1965), *Sincerity and Authenticity* (1972), and *Mind in the Modern World* (1972). He was one of the best-known American literary critics of his time. His wife was the critic and writer Diana Trilling (1905–96).

trillium \'tri-lē-əm\ Any of about 25 species of spring-flowering perennial herbaceous plants that make up the genus *Trillium* in the LILY FAMILY, native to North America and Asia. Whorls of oval leaves, flower parts, and fruits are arranged in groups of three. Each solitary white, greenish-white, yellow, pink, or purple flower is borne on a short stalk that arises from the whorl of leaves. Many species are cultivated in wildflower gardens. Wild trillium (also called wake-robin or birthroot) is a protected species.

trilobite \'trī-lə-ˌbīt\ Any of a group of ovate ARTHROPODS (subphylum Trilobita) that came to dominate the seas c. 540 million years ago and became extinct c. 245 million years ago. Trilobites had a chitinous exoskeleton and three body lobes: a raised middle lobe with a lower lobe on each side. The head, thorax, and tail were segmented; each segment bore two appendages. The forward-most appendages were sense and feeding organs. Most species had two compound eyes, though some were eyeless. Some were predators, others were scavengers, and still others probably ate plankton. *Paradoxides harlani*, found near Boston, grew to 18 in. (45 cm) long and may have weighed 10 lbs (4.5 kg). Other species were small.

Trilobite

Trimble, David *orig.* **William David Trimble** (b. Oct. 15, 1944, Belfast, N.Ire.) Former first minister of Northern Ireland and corecipient with JOHN HUME of the Nobel Prize for Peace in 1998. Trimble was elected to the British Parliament in 1990 and became leader of the Ulster Unionist Party (UUP) in 1995. He represented the UUP in multiparty peace talks beginning in September 1997. These talks, which included members of SINN FÉIN, the political wing of the IRISH REPUBLICAN ARMY (IRA), culminated in the Good Friday Agreement of April 1998, which aimed to restore self-government in Northern Ireland. Defying opposition from hard-line unionists, he signed the agreement and successfully campaigned for its acceptance in referenda in Northern Ireland and in Ireland. In subsequent elections to the new Northern Ireland Assembly, he was elected first minister. He resigned as first minister in 2001, following a conflict with the IRA over decommissioning (disarmament), though he returned to government later that year after decommissioning commenced; the post of

© 2006 Encyclopædia Britannica, Inc.

first minister was suspended the following year. In 2005 he lost his seat in the British Parliament and subsequently resigned as leader of the UUP.

trimurti \tri-'mu̇r-tē\ In Hinduism, the triad of the three great gods: Brahma, Vishnu, and Shiva. Scholars consider the trimurti doctrine an attempt to reconcile different monotheistic approaches with one another and with the philosophic doctrine of ultimate reality. In trimurti symbolism, the three gods are collapsed into a single form with three faces. Each god is in charge of an aspect of creation, with Brahma as creator, Vishnu as preserver, and Shiva as destroyer; however, some sects ascribe all aspects of creation to their deity of choice. Though sometimes called the Hindu Trinity, trimurti has little similarity to the Holy Trinity of Christianity.

Trinidad and Tobago \'tri-nə-ˌdad...tə-'bā-gō\ *officially* **Republic of Trinidad and Tobago** Island country, West Indies. The islands of Trinidad and Tobago—the two southernmost links in the Antilles island

chain—lie northeast of Venezuela and northwest of Guyana. Area: 1,980 sq mi (5,128 sq km). Population (2005 est.): 1,298,000. Capital: Port of Spain. The people are mainly of South Asian or African ancestry. Language: English (official). Religions: Christianity (Protestant, Roman Catholic), Hinduism, Islam. Currency: Trinidad and Tobago dollar. The islands are mostly flat or rolling, with narrow belts of mountainous highlands and luxuriant rain forests. The Caroni Swamp, an important bird sanctuary on Trinidad, supports flamingo, egret, and scarlet ibis populations. The country has large reserves of petroleum and natural gas, as well as one of the world's largest supplies of natural asphalt. Other industries include agriculture, fishing, and tourism. Chief crops include sugarcane, citrus fruits, cocoa, and coffee. It is a republic with two legislative houses; its chief of state is the president, and the head of government is the prime minister. When Christopher Columbus visited Trinidad in 1498, it was inhabited mostly by Arawak Indians, though there were probably some Carib speakers as well; Caribs inhabited Tobago. The islands were settled by the Spanish in the 16th century. In the 17th–18th centuries African slaves were imported for plantation labour to replace the original Indian population, which had been decimated by the impact of slavery and diseases introduced by the Europeans. Trinidad was surrendered to the British in 1797. The British attempted to settle Tobago in 1721, but the French captured the island in 1781 and transformed it into a sugar-producing colony. The British acquired it in 1802. After slavery ended in the islands (1834–38), immigrants from India were brought in to work the plantations. Trinidad and Tobago were administratively combined in 1889. Granted limited self-government in 1925, the islands became an independent state within the Commonwealth in 1962 and a republic in 1976. There occurred some political unrest and in 1990 a failed Muslim-fundamentalist coup against the government.

Trinity, Holy In Christian doctrine, the unity of the Father, Son, and Holy Spirit as one God in three persons. The word Trinity does not appear in the Bible. It is a doctrine formulated in the early church to interpret the way God revealed himself, first to Israel, then in Jesus as Saviour, and finally as Holy Spirit, preserver of the church. The doctrine of the Trinity developed in the early centuries of the church and was explicitly stated at the Council of Nicaea in 325.

Trinity College See University of Dublin

Trintignant \tra^{n}-tēn-'yä^{n}**, Jean-Louis** (b. Dec. 11, 1930, Piolenc, France) French film actor. After leaving law school to study acting, he made his stage debut in 1951 and his film debut in 1956. He won favourable notice in *And God Created Woman* (1956) and gained international fame for his role as a race-car driver in *A Man and a Woman* (1966). Known for his reserved but intense screen persona, he conveyed the psychic conflicts of repressed characters in *My Night at Maud's* (1969), *Z* (1969), and, most strikingly, *The Conformist* (1970), among many other films. He worked sparingly in the 1980s and '90s because of poor health, but his role in *Three Colours: Red* won him acclaim.

trio sonata Principal chamber music genre of the Baroque era. Despite its name, it requires four performers: two melody instruments and continuo (usually a keyboard instrument and a bass instrument). It arose early in the 17th century as an instrumental version of the Italian vocal-duet ensemble. The two upper instruments, usually violins, generally wove their melodic, quasi-vocal lines high above the accompanying parts. Two standard forms emerged after 1750: the *sonata da chiesa*, or church sonata, standardized as a four-movement form (in slow-fast-slow-fast order); and the suite-like *sonata da camera*, or chamber sonata. By 1770 the genre had been abandoned in favour of the solo sonata.

Tripitaka \tri-'pi-tə-kə\ *Pali* **Tipitaka** Collective term for the three major divisions of the Pali canon, the canon of Theravada Buddhism. (The term means "Triple Basket.") It consists of the Abhidhamma Pitaka, the Sutta Pitaka, and the Vinaya Pitaka, which were transmitted orally by the sangha until they were committed to writing about 500 years after the Buddha's death. The texts appeared in two languages, Sanskrit and Pali, the Pali version being the better preserved. Sanskrit versions were translated into Tibetan, Chinese, and other languages.

Triple Alliance (1882) Secret agreement between Germany, Austria-Hungary, and Italy. It provided that Germany and Austria-Hungary would support Italy if it was attacked by France, that Italy would similarly assist Germany, and that Italy would remain neutral if Austria-Hungary was attacked by Russia. The alliance advanced Otto von Bismarck's efforts to isolate France. Conflicts between Italy and Austria-Hungary over their interests in the Balkans led Italy to reach an understanding of neutrality with France in 1902, which effectively nullified Italy's pledge to the members of the Triple Alliance, though the alliance was renewed in 1907 and 1912. See also Austro-German Alliance.

Triple Alliance, War of the *or* **Paraguayan War** (1864/65–70) Bloodiest conflict in Latin American history, fought between Paraguay and the allied countries of Argentina, Brazil, and Uruguay. The Paraguayan dictator Francisco Solano López (1827–70), objecting to Brazil's interference in the politics of neighbouring Uruguay, declared war on Brazil in 1864. The next year Argentina organized the Triple Alliance with Brazil and Uruguay. After three years of fighting, the allies annihilated the Paraguayan forces, but Solano López carried on a guerrilla war until he was killed. Paraguay was devastated by the war; its population was reduced by half, and territory covering some 55,000 sq mi (140,000 sq km) was annexed by Brazil and Argentina.

Triple Crown In U.S. horse racing, an unofficial championship attributed to a Thoroughbred horse that in a single season wins the Kentucky Derby, the Preakness Stakes, and the Belmont Stakes. First won in 1919 by Sir Barton, it has since been won 10 times, most recently by Secretariat (1973), Seattle Slew (1977), and Affirmed (1978).

Triple Entente \än-'tänt\ (1907) Association between Britain, France, and Russia. It developed from the Franco-Russian Alliance of 1894, the Anglo-French Entente Cordiale of 1904, and the Anglo-Russian Entente of 1907. Formed to settle mutual colonial disputes, the alignment became the nucleus of the Allied Powers in World War I.

© 2006 Encyclopædia Britannica, Inc.

triple jump *or* **hop, step, and jump** TRACK-AND-FIELD distance jump. It incorporates three distinct, continuous movements: a hop, in which the athlete takes off and lands on the same foot; a step, in which he lands on the other foot; and a jump, in which the athlete lands in any manner, usually with both feet together. It has been a modern Olympic event since the first games in 1896.

Tripoli \'tri-pə-lē\ *Arabic* **Ṭarābulus al-Shām** \tə-'rä-bə-ləs-al-'sham\ Seaport city (pop., 1998 est.: 160,000), northwestern Lebanon. Founded c. 700 BC, it became the capital of a federation of three PHOENICIAN city-states: SIDON, TYRE, and Arvad. It was controlled by the Seleucids and Romans and taken by the Muslims in the mid-7th century AD. Besieged and partially destroyed by crusaders in the early 12th century, it was rebuilt by the later Crusaders (see CRUSADES). It was occupied by the Egyptians in the 1830s, the British in 1918, and the British and Free French in 1941. It became part of the Republic of Lebanon in 1946. It has sometimes been a centre of Christian-Muslim conflict during Lebanon's history. It was also the scene of a siege in 1983 by Palestine Liberation Organization (PLO) rebels against PLO leader YĀSIR ʿARAFĀT. It is a major port, a commercial and industrial centre, and a popular beach resort. At the terminus of an oil pipeline from Iraq, it is an important oil storage and refining centre.

Tripoli *Arabic* **Ṭarābulus al-Gharb** \tə-'rä-bə-ləs-al-'gärb\ City (pop. 2003 est.: city, 1,150,000; urban agglom., 2,006,000), capital of LIBYA. Located on the MEDITERRANEAN SEA, it is the country's largest city and chief seaport. Founded by the PHOENICIANS c. 7th century BC, it was known as Oea in ancient times and was one of the three cities of the region of TRIPOLITANIA. It was controlled by the Romans from the 1st century BC and later by the Byzantines. It was taken by the Arabs in 645. Conquered by the OTTOMAN EMPIRE in 1551, it was made an Ottoman colonial capital. It was under Italy's control (1911–43), after which it was occupied by the British until Libya's independence in 1951. U.S. warplanes bombed targets within the city in 1983 in response to Libya's alleged support of terrorist activity. Historical structures include numerous mosques and a Roman triumphal arch. In 1973 Al-Fateh University replaced the former University of Libya.

Trípolis \'tri-pə-ləs\ City (pop., 2001: 28,976), southern Greece, the commercial centre of the central PELOPONNESE. It was founded in the 14th century AD as Drobolitza to replace the ancient cities of Pallantium, TEGEA, and MANTINEA. Rebuilt in 1770, it became the seat of the local Ottoman pasha. The city prospered until 1828, when it was destroyed in the War of GREEK INDEPENDENCE. It was rebuilt after 1834.

Tripolitan \tri-'pä-lə-tᵊn\ **War** (1801–05) Conflict between the U.S. and Tripoli. The U.S. refused to continue paying tribute to the rulers of the North African BARBARY COAST states, which had bought immunity from pirate attacks in the Mediterranean. The pasha of Tripoli demanded greater tribute and then declared war on the U.S. (1801). A U.S. naval squadron was sent to Tripolitan waters and fought several skirmishes, including a raid by STEPHEN DECATUR. A U.S. naval blockade and an overland expedition from Egypt ended the war with a peace treaty favourable to the U.S.

Tripolitania \tri-ˌpä-lə-'tā-nē-ə\ Historical region, North Africa. It is now part of northwestern Libya. Colonized by the PHOENICIANS in the 7th century BC, it was named for its three chief cities—LEPTIS MAGNA, Oea (TRIPOLI), and SABRATA. It comprised the eastern part of Carthaginian territory by the 3rd century BC and came under Numidian chieftains in the mid-2nd century BC. After the Numidian War (46 BC), it was attached to the Roman province of Africa Nova (see Roman AFRICA). It fell under the Islamic caliphate in the 7th century AD and was ruled by successive Arab and Berber dynasties before becoming part of the Ottoman Empire in 1551. The region gained its independence in 1711. As part of the BARBARY COAST, corsairs operating from there plundered shipping in the Mediterranean Sea, leading to the TRIPOLITAN WAR with the U.S. (1801–05). It came under Ottoman administration again in 1835. The Italians acquired the region in 1912, and it was the scene of fierce fighting between British and German forces during the NORTH AFRICA CAMPAIGNS (1940–43) of World War II. In 1951, with the provinces of CYRENAICA and FEZZAN, it formed the independent kingdom of Libya; the provinces were dissolved in 1963.

Trippe, Juan T(erry) (b. June 27, 1899, Seabright, N.J., U.S.—d. April 3, 1981, New York, N.Y.) U.S. airline founder. He served as a pilot in World War I. After graduating from Yale University in 1922, he promptly established an air taxi service using government-surplus aircraft. He next formed Colonial Air Transport, which began the first airmail route between New York City and Boston. In 1927 he founded PAN AMERICAN WORLD AIRWAYS. Under him the company introduced the first round-the-world air service (1947) and the first commercial jets (1955). He retired in 1968.

Tripura \'tri-pə-rə\ State (pop., 2001 prelim.: 3,191,168), northeastern India. It is bordered on three sides by BANGLADESH and by MIZORAM state; it has an area of 4,049 sq mi (10,486 sq km), and its capital is AGARTALA. It was an independent Hindu kingdom for more than 1,000 years before it became part of the Mughal Empire in the 17th century. After 1808 it was under the influence of the British government. Tripura became a union territory in 1956 and acquired full status as a state in 1972. The main economic activity is agriculture, with rice and jute the major crops.

trireme \'trī-ˌrēm\ Oar-powered warship. Light, fast, and maneuverable, it was the principal naval vessel with which Persia, Phoenicia, and the Greek city-states vied for mastery of the Mediterranean from the Battle of SALAMIS (480 BC) through the end of the PELOPONNESIAN WAR (404). The Athenian trireme was about 120 ft (37 m) long, and was rowed by 170 oarsmen seated in three tiers along each side; it could reach speeds of more than 7 knots (8 mph, or 13 kph). Square-rigged sails were used when the ship was not engaged in battle. Armed with a bronze-clad RAM, it carried spearmen and bowmen to attack enemy crews. By the late 4th century BC, armed deck soldiers had become so important in naval warfare that it was superseded by heavier ships. See also GALLEY.

Tristan and Isolde Lovers in a medieval romance based on Celtic legend. The hero Tristan goes to Ireland to ask the hand of the princess Isolde for his uncle, King Mark of Cornwall. On their return the two mistakenly drink a love potion prepared for the king and fall deeply in love. After many adventures, they make peace with Mark, who marries Isolde. The distraught Tristan goes to Brittany, where he marries another noble Isolde. When he is wounded by a poisoned arrow, he sends for the first Isolde. His jealous wife tells him his true love has refused to come; he dies just before she arrives, and she dies in his arms. The original poem has not survived, but it exists in many later versions and even became part of ARTHURIAN LEGEND. GOTTFRIED von Strassburg's 13th-century version, considered the masterpiece of medieval German poetry, was the basis for RICHARD WAGNER's opera *Tristan und Isolde* (first performed in 1865).

Tristano, Lennie *orig.* **Leonard Joseph Tristano** (b. March 19, 1919, Chicago, Ill., U.S.—d. Nov. 18, 1978, New York, N.Y.) U.S. JAZZ pianist. Blind from childhood, Tristano performed and taught in New York City from the 1940s. His recordings featured players who had studied with him, including saxophonists Lee Konitz (b. 1927) and Warne Marsh (1927–87). Although resistant to classification, Tristano's music displayed a rigour and virtuosity appropriate to BEBOP while its aesthetic foreshadowed much of cool jazz.

triticale \ˌtri-tə-'kā-lē\ WHEAT-RYE hybrid that has a high yield and rich protein content. The first cross was reported in 1875, the first fertile cross in 1888. The name triticale first appeared in scientific literature in 1935 and is attributed to Erich TSCHERMAK VON SEYSENEGG. In favourable environmental conditions its yield equals that of wheat; under poor conditions its yield exceeds that of wheat. Its flour is not very suitable for breadmaking but can be blended with wheat flour. Major producers are Russia, the U.S., and Australia.

tritium \'tri-tē-əm, 'tri-shē-əm\ Isotope of HYDROGEN, chemical symbol written as ^{3}H or T, with atomic number 1 but ATOMIC WEIGHT approximately 3. Its nucleus contains one PROTON and two NEUTRONS. Tritium is radioactive (see RADIOACTIVITY), with a HALF-LIFE of 12.32 years. Its occurrence in natural water in an amount 10^{-18} that of ordinary hydrogen is believed to be due to the action of COSMIC RAYS. Some tritium is used in self-luminous materials (e.g., for watch dials) and as a radioactive tracer in chemical and biochemical studies. NUCLEAR FUSION of DEUTERIUM and tritium at high temperatures releases enormous amounts of ENERGY. Such reactions have been used in NUCLEAR WEAPONS and experimental power reactors. See also HEAVY WATER.

Triton \'trī-tᵊn\ In GREEK MYTHOLOGY, a merman and a demigod of the sea. He was the son of POSEIDON and Amphitrite. According to HESIOD, Triton lived in a golden palace in the depths of the sea. He was represented as human down to the waist, which tapered into a fish tail, and he had a spiral conch shell that he blew to calm or raise the waves. Some traditions held that there were many Tritons.

Triton \'trī-tᵊn\ Largest of NEPTUNE's moons. Its diameter is about 1,680 mi (2,700 km), nearly 80% that of Earth's Moon. Unique among the large

© 2006 Encyclopædia Britannica, Inc.

moons of the solar system, Triton moves in a retrograde orbit, opposite the direction of Neptune's rotation. Its orbital period of 5.9 Earth days is the same as its rotation period; as a result it always keeps the same face toward Neptune. It has a very thin atmosphere of nitrogen and methane and a surface temperature of −390 °F (−235 °C). Its surface is covered with enormous expanses of ice sculpted with fissures, puckers, and ridge-crossed depressions. Geyser-like plumes observed by the VOYAGER 2 spacecraft may be gas venting through fissures when the surface is warmed by sunlight. Triton appears to have formed elsewhere in the solar system and to have been gravitationally captured by Neptune in the planet's early history.

triumph Ancient Roman ritual procession honouring a general who had won a major battle and killed at least 5,000 of the enemy. Senators and magistrates were followed by sacrificial animals, captured loot, and captives in chains. The general, in a purple-and-gold tunic, rode in a chariot, holding a laurel branch in his right hand and an ivory sceptre in his left, while a slave held a golden crown over his head. Lastly came the soldiers, who sang songs. Under the empire only the emperor and members of his family celebrated triumphs.

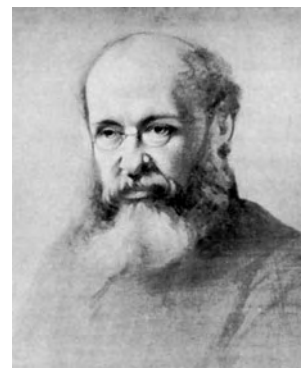
triumphal arch Monumental structure, originating in Rome, pierced by at least one arched passageway and erected to honour an important person or commemorate a significant event. It usually spanned a street or roadway and was built astride the line of march of a victorious army during its triumphal procession. Most were built during the empire period. The basic form consisted of two piers connected by an arch and crowned by a superstructure, or attic, that served as a base for statues and bore inscriptions. The large central arch could also be flanked by two smaller arches. The Roman triumphal arch had a facade of marble columns, and the archway and sides were adorned with relief sculpture. Among those built since the Renaissance is the ARC DE TRIOMPHE in Paris.

triumvirate \trī-'əm-vir-ət\ In ancient Rome, usually a board of three officials who assisted higher magistrates in judicial functions, oversaw festival banquets, or ran the mint. The First Triumvirate (60 BC) of POMPEY, Julius CAESAR, and CRASSUS was an informal group of three strong leaders with no sanctioned powers. The Second Triumvirate (43 BC), consisting of Mark ANTONY, LEPIDUS, and Octavian (later AUGUSTUS)—formally *tresviri rei publicae constituendae* ("triumvirate for organizing the state")—held absolute dictatorial power.

Troas \'trō-ˌas\ *or* **the Troad** Ancient region surrounding the city of TROY. It consisted mainly of the northwestern projection of Anatolia into the Aegean Sea. It extended from the Gulf of Edremit to the Sea of MARMARA and the DARDANELLES and from the Ida mountain range to the Aegean. St. PAUL visited the region on his missionary journeys.

Trobriand Islands \'trō-brē-ˌand\ *or* **Kiriwina Islands** \ˌkir-ə-'wē-nə\ Group of small coral islands, Solomon Sea, South Pacific Ocean, PAPUA NEW GUINEA. The islands are low-lying with coral reefs. The group has a total land area of about 170 sq mi (440 sq km). The largest, Kiriwina, is an atoll 30 mi (48 km) long and 3–10 mi (5–16 km) wide, covered largely with swamp; it served as an air and naval base for the Allies in 1943. Anthropologist BRONISLAW MALINOWSKI conducted research among the Trobriand islanders 1915–18.

Trobriander Any of the Melanesian people of the Kiriwina (TROBRIAND) Islands, lying off eastern New Guinea. Their subsistence is based on yams and other vegetables, domesticated pigs, and fish. Trobrianders are noted for their elaborate intertribal trading system, the *kula*, by which red shell necklaces are traded between permanent trading partners in a clockwise direction around a ring of islands; white shell bracelets are traded counterclockwise. Among the Trobrianders, wealth is extremely important as a sign of power. They were the subject of highly influential studies by BRONISŁAW MALINOWSKI.



Troilus and Cressida \'trȯi-ləs...'kre-si-də\ Lovers in medieval romance, based on characters from GREEK MYTHOLOGY. In the *Iliad*, Troilus, son of PRIAM and HECUBA, is dead before the TROJAN WAR starts. In non-Homeric legends he was said to have been killed during the war by ACHILLES. He was first turned into a romantic figure in the Middle Ages, when he was portrayed as an innocent young lover betrayed by the faithless Cressida, who abandoned him for the Greek warrior Diomedes. The first version of the story was written by the 12th-century TROUVÈRE Benoît de Sainte-Maure in the poem "Roman de Troie." More famous versions include GIOVANNI BOCCACCIO's "Il Filostrato," GEOFFREY CHAUCER's "Troilus and Criseyde," and WILLIAM SHAKESPEARE's drama *Troilus and Cressida.*

Trojan asteroids Two groups of ASTEROIDS named for heroes of Greece and Troy in Homer's *Iliad*. These objects revolve around the Sun at the Lagrangian points (see Joseph-Louis LAGRANGE) in Jupiter's orbit. Achilles, the first, was discovered in 1906. About 650 are known, but their actual number is estimated in the thousands. The term Trojan also applies to objects occupying the corresponding Lagrangian points in the orbits of other planets. Two such asteroids were discovered in Mars's orbit in the 1990s.

Trojan War Mostly legendary conflict between the Greeks and the people of TROY in western Asia Minor. It was dated by later Greeks to the 12th or 13th century BC. It is celebrated in HOMER's *Iliad* and *Odyssey*, in Greek tragedy, and in Roman literature. In Homer's account the Trojan prince PARIS ran off with the beautiful HELEN, wife of MENELAUS of Sparta, whose brother AGAMEMNON then led a Greek expedition to retrieve her. The war lasted 10 years; its participants included HECTOR, ACHILLES, PRIAM, ODYSSEUS, and AJAX. Its end resulted from a ruse: The Greeks built a large wooden horse in which a raiding party hid. When the Greeks pretended to leave, the Trojans brought the horse into the walled city and the Greeks swarmed out, opening the gates to their comrades and sacking Troy, killing the men and enslaving the women. The extent of the legend's actual historical content is not known; excavations have revealed human habitation from 3000 BC to AD 1200, and there is evidence of violent destruction about 1250 BC.

trolley car See STREETCAR

Trollope \'trä-ləp**, Anthony** (b. April 24, 1815, London, Eng.—d. Dec. 6, 1882, London) English novelist. He worked for the post office in England and Ireland from 1834 to 1867. Beginning in 1844 he produced 47 novels, writing mainly before breakfast at a fixed rate of 1,000 words an hour. His best-loved and most famous works are the six interconnected Barsetshire novels, including *Barchester Towers* (1857) and *The Last Chronicle of Barset* (1867). Depicting the social scene in an imaginary English county, they abound in memorable characters and atmosphere. The Palliser novels, dealing with political issues and featuring the character Plantagenet Palliser, include the sharply satirical *The Eustace Diamonds* (1872). Other works, such as *He Knew He Was Right* (1869), show great psychological penetration. *The Way We Live Now* (1875), with its ironic view of the Victorian upper classes, is especially highly regarded.

Anthony Trollope, oil painting by S. Laurence, 1865; in the National Portrait Gallery, London.
COURTESY OF THE NATIONAL PORTRAIT GALLERY, LONDON

trombone BRASS INSTRUMENT with an extendable slide with which the length of its tubing can be increased. It has a mostly cylindrical bore and a cup-shaped mouthpiece. The slide performs the same function as the valves in other brass instruments. Valve trombones, both with and without slides, were developed in the early 19th century; they provide increased agility but diminished tone quality. The trombone exists in several sizes; the tenor trombone in B-flat is the standard instrument, but the bass trombone is also used orchestrally. The trombone (long known as the sackbut) developed in the 15th century and has changed little over 400 years. By the 16th century it had been adopted by town, court, church, and military bands; it was employed in early opera orchestras, but it only began to be used in the symphony orchestra c. 1800. In the 20th century it became important in dance and jazz bands.

trompe l'oeil \trōⁿp-'lœi,\ *English* \ˌtrȯmp-'ləi\ *French* **"deceive the eye"** Style of representation in which a painted object is intended to deceive the viewer into believing it is the object itself. First employed by the ancient Greeks, trompe l'oeil was also popular with Roman muralists. Since the early Renaissance, European painters have used trompe l'oeil to create false frames from which the contents of still lifes or portraits seemed to spill and to paint windowlike images that appeared to be actual openings in a wall or ceiling.

Trondheim \'trȯn-ˌhām\ City (pop., 2000: 148,859), central Norway. It is located on Trondheim Fjord, an inlet of the Norwegian Sea that extends 80 mi (130 km) inland. Trondheim was founded by King Olaf I Tryggvason in 997, and it prospered as a trade centre until the Hanseatic League made Bergen its chief port. The city declined until the late 19th century, when it was linked by rail to Oslo. Norway's third largest city, it is a major Norwegian land and sea transport link and a manufacturing centre.

Tropic of Cancer Parallel of latitude approximately 23°27' north of the terrestrial Equator. It is the northern boundary of the tropics and marks the northernmost latitude at which the Sun can be seen directly overhead at noon.

Tropic of Capricorn Parallel of latitude approximately 23°27' south of the terrestrial Equator. It is the southern boundary of the tropics and marks the southernmost latitude at which the Sun can be seen directly overhead at noon.

tropical cyclone Severe atmospheric disturbance in tropical oceans. Tropical cyclones have very low atmospheric pressures in the calm, clear centre (the eye) of a circular structure of rain, cloud, and very high winds. In the Atlantic and Caribbean they are called hurricanes; in the Pacific they are known as typhoons. Because of the Earth's rotation, tropical cyclones rotate clockwise in the Southern Hemisphere and counterclockwise in the Northern. They may be 50–500 mi (80–800 km) in diameter, and sustained winds in excess of 100 mph (160 kph) are common. In the eye, however, the winds drop abruptly to light breezes or even complete calm. The lowest sea-level pressures on Earth occur in or near the eye.

Cross section of a tropical cyclone. A cyclone derives its power from the warm air and water found at tropical latitudes. Its winds rotate around the low-pressure centre, or "eye," where relative calm prevails. Wind and rain are usually most severe in or near the eyewall.
© MERRIAM-WEBSTER INC.

tropical fish Any of various small fishes of tropical origin often kept in aquariums. They are interesting for their behaviour or showiness or both. Popular varieties include the angelfish, guppy, kissing gourami, sea horse, Siamese fighting fish, and tetra.

tropical medicine Science of diseases seen primarily in tropical or subtropical climates. It arose in the 19th century when European colonial doctors encountered infectious diseases unknown in Europe. The discovery that many tropical diseases (e.g., malaria, yellow fever) were spread by mosquitoes led to discovery of other vectors' roles (see sleeping sickness, plague, typhus) and to efforts to destroy vector breeding grounds (e.g., by draining swamps). Later, antibiotics came to play an increasingly important role. Research institutes and national and international commissions were organized to control common tropical illnesses, at least in areas with Europeans. As colonies became independent, their governments took over most of these efforts, with help from the World Health Organization and the former colonizing countries.

troposphere \'trō-pə-ˌsfir\ Lowest region of the atmosphere, bounded by the Earth below and the stratosphere above, with the upper boundary being about 6–8 mi (10–13 km) above the Earth's surface. The troposphere is marked by decreasing temperature with height, which distinguishes it from the stratosphere. Most clouds and weather systems occur in the troposphere.

Troppau \'trȯ-ˌpaů**, Congress of** (1820) Meeting of the Holy Alliance powers held at Troppau in Silesia (modern Opava, Czech Rep.). Attended by representatives of Austria, Russia, and Prussia and by observers from Britain and France, the alliance signed a declaration of intention (the Troppau protocol) to take collective action against revolution. The congress agreed that states having undergone revolutions would be excluded from the European alliance. They invited the king of the Two Sicilies to meet at the Congress of Laibach to discuss intervention against the revolution in Naples. Britain and France did not accept the protocol, demonstrating the division between the eastern and western members of the alliance and seriously weakening it.

Trotsky, Leon *orig.* **Lev Davidovich Bronshtein** (b. Nov. 7, 1879, Yanovka, Ukraine, Russian Empire—d. Aug. 20, 1940, Coyoacán, Mex., near Mexico City) Russian communist leader. Born to Russian Jewish farmers, he joined an underground socialist group and was exiled to Siberia in 1898 for his revolutionary activities. He escaped in 1902 with a forged passport using the name Trotsky. He fled to London, where he met Vladimir Lenin. In 1903, when the Russian Social-Democratic Workers' Party split, Trotsky became a Menshevik, allying himself with Lenin's opponents. He returned to St. Petersburg to help lead the Russian Revolution of 1905. Arrested and again exiled to Siberia, he wrote *Results and Prospects*, setting forth his theory of "permanent revolution." He escaped to Vienna in 1907, worked as a journalist in the Balkan Wars (1912–13), and moved around Europe and the U.S. until the Russian Revolution of 1917 brought him back to St. Petersburg (then Petrograd), where he became a Bolshevik and was elected leader of the workers' soviet. He played a major role in the overthrow of the provisional government and the establishment of Lenin's communist regime. As commissar of war (1918–24), Trotsky rebuilt and brilliantly commanded the Red Army during the Russian Civil War. Although favoured by Lenin to succeed him, Trotsky lost support after Lenin's death (1924) and was forced out of power by Joseph Stalin. After a campaign of denunciation, he was expelled from the Politburo (1926) and Central Committee (1927), then banished from Russia (1929). He lived in Turkey and France, where he wrote his memoirs and a history of the revolution. Under Soviet pressure, he was forced to move around Europe and eventually found asylum in 1936 in Mexico, where, falsely accused in the purge trials as the chief conspirator against Stalin, he was murdered in 1940 by a Spanish communist.

Trotsky
H. ROGER-VIOLLET

Trotskyism Marxist ideology based on the theory of permanent revolution first expounded by Leon Trotsky. Trotsky believed that because all national economic development was affected by the laws of the world market, a revolution depended on revolutions in other countries for permanent success, a position that put him at odds with Joseph Stalin's "socialism in one country." After Trotsky's exile in 1929, Trotskyists continued to attack the Soviet bureaucracy as "Bonapartist" (based on the dictatorship of one man). In the 1930s Trotskyists advocated a united front with trade unions against fascism. After Trotsky's murder (1940), Trotskyism became a generic term for various revolutionary doctrines that opposed the Soviet form of communism. See also Leninism, Marxism, Stalinism.

troubadour \'trü-bə-ˌdůr, 'trü-bə-ˌdůr\ One of a class of lyric poets and poet-musicians, often of knightly rank, that flourished from the 11th through the 13th century, chiefly in Provence and other regions of southern France, northern Spain, and northern Italy. They wrote in the *langue d'oc* of southern France (see Languedoc) and cultivated a lyric poetry intricate in metre and rhyme and usually of a romantic amatory strain reflecting the ideals of courtly love. Favoured at courts, troubadours had great freedom of speech and were charged with creating around the court ladies an aura of pleasant cultivation. Their poetry, often set to music, was to influence all later European lyrical poetry. See also trouvère.

Troubles, Time of (1606–13) Period of political crisis in Russia. After the death of Fyodor I and the end of the Rurik dynasty (1598), the boyars opposed the rule of Boris Godunov and after his death placed the nobleman Vasily Shuysky (1552–1612) on the throne in 1606. Shuysky's rule was weakened by revolts, challenges by the second False Dmitry, and the invasion of Russia by the Polish king Sigismund III Vasa in 1609–10. The Russians finally rallied against the Polish invaders and succeeded in ousting them from their control of Moscow in 1612. A new representative assembly met in 1613 and elected Michael Romanov as tsar, commencing the 300-year reign of the Romanov dynasty.

trout Any of several prized game and food fishes of the family Salmonidae, native to the Northern Hemisphere but widely introduced elsewhere. Though most species inhabit cool fresh waters, a few (called sea trout; e.g., cutthroat trout) migrate to the sea between spawnings. Some weakfish are also called sea trout. The genus *Oncorhynchus* includes salmon and several trout species; *Salvelinus* contains trout species regarded as chars. Trout species vary greatly in anatomy, colour, and habits. Most live among submerged objects or in riffles and deep pools, eating insects, small fishes and their eggs, and crustaceans. See also brook trout; brown trout; lake trout; rainbow trout.

trouvère \trü-'ver\ One of a school of poets that flourished in northern France from the 11th to the 14th century. Trouvères were the counterparts in the language of northern France (the *langue d'oïl*) to the Provençal troubadour. Of either aristocratic or humble origins, they were originally connected with feudal courts but later found middle-class patrons. Noted for such forms as the chanson de geste, their works are generally narratives; their basic subject was courtly love. Trouvères pleased their audiences by combining stylized themes and traditional metrical forms rather than by originality of expression. The lyrics were intended to be sung, by the poet alone or accompanied by a hired musician.

Trowbridge \'trō-ˌbrij\ Town (pop., 1995 est.: 30,000), county seat of Wiltshire, southern England. Trowbridge has some notable buildings, including St. James's parish church, which dates from the 14th century. George Crabbe was rector there toward the end of his life. The town is famous for its fine woolen cloth.

Troy *or* **Ilium** Ancient city in Troas, northwestern Anatolia. It holds an enduring place in both literature and archaeology. In literature, it is well known as the location of the Trojan War. The archaeological site, a huge mound at modern Hisarlık, Tur., on the Menderes (Scamander) River, was first excavated by archaeologist Heinrich Schliemann (1870–90). It consists of nine major layers dating from the early Bronze Age to Roman times (c. 3000 BC–4th century AD). In Greek legend, the city was besieged by the Greeks for 10 years and finally destroyed. Its story is told in Homer's *Iliad* and *Odyssey* and in Virgil's *Aeneid*. Whether the site is the actual city of these works is still debated, but the archaeological evidence indicates that a city (Troy VIIa) was destroyed at that location c. 1260–40 BC and likely was the Homeric Troy. The ruins were designated a UNESCO World Heritage site in 1998.

Trubetskoy \ˌtrü-byit-'skȯi**, Nikolay (Sergeyevich)** (b. April 16, 1890, Moscow, Russia—d. June 25, 1938, Vienna, Austria) Russian linguist. Born into a family of scholars, he held professorships in Russia and (from 1922) at the University of Vienna. One of the founders of the Prague school of linguistics, he was noted as the author of the school's most important work on phonology, *Principles of Phonology* (1939). Influenced by Ferdinand de Saussure, Trubetskoy redefined the phoneme functionally as the smallest distinctive unit within the structure of a language. He died of a heart attack after being persecuted by the Nazis for criticizing racist theory.

Truce of God Measure by the medieval Roman Catholic Church to suspend warfare on certain days of the week and for certain church festivals and Lent. It was instituted in France as early as 1027, and elsewhere in Europe (excluding England) during the next several decades. The popes later took its direction into their own hands, and the first decree of the Council of Clermont (1095) proclaimed a weekly truce for all Christendom, with an oath of adherence to be taken by all men over age 12. The truce was most powerful in the 12th century but was never entirely effective.

Trucial States See United Arab Emirates

truck *or* **lorry** Motor vehicle designed to carry freight or heavy articles. The first truck was built in Germany in 1896 by Gottlieb Daimler. By the 1920s trucks had become a major means of freight transport. Gasoline engines for trucks were common until the 1940s, when diesel engines generally replaced them. Trucks may be either straight (all axles attached to the frame) or articulated (two or more frames connected by couplings); large articulated trucks consist of a towing tractor and a connected semitrailer. Air brakes were added to trucks in 1918 and four-wheel brakes in 1925; later improvements included power steering.

Trudeau, Pierre (Elliott) (b. Oct. 18, 1919, Montreal, Que., Can.—d. Sept. 28, 2000, Montreal) Prime minister of Canada (1968–79, 1980–84). He practiced law before being elected to the Canadian House of Commons (1966–84). He was minister of justice (1967–68) in Lester Pearson's administration. He became leader of the Liberal Party and prime minister in 1968. A determined antiseparatist, he advocated a strong federal government and took a determined stand against separatist terrorists. After nine months out of office, he returned in 1980 to initiate reforms that called for the constitutional "patriation," or transfer, of the amending authority from the British Parliament to Canada. To this end, he effected passage of the Canada Act, which precipitated Canada's official independence from Britain. His term saw the adoption of official bilingualism. He spent his final years in office seeking greater economic independence for Canada, forming better trade relations between industrialized democracies and developing countries, and urging further international disarmament talks. He resigned as leader of the Liberal Party and retired from politics in 1984, by which time he was the longest-serving leader of any Western democracy.

Truffaut \trü-'fō,\ *English* \trü-'fō**, François** (b. Feb. 6, 1932, Paris, France—d. Oct. 21, 1984, Neuilly-sur-Seine, near Paris) French film director and critic. As a film critic for the avant-garde *Cahiers du Cinéma*, he advocated the auteur theory and helped establish the New Wave movement. His first feature film was the semi-autobiographical *The 400 Blows* (1959), a portrait of a delinquent boy, that won him international acclaim. Influenced by Jean Renoir and Alfred Hitchcock, he made varied and admired movies such as *Shoot the Piano Player* (1960), *Jules and Jim* (1961), *Fahrenheit 451* (1966), *Stolen Kisses* (1968), *The Wild Child* (1969), *Day for Night* (1973, Academy Award), *The Story of Adèle H.* (1975), and *The Last Metro* (1980). His films record life's grayness and flatness with a sense of resignation quite distinct from platitude or petulant nihilism.

truffle Edible, underground fungus in the genus *Tuber* (class Ascomycetes, division Mycota), prized as a food delicacy since antiquity. Native mainly to temperate regions, truffles flourish in open woodlands on calcium-rich soil. The different species range from pea-sized to orange-sized. Truffles usually are associated with tree roots and are found up to about 1 ft (30 cm) below the soil surface. Experienced gatherers occasionally detect mature truffles by scent or by the morning and evening presence of hovering columns of small yellow flies, but more often with the help of trained pigs or dogs. The truffle is important in French cookery, and truffle gathering is an important industry in France. Truffles are among the most highly valued foods in the world. False truffles (genus *Rhizopogon*) form small, underground, potato-like structures under coniferous trees in parts of North America.

English truffle (*Tuber aestivum*).

Trujillo \trü-'hē-yō\ **(Molina), Rafael (Leónidas)** (b. Oct. 24, 1891, San Cristóbal, Dom.Rep.—d. May 30, 1961, Ciudad Trujillo, near San Cristóbal) Dictator of the Dominican Republic (1930–61). He entered the army in 1918 and rose through the ranks to become a general in 1927. In 1930 he seized power from Pres. Horacio Vásquez, and from then until his assassination he remained in absolute control of the country. Though he introduced a degree of economic modernization, its benefits were distributed inequitably, government corruption was rife, and Dominicans suffered the loss of civil and political liberties under his regime.

trullo Circular stone building roofed with a conical construction of dry stone masonry, unique to the region of Puglia in southeastern Italy and especially to the town of Alberobello, where trulli are used as dwellings. Trulli were built by piling circular courses of gray stone to a pinnacle on

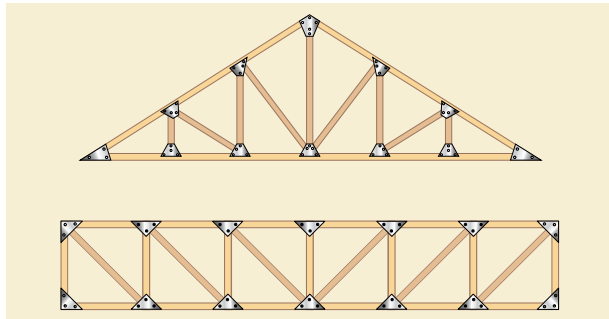
a whitewashed cylindrical wall. No mortar was used; the stones were held in place by gravity and pressure against one another.

Truman, Harry S. (b. May 8, 1884, Lamar, Mo., U.S.—d. Dec. 26, 1972, Kansas City, Mo.) 33rd president of the U.S. (1945–53). He worked at various jobs before serving with distinction in World War I. He became a partner in a Kansas City haberdashery; when the business failed, he entered Democratic Party politics with the help of Thomas Pendergast. He was elected county judge (1922–24), and he later became presiding judge of the county court (1926–34). His reputation for honesty and good management gained him bipartisan support. In the U.S. Senate (1935–45), he led a committee that exposed fraud in defense production. In 1944 he was chosen to replace the incumbent Henry Wallace as the Democratic Party vice presidential nominee, and he won election with Pres. Franklin D. Roosevelt. After only 82 days as vice president, he became president on Roosevelt's death (April 1945). He quickly made final arrangements for the San Francisco charter-writing meeting of the UN, helped arrange Germany's unconditional surrender on May 8, which ended World War II in Europe, and in July attended the Potsdam Conference. The Pacific war ended officially on September 2, after he ordered atomic bombs dropped on Hiroshima and Nagasaki; his justification was a report that 500,000 U.S. troops would be lost in a conventional invasion of Japan. He announced what would become known as the Truman Doctrine, which entailed aid for Greece and Turkey (1947); established the Central Intelligence Agency; and pressed for passage of the Marshall Plan to aid the economic recovery of western Europe. In the 1948 presidential election he defeated Thomas Dewey despite widespread expectation of his own defeat. On July 26, 1948, Truman issued an executive order banning segregation in the armed forces. He initiated a foreign policy of containment to restrict the Soviet Union's sphere of influence, pursued his Point Four Program, and initiated the Berlin airlift (see Berlin blockade and airlift) and the NATO pact of 1949. He sent troops under Gen. Douglas MacArthur to fight in the Korean War. Problems of pursuing the war occupied his administration until he retired. Though he was often criticized during his presidency, his reputation grew steadily in later years.

Truman Doctrine Pronouncement by Pres. Harry Truman. On March 12, 1947, he called for immediate economic and military aid to Greece, which was threatened by a communist insurrection, and to Turkey, which was under pressure from Soviet expansion in the Mediterranean. Engaged in the Cold War with the Soviet Union, the U.S. sought to protect those countries from falling under Soviet influence after Britain announced that it could no longer give them aid. In response to Truman's message, Congress appropriated $400 million in aid.

Trumbull, John (b. June 6, 1756, Lebanon, Conn.—d. Nov. 10, 1843, New York, N.Y., U.S.) U.S. painter, architect, and author. The son of Gov. Jonathan Trumbull (1710–85), he served as an aide to George Washington during the American Revolution and later as secretary to John Jay in London. In 1784 he studied painting in London with Benjamin West, and with West's encouragement he began the celebrated series of historical paintings and engravings he would work on throughout his life. In 1817 he was commissioned by Congress to paint the four large pictures that decorate the Capitol rotunda (completed 1826); most of the figures in the often-reproduced *Declaration of Independence* were painted from life.

Trump, Donald J(ohn) (b. 1946, New York, N.Y., U.S.) U.S. real-estate developer. He joined his father's Trump Organization (1968) and expanded its holdings of rental housing. By the 1990s Trump's business empire encompassed a number of high-rises (including the Empire State Building), hotels, and condominiums, including Trump Tower; more than 25,000 rental and co-op apartment units in Queens and Brooklyn; and several hotel-casino complexes in the nearby gambling centre of Atlantic City, N.J. An economic slump in the late 1980s forced him to cede partial control of his properties to creditors, but his fortunes rebounded in the 1990s, and he embarked on a vast building project on New York's West Side. His political ambitions and enjoyment of publicity combined to keep him in the public eye.



trumpet Brass instrument with tubing twice-folded in an elongated shape. (In its broad sense, trumpet may refer to any lip-vibrated instrument.) The modern trumpet has a mostly cylindrical bore, three valves, and a cup-shaped mouthpiece, and it is usually a B-flat or C instrument. The trumpet had taken its basic modern shape, with its ovoid loop, by c. 1500. In the 17th–18th centuries it employed crooks (removable lengths of tubing) to enable playing in different keys. The valved trumpet was developed in the 1820s. The trumpet has been associated with ceremonial and military uses since the 16th century. It joined the standard orchestra by c. 1700, though it was only selectively used, usually with the timpani. Its brilliant sound has since made it indispensable in a wide variety of ensembles. See also cornet; flügelhorn.

trumpeter swan Black-billed species (*Cygnus cygnus buccinator*) of swan, named for its far-carrying, low-pitched call. About 6 ft (1.8 m) long, with a 10-ft (3-m) wingspan, it is the largest swan, though it weighs less than the mute swan. Once threatened with extinction (fewer than 100 were counted in the U.S. in 1935), it has made a strong comeback; though still listed as vulnerable, its population in western Canada and the northwestern U.S. now exceeds 5,000.

Truong Chinh \trü-'ŏŋ-'chin\ *orig.* **Dang Xuan Khu** (b. Feb. 9, 1907, Ha Nam Ninh province, Viet.—d. Sept. 30, 1988, Hanoi) Vietnamese statesman, writer, and communist intellectual. He was an anticolonialist activist as a youth, joining Ho Chi Minh in 1928. He became a teacher and joined the Indochinese Communist Party, becoming its secretary-general in 1941. With Vo Nguyen Giap he developed the strategy that led to a Vietnamese victory over the Japanese occupation forces in 1945. With Le Duan (1908–86) and Pham Van Dong (1906–2000) he ruled North Vietnam after Ho's death in 1969.

Truro City (pop., 1995 est.: 25,000), county seat of Cornwall, southwestern England. It is located on the River Truro at the head of Falmouth Harbor. Industries include food processing and light engineering.

truss In building construction, a structural frame usually fabricated from pieces of metal or timber to form a series of triangles lying in a single plane. The linear members are subject only to compression or tension. The horizontal pieces forming the top and bottom of the truss are called the chords, and the sloping and vertical pieces connecting the chords are collectively called the web. Unlike a vault, the truss exerts no thrust but only downward pressure; supporting walls require no buttressing or extra thickening. Trusses have been used extensively in roofing and bridges. Wood trusses were probably first used in primitive dwellings c. 2500 BC. Wood was replaced by iron, which in turn was succeeded by steel.

A truss's outer members are called the chords, its interior members are called the web members, and each triangular section is called a panel. A pitched truss (top) has inclined top chords; a flat truss (bottom) has parallel top and bottom chords.

trust In law, a relationship between parties in which one, the trustee or fiduciary, has the power to manage property, and the other, the beneficiary, has the privilege of receiving the benefits from that property. Trusts are used in a variety of contexts, most notably in family settlements and in charitable gifts. The traditional requirements of a trust are a named beneficiary and trustee, an identified property (constituting the principal of the trust), and delivery of the property to the trustee with the intent to create a trust. Trusts are often created for the sake of advantageous tax treatment (including exemption). A charitable trust, unlike most trusts, does not require definite beneficiaries and may exist in perpetuity. See also trust company.

trust company Company, often a commercial bank, acting as trustee for individuals and businesses and providing related financial or estate-planning services. Trust services for individuals commonly include the administration of estates, living trusts (trusts that become effective during the lifetimes of their makers, or settlors), and testamentary trusts (trusts originating in a will). Services for businesses include the admin-

© 2006 Encyclopædia Britannica, Inc.

istration of corporate bond indentures and corporate pension funds. Trust companies may also serve as corporate stock registrars and as paying agents for the distribution of dividends.

trust fund Property (e.g, money or securities) held in a trust; that is, property held legally by one party (the legal owner) for the benefit of another party (the equitable owner). The legal owner, or trustee, has the right of possession and the right of use of the property, but must exercise those rights to the benefit of the equitable owner, or beneficiary. In Anglo-American law, trust funds are set up principally for family settlements and for charitable giving. In the commercial sector, trust funds are often set up to provide for employee pensions and profit-sharing programs.

truth In philosophy, the property of statements, thoughts, or propositions that are said, in ordinary discourse, to agree with the facts or to state what is the case. At least four major types of truth theory have been proposed: correspondence theories (see REALISM), coherence theories (see COHERENTISM, IDEALISM), pragmatic theories (see PRAGMATISM), and deflationary theories. The latter group encompasses a wide variety of views, including the redundancy theory, the disquotation theory, and the prosentential theory.

Truth, Sojourner *orig.* **Isabella Van Wagener** (b. c. 1797, Ulster county, N.Y., U.S.—d. Nov. 26, 1883, Battle Creek, Mich.) U.S. evangelist and social reformer. The daughter of slaves, she spent her childhood as an abused chattel of several masters. After being freed in about 1827, she worked as a domestic in New York City (1829–43) and began preaching on street corners with the evangelical missionary Elijah Pierson. Adopting the name Sojourner Truth, she left New York to obey a "call" to travel and preach. Adding ABOLITIONISM and women's rights to her religious messages, she traveled in the Midwest, where her magnetism drew large crowds. At the start of the AMERICAN CIVIL WAR she gathered supplies for black volunteer regiments. In 1864 she went to Washington, D.C., where she helped integrate streetcars and was received at the White House by Pres. ABRAHAM LINCOLN. After the war she worked for the freedmen's relief organization and encouraged migration to Kansas and Missouri.

Sojourner Truth.

TRW Inc. U.S. manufacturer of advanced equipment and systems for industry and government. Founded in 1901 as a maker of cap screws, it was incorporated in 1916 as the Steel Products Co. The name was changed to Thompson Products, Inc., in 1926, then to Thompson Ramo Wooldridge Inc. after a merger in 1958, and to TRW Inc. in 1965. Through its various divisions and subsidiaries, TRW designed and manufactured a wide range of automotive parts, electronic systems for military aircraft, and spacecraft. Its information systems and services segments maintain databases for screening credit histories. In 2002 defense contractor Northrop Grumman acquired TRW for its aerospace division.

tryptophan \'trip-tə-ˌfan\ One of the essential AMINO ACIDS. It is a HETEROCYCLIC COMPOUND that is found in small amounts in most PROTEINS. It plays an important role in the growth and development of infants and in the biosynthesis of SEROTONIN and NIACIN (thus, deficiency of niacin or tryptophan can cause PELLAGRA). Its occurrence in milk has been suggested as the reason that drinking milk before bedtime helps people sleep. It is used in medicine and nutrition research, in enriched foods, and as a dietary supplement.

Ts'ai-shen See CAISHEN

Ts'ao Chan See CAO ZHAN

Ts'ao Ts'ao See CAO CAO

tsar *or* **czar** \'zär, '(t)sär\ Byzantine or Russian emperor. The title, derived from *caesar*, was used in the Middle Ages to refer to a supreme ruler, particularly the Byzantine emperor. With the fall of the BYZANTINE EMPIRE in 1453, the Russian monarch became the only remaining Orthodox monarch, and the Russian Orthodox clergy considered him a possible new supreme head of Orthodox Christianity. IVAN IV (the Terrible) was the first to be crowned tsar, in 1547. Though theoretically wielding absolute power, he and his successors were limited by the power of the Orthodox church, the Boyar Council, and the successive legal codes of 1497, 1550, and 1649. In 1721 PETER I changed his title to "Emperor of All Russia," but he and his successors continued to be popularly called tsars.

Tsaritsyn See VOLGOGRAD

Tsavo \'tsä-ˌvō\ **National Park** Park, southeastern Kenya, east of Mount KILIMANJARO. Established in 1948, it covers 8,036 sq mi (20,812 sq km) and is Kenya's largest national park. It comprises semiarid plains covered by dormant vegetation (which blooms after a light rain) and acacia and baobab trees. Wildlife includes elephants, lions, rhinoceroses, hippopotamuses, hartebeests, and hundreds of bird species. Poaching and brush fires are constant problems.

Tschermak von Seysenegg \'cher-ˌmäk-fȯn-'zī-zə-ˌnek**, Erich** (b. Nov. 15, 1871, Vienna, Austria—d. Oct. 11, 1962, Vienna) Austrian botanist. He was one of the codiscoverers of GREGOR MENDEL's classic papers on heredity and the garden pea. Before running across Mendel's papers he had conducted his own breeding experiments with the garden pea, but he found that Mendel's work duplicated and in some ways surpassed his own. In the same year that he reported his findings (1900), HUGO DE VRIES and CARL ERICH CORRENS also reported their discovery of Mendel's papers. See also WILLIAM BATESON.

Tselinograd See ASTANA

Tseng Kuo-fan See ZENG GUOFAN

tsetse fly \'tset-sē, 'tsē-tsē\ Any of about 21 species (genus *Glossina*, family Muscidae) of African bloodsucking DIPTERANS that are robust, sparsely bristled, and usually larger than a HOUSEFLY. They have stiff, piercing mouthparts. Only two species commonly transmit the protozoan parasites (trypanosomes) that cause human SLEEPING sickness: *G. palpalis*, found primarily in dense streamside vegetation, and *G. morsitans*, found in more open woodlands. The female requires a sufficient blood meal to produce viable larvae, but both sexes suck blood almost daily.

Tshombe \'chȯm-bā**, Moise (-Kapenda)** (b. Nov. 10, 1919, Musumba, Belgian Congo—d. June 29, 1969, Algiers, Alg.) President of the secessionist African state of Katanga (1960–63) and premier of the united Congo Republic (1964–65). After losing national elections to PATRICE LUMUMBA in 1960, Tshombe declared his Katanga province independent. When the UN intervened in 1963, he was forced into exile; he returned the following year as premier in JOSEPH KASAVUBU's government but was dismissed in 1965. See also MOBUTU SESE SEKO.

Tsimshian \'chim-shē-ən\ One of the peoples of the NORTHWEST COAST INDIANS living in the Skeena and Nass river area in west-central British Columbia, Can., and southern Alaska, U.S. The Tsimshian dialects belong to the family of PENUTIAN LANGUAGES. The traditional economy was based on fishing, with some hunting in winter. Large winter houses, made of wood and often carved and painted, symbolized family wealth. Descent was traced through the maternal line. Lineages functioned largely independently, but all participated in major ceremonies and in warfare. Various important events were marked by a POTLATCH. At the turn of the 21st century the Tsimshian numbered in the thousands.

Tsugaru \tsü-'gär-ü\ **Strait** Strait, northwestern Pacific Ocean. It extends from the Sea of JAPAN (East Sea) to the open ocean between the islands of HONSHU and HOKKAIDO, Japan. It is 15–25 mi (24–40 km) wide. The Seikan Tunnel linking Aomori and Hakodate cities runs beneath the strait. Completed in 1988, it is the longest railway tunnel in the world; 14.5 mi (23.3 km) of its 33.5 mi (53.9 km) length lie under the strait.

tsunami \tsù-'nä-mē\ *or* **seismic sea wave** *or* **tidal wave** Catastrophic ocean WAVE, usually caused by a submarine earthquake. Underwater or coastal landslides or volcanic eruptions also may cause tsunamis. The term *tsunami* is Japanese for "harbour wave." The term *tidal wave* is a misnomer, because the wave has no connection with the tides. Perhaps

© 2006 Encyclopædia Britannica, Inc.

the most destructive tsunami ever occurred in 2004 in the Indian Ocean, after an earthquake struck the seafloor off the Indonesian island of Sumatra. More than 200,000 people were killed in Indonesia, Thailand, India, Sri Lanka and other countries as far away as Somalia on the Horn of Africa.

Tsvet \ˈtsvet**, Mikhail (Semyonovich) Tsvet** *also spelled* **Tsvett** *or* **Tswett** (b. May 14, 1872, Asti, Italy—d. June 26, 1919, Voronezh, Russian S.F.S.R.) Italian-born Russian botanist and chemist. He is credited with the discovery (in 1903) and application of CHROMATOGRAPHY. In 1910 he described how he extracted plant PIGMENTS with ether and alcohol and percolated the solution through columns of calcium carbonate or powdered sugar; the different pigments appeared as separate coloured bands. Tsvet discovered several new CHLOROPHYLLS and coined the words *chromatography* and *carotenoid*. His work was not discovered by mainstream Western scientists for nearly 30 years.

Tsvetayeva \tsvʸi-ˈtå-yə-və**, Marina (Ivanovna)** (b. Oct. 8, 1892, Moscow, Russia—d. Aug. 31, 1941, Yelabuga) Russian poet. After spending most of her youth in Moscow, she began studies at the Sorbonne in Paris at age 16. She published her first poetry collection in 1910. Her verses on the Russian Revolution glorify the anti-Bolshevik resistance, of which her husband was a part. She lived abroad from 1922 to 1939, mostly in Paris, writing varied works including poetry that increasingly reflected nostalgia for her homeland. Many of her best and most typical poetic qualities are displayed in the long verse fairy tale *Tsar-devitsa* (1922; "Tsar-Maiden"). Separated from her husband and daughter and isolated from friends after the evacuation of Moscow, she committed suicide. Though little known outside Russia, she is considered one of the finest 20th-century poets in Russian.

Tswana \ˈtswä-nə\ Westerly division of the SOTHO peoples of South Africa and Botswana. The Tswana, numbering 4.1 million, live in a grassland environment in which they raise livestock and grow corn and sorghum. There is a seasonal migration of Tswana men, many of whom work in the mining and industrial centres of South Africa.

t'u-ti See TUDI

Tuamotu \ˌtü-ə-ˈmō-tü\ **Archipelago** Group of about 80 islands (pop., 1996: 14,283), FRENCH POLYNESIA. The archipelago comprises 75 atolls, one raised coral atoll (Makatea), and innumerable coral reefs, roughly dispersed northwest-southeast as a double chain for over 900 miles (1,450 km). Europeans visited the islands in the 16th–17th centuries. France occupied them in 1844 and annexed them in 1880 as a Tahitian dependency. They now form, with the GAMBIER ISLANDS, an administrative division of French Polynesia. In 1947 THOR HEYERDAHL's Kon-Tiki expedition ended on Raroia—one of Tuamotu's many reefs. France has used some uninhabited atolls in the archipelago for nuclear testing.

Tuareg \ˈtwä-ˌreg\ A member of a nomadic Berber-speaking people of the southwestern Sahara in Africa. Their feudal, matrilineal culture divides society into nobles, clergy, vassals, artisans, and labourers (once slaves). Northern Tuareg live mainly in true desert; southern Tuareg live in steppe and savanna. They have traditionally engaged in herding, agriculture, convoying caravans across their territories, and raiding neighbouring tribes. They combine many pre-Islamic rituals and customs with Sunnite Muslim beliefs. Droughts in the 1970s and '80s reduced their numbers and eroded their traditional way of life.

tuatara \ˌtü-ə-ˈtä-rə\ Either of two species (*Sphenodon punctatus* and *S. guntheir*) of lizardlike, nocturnal REPTILES of the order Rhynchocephalia, found on certain islets of New Zealand. Up to 2 ft. (60 cm) long and weighing over 2 lbs (1 kg), tuataras have two pairs of well-developed limbs, a scaly crest down the neck and back, a third eyelid that closes horizontally, and a pineal eye between the two normal eyes. A bony arch behind the eyes distinguishes tuataras from lizards. They eats insects, other small animals, and birds' eggs. In spring, they lay 8–15 eggs away from their burrow. Tuataras may live about 100 years.

Tuatha Dé Danann \ˈtü-ə-hə-ˈdʸā-ˈdå-nən\ In Celtic mythology, a race inhabiting Ireland before the arrival of the Milesians, the ancestors of the modern Irish. Skilled in magic, they were banished from heaven because of their knowledge and descended on Ireland in a cloud of mist. They were thought to have disappeared into the hills when overcome by the Milesians. They were regarded as actual people by native historians up to the 17th century. Representative of the Celtic pantheon, they have become associated in popular legend with the numerous fairies still said to inhabit the Irish landscape.

tuba Deep-pitched valved BRASS INSTRUMENT with a widely expanding conical bore. Tubas vary in size and pitch. The tubing is coiled in an oblong shape, and the bell points upward or forward. Patented in Berlin in 1835, the tuba displaced the ophicleide to become the foundation of the brass section in the orchestra and in military and brass bands. See also EUPHONIUM, SOUSAPHONE.

Tubb, Ernest (Dale) (b. Feb. 9, 1914, Crisp, Texas, U.S.—d. Sept. 6, 1984, Nashville, Tenn.) U.S. COUNTRY MUSIC singer and songwriter. His first musical influence was the yodeling of JIMMIE RODGERS. He became one of the earliest exponents of honky-tonk with hits such as "I'm Walking the Floor over You" (1941). He joined the GRAND OLE OPRY in 1942, and he became one of the first musicians to record in Nashville. He was a pioneer of the electric guitar in the early 1950s. His Nashville radio program, *Midnight Jamboree* (from 1947), helped launch many stars, including the Everly Brothers and ELVIS PRESLEY. In 1947 he starred in the first country music show at Carnegie Hall.

tube worm Any of numerous species of sedentary, solitary or colonial, marine WORMS that spend their entire life in a tube made from special secretions or from sand grains glued together. Found worldwide, tube worms range from less than an inch (25 mm) to more than 20 ft (6 m) long. The bottom of the tube is attached to the seafloor; the mouth and tentacles are at the upper, open end. The worm breathes through gills, the tentacles, or the body wall. The tentacles, variously arranged, are used to filter-feed aquatic plants and animals. Tube worms occur in the ANNELID class Polychaeta and in the phyla Phoronida and Pogonophora. Many, mostly unnamed, forms live in deep-ocean vent communities.

tuber Short, thickened, mostly underground STEM that constitutes the resting stage of certain seed plants. It is often an organ of food storage, reproduction, or both. It bears minute scale leaves, each with a bud that has the potential for developing into a new plant. The common POTATO is a typical tuber; the much-reduced leaves and associated buds form its "eyes." The term is also used imprecisely but widely for fleshy roots or RHIZOMES that resemble tubers (e.g., the "tuber" of the DAHLIA, actually a tuberous root).

tuberculosis \tü-ˌbər-kyə-ˈlō-səs\ **(TB)** *formerly* **consumption** BACTERIAL DISEASE caused by some species of MYCOBACTERIUM (tubercle BACILLUS). Mentioned in ancient Egyptian records and by HIPPOCRATES, it has occurred throughout history worldwide. In the 18th–19th centuries it reached near-epidemic proportions in the rapidly industrializing and urbanizing Western world, where it was the leading cause of death until the early 20th century. TB resurged in the 1980s, spreading from AIDS patients to others, especially in prisons, homeless shelters, and hospitals, since enclosed settings promote spread. It occurs worldwide and is still a major cause of death in many countries. The body isolates the bacilli by forming tiny tubercles (nodules) around them. This often arrests TB's progress and no symptoms occur, but if the disease is not treated, it may become active—and contagious—later in life, most often when the immunity of the infected individual is suppressed (e.g., AIDS, after organ TRANSPLANT). The original tubercle breaks down, releasing still viable bacilli into the bloodstream to cause a new infection, which starts with loss of energy and weight and persistent cough. Health deteriorates, with increasing cough and possibly pleurisy (see THORACIC CAVITY) and spitting up blood. Growing tubercle masses may destroy so much lung tissue that RESPIRATION cannot supply the body with enough oxygen. Other organs can be affected, with complications including MENINGITIS. A VACCINE with weakened bacteria has helped control infection, but preventing exposure by recognizing and treating active TB early is more effective. Because many strains are resistant to drugs, treatment requires at least two drugs to which the patient's strain is sensitive and at least six months; inadequate treatment lets resistant bacilli multiply. The acute disease caused by multidrug-resistant strains is very hard to cure and usually fatal.

Tubman, Harriet *orig.* **Arminta Ross** (b. c. 1820, Dorchester county, Md., U.S.—d. March 10, 1913, Auburn, N.Y.) U.S. abolitionist. Born into slavery, she escaped to the North by the UNDERGROUND RAILROAD in 1849. She made frequent trips into the South to lead over 300 slaves to freedom, despite large rewards offered for her arrest. Known as the "Moses of her people," she was admired by abolitionists such as JOHN

© 2006 Encyclopædia Britannica, Inc.

Brown, who called her General Tubman. In the American Civil War, she served as a nurse, laundress, and spy for Union forces in South Carolina. She later settled in Auburn, N.Y., and was eventually granted a federal pension for her war work.

Tubman, William V(acanarat) S(hadrach) (b. Nov. 29, 1895, Harper, Liberia—d. July 23, 1971, London, Eng.) President of Liberia (1944–71). Tubman educated himself in law before entering public service, eventually ascending to the Supreme Court (1937–44). As president, Tubman enacted suffrage and property rights for women, authorized participation in government by all ethnic groups, and established a nationwide public-school system.

Tuchman \'tək-mən**, Barbara** *orig.* **Barbara Wertheim** (b. Jan. 30, 1912, New York, N.Y., U.S.—d. Feb. 6, 1989, Greenwich, Conn.) U.S. historian. She wrote for *The Nation* and other publications before beginning to write most of the books that made her a leading popular historian. Marked by a masterly literary style and a powerful grasp of complex issues, they include *The Zimmermann Telegram* (1958); *The Guns of August* (1962, Pulitzer Prize), on the first month of World War I; *Stilwell and the American Experience in China, 1911–45* (1970, Pulitzer Prize), a study of the China-U.S. relationship; and *A Distant Mirror* (1978), concerning 14th-century France.

Barbara Tuchman.
© JERRY BAUER

Tucson \'tü-ˌsän\ City (pop., 2000: 486,699), southeastern Arizona, U.S. It lies along the Santa Cruz River on a hilly plain of the Sonoran Desert rimmed by mountains. In 1700 the Spanish founded several missions nearby, and in 1776 the small walled pueblo of Tucson was made a Spanish presidio (fort). It remained the province's military headquarters under Mexican rule. The U.S. acquired the territory through the Gadsden Purchase (signed in 1853). Tucson was the territorial capital from 1867 to 1877. It grew with the arrival of the railroad in 1880 and the discovery of silver at nearby Tombstone and copper at Bisbee. Its dry, sunny climate and desert locale have made it a popular tourist and health resort and retirement community. It is the seat of the University of Arizona (1885).

Tucuna *or* **Ticuna** *or* **Tikuna** \tə-'kü-nəs\ South American Indian people living in Brazil, Peru, and Colombia. Traditional Tucunas live in the rainforest of the northwestern Amazon basin, cultivating cassava and corn (maize), raising chickens, and hunting and gathering in the forest. They make baskets, pottery, and bark cloth and trade animal hides and handmade canoes for money and manufactured goods. They were once skilled hunters with blowguns, spears, and snares, but depletion of animal populations has altered old hunting patterns.

Tudjman \'tůj-män**, Franjo** (b. May 14, 1922, Veliko Trgovisce, Kingdom of Serbs, Croats, and Slovenes—d. Dec. 10, 1999, Zagreb, Cro.) Croatian politician and president of Croatia (1990–99). He served with the partisans under Marshal Tito in World War II. He taught political science and history at the University of Zagreb (1963–67) and later wrote numerous books on history and politics. He was expelled from the Yugoslav Communist Party in 1967 for his nationalist writings, and he was imprisoned in 1972 and 1981. In 1989 Tudjman founded the Croatian Democratic Union, which won Croatia's first free parliamentary elections in 1990. Named president, he pressed for the creation of a homogenous Croatian state. When Serbian areas of Eastern and Western Slavonia and the Krajina revolted, they were occupied by the Yugoslav army. Beginning in 1995, Tudjman reasserted control over these areas and established virtual control over portions of Bosnia and Herzegovina with majority Croatian populations. His authoritarian style, along with his refusal to cooperate with the International Criminal Tribunal for the Former Yugoslavia, led to the international isolation of Croatia, and his excesses in the Bosnian conflict and his autocratic rule earned Tudjman a reputation for brutality.

Tudor, Antony *orig.* **William Cook** (b. April 4, 1908, London, Eng.—d. April 20, 1987, New York, N.Y., U.S.) British-born U.S. dancer, teacher, and choreographer. In 1927 he joined Marie Rambert's company, where he choreographed and danced such works as *The Planets* (1934) and *The Lilac Garden* (1936). In 1940 he moved to New York City, joining the new Ballet Theatre (later American Ballet Theatre), for which he created many of his signature psychological ballets, including *Pillar of Fire* (1942) and *Shadow of the Wind* (1948). In these works he sought to convey emotional conflict and aspects of character and motivation. In 1974 he became associate director of American Ballet Theatre.

Tudor, Henry See Henry VII (England)

Tudor, house of English royal dynasty that gave five sovereigns to England (1485–1603). The Tudors originated in the 13th century, but the dynasty's fortunes were established by Owen Tudor (c. 1400–61), a Welsh adventurer who took service with Henry V and married Henry's widow, Catherine of Valois (1401–37). Owen and Catherine's son Edmund Tudor (c. 1430–56) was created earl of Richmond and married Lady Margaret Beaufort (1443–1509), a descendant of John of Gaunt of the house of Lancaster. Their son Henry Tudor claimed the English throne as Henry VII in 1485 and cemented his claim with his marriage to Elizabeth of the house of York, daughter of Edward IV. The Tudor rose symbolized the union between the red rose of the Lancastrians and the white rose of the Yorkists. The Tudor dynasty continued in the 16th century with the reigns of Henry VIII and his children Edward VI, Mary I, and Elizabeth I. In 1603 the dynasty was succeeded by the house of Stuart.

Tudor, Margaret See Margaret Tudor

Tudor, Mary See Mary I

Tudor style Architectural style in England (1485–1558) that made lavish use of half-timbering (see timber framing), as well as oriels, gables, decorative brickwork, and rich plasterwork. Exposed diagonal bracing usually occurs at building corners, with the second story often sporting a picturesque overhang; this cantilevered construction partially counterbalances the load carried by the spanning portions of the beams.

tuff Relatively soft, porous rock that is usually formed by the compaction and cementation of volcanic ash or dust. Tuff may vary greatly not only in texture but also in chemical and mineralogical composition. In some eruptions, foaming magma wells to the surface as an emulsion of hot gases and incandescent particles; the shredded pumice-like material spreads swiftly, even over gentle slopes, as a glowing avalanche (nuée ardente) that may move many miles at speeds of 100 mph (160 kph).

Tugela River \tü-'gā-lə\ Principal river, KwaZulu-Natal province, South Africa. It rises in the Mont-aux-Sources plateau and hurtles 3,110 ft (948 m) down a series of waterfalls to cut through Tugela Gorge. It ends its 312-mi (502-km) course at the Indian Ocean. It was the scene of battles in the South African War in 1899–1900. Historically, the Tugela marked the southern boundary of Zululand.

Tugwell, Rexford G(uy) (b. July 10, 1891, Sinclairville, N.Y., U.S.—d. July 21, 1979, Santa Barbara, Calif.) U.S. economist. He joined the economics faculty of Columbia University in 1920, and in 1932 he became a member of the Brain Trust that advised Franklin D. Roosevelt. Appointed undersecretary of agriculture, he helped formulate farm policy and other New Deal economic reforms (1933–36). He chaired the New York City Planning Commission (1938–41), served as governor of Puerto Rico (1941–46), and taught at the University of Chicago (1946–57).

Tuileries Palace \'twē-lə-ˌrēz\ French royal residence, adjacent to the Louvre in Paris, destroyed by arson in 1871. The original palace, commissioned by Catherine de Médicis, was begun in 1564 by Philibert Delorme (c. 1515–1570); the next 200 years saw numerous additions and alterations by Jean Bullant (1520?–1578), Jacques du Cerceau (c. 1520–1585), Louis Le Vau (1612–1670), and others. The Tuileries Gardens have changed little since Andre Le Notre redesigned them in 1664. His design extended the central walkway beyond the gardens and out into the countryside to the hilltop west of the palace, where the Arc de Triomphe now stands.

Tukhachevsky \ˌtůk-ə-'chef-skē**, Mikhayl (Nikolayevich)** (b. Feb. 16, 1893, near Slednevo, Russia—d. June 11, 1937) Soviet Red Army officer. In the Russian Civil War, he commanded the recapture of Siberia from Aleksandr Kolchak and led the Cossack forces against Anton Denikin (1920). He thereafter played a leading role in military reform; from 1931 he directed the rearmament of the Soviet Union. He served as Soviet chief of staff (1925–28) and later as deputy commissar for defense (1931–

© 2006 Encyclopædia Britannica, Inc.

37); he was made a marshal of the Soviet Union in 1935. A victim of the PURGE TRIALS in 1937, he was tried and executed with other top Red Army commanders. In 1988 he was cleared judicially and rehabilitated by official decree.

Tukulor \ˌtü-kü-'lər\ Muslim people of Senegal and western Mali. Because of extended contacts with the FULANI, the Tukulor speak a dialect of Fula, an Atlantic language of the NIGER-CONGO family. In the 10th–18th centuries they were dominated by a succession of non-Tukulor groups in the kingdom of Tekrur. About 1850 they established an empire and conquered the BAMBARA kingdoms of Kaarta and Segu and extended their empire to TIMBUKTU before it was destroyed by the French in 1890. Today the Tukulor raise livestock, fish, and cultivate millet and sorghum.

Tula Ancient city in Mexico, the capital of the TOLTECS, which flourished in the 10th–12th centuries. Its exact location is uncertain; the archaeological site now designated Tula, near the town of that name in Hidalgo state, has been the choice of historians, but other scholars identify Tula with what is now usually called TEOTIHUACÁN. The Tula site suggests a city that had a population in the tens of thousands. The major civic centre consists of a plaza bordered by a five-stepped pyramid, two other pyramids, and two ball courts. Tula's art and architecture are strikingly similar to those of the AZTEC capital, TENOCHTITLÁN, and its artistic themes suggest that the Aztecs' concept of themselves as warrior-priests of the sun god was borrowed directly from Tula.

tulip Any of almost 4,000 varieties of about 100 species of cultivated bulbous herbaceous plants making up the genus *Tulipa* in the LILY FAMILY, native to Eurasia. Among the most popular of all garden flowers, the tulip produces two or three thick, bluish-green leaves clustered at the base of the plant. The usually solitary inverted bell-shaped flowers have three petals and three sepals. Colors range from white through yellows and reds to brown and deep purple to almost black. Streaked blossoms get their streaks from a harmless virus infection that causes the color to disappear in patterns, letting white or yellow show through.

tulip tree *or* **tulip poplar** *or* **yellow poplar** Lofty North American ornamental and timber tree (*Liriodendron tulipifera*) of the MAGNOLIA family, not related to true POPLARS. It occurs in mixed HARDWOOD stands in eastern North America. It is taller than all other eastern broad-leaved trees (up to 197 ft, or 60 m), and its trunk often has a diameter greater than 7 ft (2 m). Long-stemmed, bright-green leaves have two to four side lobes and blunted tips. Yellowish-green tuliplike flowers have six petals, orange at their bases, and three bright-green sepals. Other characteristics include conelike clusters of winged fruits; aromatic, purplish-brown twigs; stunning golden-yellow autumn leaves; winter buds resembling a duck's bill; and resistance to pests and diseases. The wood is used to manufacture furniture parts, plywood panels, paper, boxes, and crates.

Tull, Jethro (b. 1674, Basildon, Berkshire, Eng.—d. Feb. 21, 1741, Prosperous Farm, near Hungerford, Berkshire) British agronomist and inventor. He was educated at Oxford. Around 1701 he perfected a horse-drawn seed drill that economically sowed the seeds in neat rows, and later a horse-drawn hoe. He stressed the use of manure and the importance of breaking up the soil into small particles. Tull's methods, though initially attacked, were eventually adopted by many large landowners, and they helped form the basis of modern agriculture.

Tulsa City (pop., 2000: 393,049), northeastern Oklahoma, U.S. On the ARKANSAS RIVER, Tulsa originated in 1836 as a settlement of CREEK Indian immigrants; white settlement began in 1882 after the arrival of the railway. The discovery of oil nearby in the early 20th century launched an oil and gas boom, and phenomenal growth followed. Many major oil companies now have plants and offices in the city. It is the head of navigation for the Arkansas River Navigation System, a waterway that stretches 440 mi (708 km) to the junction of the Arkansas and MISSISSIPPI rivers. The commercial and financial centre of a rich agricultural area, it is the seat of the University of Tulsa (1894) and Oral Roberts University (1965).

tumbleweed Plant that breaks away from its roots and is driven about by the wind as a light rolling mass, scattering seeds as it goes. Examples include pigweed (*Amaranth retroflexus*, a widespread weed in the western U.S.) and other AMARANTHS, tumbling mustard, Russian thistle, the steppe plant *Colutea arborea*, and the grass *Spinifex* of Indonesian shores and Australian steppes.

Tumen \'tü-'mən\ **River** River, eastern Asia. It forms the northeastern frontier of North Korea with China and Russia. It originates on Mount Paektu, North Korea's highest mountain, and flows generally north and northeast before turning southeast to enter the Sea of JAPAN (East Sea). It is 324 mi (521 km) long but navigable for only 53 mi (85 km). Many historic battle sites lie along its banks.

tumour *or* **neoplasm** Mass of abnormal tissue that arises from normal cells, has no useful function, and tends to grow. Cell abnormalities may include increased size or number or loss of characteristics that differentiate their tissue of origin. Cells in malignant tumours (see CANCER) have a distorted size, shape, and/or structure. Less differentiated cells tend to grow faster. Malignant tumours invade tissues locally and spread (metastasize) in blood or lymph: the stronger the tendency to metastasize, the more malignant the tumour. Tumours may not cause pain until they press on or invade nerves. Both benign and malignant tumours can press on nearby structures, block vessels, or produce excess hormones, all of which can cause death. Benign tumours remain as a solid mass that can be removed by surgery if accessible; they can consist of various tissues and may become malignant; malignant tumours, though they may remain quiescent for a time, never become benign.

tuna Any of seven species (genus *Thunnus*, family Scombridae) of commercially valuable food fishes. Species range from the 80-lb (36-kg) ALBACORE to the bluefin tuna (*T. thynnus*), which grows to 14 ft (4.3 m) long and weighs up to 1,800 lbs (800 kg). Tunas have a slender, streamlined body and a forked or crescent-shaped tail. They are unique among fishes in having a vascular system modified to maintain a body temperature above the water temperature. Though slow swimmers, they migrate long distances over all the world's oceans. They eat fishes, squid, shellfish, and plankton.

tundra Treeless, level or rolling ground above the TAIGA in polar regions (Arctic tundra) or on high mountains (alpine tundra), characterized by bare ground and rock or by such vegetation as mosses, lichens, small herbs, and low shrubs. Animal species are limited by harsh environmental conditions. In the Arctic tundra they include lemmings, the Arctic fox, the Arctic wolf, caribou, reindeer, and musk-oxen. In the alpine tundra many animals, including mountain sheep and wildcats, descend to warmer zones during winter. The climate of alpine tundra is more moderate and has a higher amount of rainfall than does Arctic tundra. The freezing climate of the Arctic produces a layer of permanently frozen soil (PERMAFROST). An overlying layer of soil alternates between freezing and thawing with seasonal temperature variations. Alpine tundras have a freeze-thaw layer but no permafrost. Because Arctic tundras receive extremely long periods of daylight and darkness (lasting between one and four months), BIOLOGICAL RHYTHMS tend to be adjusted more to variations in temperature than to variations in sunlight. Arctic tundra covers about one-tenth of the earth's surface. Alpine tundras begin above the timberline of spruce and firs. Because of the small number of plant and animal species and the fragility of the food chains in tundra regions, natural or mechanical damage to any element of the habitat affects the whole ecosystem.

tuned circuit Electrically conducting pathway containing both INDUCTANCE and CAPACITANCE elements. When these elements are connected in series, the CIRCUIT presents low ELECTRICAL IMPEDANCE to ALTERNATING CURRENT of the same frequency as the resonance frequency of the circuit and high impedance to current of other frequencies. The circuit's resonance frequency is determined by the values of inductance and capacitance. When the circuit elements are connected in parallel, the impedance is high at the resonance frequency and low at other frequencies. With their ability to pass only certain frequencies, tuned circuits are important in, for example, radio and television receivers.

tungsten *or* **wolfram** \'wůl-frəm\ Metallic chemical ELEMENT, one of the TRANSITION ELEMENTS, chemical symbol W, atomic number 74. Exceptionally strong, white to grayish, and brittle, it has the highest melting point (6,170 °F [3,410 °C]), greatest high-temperature strength, and lowest THERMAL EXPANSION coefficient of any METAL. Its chief uses are in STEELS to increase hardness and strength and in lightbulb filaments (see INCANDESCENT LAMP). It is also used in electrical contacts, rocket nozzles, chemical

© 2006 Encyclopædia Britannica, Inc.

apparatus, high-speed rotors, and SOLAR-ENERGY devices. Tungsten is relatively inert, but compounds (in which it has various VALENCES) are known. The most important, tungsten CARBIDE, noted for its hardness, is used to increase the wear-resistance of cast iron and of tools' cutting edges.

tungsten-halogen lamp See HALOGEN LAMP

Tungusic languages See MANCHU-TUNGUS LANGUAGES

Tunguska event \tůŋ-'gü-skə\ (June 30, 1908) Enormous aerial explosion that flattened about 500,000 ac (2,000 sq km) of pine forest near the Stony Tunguska River in central Siberia. Its energy is estimated to have been equivalent to that of about 15 megatons of TNT. Uncertain evidence suggests that a meteoroid (see METEOR) 150–300 ft (45–90 m) in diameter or, less likely, a COMET disintegrated in the atmosphere high above Earth's surface, creating a fireball and blast wave but no crater. Eyewitnesses spoke of a fireball lighting the horizon, initially visible from about 500 mi (800 km) away, followed by trembling ground and hot winds strong enough to throw people down and shake buildings. The object's vaporization scattered dust high into the atmosphere, causing abnormally bright nighttime skies in Siberia and Europe for some time afterward.

tunicate \'tü-ni-kət\ Any of some 2,000 species (CHORDATE subphylum Tunicata, or Urochordata) of small marine invertebrates that are abundant worldwide. Tunicates are either sessile (permanently attached), free-swimming, or planktonic (floating). The name tunicate derives from a secreted protective covering (the tunic) containing cellulose. Floating species often form colonies that may be 13 ft (4 m) long. Some free-swimming species are too small to see. Adults filter feed on microorganisms. Sessile forms growing on ships' hulls may be a nuisance, but some species are pharmaceutically useful. See also SEA SQUIRT.

tuning and temperament In music, the adjustment of one sound source, such as a voice or string, to produce a desired pitch in relation to a given pitch, and the modification of that tuning to lessen dissonance. Tuning assures a good sound for a given pair of tones; temperament compromises the tuning to assure a good sound for any and all pairs of tones. Two vibrating strings sound best together if the ratio between their lengths can be expressed by two small whole numbers. If two strings vibrate in a ratio of 2:1, the vibrations will always coincide and so reinforce each other. But if they vibrate in a ratio of 197:100 (very close to 2:1), they will cancel each other out three times per second, creating audible "beats." These beats are what make something sound "out of tune." Since a tone produced by one ratio will not necessarily agree with the same tone created by repeatedly applying another ratio, either some INTERVALS must be mistuned to allow for the perfect tuning of others or all intervals must be slightly mistuned. Before 1700, several systems were used based on the former compromise, including "just intonation"; since then, the compromise known as "equal temperament," in which the ratios represented by each pair of adjacent notes are identical, has prevailed.

Tunis \'tü-nəs\ City (pop., 2004: 728,453), capital of TUNISIA. It is situated on Tunis Lake, an inlet of the Gulf of Tunis; its port, La Goulette (Ḥalq al-Wādī), is 6 mi (10 km) to the northeast. Founded by Libyans, it was later a small town under CARTHAGE; it became important after the Muslim conquest in the 7th century AD. It was a religious centre during the AGHLABID DYNASTY (9th century) and reached its greatest prosperity under the HAFṢID DYNASTY (13th century). The Spanish and Ottomans controlled it during the 16th century, and it was occupied by the Germans in 1942. It was made the national capital when Tunisia gained independence from France in 1956. It produces textiles, carpets, and olive oil and has metallurgical industries. Tourism is also important. The city's historic centre was designated a UNESCO WORLD HERITAGE SITE in 1979.

Tunisia \tü-'nē-zhə\ *officially* **Tunisian Republic** Country, North Africa. Area: 63,170 sq mi (163,610 sq km). Population (2005 est.): 10,038,000. Capital: TUNIS. The population is of Arab and Berber (Amazigh) ancestry. Languages: Arabic (official), French. Religion: Islam (official; predominantly Sunni). Currency: Tunisian dinar. Tunisia comprises a coastal region, mountains, an extensive hilly steppe, a marshy area with shallow salt lakes, and a tract of the SAHARA. The Majardah is its longest (about 290 mi [460 km]) and only perennial river. Tunisia contains some of the largest phosphate and natural gas reserves in Africa, as well as substantial oil reserves. Major economic activities are services, agriculture, light industries, and the production and export of petroleum and phosphates. Tourism, focusing on Tunisia's beaches and Roman ruins, is also important. Tunisia is a republic with one legislative house; its chief

of state is the president, and the head of government is the prime minister. From the 12th century BC the Phoenicians had a series of trading posts on the North African coast. By the 6th century BC the Carthaginian kingdom encompassed most of present-day Tunisia. The Romans ruled from 146 BC. It was part of the Byzantine Empire until the Muslim Arab invasions in the mid-7th century AD. The area was fought over, won, and lost by many, including the ʿABBĀSID DYNASTY, the ALMOHAD DYNASTY, Spain, and the Ottoman Empire, which conquered it in 1574 and held it until the late 19th century. For a time it maintained autonomy as the French, British, and Italians contended for the region. In 1881 it became a French protectorate. During World War II (1939–45) U.S. and British forces captured it (1943), putting an end to a brief German occupation. France granted it full independence in 1956; HABIB BOURGUIBA assumed power and remained in power until he was forced from office in 1987. His successor, Zine al-Abidine Ben Ali, continued his authoritarian-style rule.

tunnel Horizontal or nearly horizontal underground or underwater passageway. Tunnels are used for mining, as passageways for trains and motor vehicles, for diverting rivers around damsites, for housing underground installations such as power plants, and for conducting water. Ancient civilizations used tunnels to carry water for irrigation and drinking, and in the 22nd century BC the Babylonians built a tunnel for pedestrian traffic under the Euphrates River. The Romans built AQUEDUCT tunnels through mountains by heating the rock face with fire and rapidly cooling it with water, causing the rock to crack. The introduction of gunpowder blasting in the 17th century marked a great advance in solid-rock excavation. For softer soils, excavation is accomplished using devices such as the tunneling mole, with its rotating wheel that continuously excavates material and loads it onto a conveyor belt. Railroad transportation in the 19th–20th century led to a tremendous expansion in the number and length of tunnels. Brick and stone were used for support in early tunnels, but in modern tunneling steel is generally used until a concrete lining can be installed. A common method of lining involves spraying SHOTCRETE onto the tunnel crown immediately after excavation.

tunneling *or* **barrier penetration** In physics, the passage of a particle through a seemingly impassable energy barrier. Though a particle's energy may be too low to surmount a barrier in classical physics, the particle may still cross the barrier as a consequence of its quantum-mechanical wave properties. An important application of this phenomenon is in the operation of the scanning tunneling microscope.

Tunney, Gene *orig.* **James Joseph Tunney** (b. May 25, 1898, New York, N.Y., U.S.—d. Nov. 7, 1978, Greenwich, Conn.) U.S. boxer. Tunney boxed in the Marine Corps, earning the nickname "the Fighting

© 2006 Encyclopædia Britannica, Inc.

Marine." He defeated JACK DEMPSEY in 1926 to become the world heavyweight champion. In a controversial rematch in Chicago in 1927, Dempsey knocked Tunney to the canvas in the seventh round but failed to retire immediately to a neutral corner, thus delaying the count; the "long count" allowed Tunney to rise and win the 10-round fight. He retired the next year with a record of 65 wins in 77 bouts.

Tupac Amarú \tü-'päk-ä-'mär-ü\ Peruvian revolutionary group. Founded in 1983, the group is best known for holding 490 people hostage in the Japanese embassy in Lima (1996) in an effort to gain the release of jailed comrades. After a standoff of several weeks, Peruvian troops stormed the embassy and killed all the guerrillas. Defections have apparently since decreased its membership. The group takes its name from the Indian revolutionary Tupac Amarú II (orig. José Gabriel Condorcanqui, 1742?–81), who in 1780 led Peruvian Indian peasants in the last widespread rebellion against Spain before independence. The Indians identified him with his ancestor Tupac Amarú, the last leader of the INCA, who was executed by the Spaniards in 1572.

Tupamaro \ˌtü-pə-'mä-rō\ Member of the National Liberation Movement, a Uruguayan leftist urban guerrilla organization founded c. 1963 and named for Tupac Amarú II, an 18th-century Peruvian revolutionary. The earliest Tupamaro efforts involved robbing banks and businesses and distributing the goods to the poor, but in the late 1960s they mounted a wave of violence aimed at the authorities. The military government that seized power in 1973 launched an offensive against them, killing some 300 and imprisoning 3,000 others. When democratic rule returned in 1985, the Tupamaros were reorganized as a political party.

tupelo \'tü-pə-ˌlō\ Any of about seven species of trees that make up the genus *Nyssa* in the sour gum family (Nyssaceae). Five are found in moist or swampy areas of eastern North America, one in eastern Asia, and one in western Malaysia. They all have horizontal or hanging branches, broad leaves, and male and female flowers on different plants. North American species bear greenish-white flowers and small bluish-black or purple berries. The most widespread North American species is the BLACK GUM. Tupelo wood, most of which comes from the water tupelo (*N. aquatica*), is pale yellow to light brown, fine-textured, and strong. It is used for crates and boxes, flooring, wooden utensils, and veneers.

Tupian \tü-'pē-ən\ **languages** Family of South American Indian languages with at least seven subgroups, spoken or formerly spoken in scattered areas from the Andes Mountains to the Atlantic Ocean and (with two exceptions) south of the Amazon River to southernmost Brazil and Paraguay. About one half of the 50 attested Tupian languages are extinct. The largest subgroup, Tupí-Guaraní, includes the extinct language Tupinambá, the source for borrowings of many New World flora and fauna terms into Portuguese and hence other European languages. Another language of the subgroup, Guaraní, is spoken as a first or second language by more than 90% of Paraguayans, who consider it a token of Paraguayan identity.

Tupolev *officially* **ANTK imeni A.N. Tupoleva** *formerly* **OKB-156** Russian aerospace design bureau that is a major producer of passenger airliners and military bombers. It originated in 1922 as a group within the U.S.S.R.'s Central Aerohydrodynamics Institute to develop military aircraft. Under ANDREI TUPOLEV, it created the TB-1 (ANT-4) all-metal, cantilever-wing bomber (first flights 1925–26). After several years' confinement for political reasons, Tupolev was freed, and in 1943 he reestablished his team as the design bureau OKB-156. At the end of World War II, the bureau built the Tu-4 strategic bomber, a copy of the U.S. B-29. In the 1950s it produced the turboprop Tu-95 heavy bomber (NATO, "Bear"), which became a Soviet mainstay, and the first Soviet jetliner, the Tu-104 (first flown 1955). Between the late 1950s and early '80s, it introduced new supersonic bombers, including the variable-wing Tu-22M ("Backfire") and Tu-160 ("Blackjack"), and airliners such as the Tu-114 turboprop, Tu-154 trijet, and Tu-144 supersonic transport. In 1989, in honor of Tupolev (died 1972), the bureau was renamed ANTK imeni A.N. Tupoleva. After the dissolution of the U.S.S.R. in 1991, it became a joint stock company with the Russian government holding a limited financial interest. In the 1990s its projects involved jetliners such as the Tu-204 (in service 1996) and Tu-324.

Tupolev \'tü-pəl-yif**, Andrei (Nikolayevich)** (b. Nov. 10, 1888, Pustomazovo, Russia—d. Dec. 23, 1972, Moscow) Russian aircraft designer. In 1918 he cofounded the U.S.S.R.'s Central Aerohydrodynamics Institute, and in 1922 he became head of its design bureau (see TUPOLEV), producing airplanes of all-metal construction. Arrested in 1937 on charges of activities against the state, he was assigned to work on the design of military aircraft. Under confinement, he led a team that produced the Tu-2 twin-engine tactical bomber, which was widely used in World War II. Freed during the war, Tupolev and his reestablished design bureau replicated the U.S. B-29; the resulting Tu-4 became the Soviet Union's principal strategic bomber until the mid-1950s. After adapting jet propulsion to several piston-engine airframes, Tupolev introduced the swept-wing Tu-16 (NATO, "Badger") jet bomber (first flown 1952) and its civilian derivative Tu-104 (1955), one of the first jet transports to provide regular passenger service. Tupolev and his son Alexei headed the effort that produced the Tu-144 supersonic transport, the first passenger jet to exceed Mach 1 (1969).

Tura \'tü-rä**, Cosimo** *or* **Cosmè Tura** (b. c. 1430, Ferrara—d. 1495, Ferrara) Italian painter. Court painter to the ESTE FAMILY at Ferrara, his early Renaissance style was influenced by ANDREA MANTEGNA and PIERO DELLA FRANCESCA. A master of allegory and decorative painting, he was the founder and first significant figure of the school of Ferrara. His work is characterized by a mannered, nervous, and wiry line, carefully rendered detail, and brilliant colour.

Turābī \tù-'rä-bē**, Ḥasan al-** (b. 1932, The Sudan) Sudanese Muslim religious scholar and lawyer. After receiving a traditional Muslim education, he studied at the University of London and the Sorbonne in Paris. In the early 1950s he joined the Sudanese branch of the MUSLIM BROTHERHOOD. While teaching law at the University of Khartoum (1957–65), he participated in the 1958 revolution that ended military rule. He later served in the national legislature (1965–67). He supported the 1985 overthrow of Gaafar Mohamed el-NIMEIRI. That same year he formed the National Islamic Front (NIF), an incarnation of the Muslim Brotherhood. In 1989 the NIF supported a coup that brought ʿUmar Ḥasan al-Bashīr to power. He later served as speaker of the National Assembly (1996–98) and was arrested in 2001 during a power struggle with al-Bashīr.

turbidity current Underwater current of abrasive sediments. Such currents appear to be relatively short-lived, transient phenomena that occur at great depths. They are thought to be caused by the slumping of sediment that has piled up at the top of the continental slope, particularly at the heads of SUBMARINE CANYONS. Slumping of large masses of sediment creates a dense slurry, which then flows down the canyon to spread out over the ocean floor and deposit a layer of sand in deep water. Repeated deposition forms SUBMARINE FANS, analogous to the alluvial fans found at the mouths of river canyons.

turbine \'tər-bən, 'tər-ˌbīn\ Any of various devices that convert the ENERGY in a stream of fluid into mechanical energy by passing the stream through a system of fixed and moving fanlike blades and causing the latter to rotate. A turbine looks like a large wheel with many small radiating blades around its rim. There are four broad classes of turbine: water (hydraulic), steam, wind, and gas. The most important application of the first three is the generation of electricity; gas turbines are most often used in aircraft.

turbojet JET ENGINE in which a TURBINE-driven COMPRESSOR draws in and compresses air, forcing it into a combustion chamber into which fuel is injected. Ignition causes the gases to expand and to rush first through the turbine and then through a nozzle at the rear. Forward thrust is generated as a reaction to the rearward momentum of the exhaust gases. The turbofan or fanjet, a modification of the turbojet, came into common use in the 1960s. In the turbofan, some of the incoming air is bypassed around the combustion chamber and is accelerated to the rear by a turbine-operated fan. It moves a much greater mass of air than the simple turbojet, providing advantages in power and economy. See also RAMJET.

turboprop Hybrid engine that provides jet thrust and also drives a propeller. It is similar to the TURBOJET except that an added TURBINE, behind the combustion chamber, works through a shaft and speed-reducing gears to turn a propeller at the front of the engine. Because of improvements in turbojet design, the turboprop, which is less efficient at high speeds, lost much of its importance in the 1960s, though it is still used for relatively short-range aircraft.

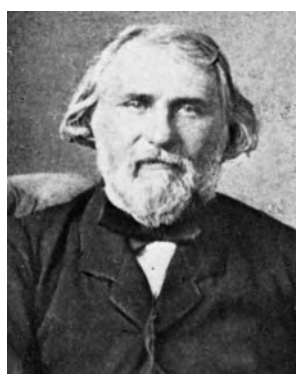
turbot \'tər-bət\ Species (*Scophthalmus maximus*, family Scophthalmidae or Bothidae) of broad-bodied European FLATFISH, a highly valued food fish. It lives along sand and gravel shores. It is left-sided (with eyes normally on the left side of the head) and scaleless; the head and body are

© 2006 Encyclopædia Britannica, Inc.

studded with numerous bony knobs. Turbots grow to, at most, 40 in. (1 m) long and weigh about 55 lb (25 kg). Colour varies with the surroundings but is usually gray-brown or light brown with darker markings. A related species is the Black Sea turbot (*S. maeoticus*). Certain right-sided Pacific flatfish (genus *Pleuronichthys*, family Pleuronectidae) are also called turbot.

turbulence In FLUID MECHANICS, a flow condition (see TURBULENT flow) in which local speed and pressure change unpredictably as an average flow is maintained. Common examples are wind and water swirling around obstructions, or fast flow (REYNOLDS NUMBER greater than 2,100) of any sort. Eddies, vortices, and a reduction in DRAG are characteristics of turbulence. Lowered drag enables golf balls to travel farther than they would do otherwise, and the dimpled surface of golf balls is meant to encourage turbulence in the BOUNDARY layer. If swimsuits with rough surfaces help swimmers to move faster, as has been claimed, the same explanation may apply.

Turcoman See TURKMEN



Turenne \tù-'ren**, Henri de La Tour d'Auvergne, viscount de** *orig.* **Henri de La Tour d'Auvergne** (b. Sept. 11, 1611, Sedan, France—d. July 27, 1675, Sasbach, Baden-Baden) French military leader. He earned his reputation as a military leader in the THIRTY YEARS' WAR, especially with the capture of Turin (1640). Made a marshal of France (1643), he commanded the French army in Germany and joined the Swedish army in conquering Bavaria (1648). In France he joined the aristocrats in the FRONDE (1649), but later he skillfully commanded the royal army to defeat the forces led by the prince de CONDÉ, who had allied himself with Spain, and to bring about the Peace of the PYRENEES (1659), which ended France's war with Spain. Appointed marshal-general (1660), Turenne marched alongside LOUIS XIV in joint command of the French armies in the War of DEVOLUTION (1667–68). His bold strategies won numerous victories against the imperial army in Germany (1672–75), but he was killed in action at Sasbach. He was buried with the kings of France at Saint-Denis and later moved to the Invalides by NAPOLEON, who esteemed Turenne as the greatest military leader in history.

Turenne, detail of a portrait by Charles Le Brun; in the Musée National de Versailles et des Trianons.
CLICHE DES MUSEES NATIONAUX, PARIS

turf In horticulture, the surface layer of soil with its matted, dense vegetation, usually GRASSES grown for ornamental or recreational use. Such turf grasses include Kentucky BLUEGRASS, creeping BENT grass, fine or red fescue, and PERENNIAL ryegrass among the popular cool-season types, and Bermuda grass, zoysia grass, and St. Augustine grass among the warm-season types. Turf grasses are often grown on turf, or sod, farms. Plugs, blocks, squares, or strips are cut and transplanted to areas where they quickly establish and grow. Lawns are fine-textured turfs that are mowed regularly and closely to develop into dense, uniformly green coverings that beautify open spaces and provide sports playing surfaces (e.g., tennis lawns, golf and bowling greens, and racing turfs).

Turgenev \tůr-'g^{y}ā-n^{y}if**, Ivan (Sergeyevich)** (b. Nov. 9, 1818, Oryol, Russia—d. Sept. 3, 1883, Bougival, near Paris, France) Russian novelist, poet, and playwright. His years at the University of Berlin convinced him of the West's superiority and the need for Russia to Westernize. He lived in Europe after c. 1862. He is known for realistic, affectionate portrayals of the Russian peasantry and for penetrating studies of the Russian intelligentsia who were attempting to move the country into a new age. His most famous early work is "The Diary of a Superfluous Man" (1850), which supplied the epithet "superfluous man" for the weak-willed intellectual protagonist common in 19th-century Russian literature. He gained fame with the short-story cycle *A Sportman's Sketches* (1852), which criticizes serfdom. His dramatic masterpiece, *A Month in the Country* (1855), and the novel *Rudin* (1856) followed. His interest in change and intergenerational differences is reflected in the controversial *Fathers and Sons* (1862), his greatest novel. Turgenev's work is distinguished from that of his contemporaries by its sophisticated lack of hyperbole, its balance, and its concern for artistic values. His greatest work was always topical, committed literature, having universal appeal in the elegance of the love story and the psychological acuity of the portraiture.

Ivan Turgenev.
FROM THE COLLECTION OF DAVID MAGARSHACK

turgor \'tər-gər\ Pressure exerted by fluid in a cell that presses the cell membrane against the cell wall. Turgor is what makes living plant tissue rigid. Loss of turgor, resulting from the loss of water from plant cells, causes flowers and leaves to wilt. Turgor plays a key role in the opening and closing of stomata (see STOMA) in leaves.

Turgot \tůr-'gō**, Anne-Robert-Jacques, baron de l'Aulne** (b. May 10, 1727, Paris, France—d. March 18, 1781, Paris) French administrator and economist. He entered the royal administrative branch of the magistracy in 1753, then became intendant (governor) of Limoges (1761–74), where he instituted economic and administrative reforms. A PHYSIOCRAT, in 1766 he wrote his best-known work, *Reflections on the Formation and Distribution of Wealth*. In 1774 he was appointed comptroller general by LOUIS XVI and introduced his Six Edicts to expand economic reforms. His effort to abolish the CORVÉE (unpaid forced labour by peasants) was opposed by the privileged classes, and he was dismissed in 1776.

Turin *Italian* **Torino** City (pop., 2001 prelim.: 857,433), PIEDMONT region, northwestern Italy. Located on the PO RIVER, it was founded by the Taurini. It was partly destroyed by HANNIBAL in 218 BC. It was made a Roman military colony under Emperor AUGUSTUS. A part of the Lombard duchy in the 6th century AD, it became the seat of government under CHARLEMAGNE (742–814). It passed to the house of SAVOY in 1046. The capital of the kingdom of SARDINIA in 1720, Turin was occupied by the French during the NAPOLEONIC WARS. The political and intellectual centre of the RISORGIMENTO movement, it served as the first capital of united Italy (1861–65). During World War II Turin sustained heavy damage from Allied air raids but was rebuilt. It is the focus of Italy's automotive industry and an international fashion centre. The Shroud of TURIN has been housed in the 15th-century cathedral there since the 16th century.

Turin, Shroud of Linen fragment said to be the burial garment of JESUS. It has been preserved since 1578 in the royal chapel of the Cathedral of San Giovanni Battista in Turin, Italy. Measuring 14.5 by 3.7 ft (4.42 by 1.13 m), it appears to portray images of the back and front of a gaunt, sunken-eyed man. The images contain markings that correspond to the STIGMATA and stains presumed to be blood. The cloth emerged historically in 1354 and went on exhibition in 1389, first as a representation of the shroud and eventually as the shroud itself. In 1988 independent tests using radiocarbon dating techniques indicated that the cloth had been made c. 1260–1390. Subsequent chemical analyses and other tests, however, suggested a much older date, possibly even the 1st century.

Turing \'tůr-iŋ**, Alan (Mathison)** (b. June 23, 1912, London, Eng.—d. June 7, 1954, Wilmslow, Cheshire) English mathematician and logician. He studied at the University of Cambridge and at Princeton's Institute for Advanced Study. In his seminal 1936 paper "On Computable Numbers," he proved that there cannot exist any universal algorithmic method of determining truth in mathematics and that mathematics will always contain undecidable (as opposed to unknown) propositions. That paper also introduced the TURING MACHINE. He believed that computers eventually would be capable of thought indistinguishable from that of a human and proposed a simple test (see TURING TEST) to assess this capability. He did valuable work in CRYPTOGRAPHY during World War II, playing an important role in breaking the Enigma code used by Germany for radio communications. After the war he taught at the University of Manchester and began work on what is now known as ARTIFICIAL INTELLIGENCE.

Turing machine Hypothetical computing device proposed by ALAN M. TURING (1936). Not actually a machine, it is an idealized mathematical model that reduces the logical structure of any computing device to its essentials. It consists of an infinitely extensible tape, a tape head that is

© 2006 Encyclopædia Britannica, Inc.

capable of performing various operations on the tape, and a modifiable control mechanism in the head that can store instructions. As envisaged by Turing, it performs its functions in a sequence of discrete steps. His extrapolation of the essential features of INFORMATION PROCESSING was instrumental in the development of modern DIGITAL COMPUTERS, which share his basic scheme of an input/output device (tape and tape reader), central processing unit (CPU, or control mechanism), and stored MEMORY.

Turing test Test proposed by ALAN M. TURING to determine whether a computer can be said to "think." Turing suggested the "imitation game," wherein a remote human interrogator, within a fixed time frame, must distinguish between a computer and a human subject based on their replies to questions posed by the interrogator. A series of such tests would measure the computer's success at "thinking" by the probability of its being misidentified as the human subject. The test is performed today in competitions that test the success of ARTIFICIAL INTELLIGENCE.

Turkana, Lake See Lake RUDOLF

Turkana remains See LAKE TURKANA REMAINS

Turkey *officially* **Republic of Turkey** Country, western Asia and southeastern Europe. Area: 299,158 sq mi (774,815 sq km), nearly all of which lies in Asia. Population (2005 est.): 72,083,000. Capital: ANKARA.

Ethnic groups include the Turks and Kurds. Languages: Turkish (official), Kurdish, Arabic. Religion: Islam (mostly Sunni). Currency: Turkish lira. Turkey is a mountainous country with an extensive plateau covering central ANATOLIA. The highest peak is Mount ARARAT (16,853 ft [5,137 m]). The TAURUS MOUNTAINS lie in the south. Rivers include the TIGRIS, EUPHRATES, KIZIL, and MENDERES. Turkey is a major producer and exporter of chromite and also mines iron ore, coal, lignite, bauxite, and copper. It is the Middle East's leading steel producer. Chief agricultural products include wheat, barley, olives, and tobacco. Tourism also is important. Turkey is a republic with one legislative house; its chief of state is the president, and the head of government is the prime minister. Turkey's early history corresponds to that of Anatolia, the BYZANTINE EMPIRE, and the OTTOMAN EMPIRE. Byzantine rule emerged when CONSTANTINE THE GREAT made Constantinople (modern ISTANBUL) his capital. The Ottoman Empire, begun in the 12th century, dominated for more than 600 years; it ended in 1918 after the YOUNG TURK revolt (1908) precipitated its demise. Under the leadership of MUSTAFA KEMAL ATATÜRK, a republic was proclaimed in 1923. Turkey remained neutral throughout most of World War II (1939–45), siding with the Allied powers in 1945. Since the war it has alternated between civil and military governments and has had several conflicts with Greece over CYPRUS. The country has developed a strong, diversified economy, but it has also experienced periods of political and civic turmoil between Islamists and secularists and ongoing ethnic tension with Kurdish separatists.

turkey Either of two species of birds in the family Meleagrididae. The North American common turkey (*Meleagris gallopavo*) has been domesticated since pre-Columbian times. The adult male has a featherless, bright-red head, a fleshy red ornament (snood) growing over the bill, and a similar wattle on the throat. The male (gobbler or tom) may be 50 in. (1.3 m) long and may weigh over 20 lb (10 kg). Wild turkeys inhabit woodlands near water, eating seeds, insects, and an occasional frog or lizard. Males assemble a harem, and each hen lays 8–15 eggs in a hollow in the ground. An excellent source of meat and easily shot, the wild turkey was practically exterminated by European settlers; conservation efforts have reestablished it in much of its former range. The ocellated turkey (*Agriocharis,* or *Meleagris, ocellata*) of Central America has never been domesticated.

Male common turkey (*Meleagris gallopavo*), displaying.
S.C. BISSEROT—BRUCE COLEMAN INC.

turkey vulture *or* **turkey buzzard** Species (*Cathartes aura*) of long-winged, long-tailed VULTURE (family Cathartidae), about 30 in. (75 cm) long, with dark plumage, whitish beak and legs, bare red head covered with whitish bumps, and a 6-ft (1.8-m) wingspread. It uses its keen sense of smell to find carrion. It occurs throughout the Americas except in northern Canada; the northerly and southernmost populations are migratory.

Turkic languages Family of more than 20 ALTAIC languages spoken by some 135 million people from the Balkans to central Siberia. The traditional division of Turkic is into four groups. The southeastern or Uighur group comprises Uighur, spoken mainly in Xinjiang, China; and Uzbek, spoken mainly in Uzbekistan, other Central Asian republics, and northern Afghanistan. The southwestern, or Oguz, group includes TURKISH; Azerbaijani (Azeri), spoken in Azerbaijan and northwestern Iran; Crimean Tatar, spoken mostly in Ukraine and Uzbekistan; and Turkmen, used in Turkmenistan, northern Iran, and northern Afghanistan. The northwestern, or Kipchak, group includes Kazakh, spoken in Kazakhstan, other Central Asian republics, and western China and Mongolia; Kyrgyz, spoken in Kyrgyzstan, other Central Asian republics, and western China; TATAR; Baskhir, spoken in Bashkortostan and adjacent areas in Russia; Karachay-Balkar and Kumyk, spoken in the Russian Caucasus; and Karaim, with a few speakers in Lithuania and parts of southwestern Ukraine. The northeastern, or Altai, group comprises languages and dialects spoken in Siberia northeast of the Irtysh River and in adjacent parts of Mongolia, including Altai, Khakas, Shor, and Tuvan; and Sakha, spoken in Sakha (Yakutia) republic of Russia and adjacent areas. Distinct from all the other languages is Chuvash, spoken in Russia's Chuvash republic and adjacent areas. The earliest attestations of Turkic are a group of 8th-century funerary inscriptions of northern Mongolia, in a distinctive writing system called runic script, or Turkic runes. With the Islamization of nearly all Turkic peoples southwest of the Irtysh beginning c. 900, Turkic languages began to adopt the ARABIC ALPHABET. Today the LATIN ALPHABET and CYRILLIC ALPHABET are more extensively used.

Turkic peoples Any of various peoples who speak one of the TURKIC languages. They are connected with the Tuque (T'u-chüeh), nomadic people who in the 6th century AD founded an empire stretching from Mongolia to the Black Sea (see TURKISTAN). In the 11th century the SELJÜQS created an extensive empire after defeating the Byzantines at the Battle of MANZIKERT (1071), an event that opened Anatolia to settlement by Turkic-speaking peoples (and eventually led to the establishment of the Republic of TURKEY in the 20th century). Though overrun by the MONGOLS in the 13th century, the Turks succeeded in absorbing them after GENGHIS KHAN's death (1227). In the 14th century TIMUR, who was of mixed Mongolian and Turkic ancestry, held most of Central Asia and some of South Asia. In the 15th century Russian expansion drove the Turkic peoples eastward into what is now Kazakhstan. Today Turkic peoples live mostly in Turkey, Uzbekistan, Afghanistan, Kazakhstan, and Turkmenistan.

Turkish Angora cat Breed of longhaired DOMESTIC CAT that probably arose from a domesticated cat of Tatars who migrated to Turkey, where it is now regarded as a national treasure. It has a long body, fine bones, a pointed face, and a silky, medium-length coat. White is the most popular colour, but it may be any of several solid colours or any pattern of two or more colours.

Turkish bath Bath originating in the Middle East, combining exposure to warm air, steam immersion, massage, and a cold bath or shower. The Turkish bath (*ḥammām*) reflects the fusion of the massage and cosmetic aspects of the Eastern bath tradition and the plumbing and heating techniques of the Romans. Turkish baths were smaller than the Roman THERMAE and more sparsely lit. The baths at Constantinople were domed, and rooms were richly decorated with marble or mosaics. Used for socializing and relaxation as well as bathing, the *ḥammām* was popular throughout the Islamic world; some baths are still in use. In the 19th century, the Turkish bath was adapted and exported to Europe and the U.S.

Turkish language TURKIC language of Turkey, spoken by about 90% of its population. Turkish has about 59 million speakers, with many enclaves in the Balkans and Cyprus (dating from Ottoman times) and in western Europe. Turkish was introduced into Anatolia with the invasion of Turkmen tribes in the 13th–14th centuries. Anatolian Turkish, written in the ARABIC ALPHABET, is first attested in the 13th century. Ottoman Turkish was so heavily influenced by Persian and Arabic that it lost some of its Turkic characteristics and was incomprehensible to lower social strata. Efforts to re-Turkicize the language began in the 18th century but did not make serious gains until the 20th century and the founding of the Turkish republic. Much Perso-Arabic vocabulary was removed, and the LATIN ALPHABET was adopted with the addition of diacritics to symbolize sounds peculiar to Turkish.

Turkish van cat Breed of semi-longhaired DOMESTIC CAT distinguished mainly by its unusual colour pattern: white, with coloured markings only on the head and tail. "Van" is a common term in the breed's native region, Central and South Asia, used also to describe other cats with similar markings. The breed was brought to Europe by returning Crusaders. A unique feature is its cashmere-like, waterproof coat; it loves water, and in its native region it has been called the swimming cat. It is large, active, and intelligent.

Turkistan *or* **Turkestan** Historical region, Central Asia. This somewhat broad geographic region—situated between Siberia to the north and Tibet, India, Afghanistan, and Iran to the south—derived its name from its inhabitants, who were predominantly of Turkic ancestry. The total area of more than 1,000,000 sq mi (2,600,000 sq km) was bisected by the PAMIR and TIEN SHAN ranges, forming West and East Turkistan. West Turkistan, which included what is now Turkmenistan, Uzbekistan, Tajikistan, Kyrgyzstan and southern Kazakhstan, came under Russian rule in the 19th century. East Turkistan was annexed by China in the 8th century; it included what is now the Uygur Autonomous Region of XINJIANG.

Turkmen Member of a Central Asian people belonging to the southwestern branch of the Turkic linguistic group. At the beginning of the 21st century, they numbered more than six million, and most lived in Turkmenistan and adjacent parts of Central Asia. A significant number also live in Iran and parts of Turkey and Afghanistan, and there are pockets of Turkmen in northern Iraq and Syria. Initially a nomadic pastoral people living in tent villages, many took up agriculture while under Soviet rule. Most are Muslim, and they have traditionally divided themselves by economic function. They are patrilineal, and each family or tribal group is headed by a KHAN.

Turkmenistan Country, Central Asia. Area: 188,500 sq mi (488,100 sq km). Population (2005 est.): 4,833,000. Capital: ASHGABAT. Turkmen make up three-fourths of the population, with small groups of Uzbeks, Russians, Kazakhs, and Tatars. Language: Turkmen (official). Religions: Islam (predominantly Sunni); also Eastern Orthodox. Currency: manat. There are some hills and low mountains. About nine-tenths of Turkmenistan is desert, chiefly the KARAKUM. The main rivers are the AMU DARYA and MORGHĀB. Many irrigation canals and reservoirs have been built, including the Karakum Canal, which runs 870 mi (1,400 km) between the Amu Darya and the CASPIAN SEA. The country's chief products are petroleum and natural gas, cotton, silk, carpets, fish, and fruit. It is a republic with one legislative house; its head of state and government is the president, assisted by the People's Council. The earliest traces of human settlement in Central Asia, dating to Paleolithic times, have been found in Turkmenistan. The nomadic, tribal Turkmen probably entered the area in the 11th century AD. They were conquered by the Russians in the early 1880s, and the region became part of Russian Turkistan. It was organized as the Turkmen S.S.R. in 1924 and became a constituent republic of the U.S.S.R. in 1925. The country gained full independence from the Soviet Union in 1991 under the name Turkmenistan. It experienced years of economic difficulty until oil and gas production was more fully developed and was subject to the highly authoritarian rule of Saparmurad Niyazov.

Turks and Caicos \'kā-ˌkōs, 'kā-kəs\ **Islands** British dependency (pop., 2002 est.: 18,738), WEST INDIES. It comprises two small island groups at the southeastern end of The BAHAMAS. The Turks group includes Grand Turk, Salt Cay, and lesser cays. The Caicos group includes South Caicos, East Caicos, Middle (or Grand) Caicos, North Caicos, Providenciales, West Caicos, and several smaller cays. The seat of government is at Cockburn Town on Grand Turk Island. When Spanish explorer Juan PONCE DE LEÓN visited in 1512, the islands were inhabited by Indians. British colonists from BERMUDA arrived in 1678. The islands were at first placed under the government of The Bahamas, but in 1874 they were annexed to the colony of Jamaica. The Turks and Caicos Islands became a crown colony in 1962 and shared a governor with The Bahamas from 1965 to 1973. A new constitution was adopted in 1988. The chief industries are tourism and offshore financial services.

turmeric \'tər-mə-rik\ Perennial herbaceous plant (*Curcuma longa*; family Zingiberaceae), native to southern India and Indonesia. Its tuberous RHIZOMES have been used from antiquity as a condiment, as a textile dye, and medically as an aromatic stimulant. The rhizome has a pepperlike aroma and a somewhat bitter, warm taste. It colours and flavours prepared mustard and is used in curry powder, relishes, pickles, spiced butters, and numerous culinary dishes. Paper tinged with turmeric turns from yellow to reddish brown when an alkali is added to it, thus providing a test for alkalinity.

Turmeric (*Curcuma longa*).

Turner, Frederick Jackson (b. Nov. 14, 1861, Portage, Wis., U.S.—d. March 14, 1932, San Marino, Calif.) U.S. historian. He taught at the University of Wisconsin and at Harvard University. Deeply influenced by his Wisconsin childhood, Turner rejected the doctrine that U.S. institutions could be traced mainly to European origins, and he demonstrated his theories in a series of essays. In "The Significance of the Frontier in American History" (1893) he asserted that the American character had been shaped by frontier life and the end of the frontier era. Later he focused on sectionalism as a force in U.S. development. His essays were collected in *The Frontier in American History* (1920) and *Significance of Sections in American History* (1932, Pulitzer Prize).

Turner, J(oseph) M(allord) W(illiam) (b. April 23, 1775, London, Eng.—d. Dec. 19, 1851, London) British landscape painter. The son of a barber, he entered the Royal Academy school in 1789. In 1802 he became a full academician and in 1807 was appointed professor of perspective. His early work was concerned with accurate depictions of places, but he soon learned from Richard Wilson to take a more poetic and imaginative approach. *The Shipwreck* (1805) shows his new emphasis on luminosity, atmosphere, and Romantic, dramatic subjects. After a trip to Italy in 1819, his colour became purer and more prismatic, with a general heightening of key. In later paintings, such as *Sunrise, with a Boat Between Headlands* (1845), architectural and natural details are sacrificed to effects of colour and light, with only the barest indication of mass. His compositions became more fluid, suggesting movement and space. In breaking down conventional formulas of representation, he anticipated French Impressionism. His immense reputation in the 19th century was due largely to John Ruskin's enthusiasm for his early works; 20th-century critics celebrated the abstract qualities of his late colour compositions.

Turner, Nat (b. Oct. 2, 1800, Southampton county, Va., U.S.—d. Nov. 11, 1831, Jerusalem, Va.) U.S. insurrectionist. Born into slavery, he became convinced of his mission to lead American slaves out of bondage and developed a scheme to capture the armoury at Jerusalem, Va. He took an eclipse of the sun as a sign to act (1831) and began his insurrection by killing his master's family. He led 75 slaves as they killed about 60 whites on a two-day march to Jerusalem. About 3,000 state militia and local whites defeated the insurrectionists, who were captured or killed. Turner eluded arrest for six weeks but was found, tried, and hanged. Alarmed by the uprising, Southern states passed legislation forbidding the education, movement, or assembly of slaves.

Turner, Ted *orig.* **Robert Edward Turner, III** (b. Nov. 19, 1938, Cincinnati, Ohio, U.S.) U.S. broadcasting entrepreneur. He took over his father's Atlanta-based advertising firm after the latter's 1963 suicide and restored it to profitability. In 1970 he bought the Atlanta television station WJRJ (later WTBS), which in 1975 became the superstation of the Turner Broadcasting System, broadcasting via satellite to cable systems nationwide. An avid sportsman, he purchased professional baseball and basketball franchises in Atlanta, and in 1977 he piloted his yacht, *Courageous*, to victory in the America's Cup race. He expanded his broadcasting empire with the 1980 launch of the Cable News Network (CNN) and the 1986 purchase of MGM/UA Entertainment (MGM) and its library of more than 4,000 movies. He married Jane Fonda in 1991 (divorced 2001). In 1996 he merged his broadcasting system with Time Warner and became its vice-chairman (see AOL Time Warner). In 2003 he resigned as vice-chairman of AOL Time Warner.

Turner syndrome Chromosomal disorder (from the presence of only one sex chromosome, X, in all or some of the body's cells) that causes abnormal sexual development in females. The syndrome may include absent or undeveloped ovaries, underdeveloped secondary sex characteristics, low hairline, webbed neck, shield-shaped chest with wide-spaced nipples, and kidney and heart malformations with coarctation (narrowing) of the aorta. It may not be recognized until a girl fails to undergo puberty at a normal age. Estrogen treatment results in puberty, adult appearance, and normal sex drive but not fertility. Surgery can correct malformations.

turnip Hardy biennial plant in the mustard family, cultivated for its fleshy roots and tender leaves. There are two species, the turnip proper (*Brassica rapa*) and the Swedish turnip, or rutabaga. The true turnip probably originated in middle and eastern Asia and spread by cultivation throughout the temperate zone. Both species are cool-season crops. Turnips develop rapidly enough to have an early-spring or late-summer seeding produce a crop before, respectively, extremes of summer or late-fall weather occur.

turpentine Any resinous exudate or extract from conifers, especially pines; now also commonly a term for its volatile fraction, oil (or spirits) of turpentine. Semifluid mixtures of organic compounds consisting of resins dissolved in a volatile oil, turpentines can be distilled (see distillation) into the volatile oil of turpentine and the nonvolatile rosin. The oil, a mixture of monoterpenes (see isoprenoid), chiefly pinene, is a colourless, odorous, flammable liquid that does not mix with water but is a good solvent for many substances. Oil of turpentine is favoured over petroleum solvents as an oil-paint thinner, varnish solvent, and brush cleaner. Its chief use is now as a raw material for resins, insecticides, oil additives, and synthetic pine oil and camphor and as a solvent.

turquoise Hydrated copper and aluminum phosphate mineral, $CuAl_6(PO_4)_4(OH)_8 \cdot 4H_2O$, that is used extensively as a gemstone. The colour of turquoise ranges from blue through various shades of green to greenish and yellowish gray. A delicate sky-blue, which provides an attractive contrast with precious metals, is most valued for gem purposes. Numerous deposits of turquoise in the southwestern U.S. have been worked for centuries by American Indians. The mineral also occurs in Iran, northern Africa, Australia, and Siberia.

turtle Any of more than 250 species (order Chelonia) of reptiles having a bony shell overlaid with horny shields; found in most parts of the world. Turtles have existed for 200 million years, making them the oldest of all surviving reptiles. Most species are aquatic or semiaquatic; some are terrestrial. Turtles eat plants, animals, or both. They are toothless, have a horny beak, and range from less than 4 in. (10 cm) to more than 7 ft (2 m) long. They have sturdy, sprawling limbs with short feet or paddlelike flippers (marine turtles). Some species bend the neck sideways, but most pull the head and neck backward into the shell. Almost half the known turtle species are rare, threatened, or endangered. See also box turtle, painted turtle, snapping turtle, softshell turtle, terrapin, tortoise.

turtledove Species (*Streptopelia turtur*, family Columbidae) of migratory European pigeon that winters in northern Africa. It is about 11 in. (28 cm) long and has a reddish brown body, blue-gray head, and white-tipped tail. A ground feeder, it eats prodigious amounts of small seeds. The name is applied to other temperate and tropical Old World *Streptopelia* species of slim, fast-flying game birds. The ringed turtledove, or ringdove, has feral populations in California and Florida, U.S.; the laughing and spotted doves have also been introduced outside their native habitats.

Tuscany *Italian* **Toscana** Region (pop., 2001 prelim.: 3,460,835), west-central Italy. It covers 8,877 sq mi (22,992 sq km), and its capital is Florence. Originally settled by Etruscans c. 1000 BC, Tuscany came under Roman rule in the 3rd century BC. It was a Lombard duchy in the 6th century AD. It comprised several independent city-states in the 12th–13th centuries, which were subsequently united under the Medici family of Florence. Tuscany passed to the house of Lorraine in 1737 and to Sardinia and the Kingdom of Italy in the 1860s. The region suffered severe damage in World War II and extensive floods in 1966. Its mineral resources include the world-famous Carrara marble. Its agricultural products include olives, olive oil, wines, and livestock. Tourism is important at its historical centres, including Florence and Pisa.

Tusculum \'təs-kyə-ləm\ Ancient town, Latium, Italy. Located near Rome, it was a Latin settlement as early as the 1st millennium BC and probably was under the influence of the Etruscans. It was a favourite resort of wealthy Romans (1st century BC–4th century AD), and it was the home of orator Marcus Tullius Cicero. Tourist attractions include a Roman forum, a 2nd-century amphitheatre, and a medieval castle.

Tuskegee Airmen \tə-'skē-gē\ Black servicemen of the U.S. Army Air Forces (USAAF) who trained at Alabama's Tuskegee Army Air Field in

© 2006 Encyclopædia Britannica, Inc.

World War II. They constituted the first African American flying unit in the U.S. military. The first class trained at Tuskegee in 1941 became the 99th Pursuit Squadron, commanded by Lt. Col. Benjamin O. Davis, Jr. They flew their first mission in the Mediterranean in 1943. Later that year the army activated three more squadrons; joined with the 99th in 1944, they constituted the 332nd Fighter Group. The latter was the USAAF's only escort group that did not lose a bomber to enemy planes. A second black flying group, the 477th Bombardment Group, was established near the end of the war. In all, the Tuskegee Airmen flew 1,578 missions, destroyed 261 enemy aircraft, and won over 850 medals.

Tuskegee University Private university in Tuskegee, Alabama, U.S. Booker T. Washington founded the school in 1881 as a teachers' college for blacks, and it still has a predominantly African American student body. George Washington Carver conducted most of his research (1896–1943) at Tuskegee, and Frederick D. Patterson, founder of the United Negro College Fund (1944), served as the school's president (1935–53). The infamous Tuskegee syphilis study, a U.S. Public Health Service project examining the course of untreated syphilis in black men, was based there from the 1930s. Today the university comprises schools of arts and sciences, agriculture, business, education, engineering and architecture, nursing, and veterinary medicine.

Tussaud \tù-'sō**, Marie** *orig.* **Marie Grosholtz** (b. Dec. 1, 1761, Strasbourg, France—d. April 16, 1850, London, Eng.) French British founder of Madame Tussaud's museum of wax figures in London. From 1780 until the French Revolution, she served as art tutor to Louis XVI's sister. During the Reign of Terror she made death masks from heads—frequently those of her friends—freshly severed by the guillotine. In 1802 she moved to Britain with her collection of wax models. Her museum contains a variety of historical figures, including the original models she made of her great contemporaries, including Voltaire and Benjamin Franklin. By the turn of the 21st century, branches of her museum were located throughout the world.

tussock moth Typical member of the small European and New World lepidopteran family Liparidae (formerly Lymantriidae). The large, hairy larvae of most species have hair tufts, or tussocks; many have stinging hairs. Several species, including the gypsy moth, browntail moth, satin moth, and nun moth, damage trees. The larvae feed on foliage, sometimes foraging from a silken tent or a colonial nest of webbed leaves. Larvae pupate in a cocoon attached to a tree branch or trunk. Adult females range from white to brown; some, such as the white-marked tussock moth, are wingless. See also moth.

Tutankhamen \ˌtü-ˌtäŋ-'kä-mən\ *orig.* **Tutankhaten** (fl. 14th century BC) Egyptian pharaoh (r. 1333–23 BC) of the 18th dynasty. When he took the throne at about age eight, he was advised to move back to Memphis from Akhetaton, the city of his father-in-law and predecessor, Akhenaton. During his reign the traditional religion was restored after the changes made by Akhenaton. Shortly before he died, while still in his teens, he sent troops to Syria to aid an ally against a group connected with the Hittites. Because his name was among those stricken from the royal lists during the 19th dynasty, his tomb's location was forgotten and his burial chamber was not opened until 1922, when it was discovered by Howard Carter (1873–1939). Its treasures made Tutankhamen perhaps the best-known of the pharaohs despite his early death and limited accomplishments.

Tutsi \'tüt-sē\ People of Rwanda and Burundi who are traditionally considered Nilotic. They speak Rundi or Rwanda (mutually intelligible languages of the Niger-Congo family) and number some 1.5 million. The Tutsi represent a traditional aristocratic minority, which has dominated the more populous Hutu. Originally warrior-herders, the Tutsi entered the area in the 14th or 15th century and later, assisted by German and Belgian colonial regimes, cultivated a lord-vassal relationship with the Hutu. At the head of the pyramidal political structure was the *mwami* ("king"), considered to be of divine origin. Today Hutu and Tutsi cultures have largely become integrated. In addition to sharing languages, they both adhere to similar traditional and/or Christian religious beliefs. The Tutsi retained their dominant position over the Hutu in Rwanda until 1961, when the monarch was overthrown. An unsuccessful Hutu revolt in Burundi in 1972 led to 100,000 deaths, mostly Hutu. In 1993 in Burundi and in 1994 in Rwanda, further clashes occurred, the latter including a genocidal campaign by Hutu militia and civilians in which more than a million Tutsi and their Hutu allies were killed and one to two million Hutu fled to refugee camps in Congo (Kinshasa; then Zaire) and Tanzania.

Tutu, Sir Desmond (Mpilo) (b. Oct. 7, 1931, Klerksdorp, S.Af.) South African Anglican cleric. He studied theology at the University of South Africa and King's College, London. He became an Anglican priest in 1961 and bishop of Lesotho in 1976. In 1978 he became general secretary of the South African Council of Churches and an eloquent and outspoken advocate for the rights of black South Africans. He emphasized nonviolent protest and encouraged other countries to apply economic pressure to South Africa. In 1984 he received the Nobel Prize for Peace for his role in opposing apartheid. In 1986 he was elected the first black archbishop of Cape Town and titular head of South Africa's 1.6-million-member Anglican Church. He retired from the primacy in 1996 and became chairman of the Truth and Reconciliation Commission, charged with hearing evidence of human-rights violations under white rule. Since 1988 he has been chancellor of the University of the Western Cape in Bellville, S.Af.

Tutuola \ˌtü-tü-'wō-lä**, Amos** (b. 1920, Abeokuta, Nigeria—d. June 8, 1997, Ibadan) Nigerian writer. He had only six years of formal schooling and wrote in English and outside the mainstream of Nigerian literature. His stories incorporated Yoruba myths and legends into loosely constructed prose epics that improvised on traditional themes. His best-known work is *The Palm-Wine Drinkard* (1952), a classic quest tale that was the first Nigerian book to achieve international fame. His later works include the tale *The Witch-Herbalist of the Remote Town* (1981), *Yoruba Folktales* (1986), and *Village Witch Doctor* (1990).

Tuvalu \tü-'vä-lü\ Island country, west-central South Pacific Ocean. Area: 9.9 sq mi (25.6 sq km). Population (2005 est.): 9,700. Capital: Vaiaku, Fongafale islet (of Funafuti atoll). The majority of the people are Polynesian. Languages: Tuvaluan; English is widely used. Religion: Christianity (predominantly Protestant). Currency: Tuvalu dollar (equivalent to the Australian dollar). Tuvalu is an island group comprising five atolls and four coral islands, all of them low-lying, with maximum elevations below 20 ft (6 m), and covered mainly with coconut palms, breadfruit trees, and grasses. The economy is based on subsistence agriculture and livestock raising. Tuvalu is a constitutional monarchy with one legislative house; its chief of state is the British monarch represented by the governor-general, and the head of government is the prime minister. The original Polynesian settlers probably came mainly from Samoa or Tonga. The islands were sighted by the Spanish in the 16th century. Europeans settled there in the 19th century and intermarried with Tuvaluans. During this period Peruvian slave traders known as "blackbirders" decimated the population. In 1856 the U.S. claimed the four southern islands for guano mining. Missionaries from Europe arrived in 1865 and rapidly converted the islanders to Christianity. In 1892 Tuvalu, then known as the Ellice Islands, joined the British Gilbert Islands, a protectorate that became the Gilbert and Ellice Islands colony in 1916. Tuvaluans voted in 1974 for separation from the Gilberts (now Kiribati), whose people are Micronesian. Tuvalu gained independence in 1978, and in 1979 the U.S. relinquished its claims. Elections were held in 1981, and a revised constitution was adopted in 1986. The government subsequently has tried to improve Tuvalu's economy, including finding overseas job opportunities for its citizens.

Tuxtla \'tüst-lä\ *in full* **Tuxtla Gutiérrez** City (pop., 2000: 424,579), capital of Chiapas state, southeastern Mexico. The Spanish who arrived there in the 16th century were frequently beset by Indians, and the town grew slowly. In 1892 it was made the state capital. It is now the major commercial and manufacturing centre in the state and an agricultural distributing point. There are archaeological remains of pre-Columbian culture in the region.

Tuzla \'tüz-lä\ Town (pop., 1991: 83,770), northeastern Bosnia and Herzegovina. Deposits of rock salt are located nearby; in the 10th cen-

tury the town was called Soli (meaning "salts"), and its present name is from the Turkish *tuz*, "salt." It was a Turkish garrison town from 1510 until it passed to the Austro-Hungarian Empire in the 19th century. It was incorporated into Yugoslavia in 1918. It is the centre for a mining region and an agricultural district. It was a target during the war in Bosnia in the 1990s (see BOSNIAN CONFLICT).

Twain, Mark *orig.* **Samuel Langhorne Clemens** (b. Nov. 30, 1835, Florida, Mo., U.S.—d. April 21, 1910, Redding, Conn.) U.S. humorist, writer, and lecturer. He grew up in Hannibal, Mo., on the Mississippi River. At age 13 he was apprenticed to a local printer. In 1856 he signed on as an apprentice to a steamboat pilot. He plied the Mississippi for almost four years before going to Nevada and California. In 1863 he took his pseudonym, the riverman's term for water "two fathoms deep." In a California mining camp he heard the story that he would make famous as "The Celebrated Jumping Frog of Calaveras County" (1865). He traveled widely, using his travels as subject matter for lectures and books, including the humorous narratives *The Innocents Abroad* (1869) and *Roughing It* (1872). He won a worldwide audience for his stories of youthful adventures, especially *Tom Sawyer* (1876), *The Prince and the Pauper* (1881), *Life on the Mississippi* (1883), and *Huckleberry Finn* (1884), one of the masterpieces of American fiction. The satirical *A Connecticut Yankee in King Arthur's Court* (1889) and increasingly grim works including *Pudd'nhead Wilson* (1894) and *The Man Who Corrupted Hadleyburg* (1900) followed. In the 1890s financial speculations bankrupted him, and his eldest daughter died. After his wife's death (1904), he expressed his pessimism about human character in such late works as the posthumously published *Letters from the Earth* (1962).

tweed Medium- to heavy-weight fabric, rough in surface texture, produced in a great variety of colour and weave effects (see WEAVING). Most tweeds are made entirely of WOOL, but an increasing number are blends of wool with cotton, rayon, or other synthetic fibres. Most are woven from dyed YARNS, but some are dyed after being woven. Technical advances in dyeing raw stock, yarns, and fabrics, together with new techniques in finishing, have resulted in a wide variety of durable cloths.

Tweed, River River, southeastern Scotland and northeastern England. It rises in the Borders region of southeastern Scotland and flows east, forming a section of the border between Scotland and England. It then crosses into England and empties into the NORTH SEA at Berwick. It is 97 mi (156 km) long.

Tweed, William Marcy *known as* **Boss Tweed** (b. April 3, 1823, New York, N.Y., U.S.—d. April 12, 1878, New York City) U.S. politician. He worked as a bookkeeper and volunteer firefighter. As city alderman (1851–56), he gained influence in TAMMANY HALL and obtained important positions in city government. He appointed political cronies to key city posts and built a group later called the Tweed ring. As head of Tammany's general committee (from 1860), he controlled the Democratic Party's nominations to all city positions. He opened a law office to receive payments for "legal services" from city contractors and corporations. Elected to the state senate (1868), he also became Tammany's grand sachem (leader) and controlled city and state political patronage. He gained control of the city treasury and plundered sums estimated at between $30 million and $200 million. Reformers and exposure by the press, including THOMAS NAST's cartoons in *Harper's Weekly*, brought prosecution, led by SAMUEL TILDEN, that resulted in Tweed's conviction and imprisonment (1873–75, 1876–78).

Boss Tweed
COURTESY OF THE LIBRARY OF CONGRESS, WASHINGTON, D.C.

Twelve Tables, Law of the Earliest codification of ancient ROMAN LAW, traditionally dated to 451–450 BC. They were purportedly written at the demand of the plebeians, who felt that their legal rights were hampered by the fact that court judgments were rendered according to unwritten custom preserved only within a small group of learned patricians. The Twelve Tables were not a reform or a liberalizing of old custom; they recognized the prerogatives of the patrician class and of the patriarchal family, the validity of enslavement for unpaid debt, and the interference of religious custom in civil cases. Because only random quotations from the Twelve Tables are extant, knowledge about their contents is largely derived from references in later juridical writings. Venerated by the Romans as a prime legal source, the Twelve Tables were superseded by later changes in Roman law but were never formally abolished.

Twentieth Century-Fox Film Corp. U.S. movie studio. It was formed in 1935 by the merger of Twentieth Century Pictures (founded in 1933 by Joseph Schenck and DARRYL F. ZANUCK) and the Fox Film Corp. (founded in 1915 by William Fox). The new studio produced mainly westerns and musicals into the 1940s, as well as notable films such as *The Grapes of Wrath* (1940) and *The Snake Pit* (1948). In 1953 it introduced CinemaScope with *The Robe*, and later in the decade it made hits such as *The King and I* (1956) and *South Pacific* (1958). After the expensive failure of *Cleopatra* (1963), the studio recouped with *The Sound of Music* (1965), *Patton* (1970), *M*A*S*H* (1970), and *Star Wars* (1977), the film industry's most profitable movie to that time. In 1981 the company was bought by the oil magnate Marvin Davis, who resold it in 1985 to RUPERT MURDOCH. Murdoch consolidated his American film and television companies under a holding company, Fox, Inc.

Twentieth Congress of the Communist Party of the Soviet Union (Feb. 14–25, 1956) Meeting at which NIKITA KHRUSHCHEV repudiated JOSEPH STALIN and STALINISM. Khrushchev's secret speech denouncing the former Soviet leader was accompanied by his Report of the Central Committee to the Congress, which announced a new line in Soviet foreign policy. He based his new policy on "the Leninist principle of coexistence of states with different social systems." Khrushchev also used the Congress to promote his loyal supporters to high party office and to take control of the party from the Stalinist old guard.

twenty-one See BLACKJACK

twill One of the three basic TEXTILE weaves (see WEAVING), distinguished by diagonal lines. In the simplest twill, the weft crosses over two warp YARNS, then under one, the sequence being repeated in each succeeding shot (row), but stepped over, one warp either to the left or right. In regular twill, the diagonal line is repeated regularly, usually running upward from left to right at 45°. The weave can be varied in many ways—for example, by changing the direction of the twill line (as in herringbone twill) or its angle. Twill is much used for men's wear and many other clothing applications because it has stretch on both diagonals, which makes clothes comfortable even if closely fitted. DENIM and many TWEEDS are of twill weave.

Twining, Nathan F(arragut) (b. Oct. 11, 1897, Monroe, Wis., U.S.—d. March 29, 1982, Lackland Air Force Base, near San Antonio, Texas) U.S. air force officer. He graduated from West Point and served as an army pilot from 1924. In World War II he commanded the air force in the South Pacific and directed the air war against Japan in the Solomon Islands and New Guinea (1943) and Japan (1945). In 1944–45 he led the strategic bombing campaign against Germany and the Balkans. He later became chief of staff of the U.S. Air Force (1953–57) and chairman of the Joint Chiefs of Staff (1957–60).

Two Sicilies See TWO SICILIES

Two Sicilies, Kingdom of the Former kingdom, Italy. It united the southern part of the Italian peninsula with the island of SICILY. The region was conquered by the Normans in the 11th century; the two areas were divided in 1282 between the Angevin (French) dynasty on the mainland and the Aragonese (Spanish) dynasty on the island, both of which claimed the title of King of Sicily. In 1442 ALFONSO V of Aragon reunited the two areas and took the title of King of the Two Sicilies. This title was sometimes used during the Spanish and Bourbon rule of the region in the 16th–19th centuries; it became official in 1816, when the administration of both areas was combined and Sicily lost its autonomy. Conquered by Giuseppe de GARIBALDI in 1860, the Two Sicilies became part of the Kingdom of Italy.

in 1967 and beginning to write full-time. Her novels, comedies of manner marked by compassionate wit and precise details of domestic life, include *Dinner at the Homesick Restaurant* (1982), *The Accidental Tourist* (1985; film, 1988), *Breathing Lessons* (1988, Pulitzer Prize), and *A Patchwork Planet* (1998). Several focus on eccentric middle-class people living in chaotic, disunited families in Baltimore.

Tyler, John (b. March 29, 1790, Charles City county, Va., U.S.—d. Jan. 18, 1862, Richmond, Va.) 10th president of the U.S. (1841–45). He practiced law before serving in the Virginia legislature (1811–16, 1823–25, 1839) and as governor of Virginia (1825–27). In the U.S. House of Representatives (1817–21) and Senate (1827–36), he was a supporter of STATES' RIGHTS. Though a slaveholder, he sought to prohibit the slave trade in the District of Columbia, provided Maryland and Virginia concurred. He resigned from the Senate rather than acquiesce to state instructions to change his vote on a censure of Pres. ANDREW JACKSON. After breaking with the Democratic Party, he was nominated by the WHIG PARTY for vice president under WILLIAM H. HARRISON. They won the 1840 election, carefully avoiding the issues and stressing party loyalty and the slogan "Tippecanoe and Tyler too!" Harrison died a month after taking office, and Tyler became the first to attain the presidency "by accident." He vetoed a national bank bill supported by the Whigs, and all but one member of the cabinet resigned, leaving him without party support. Nonetheless, he reorganized the navy, settled the second of the SEMINOLE WARS in Florida, and oversaw the annexation of Texas. He was nominated for reelection but withdrew in favour of JAMES K. POLK and retired to his Virginia plantation. Committed to states' rights but opposed to SECESSION, he organized the Washington Peace Conference (1861) to resolve sectional differences. When the Senate rejected a proposed compromise, Tyler urged Virginia to secede.

Tyler, Wat See PEASANTS' REVOLT

Tylor, Sir Edward Burnett (b. Oct. 2, 1832, London, Eng.—d. Jan. 2, 1917, Wellington, Somerset) British anthropologist, often called the founder of CULTURAL ANTHROPOLOGY. He taught at Oxford University (1884–1909), where he became the first professor of anthropology. His *Primitive Culture*, 2 vol. (1871), influenced by CHARLES DARWIN, developed the theory of an evolutionary relationship between what he called primitive and modern cultures, stressing the cultural achievements that marked the progression of all humanity from a "savage" to a "civilized" state. At a time when there was still controversy over whether all human races belonged to a single species, Tylor was a powerful advocate of the unity of all humankind. He was instrumental in establishing anthropology as an academic discipline. See also ANIMISM; SOCIOCULTURAL EVOLUTION.

Tyne, River River, NORTHUMBERLAND, northern England. Formed by the confluence of the North Tyne and the South Tyne, it flows east into the North Sea. The Tyne is 62 mi (100 km) long. It has shipped coal for at least six centuries. Its estuary is now lined with industry and large urban communities.

Tyne and Wear \'tīn...'wir\ Metropolitan county (pop., 2001: 1,075,979), northeastern England. It was named for its two main rivers, the TYNE and the Wear. Settled since prehistoric times, the area was occupied by the Romans, who built HADRIAN'S WALL. Saxon, then Norman settlement followed. From the 13th century to recent times, the economy was based on local coal reserves and on such coal-dependent industries as glass, pottery, and chemicals. The main industries now include shipbuilding and heavy electrical engineering.

typeface See FONT

types, theory of In LOGIC, a theory introduced by BERTRAND RUSSELL and ALFRED NORTH WHITEHEAD in their *Principia Mathematica* (1910–13) to deal with logical PARADOXES arising from the unrestricted use of PROPOSITIONAL FUNCTIONS as variables. The type of a propositional function is determined by the number and type of its arguments (the distinct variables it contains). By not allowing propositional functions to be applied to arguments of equal or higher type, contradictions within the system are avoided.

typesetting Setting of type for use in any of various PRINTING processes. Type for printing, using woodblocks, was invented in China in the 11th century, and movable type using metal molds had appeared in Korea by the 13th century. It was reinvented in Europe in the 1450s by JOHANNES GUTENBERG. For much of its history, typesetting and printing were often performed by the same person, who arranged movable type, one character at a time, in rows corresponding to the individual lines in the publication and operated the hand press to imprint the image on paper. Typesetting was revolutionized in the 1880s with the invention of the "hot-metal" processes: LINOTYPE (1884), in which the lines of type were assembled by use of a typewriter-like keyboard and each line was cast as a single slug of molten metal, and MONOTYPE (1887), which also used a keyboard but cast each character separately. Photocomposition—the composition of text directly on film or photosensitive paper using a rotating drum or disk with cutout type characters through which light could be directed onto the receiving surface—appeared in the early 20th century. By the late 20th century, computers and publishing software generated characters and handled most hyphenation, layout, and other page-makeup decisions, with the resulting electronic file, including any graphics, passed to a laser printer for paper or film reproduction.

typewriter Machine for writing characters similar to those made by printers' types, especially a machine in which the characters are produced by steel types striking the paper through an inked ribbon, the types being activated by corresponding keys on a keyboard and the paper being held by a roller (the platen) that is automatically moved along with a carriage when a key is struck. The first practical typewriter was patented in 1868 by CHRISTOPHER L. SHOLES; commercial production began at the Remington firearms company in 1874. By the end of the century the typewriter had come to dominate the American office. The first electric typewriter for office use was introduced in 1920. From the 1970s typewriters began to be replaced by PERSONAL COMPUTERS and their associated printers.

typhoid *or* **typhoid fever** Acute infectious disease resembling TYPHUS (and distinguished from it only in the 19th century). *Salmonella typhi*, usually ingested in food or water, multiplies in the intestinal wall and then enters the bloodstream, causing SEPTICEMIA. Symptoms begin with headache, aching, and restlessness. High fever gradually develops, with delirium. A rash appears on the trunk. The sites where the bacilli multiplied become inflamed and may ulcerate, leading to intestinal bleeding or PERITONITIS. Patients become exhausted and emaciated; up to 25% die if not treated. ANTIBIOTIC treatment is effective. Patients can carry typhoid for weeks to months or years. Carriers can contaminate the food they handle. Prevention depends mainly on water and sewage treatment and excluding carriers from food-handling jobs.

Typhoid Mary *byname of* **Mary Mallon** (b. 1870?—d. Nov. 11, 1938, North Brother Island, N.Y., N.Y., U.S.) U.S. carrier of TYPHOID. A 1904 typhoid epidemic on Long Island was traced to households where she had been a cook. She fled, but authorities finally caught up with her and isolated her on an island off the Bronx. In 1910 she was released after agreeing not to take a food-handling job, but she did, causing more typhoid outbreaks. She was returned to the island for the rest of her life. Three deaths and 51 original cases were directly attributed to her.

Typhon In GREEK MYTHOLOGY, the youngest son of GAEA and TARTARUS. A grisly monster with a hundred dragons' heads, he was conquered and cast into the underworld by ZEUS but continued to be the source of destructive winds. In other accounts, he was confined in the land of the Arimi in Cilicia or under Mount ETNA, where he caused eruptions and was thus the personification of volcanic forces. Among his children were CERBERUS, CHIMERA, and the multiheaded Hydra. Later writers identified him with the Egyptian god SETH.

typhoon See TROPICAL CYCLONE

typhus Any of a group of related diseases caused by various species of RICKETTSIA that release TOXINS into the blood. Headache, chills, fever, and general pains begin suddenly and a rash soon after. The bacteria are transmitted by lice, fleas, mites, and ticks. Epidemic typhus, spread by the body louse, is the most severe. It is one of the great scourges of history, associated with crowded, filthy conditions. Improved hygiene has nearly

© 2006 Encyclopædia Britannica, Inc.

eliminated it from the Western world, but it persists in many countries, despite modern vaccines and pesticides. Endemic typhus, spread by fleas on rats and other rodents, is milder (mortality under 5%). Scrub typhus, carried by mites, is usually classed as a separate disease. See also ROCKY MOUNTAIN SPOTTED FEVER; HANS ZINSSER.

typographic printing See LETTERPRESS PRINTING

typography Design or selection of letter forms to be organized into words and sentences and printed or displayed electronically. Typography originated after the invention of printing from movable type in the mid 15th century. The three major type families in the history of Western printing are ROMAN, italic, and BLACK LETTER (Gothic). All had their origin in the scripts of the calligraphers whose work was ultimately replaced by printing. In the succeeding centuries typographers have created some 10,000 typefaces (a complete set of letter forms of a particular design). Depending on the style of their letters, typefaces are categorized as old style, transitional, and modern. Commonly used typefaces include Caslon, Baskerville, Bodoni, Garamond, and Times New Roman. See also JOHN BASKERVILLE; GIAMBATTISTA BODONI; STANLEY MORISON. The selection of a typeface is an important part of the aesthetic process in GRAPHIC DESIGN.

tyrannosaur Any of a group of related carnivorous dinosaurs similar to the ALLOSAURS. *Tyrannosaurus rex* is the largest and best known, found as fossils in Late Cretaceous (99–65 million years ago) deposits of North America and eastern Asia. Some adults were more than 40 ft (12 m) long and 16–18 ft (over 5 m) tall and weighed 6 tons (5.4 metric tons) or more. Tyrannosaurs walked with a stooped posture, carrying the body forward and the long tail off the ground. They had a short, thick neck, a very large skull, and pointed teeth, up to 6 in. (15 cm) long, with serrated edges. Each small forelimb had two claws, perhaps for holding struggling prey. A nearly complete skeleton of *T. rex* called "Sue" is on display at the Field Museum in Chicago. Other tyrannosaurs include *Albertosaurus, Alectrosaurus,* and *Nanotyrannus*.

tyrant In ancient Greece, a cruel and oppressive absolute ruler. The Greek *tyrannos* was a ruler who seized power unconstitutionally or inherited such power. Though tyrants often replaced aristocratic regimes that were themselves unpopular, the Greeks resented their illegal autocracy, and those who killed tyrants received high honours. CYPSELUS and PERIANDER of Corinth and DIONYSIUS I of Syracuse were among the most famous tyrants.

Tyre \'tīr\ *Arabic* **Ṣūr** \'sür\ City (pop., 2003 est.: 117,100), southern Lebanon. It was a major PHOENICIAN port from c. 2000 BC through Roman times and later was noted for its silken garments and Tyrian purple dye. Probably founded as a colony of SIDON, it was first mentioned in the 14th century BC; it is frequently mentioned in the Bible. Tyre successfully resisted a 6th-century-BC siege of 13 years by the Babylonian king NEBUCHADREZZAR II, but it fell to ALEXANDER THE GREAT in 332 BC. Ruled later by the SELEUCID DYNASTY and then by the Romans, it passed to the Muslims in the 7th century AD. After its capture by the Crusaders in 1124, it became a chief city of the kingdom of Jerusalem (see CRUSADES). It fell again to the Muslims in 1291 and was destroyed. The modern city was included in Lebanon in 1920 and was occupied by Israeli forces (1982–85). Its main economic activity is fishing. Tyre's ruins were designated a UNESCO WORLD HERITAGE SITE in 1984.

Tyrol See TIROL

Tyrone \tī-'rōn\ Former county, western central Northern Ireland. In the 1973 administrative reorganization of Northern Ireland, the county was divided into several smaller districts. The O'Nialls (or O'Neills) ruled the territory from the 5th to the 16th century AD. Subsequently the vast estates passed to the English crown and were divided and granted by the king under the scheme for the Plantation of Ulster. Royalist forces established fortifications, and the area was colonized.

Tyrone \'tī-rən**, Hugh O'Neill, 2nd earl of** (b. c. 1540—d. July 20, 1616, Rome, Papal States) Irish rebel. Born into the powerful O'Neill family of Ulster, he grew up in London, then returned to Ireland (1568) to assume his grandfather's title of earl of Tyrone. As chieftain of the O'Neills from 1593, he led skirmishes against the English and won the Battle of the Yellow Ford on the River Blackwater, Ulster, which sparked a countrywide revolt (1598). He received aid and troops from Spain (1601) but was defeated by the English at Kinsale and forced to surrender (1603). In 1607 he fled with about 100 chieftains and lived in Rome the rest of his life. The so-called "flight of the earls" brought an end to Gaelic Ulster, and the province was rapidly Anglicized.

tyrosine \'tī-rə-ˌsēn\ One of the AMINO ACIDS, not essential for humans unless they have the hereditary disorder PHENYLKETONURIA. It is the biochemical precursor of many important CATECHOLAMINES. It is found in small amounts in most PROTEINS, especially INSULIN and papain (found in PAPAYA). It is used in biochemical research and as a dietary supplement.

Tyrrhenian Sea \tə-'rē-nē-ən\ *Italian* **Mare Tirreno** \'mä-rā-tē-'re-nō\ Arm of the MEDITERRANEAN SEA. It is located between the western coast of Italy and the islands of CORSICA, SARDINIA, and SICILY. It is connected with the Ligurian Sea on the northwest through the Tuscan Archipelago and with the Ionian Sea on the southeast through the Strait of MESSINA. Chief inlets include the Bay of NAPLES.

Tyson, Mike *in full* **Michael Gerald Tyson** (b. June 30, 1966, Brooklyn, N.Y., U.S.) U.S. boxer. A member of street gangs in his youth, Tyson was sent to reform school, where his boxing talent was discovered. He turned professional in 1985 and won the heavyweight title in 1986 by defeating Trevor Berbick, becoming, at age 20, the youngest heavyweight champion in history. He defended the title against LARRY HOLMES, Michael Spinks, and eight others before losing in an upset to James ("Buster") Douglas in 1990. In 1992 he was convicted of rape and sentenced to six years in prison; he was released on parole in 1995. In 1996 he challenged but lost to EVANDER HOLYFIELD; in a 1997 rematch he was disqualified for biting off a piece of Holyfield's ear, and his license was revoked. In 1999 Tyson regained his boxing license and returned to the ring. In his bout against British heavyweight champion LENNOX LEWIS in 2002, Lewis twice knocked Tyson to the canvas before knocking him out in the eighth round.

tzaddiq \'tsä-dik, tsä-'dēk\ *or* **zaddik** One who embodies the religious ideals of Judaism. The term is used repeatedly in the OLD TESTAMENT and in the TALMUD, which asserts that the continued existence of the world is due to the merits of 36 righteous men. In HASIDISM it came to refer to a religious leader who was viewed as a mediator between humankind and God. Initially the zaddikim traveled widely and engaged in social activities to strengthen the community's spiritual life. Toward the end of the 18th century, they ceased this practice and became available at home for those seeking advice.

Tzeltal \tsel-'täl\ Mayan Indian group of central Chiapas state in southern Mexico. Traditionally an agricultural people, they cultivate corn (maize), beans, chiles, squash, manioc, and peanuts with digging sticks and hoes. Their major crafts are pottery, weaving, and basketry. They profess Roman Catholicism, though pre-Columbian rituals are also practiced.

Tzotzil \tsōt-'sēl\ Mayan Indian group of central Chiapas state in southern Mexico. They live at high elevations where the climate is cool and precipitation is heavy during the rainy season. They raise sheep, primarily for wool, which they weave into ponchos for men and shawls for women. They practice shifting cultivation and grow peaches and other crops for the market. Some make pottery, leather, and fibre products or practice carpentry or stonework. Christian and native beliefs are intertwined in all Tzotzil areas.

© 2006 Encyclopædia Britannica, Inc.

U-2 Affair (1960) Confrontation between the U.S. and the Soviet Union. On May 1, 1960, the Soviet Union shot down a U.S. U-2 reconnaissance plane and called the flight an "aggressive act." The U.S. denied Soviet claims that the pilot, F. Gary Powers, had stated that his mission was to collect Soviet intelligence data. Nikita Khrushchev declared that the Soviet Union would not take part in a scheduled summit conference with the U.S., Britain, and France unless the U.S. immediately stopped flights over Soviet territory, apologized, and punished those responsible. Pres. Dwight D. Eisenhower agreed only to the first stipulation, and the conference was adjourned. Powers was tried in the Soviet Union and sentenced to 10 years in prison; in 1962 he was exchanged for the Soviet spy Rudolf Abel.

U-boat *German* **Unterseeboot ("undersea boat")** German submarine. The first German submarine, the U-1, was built in 1905. During World War I Germany became the first country to employ submarines in war, and during World War II its U-boats dominated the Battle of the Atlantic until the Allies developed new antisubmarine tactics. The principal German U-boat was the type VII; the VIIC variant was 220.25 ft (66 m) long, displaced 769 tons on the surface, carried one 90-mm deck gun and five torpedo tubes, and was manned by a crew of 44. Modern German U-boats are built for the German navy and navies of allied countries; their sophisticated structures, electonics, and propulsion systems allow them to be used for intelligence gathering and special operations in addition to defending sea lanes and threatening enemy forces.

Uaxactún \ˌwä-shäk-'tün\ Ancient Maya ruins, north-central Guatemala. One of the oldest known centres of Maya civilization, it was occupied in the 1st millennium BC; by c. 300 BC–c. AD 100 a number of ceremonial buildings had been erected, including a temple reminiscent of the more ancient Olmec civilization. Major remains predate the Classic period (AD 100–900). In the 9th century it declined, as did other southern lowland Maya centres, and was abandoned in the 10th century.

Ubangi \ü-'baŋ-gē\ **River** River, central Africa. Formed by the Bomu River and the Uele River on the northern border of the Democratic Republic of the Congo, it flows west and south, forming part of the boundary with the Central African Republic and with the Republic of the Congo. It then empties into the Congo River. It is 700 mi (1,126 km) long; with its longest headstream, it is double that length.

Ubasti See Bastet

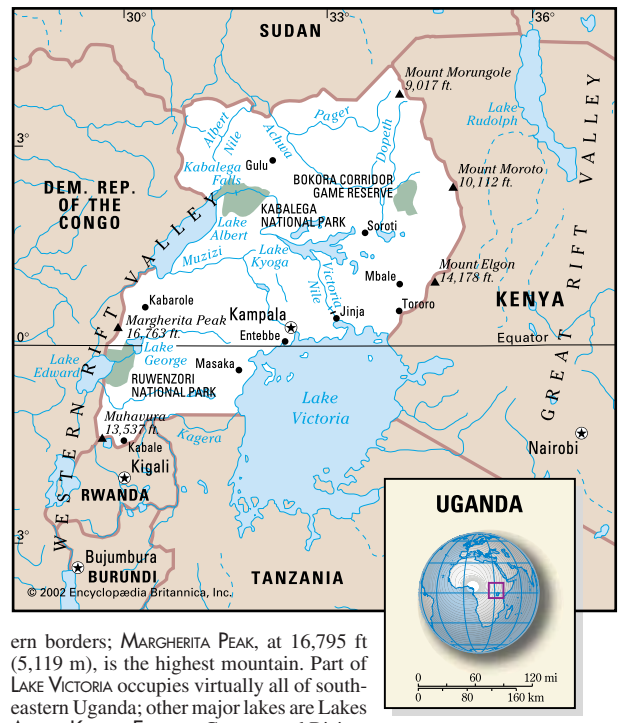
UC See University of California

Ucayali \ˌü-kä-'yä-lē\ **River** River, central and northern Peru. The chief headstream of the Amazon River, it is formed by the junction of the Apurímac and Urubamba rivers. It then meanders north to unite with the Marañón River and form the Amazon. It is navigable for about two-thirds of its 1,000-mi (1,610-km) length.

Uccello \ü-'che-lō**, Paolo** *orig.* **Paolo di Dono** (b. 1397, Pratovecchio, near Florence—d. Dec. 10, 1475, Florence) Italian painter. Though apprenticed to the sculptor Lorenzo Ghiberti, he is not known to have worked in sculpture, and at 18 he was admitted to the painters' guild in Florence. *The Deluge*, one of his frescoes in the Chiostro Verde of Santa Maria Novella, demonstrates his intense study of perspective. He became so firmly identified with perspective that John Ruskin thought he had invented it. His three panels depicting the Battle of San Romano, like all the extant works of his mature years, combine the decorative late Gothic style with the new heroic style of the early Renaissance.

UCLA See University of California

'ūd \üd\ Stringed instrument prominent in medieval and modern Islamic music, forerunner of the European lute. Dating from the 7th century, it has a pear-shaped body, a fretless fingerboard, a short neck, and a bent-back pegbox with the tuning pegs set in the sides. The gut strings, of which there are often four pairs, are plucked with a plectrum.



Udall \'yü-dəl, 'yü-ˌdȯl**, Nicholas** (b. December 1505?, Southampton, Hampshire, Eng.—d. December 1556, Westminster) English playwright, translator, and schoolmaster. The headmaster of Eton College from 1534 and of Westminster from 1555, Udall was well known as a translator. He is credited with writing many plays, of which only one is extant, *Ralph Roister Doister* (performed c. 1553), the first known English comedy. About a braggart soldier-hero who is finally shown to be an arrant coward, it marks the emergence of comedy from the medieval morality plays, interludes, and farces.

Ufa \ü-'fä\ City (pop., 2001 est.: 1,088,800), western Russia. Lying at the confluence of the Belaya and Ufa rivers, it was founded as a fortress in 1574 to protect the trade route across the Ural Mountains from Kazan to Tyumen. It became a town in 1586. It developed as an industrial centre from the late 19th century and especially after World War II. Chief industries include electrical equipment, lumber and veneer, and oil refining.

Uffizi \ü-'fēt-sē\ **Gallery** Art museum in Florence, housing the world's finest collection of Italian Renaissance painting. The core collection derives from the Medici family of Tuscany. In 1559 Cosimo I hired Giorgio Vasari to design the Uffizi Palace (1560–80), originally for use as government offices (*uffizi*). In 1565 Vasari built the corridor over the Ponte Vecchio connecting the Uffizi with the Pitti Palace. In 1737 Maria Ludovica, last of the Medici, bequeathed the family collections to Tuscany; the collection was given museum status and opened to the public in 1769. The building was restored and enlarged after bomb damage in World War II and flooding in 1966. In addition to Florentine paintings, the Uffizi houses outstanding works of other Italian and non-Italian schools, antique sculpture, a gallery of self-portraits, and 100,000 prints and drawings.

UFO See unidentified flying object

Uganda \yü-'gan-də, yü-'gän-də\ *officially* **Republic of Uganda** Country, eastern Africa. Area: 93,065 sq mi (241,038 sq km). Population (2005 est.): 27,269,000. Capital: Kampala. Uganda is home to dozens of African ethnic groups, as well as a small Asian community. Languages: English (official), Swahili. Religions: Christianity (mostly Roman Catholic; also Protestant); also Islam, traditional beliefs. Currency: Uganda shilling. A landlocked country on the Equator, Uganda is largely situated on a plateau, with volcanic mountains edging its eastern and western borders; Margherita Peak, at 16,795 ft (5,119 m), is the highest mountain. Part of Lake Victoria occupies virtually all of southeastern Uganda; other major lakes are Lakes Albert, Kyoga, Edward, George, and Bisina. The Nile River traverses the country. Huge tracts of land are devoted to national parks and game reserves. The economy is based largely on agriculture and food processing. Livestock raising and fishing are also impor-

© 2006 Encyclopædia Britannica, Inc.

tant, and there is some manufacturing and mining. Uganda is a republic with one legislative house; its head of state and government is the president. By the 19th century the region was divided into several separate local kingdoms inhabited by various Bantu- and Nilotic-speaking peoples. Arab traders reached the area in the 1840s. The kingdom of Buganda was visited by the first European explorers in 1862. Protestant and Catholic missionaries arrived in the 1870s, and the development of religious factions led to persecution and civil strife. In 1894 Buganda was formally proclaimed a British protectorate. As Uganda, it gained independence in 1962, and in 1967 it adopted a republican constitution. The civilian government was overthrown in 1971 and replaced by a military regime under Idi Amin. His invasion of Tanzania in 1978 resulted in the collapse of his regime. The civilian government was again deposed by the military in 1985, but the military government was in turn overthrown in 1986. A constituent assembly enacted a new constitution in 1995.

Ugarit \yü-'gär-it, 'yü-gə-rit\ *modern* **Ra's Shamrah** Ancient city, Middle East. It was located on the eastern coast of the Mediterranean Sea in modern Syria. The earliest settlement was a small fortified town in the 7th millennium BC. It flourished in the 15th–12th centuries BC, when great royal palaces, temples, shrines, and libraries were built there. It was destroyed c. 1200 BC. Remains at the site include ancient records in cuneiform writing.

Uí Néill \ü-'nēl\ Major dynasty of medieval Ireland, which long dominated Ulster. It was founded by a shadowy figure known as Niall of the Nine Hostages (r. 379–405). Divided into northern and southern branches, the Uí Néill ruled as high kings, to whom all other Irish kings owed deference. In the early 11th century the king of Munster, Brian Boru, challenged the high kings of the Uí Néill dynasty and ended their dominance.

Uighur *or* **Uygur** \'wē-ˌgůr\ A Turkic-speaking people of Central Asia who live largely in northwestern China. About 8,000,000 Uighurs live in China today, and some 300,000 in Uzbekistan, Kazakhstan, and Kyrgyzstan. They are among the oldest Turkic-speaking peoples of Central Asia, first mentioned in Chinese records from the 3rd century AD. In the 8th century they established a kingdom, which was overrun in 840. A Uighur confederacy (745–1209), established around the Tien Shan, was overthrown by the Mongols. This confederacy came to the aid of China's Tang dynasty during the An Lushan Rebellion. The Uighurs of that time professed a Manichaean faith.

Uinta \yü-'in-tä\ **Mountains** Mountain range, south-central Rocky Mountains, U.S. They extend east more than 100 mi (160 km) from the Wasatch Mountains across northeastern Utah and slightly into southwestern Wyoming. Many of the range's summits exceed 13,000 ft (4,000 m), including Kings Peak (13,528 ft [4,123 m]), the highest point in Utah.

Ujung Pandang \'ü-ˌjůŋ-'pän-ˌdäŋ\ *formerly* **Macassar** \mə-'ka-sər\ City (pop., 1995 est.: 1,060,257), Celebes (Sulawesi), Indonesia. Already a thriving port when the Portuguese arrived in the 16th century, it came under control of the Dutch, who built a trading station there in 1607 and finally deposed the sultan in 1667. It was made a free port in 1848 and the capital of the Dutch-sponsored state of Indonesia Timur (East Indonesia) in 1946. In 1949 it became part of the Republic of Indonesia. It is the home of Hasanuddin University (founded 1956).

ukiyo-e \ü-ˌkē-ō-'ā\ *Japanese* **"pictures of the floating world"** Dominant art movement of the Edo culture in Japan. Screen paintings were the first works to be done in the style, which depicted aspects of the entertainment quarters ("floating world") of Edo (modern Tokyo) and other cities. Ukiyo-e artists switched their focus to wood-block prints, which were mass-produced for an eager public. Favourite ukiyo-e subjects included famous courtesans and prostitutes, kabuki actors in famous roles, and erotica; they were executed in flat, decorative colours and expressive patterns. Hishikawa Moronobu is generally accredited as the first master of ukiyo-e. The transition from single- to two-colour prints was made by Okumura Masanobu; in 1765 polychrome prints using numerous blocks were introduced by Suzuki Harunobu. The essence of the ukiyo-e style was embodied in the works of Utamaro, Hokusai, and Hiroshige. The prints attracted much attention in Europe in the 19th century and had a great influence on avant-garde French artists such as the Impressionists and Post-Impressionists.

Ukraine \yü-'krān\ Country, eastern Europe. Area: 233,062 sq mi (603,628 sq km). Population (2005 est.): 47,075,000. Capital: Kiev. Ukrainians make up more than three-fourths of the population; there is a significant minority of Russians. Languages: Ukrainian (official), Russian, Romanian, Polish, Hungarian. Religions: Christianity (mostly Eastern Orthodox; also other Christians, Roman Catholic, Protestant), Islam. Currency: hryvnya. Ukraine consists of level plains and the Carpathian Mountains, which extend through the western region for more than 150 mi (240 km). The Bug (Western Bug), Dnieper (Dnipro), Donets, and Dniester (Dnistro) are the major rivers. The Donets Basin in the east-central region is one of the major heavy-industrial and mining-metallurgical complexes of Europe. There iron ore and coal are mined, and natural gas, petroleum, iron, and steel are produced. Ukraine is a major producer of winter wheat and sugar beets. It is a republic with one legislative body; its head of state is the president, and the head of government is the prime minister. Different parts of the area were invaded and occupied in the 1st millennium BC by the Cimmerians, Scythians, and Sarmatians and in the 1st millennium AD by the Goths, Huns, Bulgars, Avars, Khazars, and Magyars. Slavic tribes settled there after the 4th century. Kiev was the chief town. The Mongol conquest in the mid-13th century decisively ended Kievan power. Ruled by Lithuania in the 14th century and Poland in the 16th, the area fell to Russian rule in the 18th century. After the Russian Revolution of February 1917, Ukrainian and Bolshevik forces struggled for control of Ukraine until 1921, when the Bolsheviks prevailed. In 1924 the Ukrainian S.S.R. became a republic of the Soviet Union. The northwestern region of present-day Ukraine, however, was held by Poland (1919–39). Ukraine suffered a severe famine in 1932–33 under Soviet leader Joseph Stalin; more than five million Ukrainians died of starvation in an unprecedented peacetime catastrophe. Overrun by Axis armies in 1941 during World War II, it was further devastated before being retaken by the Soviets in 1944. In 1986 it was the site of the Chernobyl accident at a Soviet-built nuclear power plant. Ukraine declared independence in 1991. The turmoil it experienced in the 1990s as it attempted to implement economic and political reforms culminated in the disputed presidential election of 2004; invalidated by the Supreme Court after mass protests, it ultimately led to a new runoff election that brought opposition leader Viktor Yushchenko into office.

Ukrainian \yü-'krā-nē-ən\ **language** *formerly* **Ruthenian** \rü-'thē-nē-ən\ **language** Slavic language spoken by about 41 million people in Ukraine, Poland, Slovakia, Russia, and in enclaves around the world. Only about three-quarters of Ukrainians are first-language speakers of Ukrainian, but there are millions of first-language speakers in Russia, Belarus, and the Central Asian republics. Ukraine's premodern literary language was Church Slavonic (see Old Church Slavonic language). Ukrainian was one component in the chancery language of the Grand Duchy of Lithuania, which also mixed Church Slavonic, Belaru-

SIAN, and POLISH. With the fall of the Zaporizhzhya COSSACKS in the 18th century, Ukrainian speakers were stateless and the status of the language, thought of as peasant speech by the nobility, was low. The language and orthography (using a form of the CYRILLIC ALPHABET) were gradually standardized in the 19th century.

ukulele \ˌyü-kə-ˈlā-lē\ Small Hawaiian four-stringed guitar. It developed out of a similar Portuguese instrument introduced to Hawaii by sailors in the 1870s. It became highly popular in the U.S. after World War I, when it was used in JAZZ and BLUEGRASS ensembles and more widely as an amateur solo instrument.

Ulaanbaatar *or* **Ulan Bator** \ˌü-ˌlän-ˈbä-ˌtȯr\ City (pop., 2002 est.: mun., 812,500), capital of MONGOLIA. Situated on a windswept plateau, it was founded in the mid-17th century as the residence of the *bodgo-gegen*, the high priest of Tibetan Buddhism. It subsequently became a trading centre on caravan routes between Russia and China; it remains the principal junction of Mongolian transportation routes. The Outer Mongolian revolt for independence was centred there in 1911. Ulaanbaatar became the capital when the Mongolian People's Republic was established in 1924 and remained the capital when the country's name was changed to Mongolia in 1992. It is the country's main industrial centre.

Ulaid cycle See ULSTER CYCLE

Ulam \ˈü-ləm**, Stanislaw M(arcin)** (b. April 13, 1909, Lemberg, Pol., Austria-Hungary —d. May 13, 1984, Santa Fe, N.M., U.S.) Polish-born U.S. mathematician and atomic physicist. He received his doctoral degree in 1933 and was invited by John von NEUMANN to Princeton University's Institute for Advanced Study in 1936. In 1943 he moved to LOS ALAMOS, N.M., where his early work included development (with von Neumann) of the MONTE CARLO METHOD of finding approximate solutions to problems. Later, while working on a fusion bomb, he and EDWARD TELLER developed a two-stage radiation implosion design (the "Teller-Ulam configuration") that could generate an explosion capable of initiating nuclear fusion, a design that led to the creation of the HYDROGEN BOMB.

Ulan Bator See ULAANBAATAR

Ulanova \ü-ˈlä-nə-və**, Galina (Sergeyevna)** (b. Jan. 8, 1910, St. Petersburg, Russia—d. March 21, 1998, Moscow) Russian ballet dancer, the first *prima ballerina assoluta* of the Soviet Union. She trained with AGRIPPINA VAGANOVA in Leningrad and in 1928 joined the Kirov Theatre (formerly MARIINSKY THEATRE) company, where she began to dance leading roles and to develop the unique lyrical, dramatic style that won her wide acclaim. In 1944 she moved to the BOLSHOI BALLET, and during the 1950s she toured to great acclaim with the company in Europe and the U.S. She retired from dancing in 1962 but continued as ballet mistress and coach at the Bolshoi.

Ulbricht \ˈůl-ˌbrik̲t,\ *English* \ˈůl-ˌbrikt**, Walter** (b. June 30, 1893, Leipzig, Ger.—d. Aug. 1, 1973, East Berlin, E.Ger.) German communist leader and head of East Germany (1960–73). He joined the German Communist Party after World War I and was elected to its central committee in 1923. He led the party in Berlin (1929–33), then fled abroad after the Nazi takeover. As an agent for the COMINTERN, he persecuted Trotskyites and other deviationists. In 1945 he returned to the Soviet-occupied zone of Germany, helped form the Socialist Unity Party (SED) in East Germany, and served as its general secretary (1950–71). He served as deputy premier of East Germany (1949–60) and as chairman of its council of state (1960–73). A constant foe of West Germany, he built the BERLIN WALL in 1961. He exercised rigid control over East Germany while developing its industrial strength. He was forced to retire as first secretary of the SED in 1971 when the Soviet Union opened new relations with West Germany, but he retained his position as head of state until his death.

ulcer Concave sore on the skin or lining of an organ, with well-defined, sometimes raised edges. Erosion of surface tissue may extend to deeper layers. The main symptom is pain. The term most often refers to PEPTIC ULCER but also includes skin ulcer, common on legs with VARICOSE VEINS and the feet of people with DIABETES MELLITUS (when nerve damage has reduced sensation), and decubitus ulcer (bedsore or pressure sore). Other causes include INFECTION, trauma (e.g., BURN, FROSTBITE), improper nutrition (e.g., THIAMINE deficiency), and CANCER (likely in ulcers hard to the touch). Skin ulcers over a month old should be checked for cancer, especially after middle age.

ulcerative colitis \kō-ˈlī-təs\ Inflammation of the COLON, especially of its mucous membranes. The inflamed membranes develop patches of tiny ulcers, and the diarrhea contains blood and mucus. It often becomes chronic, with sustained fever and weight loss; complications and death may result. Specific causes, such as amoebic or bacillary dysentery, are rarer than unknown or multiple causes. If treatment with sulfasalazine, corticosteroids, immunosuppressive drugs, or antibiotics does not control it, part or all of the colon may have to be removed.

Ullmann, Liv (b. Dec. 16, 1939, Tokyo, Japan) Norwegian film actress. Raised mainly in Canada and the U.S., she returned to Norway and made her stage debut in Oslo. She became internationally famous in the films of Swedish director INGMAR BERGMAN, including *Persona* (1966), *The Passion of Anna* (1969), *Cries and Whispers* (1972), *Scenes from a Marriage* (1973), and *Autumn Sonata* (1978). Noted for her expressive face, natural beauty, and intelligent performances, she also starred in other Swedish and international films, including *The Emigrants* (1971) and *The New Land* (1973), and appeared on stage in the U.S. and Europe. She directed and cowrote *Sofie* (1993) and directed *Private Confessions* (1999) from Bergman's screenplay.

Ulm, Battle of (Sept. 25–Oct. 20, 1805) Major victory by France over Austria at Ulm, Bavaria. In August 1805 Austria joined the Anglo-Russian alliance against NAPOLEON and on September 11 sent 72,000 troops under Baron Karl Mack (1752–1828) into Bavaria, an ally of France. Napoleon, hoping to crush the Austrians before Russian troops could join them, sent his Grand Army of 210,000 French troops across the Rhine River, marching 18 mi (29 km) a day to reach the Danube River on September 25. After several battles, he encircled the Austrians and forced them into the city of Ulm, where they faced French artillery attacks. Seeing little chance that his troops could hold out until Russian reinforcements arrived, Baron Mack surrendered on October 20 with about 50,000 men.

Ulmanis \ˈůl-mä-nis**, Kārlis** (b. Sept. 4, 1877, Berze, Latvia, Russian Empire—d. 1942) Latvian independence leader and premier of Latvia (1918, 1919–21, 1925–26, 1931–32, 1934–40). An agronomist, he worked to improve farming in Latvia while becoming active in the Latvian independence movement. In 1905 he was forced into exile to the U.S., where he taught agriculture at the University of Nebraska until 1913. Returning to Latvia, he founded the Latvian Farmers' Union (1917) to press for independence from Russia. In 1918 he became premier of the newly independent republic. In his various terms of office he worked to resist internal dissension—instituting authoritarian rule in 1934—and military threats from Russia. Soviet occupation forced his resignation in 1940, and he was arrested and deported to Russia, where he died.

Ulster Historical province, northern IRELAND. It now forms Northern Ireland and Ulster province of Ireland. The ancient province was home to the Roman Catholic O'Neills (earls of TYRONE), who rebelled against English rule c. 1600. After they fled, most of the land was confiscated by British King JAMES I and settled with Protestant Scots, Welsh, and English. It was further colonized after Cromwellian settlement in the mid-17th century. In the early 20th century its opposition to Irish HOME RULE led to the formation of Northern Ireland.

Ulster cycle *or* **Ulaid** \ˈü-ləthʸ, ˈü-ləgʸ\ **cycle** In early Irish literature, a group of legends and tales dealing with the heroic age of the Ulaid, a people of northeast Ireland from whom the modern name Ulster derives. The stories, set in the 1st century BC, were recorded from oral tradition between the 8th and 11th century and are preserved in the 12th-century manuscripts *The Book of the Dun Cow* and *The Book of Leinster* and later compilations. Reflecting the customs of a free pre-Christian aristocracy, they combine mythological and legendary elements. Among the stories are "Bricriu's Feast," containing a beheading game that appeared in medieval narratives, and "The Tragic Death of the Sons of Usnech," dramatized in the 20th century by WILLIAM BUTLER YEATS and JOHN MILLINGTON SYNGE.

ultra Member of the extreme right (ultraroyalist) wing of the royalist movement in the French BOURBON RESTORATION (1815–30). The ultras included large landowners, clericalists, and the former ÉMIGRÉ nobility. Opposed to the FRENCH REVOLUTION's secular and egalitarian principles, they called for restrictions on the press and greater power for the Catholic church. They controlled the Chamber of Deputies and the cabinet for most of the 1820s, especially during the reign of their leader CHARLES X. Their policies proved unpopular, and they lost power after 1827; with the JULY REVOLUTION (1830), the faction ceased to exist.

Ultra Allied intelligence project that, in tapping the very highest-level communications among the armed forces of Germany and Japan, contrib-

© 2006 Encyclopædia Britannica, Inc.

uted to the Allied victory in World War II. In the early 1930s Polish cryptographers first broke the code of Germany's cipher machine Enigma. In 1939 they turned their information over to the Allies, and Britain established the Ultra project at Bletchley Park to intercept and decipher Enigma messages. The Japanese also had a modified version of the Enigma, known as "Purple" by the Americans, who were able to duplicate it well before Pearl Harbor. The intercept of signals helped Allied forces win the Battle of Britain and the battles of the Coral Sea and Midway and led to the destruction of a large part of the German forces following the Allied landing in Normandy.

ultrasonics Vibrational or stress waves in elastic media that have a frequency above 20 kilohertz, the highest frequency of sound waves that can be detected by the human ear. They can be generated or detected by piezoelectric transducers (see piezoelectricity). High-power ultrasonics produce distortion in a medium; applications include ultrasonic welding, drilling, irradiation of fluid suspensions (as in wine clarification), cleaning of surfaces (such as jewelry), and disruption of biological structures. Low-power ultrasonic waves do not cause distortions; uses include sonar, structure testing, and medical imaging and diagnosis. Some animals, including bats, employ ultrasonic echolocation for navigation.

ultrasound *or* **ultrasonography** Use of ultrasonic waves to produce images of body structures. The waves travel through tissues and are reflected back where density differs (e.g., the border between a hollow organ's wall and its inside). The reflected echoes are received by an electronic apparatus that measures their intensity level and the position of the tissue reflecting them. The results can be displayed as still images or as a moving picture of the inside of the body. Unlike X-rays or other ionizing radiation, ultrasound carries minimal, if any, risk. Most often used during pregnancy to examine the fetus, ultrasound imaging is also used on internal organs and on the eye, breast, and major blood vessels. It can often show whether a growth is benign or malignant. See also diagnostic imaging.

ultraviolet astronomy Study of astronomical objects and phenomena by observing the ultraviolet radiation (UV radiation) they emit. It has yielded much information about chemical abundances and processes in interstellar matter, the Sun, and other stellar objects, such as hot young stars and white dwarf stars. Ultraviolet astronomy became feasible once rockets could carry instruments above Earth's atmosphere, which absorbs most electromagnetic radiation of UV wavelengths. Since the early 1960s, a number of unmanned space observatories carrying UV telescopes, including the Hubble Space Telescope, have collected UV data on objects such as comets, quasars, nebulae, and distant star clusters. The Extreme Ultraviolet Explorer, launched in 1992, was the first orbiting observatory to map the sky in the shortest UV wavelengths, at the boundary with the X-ray region of the electromagnetic spectrum.

ultraviolet radiation Portion of the electromagnetic spectrum extending from the violet end of visible light to the X-ray region. Ultraviolet (UV) radiation lies between wavelengths of about 400 nanometres and 10 nanometres, corresponding to frequencies of 7.5×10^{14} Hz to 3×10^{16} Hz. Most UV rays from the Sun are absorbed by the Earth's ozone layer. UV has low penetrating power, so its effects on humans are limited to the skin. These effects include stimulation of production of vitamin D, sunburn, suntan, aging signs, and carcinogenic changes. UV radiation is also used to treat jaundice in newborns, to sterilize equipment, and to produce artificial light.

Ulysses See Odysseus

ʿUmar ibn al-Khaṭṭāb \ˈü-mär-ˌib-nül-ˌkät-ˈtäb\ (b. c. ad 586, Mecca, Arabian Peninsula—d. Nov. 3, 644, Medina) Second Muslim caliph (634–644). He initially opposed the Prophet Muhammad but became a Muslim c. 615. His daughter Ḥafṣah married Muhammad in 625. He was nominated by Abū Bakr as his successor. As caliph he spread Islam to Egypt, Syria, and Persia. His innovations affected taxation, social welfare, and the empire's entire financial and administrative fabric, and he was noted for his justice, social ideals, and candour.

ʿUmar Tal \ˌü-mär-ˈtäl\ *in full* **al-Ḥājj ʿUmar ibn Saʿīd Tal** (b. c. 1797, Halvar, Fouta-Toro [Senegal]—d. Feb. 12, 1864, near Hamdalahi, Tukulor empire [Mali]) West African founder of the Tukulor empire. Born in the Sénégal River valley, he became a mystic and set out to Mecca on a pilgrimage at age 23. Through political and religious connections he made during and after his journey, he was appointed caliph for black Africa by the head of the Tijānī brotherhood. He returned to Africa in 1833, and in 1854, in the area of upper Guinea, eastern Senegal, and western and central Mali, he ordered a jihad to sweep away the pagans and bring back lapsed Muslims. He defeated the Bambara pagans of Mali, but they soon rebelled. Attacked by the Tuaregs, Moors, and Fulani in 1863, ʿUmar's army was destroyed, and he was pursued and killed in an explosion. His empire lasted under his son Aḥmadu Seku until 1897, when it was annexed by the French.

Umayyad \ù-ˈmä-yəd\ **dynasty** (661–750) First great Muslim dynasty. It was founded by Muʿāwiyah I, who triumphed over the Prophet Muhammad's son-in-law, ʿAlī, to become the fifth caliph. He moved the capital from Medina to Damascus and used the Syrian army to extend the Arab empire. The Umayyads' greatest period was under ʿAbd al-Malik (r. 685–705), when their empire extended from Spain to Central Asia and India. Their decline began with a defeat by the Byzantine Empire in 717; intertribal feuding, discontent among non-Arab Muslim converts, and the failure of financial reforms eventually led to their unseating by the ʿAbbāsid dynasty. See also ʿAbd al-Raḥmān III; Abū Muslim; al-Ḥusayn ibn ʿAlī.

Umberto I (b. March 14, 1844, Turin, Piedmont, Kingdom of Sardinia—d. July 29, 1900, Monza, Italy) King of Italy (1878–1900) and duke of Savoy. The son of Victor Emmanuel II, he fought in the wars against Austria (1866). After ascending the throne in 1878, he led his country out of its isolation and into the Triple Alliance (1882). However, a tariff war with France led to economic difficulties (1888), and Umberto's colonial policy in Africa was ended by Italy's defeat by Ethiopia (1896). Facing increasing social unrest, he supported the imposition of martial law (1898) and created a period of turmoil that culminated in his assassination by an anarchist.

Umberto II (b. Sept. 15, 1904, Racconigi, Italy—d. March 18, 1983, Geneva, Switz.) Prince of Savoy and briefly king of Italy (1946). Son of Victor Emmanuel III, he commanded an Italian army division in World War II. In May 1946 his father abdicated in his favour, but Umberto was himself forced to abdicate in June after the Italian people voted for a republic. He and his male heirs were permanently banished from Italy (though the ban was lifted in 2002), and he settled in Portugal.

Umbria Region (pop., 2001 prelim.: 815,588), central Italy. It is located on 3,265 sq mi (8,456 sq km) in the Apennines; its capital is Perugia. Originally inhabited by the ancient Italic Umbrian tribe, it came under Rome c. 300 bc and was made one of its administrative regions in the 1st century ad. During the Christian era it became part of the Papal States. It was the seat of the 15th–16th-century Umbrian school of painting, which included Perugino and Pinturicchio, and was the home of St. Francis of Assisi. Agriculture is an economic mainstay, while its industries produce steel, chemicals, and textiles.

Umbrian Any member of an ancient pre-Etruscan people pushed into central Italy (Umbria) by the Etruscans and Gauls. They never fought an important war with the Romans. In the Social War they were among the first to make peace with Rome. They are described by ancient authors as being similar to their Etruscan enemies in culture. The Umbrian alphabet is undoubtedly of Etruscan origin. Their dialect was Indo-European.

Umbrian \ˈəm-brē-ən\ **language** Ancient Italic language spoken in central Italy in the last few centuries bc. Umbrian was related closely to Oscan and Volscian and more distantly to Latin. It was displaced by Latin at an unknown date. Modern knowledge of the language is derived almost entirely from the Iguvine Tables (c. 300–90 bc).

Unamuno \ˌü-nä-ˈmü-nō\ **(y Jugo), Miguel de** (b. Sept. 29, 1864, Bilbao, Spain—d. Dec. 31, 1936, Salamanca) Spanish philosopher and writer. He served twice as rector of the University of Salamanca (1901–14; 1931–36); he was dismissed first for espousing the Allied cause in World War I and later for denouncing Francisco Franco's Falangists. Though he also wrote poetry and plays, he was most influential as an essayist and novelist. In *The Tragic Sense of Life in Men and Peoples* (1913), he stressed the role spiritual anxiety plays in driving one to live the fullest possible life. His most famous novel is *Abel Sánchez* (1917), a modern re-creation of the biblical story of Cain and Abel. *The Christ of Velázquez* (1920), a study in poetic form of the great Spanish painter, is a superb example of modern Spanish verse.

uncertainty principle *or* **Heisenberg uncertainty principle** *or* **indeterminacy principle** Principle that states that the position and velocity of an object cannot both be measured exactly at the same time, and that the concepts of exact position and exact velocity together have no meaning in nature. Articulated by Werner Heisenberg in 1927, it applies only at the small scales of atoms and subatomic particles and is not noticeable for macroscopic objects, such as moving vehicles. Any attempt to measure the velocity of a subatomic particle precisely will displace the particle in an unpredictable way, thus invalidating any simultaneous measurement of its position. This displacement is a result of the wave nature of particles (see wave-particle duality). The principle also applies to other related pairs of variables, such as energy and time.

Uncle Sam Popular U.S. symbol, usually associated with a cartoon figure having long white hair and chin whiskers and dressed in a swallow-tailed coat, vest, tall hat, and striped trousers. The name probably originated with "Uncle Sam" Wilson, a businessman who provided beef to the army during the War of 1812. The "U.S." stamp on his barrels, meant to indicate government property, came to be associated with his nickname, which in time came to symbolize the U.S. government. The Uncle Sam figure evolved in the hands of British and U.S. cartoonists; its most familiar treatment appeared on recruiting posters during World Wars I and II with the caption "I want you."

Army recruiting poster featuring "Uncle Sam," designed by James Montgomery Flagg, 1917.
Library of Congress, Washington, D.C.

unconscious *or* **subconscious** In psychoanalysis, the part of the psychic apparatus that does not ordinarily enter the individual's awareness but may be manifested by slips of the tongue, dreams, or neurotic symptoms (see neurosis). The existence of unconscious mental activities was first elaborated by Sigmund Freud and is now a well-established principle of psychiatry. The origin of many neurotic symptoms is said to depend on conflicts that have been removed from consciousness by repression and maintained in the unconscious through various defense mechanisms. Recent biopsychological explorations have shed light on the relationship between brain physiology and the levels of consciousness at which people retain memories.

underground See subway

Underground See Resistance

Underground Railroad Secret system in northern U.S. states to help escaping slaves. Its name derived from the need for secrecy and the railway terms used in the conduct of the system. Various routes in 14 states, called lines, provided safe stopping places (stations) for the leaders (conductors) and their charges (packages) while fleeing north, sometimes to Canada. The system developed in defiance of the Fugitive Slave Acts and was active mainly from 1830 to 1860. An estimated 40,000 to 100,000 slaves used the network. Assistance was provided mainly by free blacks, including Harriet Tubman, and philanthropists, church leaders, and abolitionists. Its existence aroused support for the antislavery cause and convinced Southerners that the North would never allow slavery to remain unchallenged.

Undset \'ün-set**, Sigrid** (b. May 20, 1882, Kalundborg, Den.—d. June 10, 1949, Lillehammer, Nor.) Norwegian novelist. Her father was an archaeologist, and her home life was steeped in legend, folklore, and Norwegian history. Her early novels deal with the position of women in the contemporary lower middle class. She then turned to the distant past and created her masterpiece, the trilogy *Kristin Lavransdatter* (1920–22), which is set in medieval Norway and depicts the spiritual growth of a strong woman. Undset converted to Roman Catholicism in 1924. Her later works, including the historical novel *The Master of Hestviken* (1925–27) and novels on contemporary themes, reflect her interest in religion. She received the Nobel Prize for Literature in 1928.

unemployment Condition of a person who is able to work, is actively seeking work, but is unable to find any. Statistics on unemployment are collected and analyzed by government labour offices in most countries and are considered an important indicator of economic health. Since World War II full employment has been a stated goal of many governments. Full employment is not necessarily synonymous with a zero unemployment rate, since at any given time the unemployment rate will include some people who are between jobs and not unemployed in any long-term sense. Underemployment is the term used to describe the situation of those who are able to find employment only for shorter than normal periods—for example, part-time workers and seasonal workers—and may also describe the condition of workers whose education or training makes them overqualified for their jobs.

unemployment insurance Form of social insurance designed to compensate workers for short-term, involuntary unemployment. It was created primarily to provide financial assistance to laid-off workers during a period deemed long enough to allow them to find another job or to be rehired at their original job. In most countries, workers who are permanently disabled or who have been unemployed for a long period of time are covered under other plans. In countries such as Canada and Britain, workers in any occupation may qualify for unemployment insurance; the U.S. denies coverage to certain workers, such as government employees and the self-employed. In most countries, benefits are related to earnings and are paid for a limited period of time. Funding may come out of general government revenues or from specific taxes placed on employers or employees.

UNESCO *in full* **United Nations Educational, Scientific and Cultural Organization** Specialized agency of the UN, created in 1946 to aid peace by promoting international cooperation in education, science, and culture. It supports member states' efforts to eliminate illiteracy, encouraging the extension of free education, and acts as a clearinghouse for the exchange of ideas and knowledge. In 1972 it sponsored an international agreement to establish a World Heritage list of cultural sites and natural areas that would enjoy government protection (see World Heritage site). In 1984 the U.S. withdrew from UNESCO to protest what it considered the agency's anti-Western approach to cultural issues; the United Kingdom and Singapore withdrew a year later. The United Kingdom rejoined in 1997, and the U.S. followed suit in 2003.

uneven parallel bars Event in women's gymnastics in which a pair of wooden bars supported horizontally above the floor at different heights is used to perform acrobatic feats. The apparatus allows a great variety of movements, but hanging and swinging exercises predominate. It became an Olympic event in 1936. See also parallel bars.

Ungaretti \ˌün-gä-'rät-tē**, Giuseppe** (b. Feb. 10, 1888, Alexandria, Egypt—d. June 1, 1970, Milan, Italy) Egyptian-Italian poet. He lived in Alexandria until he was 24, and the desert regions of Egypt provide recurring images in his work. While studying in Paris, he was strongly influenced by the poets of the Symbolist movement. He was the founder of Hermeticism, which began with his *Il porto sepolto* (1916; "The Buried Port") and brought about a reorientation in modern Italian poetry. Though experimental, his poetry developed in a coherent direction in *Allegria di naufragi* (1919; "Gay Shipwrecks") and later collections. After World War II his works became more structured and acquired a more straightforward tone.

Ungava \ən-'gä-və-\ **Bay** Inlet, southern Hudson Strait, northeastern Quebec, Canada. It is about 200 mi (320 km) long and 160 mi (260 km) wide at its mouth, with a maximum depth of 978 ft (298 m). Fed by several large rivers, including the Koksoak, Leaf, and Payne, it is ice-free only four months a year. At its mouth, Akpatok Island (551 sq mi [1,427 sq km]) rises to 930 ft (283 m).

Ungava Peninsula Northern part of New Quebec district, northern Quebec, Canada. It is bounded by the Hudson Strait, Ungava Bay, Labrador, the Eastmain River, and Hudson Bay. Physiographically, it is part of the Canadian Shield.

ungulate \'əŋ-gyə-lət\ Any hoofed, herbivorous, quadruped, placental mammal in three or four orders: Artiodactyla, the even-toed ungulates (including pigs, camels, deer, and bovines); Perissodactyla, the odd-toed ungulates (including horses, tapirs, and rhinoceroses); Proboscidea (elephants); and, by some authorities, Hyracoidea (see hyrax). There are ten orders of extinct ungulates. The hoof is dermal tissue, comparable to the human fingernail, that extends over the end of a broadened terminal digit. See also ruminant.

© 2006 Encyclopædia Britannica, Inc.

UNICEF *in full* **United Nations Children's Fund** *formerly (1946–53)* **United Nations International Children's Emergency Fund** Special United Nations program for aiding national efforts to improve the health, nutrition, education, and general welfare of children. Its original purpose was to provide relief to children in countries devastated by World War II. After 1950 it turned to general programs for the improvement of children's welfare. It was awarded the Nobel Prize for Peace in 1965. UNICEF has focused its efforts on areas in which relatively small expenditures can have a significant impact on the lives of the most disadvantaged children, such as the prevention and treatment of disease. UNICEF also provides funding for health services, educational facilities, and other welfare services. It is headquartered in New York City.

Unicode International character-encoding system designed to support the electronic interchange, processing, and display of the written texts of the diverse languages of the modern and classical world. The Unicode Worldwide Character Standard includes letters, digits, diacritics, punctuation marks, and technical symbols for all the world's principal written languages, using a uniform encoding scheme. The first version of Unicode was introduced in 1991; the most recent version contains almost 50,000 characters. Numerous encoding systems (including ASCII) predate Unicode. With Unicode (unlike earlier systems), the unique number provided for each character remains the same on any system that supports Unicode.

unicorn Mythological animal resembling a white horse with a single horn on its forehead. The unicorn was depicted in Mesopotamian art and was referred to in the ancient myths of India and China. Its earliest description in Greek literature dates from c. 400 BC and probably refers to the Indian rhinoceros. The unicorn was believed to be fierce and difficult to capture, but if a virgin were brought before it, it would lay its head in the virgin's lap. Its horn was thought to offer protection against poison. Medieval writers associated the unicorn with Jesus, and the hunt for the unicorn was often represented in medieval art.

unidentified flying object (UFO) Aerial object or optical phenomenon not readily explainable to the observer. Interest in UFOs increased with developments in aeronautics and astronautics after World War II. A U.S. government panel investigating sightings in the 1950s reported that 90% coincided with astronomical or meteorological phenomena or sightings of aircraft, birds, or hot gases, sometimes under unusual weather conditions. Some remained unexplained, however, and in the mid 1960s a few scientists concluded that a small percentage indicated the presence of extraterrestrial visitors. This sensational hypothesis, promoted in the press, met with prompt resistance from other scientists. A U.S. Air Force UFO study begun in 1968 firmly rejected the extraterrestrial hypothesis, but a large fraction of the public, and a few scientists, continued to support it. UFO reports vary widely in reliability. The unaided eye is easily fooled; radar sightings of UFOs, more reliable in some ways, may fail to distinguish physical objects from meteor trails, rain, or thermal discontinuities and are subject to radio interference. See also SETI.

Unification Church *officially* **Holy Spirit Association for the Unification of World Christianity** Religious movement founded (1954) in South Korea by Sun Myung Moon. Influenced by yin-yang principles and Korean shamanism, it seeks to establish divine rule on earth through the restoration of the family, based on the union of the Lord and Lady of the Second Advent (believed to be Moon and his wife, Hak Ja Han). It strives to fulfill what it asserts to be the uncompleted mission of Jesus—procreative marriage. The church has been criticized for its recruitment policies (said to include brainwashing) and business practices. Its mass marriage ceremonies have gained press attention. Its worldwide membership is about 200,000 in more than 100 countries.

unified field theory Attempt to describe all fundamental interactions between elementary particles in terms of a single theoretical framework (a "theory of everything") based on quantum field theory. So far, the weak force and the electromagnetic force have been successfully united in electroweak theory, and the strong force is described by a similar quantum field theory called quantum chromodynamics. However, attempts to unite the strong and electroweak theories in a grand unified theory have failed, as have attempts at a self-consistent quantum field theory of gravitation.

unified science *or* **unity-of-science view** In the philosophy of logical positivism, the doctrine holding that all sciences share the same language, laws, and method. The unity of language has been taken to mean either that all scientific statements could be restated as a set of protocol sentences describing sense-data or that all scientific terms could be defined using physics terms. The unity of law means that the laws of the various sciences must be deduced from some set of fundamental laws (e.g., those of physics). The unity of method means that the procedures for supporting statements in the various sciences are basically the same. The unity-of-science movement that arose in the Vienna Circle held to those three unities, and Rudolf Carnap's "physicalism" supported the notion that all the terms and statements of empirical science could be reduced to terms and statements in the language of physics.

uniform circular motion Motion of a particle moving at a constant speed on a circle. Though the magnitude of the velocity of such an object may be constant, the object is constantly accelerating because its direction is constantly changing. At any given instant its direction is perpendicular to a radius of the circle drawn to the point of location of the object on the circle. The acceleration is strictly a change in direction and is a result of a force directed toward the centre of the circle. This centripetal force causes centripetal acceleration.

Uniform Resource Locator See URL

uniformitarianism Doctrine in geology that physical, chemical, and biologic processes now at work on and within the Earth have operated with general uniformity (in the same manner and with essentially the same intensity) through immensely long periods of time and are sufficient to account for all geologic change. In other words, the present is the key to the past. Although the term is no longer much used, the principle, originated by James Hutton, is fundamental to geologic thinking and underlies the whole development of the science of geology. See also Charles Lyell.

Unilever \'yü-nə-ˌlē-vər\ Either of two linked companies, Unilever PLC (based in London) and Unilever NV (based in Rotterdam). They are the holding companies for more than 500 firms worldwide that manufacture and sell soaps, foods, and other products. The modern Unilever was established in 1929 as an association between the British manufacturer Lever Bros. and several other European soap and margarine manufacturers. Today most Unilever sales are in household products, including soaps and detergents, margarines, cooking fats, dairy products, toiletries, and packaged and processed foods. The group also produces paper and plastic products, industrial chemicals, and animal feeds.

union See labor union

Union, Act of (May 1, 1707) Treaty that effected the union of England (and Wales) and Scotland under the name of Great Britain. The union benefited England's need for political safeguards against a possible Jacobite restoration through Scotland, and it gave Scotland economic security by freedom of trade with England. Under the treaty, initiated by Queen Anne, the two kingdoms adopted the Protestant succession, preserved Scots law and the law courts, and agreed to uniform taxation.

Union, Act of (Jan. 1, 1801) Legislative agreement uniting Great Britain and Ireland under the name of the United Kingdom of Great Britain and Ireland. After the unsuccessful Irish revolt of 1798, the British prime minister, William Pitt the Younger, decided that the best solution to the Irish problem was a union to strengthen the connection between the two countries. The Irish parliament resisted the proposal, which called for its abolition, but votes bought by cash or honours ensured passage of the agreement in 1800. The union remained until the recognition of the Irish Free State (excluding six of the counties of the northern province of Ulster) by the Anglo-Irish treaty concluded on Dec. 6, 1921; the union officially ended on Jan. 15, 1922.

Union Islands See TOKELAU

Union League Association formed to inspire loyalty to the Union cause in the AMERICAN CIVIL WAR. Ohio Republicans formed the first Union League of America (1862) to counteract the antiwar COPPERHEADS. Leagues formed in other states to support the war effort and to revitalize the REPUBLICAN PARTY. They also acted as social organizations, and some remain as clubs in cities such as New York and Washington. After the Civil War, leagues formed in the South to promote the Republican cause among free blacks.

Union of Soviet Socialist Republics (U.S.S.R.) *or* **Soviet Union** Former republic, eastern Europe and northern and central Asia. It consisted, in its final years, of 15 soviet socialist republics that gained independence at its dissolution: ARMENIA, AZERBAIJAN, Belorussia (now BELARUS), ESTONIA, Georgia (now Republic of GEORGIA), KAZAKHSTAN, Kirgiziya (now KYRGYZSTAN), LATVIA, LITHUANIA, Moldavia (now MOLDOVA), RUSSIA, TAJIKISTAN, TURKMENISTAN, UKRAINE, and UZBEKISTAN. It also contained 20 autonomous soviet socialist republics: 16 within Russia, 2 within Georgia, 1 within Azerbaijan, and 1 within Uzbekistan. Capital: MOSCOW. Stretching from the Baltic and Black seas to the Pacific Ocean and encompassing some 8,650,000 sq mi (22,400,000 sq km), the Soviet Union constituted the largest country on Earth, having a maximum east-west extent of about 6,800 mi (10,900 km) and a maximum north-south extent of about 2,800 mi (4,500 km). It encompassed 11 time zones and had common boundaries with 6 European countries and 6 Asian countries. Its regions contained fertile lands, deserts, tundra, high mountains, some of the world's longest rivers, and large inland waters, including most of the CASPIAN SEA. The coastline on the Arctic Ocean extended 3,000 mi (4,800 km), while that on the Pacific was 1,000 mi (1,600 km) long. The U.S.S.R. was an agricultural, mining, and industrial power. Following the RUSSIAN REVOLUTION OF 1917, four socialist republics were established on the territory of the former Russian Empire: the Russian Soviet Federated Socialist Republic, the Transcaucasian Soviet Federated Socialist Republic, the Ukrainian Soviet Socialist Republic, and the Belorussian Soviet Socialist Republic. These four constituent republics established the Union of Soviet Socialist Republics in 1922, to which other republics subsequently were added. A power struggle begun in 1924 with the death of communist leader VLADIMIR LENIN ended in 1927 when JOSEPH STALIN gained victory. Implementation of the first of the FIVE-YEAR PLANS in 1928 centralized industry and collectivized agriculture. A purge in the late 1930s resulted in the imprisonment or execution of millions of persons considered dangerous to the state (see PURGE TRIALS). After World War II, with their respective allies, the U.S.S.R. and the U.S. engaged in the COLD WAR. In the late 1940s the U.S.S.R. helped to establish communist regimes throughout most of eastern Europe. The U.S.S.R. exploded its first atomic bomb in 1949 and its first hydrogen bomb in 1953. Following Stalin's death, it experienced limited political and cultural liberalization under NIKITA KHRUSHCHEV. It launched the first manned orbital spaceflight in 1961. Under LEONID BREZHNEV liberalization was partially reversed, but in the mid-1980s Soviet leader MIKHAIL GORBACHEV instituted the liberal policies called GLASNOST and PERESTROIKA. By the end of 1990 the communist government had toppled, and a program to create a market economy had been implemented. The U.S.S.R. was officially dissolved on Dec. 25, 1991.

Union Pacific Corp. Company that extended the U.S. railway system to the Pacific Coast. Incorporated by an act of Congress in 1862, it was built westward 1,006 mi (1,620 km) from Omaha, Neb., to meet the CENTRAL PACIFIC RAILROAD, which was being built eastward from Sacramento, Calif. The two railroads were joined at Promontory, Utah, in 1869. The Union Pacific was largely financed by federal loans and land grants, but its involvement in the CRÉDIT MOBILIER SCANDAL left it badly in debt, and the company went into receivership in 1893. It was reorganized in 1897 by EDWARD H. HARRIMAN, under whose leadership the railroad took part in the economic development of the West. In 1982 it merged with the Missouri Pacific Railroad Co. and the Western Pacific Railroad Co. Its acquisition of the Southern Pacific Rail Corp. in 1996 made it the largest railroad in the U.S., with control of almost all rail-based shipping in the western two-thirds of the country.

union shop Arrangement under which workers are required to join a particular union within a specified period of time after beginning employment. Such an arrangement differs from the CLOSED SHOP in that the employer's choice of new employees is not restricted to union members. Advocates of the union shop argue that it prevents workers from enjoying the benefits of unionism without bearing their share of the costs. Union shops are uncommon in most countries, but they are both legal and common in the U.S. and Japan. In the U.S., workers in an enterprise usually choose, by majority vote, a single union to represent them, though in some states RIGHT-TO-WORK LAWS prohibit requiring union membership as a condition of employment, thus forbidding both the union shop and the closed shop.

unit trust See MUTUAL FUND

Unitarianism Religious movement that stresses free use of reason in religion, holds that God exists in only one person, and denies the divinity of JESUS and the doctrine of the Holy TRINITY. Its modern roots are traced to several liberal, radical, and rationalist thinkers of the Protestant REFORMATION, who were in turn inspired by ARIUS. The mainstream of British and American Unitarianism grew out of Calvinist PURITANISM. The scientist JOSEPH PRIESTLEY was a founder of the English Unitarians, who became a force in Parliament and were noted advocates of social reform. In the U.S., Unitarianism developed out of New England CONGREGATIONALISM that rejected the 18th-century revival movement. TRANSCENDENTALISM injected Unitarianism with a new interest that attracted many more followers. See also CALVINISM, UNIVERSALISM.

Unitas \yü-'nī-təs**, Johnny** *in full* **John Constantine Unitas** (b. May 7, 1933, Pittsburgh, Pa., U.S.—d. Sept. 11, 2002, Timonium, Md.) U.S. football quarterback. After playing for the University of Louisville, he was selected in the NFL draft, though he played semiprofessionally before signing with the Baltimore Colts. From 1956 to 1972, he led the Colts to five league championship games (1958, 1959, 1964, 1968, 1970) and two Super Bowl games (1969, 1971); the Colts won titles in 1958, 1959, and 1971. After one season with the San Diego Chargers (1973), Unitas retired with 22 NFL records to his name. Considered by many to be the league's greatest quarterback, he was inducted into the Pro Football Hall of Fame in 1979.

Unité d'Habitation \ǖ-nē-'tā-dȧ-bē-tȧ-'syō^{n}\ Residential block (18 stories high) in Marseille, France, that expressed LE CORBUSIER's ideal of urban family lodging. Completed in 1952, it is a vertical mixed-use community, with a shopping floor halfway up and other communal facilities on the roof. Two-story living rooms make for efficient use of volumes and permit the use of a "skip-stop" system in which elevators stop on every other floor. Each unit has front and rear balconies with sun protection provided by Le Corbusier's BRISE-SOLEIL. The concrete screen pierced with differently sized openings evokes tracery.

United Airlines *a division of* **UAL Corp.** U.S. international airline. It began as United Aircraft and Transport Corp., which first operated transcontinental passenger flights in 1929. It was the first airline to introduce stewardesses, in 1930. United Airlines, Inc., was established in Chicago in 1931 as a HOLDING COMPANY for the corporation's four constituent airlines. United expanded rapidly after World War II and became the largest air carrier in the Western world when it merged with Capital Airlines in 1961. United acquired PAN AMERICAN WORLD AIRWAYS' transpacific routes in 1986 and its Latin American and Caribbean routes in 1991. The parent company took the name UAL Corp. in 1988. When United employees held a controlling share of the airline company (1994–2003), UAL was the largest employee-owned company in the U.S.

United Arab Emirates (UAE) *formerly* **Trucial** \'trü-shəl\ **States** Country, Middle East, southwestern Asia. It is a federation of seven states on the eastern coast of the ARABIAN PENINSULA. They are the emirates of ABŪ ẒABĪ (Abu Dhabi), DUBAYY (Dubai), 'Ajmān, Al-Shāriqah (Sharjah), Umm al-Qaywayn, Ra's al-Khaymah, and Al-Fujayrah. Area: 32,280 sq mi (83,600 sq km). Population (2005 est.): 4,690,000. Capital: ABU DHABI. The indigenous inhabitants are Arabs, but there are a large number of South Asian and Iranian migrant workers. Languages: Arabic (official), English, Persian, Urdu, Hindi. Religions: Islam (official; predominantly Sunni); also Christianity, Hinduism. Currency: UAE dirham. The UAE's low-lying desert plain is broken by the Ḥajar Mountains along the MUSANDAM PENINSULA. Three natural deepwater harbours are located along the Gulf of OMAN. The UAE (mainly Abū Ẓabī) has roughly one-tenth of the world's petroleum reserves and significant natural gas deposits, the production of which are the federation's principal industries. Other important economic activities include fishing, livestock herding, and date production. The federation has one appointive advisory board; its chief of state is the president, and the head of government is the prime minister. In 1820 the British signed a peace treaty with the region's coastal rulers. The area, formerly called the Pirate Coast, became known as the Trucial Coast. In 1892 the

© 2006 Encyclopædia Britannica, Inc.

rulers agreed to entrust foreign relations to Britain, but the British never assumed sovereignty; each state maintained full internal control. The states formed the Trucial States Council in 1960 and in 1971 terminated defense treaties with Britain and established the six-member federation. Ra's al-Khaymah joined it in 1972. The UAE aided coalition forces against Iraq in the First Persian Gulf War (1991).

United Arab Republic See Egypt

United Artists Corp. U.S. film company. It was founded in 1919 by Charlie Chaplin, Mary Pickford, Douglas Fairbanks, and D.W. Griffith so that they could produce and distribute their own movies and distribute other independently produced movies. The first major production company controlled by its artists, it prospered with the films of its founders, including *The Gold Rush* (1925), and those of producers such as Samuel Goldwyn, Howard R. Hughes, and Alexander Korda. After 1951 it became mainly a distributor, releasing successful movies such as *High Noon* (1952), *Some Like It Hot* (1959), and *West Side Story* (1961). It was sold to TransAmerica Corp. in 1967 and resold to MGM in 1981. By the late 20th century United Artists was a specialty films division of MGM, producing movies such as *Leaving Las Vegas* (1995), *The Birdcage* (1996), and *Tea with Mussolini* (1999).

United Automobile Workers (UAW) *in full* **International Union, United Automobile, Aerospace, and Agricultural Implement Workers of America** U.S.-based industrial union representing automotive and other vehicular workers in the U.S., Canada, and Puerto Rico. The UAW was founded in Detroit, Mich., in 1935, when the Committee for Industrial Organization (see AFL-CIO) began to organize automotive workers. The union successfully countered automakers' initial resistance with sit-down strikes and a 1937 Supreme Court decision upholding the right to organize as declared in the Wagner Act. General Motors Corp. was the first to recognize the UAW, and most other automakers followed suit, though Ford Motor Co. continued to resist until 1941. Under Walter Reuther, the union won contracts providing for cost-of-living adjustments, health plans, and paid vacations. Reuther's friction with George Meany led the UAW to withdraw from the AFL-CIO in 1968. A short-lived alliance with the Teamsters was dissolved in 1972, and the UAW rejoined the AFL-CIO in 1981. Toward the end of the 20th century, the union's bargaining strength was eroded by an increasingly global labour market, effectively reducing the wages and benefits manufacturers were willing to pay American workers.

United Fruit Co. Historic U.S.-based produce company that became Chiquita Brands International, Inc., in 1990. It was founded in 1899 when the Boston Fruit Co. merged with other companies selling bananas grown in Central America, Colombia, and the Caribbean. Minor C. Keith, its principal founder, gained extensive land rights in Costa Rica in return for constructing railroads. United Fruit became the largest employer in Central America, developing vast tracts of jungle lands and building one of the largest private merchant navies in the world. Its exploitation of corrupt Central American politicians dependent on income from the banana business led to the term *banana republic*. Attacked in the Latin American press as *el pulpo* ("the octopus"), the company was widely accused of exploiting workers and influencing governments during the era of "dollar diplomacy" in the early to mid-20th century. United Fruit later transferred portions of its landholdings to individual growers. "Miss Chiquita," its well-known trademark, was introduced in 1944. The familiar blue Chiquita stickers were first applied to the company's bananas in 1963. In 1970 United Fruit merged with AMK Corp. to form United Brands Co., which took the Chiquita name in 1990. In the early 21st century the company concentrated its efforts on produce, notably bananas and packaged salads.

United Kingdom of Great Britain and Northern Ireland *or* **United Kingdom** *or* **Great Britain** Island country, western Europe, North Atlantic Ocean. It comprises Great Britain (England, Scotland, and

Wales) and Northern Ireland. Area: 93,788 sq mi (242,910 sq km). Population (2005 est.): 60,020,000. Capital: London. The population is composed of English (major ethnic group), Scots, Irish, and Welsh and immigrants and their descendants from India, the West Indies, Pakistan, Bangladesh, and Africa. Languages: English (official); also Welsh, Scot-

© 2006 Encyclopædia Britannica, Inc.

tish Gaelic. Religions: Christianity (Protestant [Church of England—established; Church of Scotland—national], Roman Catholic, other Christians); also Islam, Hinduism, Sikhism, Judaism. Currency: pound sterling. The country has hill, lowland, upland, highland, and mountain regions. Tin and iron ore deposits, once central to the economy, have become exhausted or uneconomical, and the coal industry, long a staple of the economy, began a steady decline in the 1950s that worsened with pit closures in the 1980s. Offshore petroleum and natural gas reserves are significant. Chief crops are barley, wheat, sugar beets, and potatoes. Major manufactures include motor vehicles, aerospace equipment, electronic data-processing and telecommunication equipment, and petrochemicals. Fishing and publishing also are important economic activities. The U.K. is a constitutional monarchy with two legislative houses; its chief of state is the sovereign, and the head of government is the prime minister.

The early pre-Roman inhabitants of Britain (see STONEHENGE) were Celtic-speaking peoples, including the Brythonic people of Wales, the Picts of Scotland, and the Britons of Britain. Celts also settled in Ireland c. 500 BC. JULIUS CAESAR invaded and took control of the area in 55–54 BC. The Roman province of Britannia endured until the 5th century AD and included present-day England and Wales. Germanic tribes, including Angles, Saxons, and Jutes, invaded Britain in the 5th century. The invasions had little effect on the Celtic peoples of Wales and Scotland. Christianity began to flourish in the 6th century. During the 8th and 9th centuries, Vikings, particularly Danes, raided the coasts of Britain. In the late 9th century ALFRED the Great repelled a Danish invasion, which helped bring about the unification of England under Athelstan. The Scots attained dominance in Scotland, which was finally unified under MALCOLM II (1005–34). William of Normandy (see WILLIAM I) took England in 1066. The Norman kings established a strong central government and feudal state. The French language of the Norman rulers eventually merged with the Anglo-Saxon of the common people to form the English language. From the 11th century, Scotland came under the influence of the English throne. HENRY II conquered Ireland in the late 12th century. His sons RICHARD I and JOHN had conflicts with the clergy and nobles, and eventually John was forced to grant the nobles concessions in the MAGNA CARTA (1215). The concept of community of the realm developed during the 13th century, providing the foundation for parliamentary government. During the reign of EDWARD I (1272–1307), statute law developed to supplement English COMMON LAW, and the first PARLIAMENT was convened. In 1314 Robert the Bruce (see ROBERT I) won independence for Scotland. The house of TUDOR became the ruling family of England following the Wars of the ROSES (1455–85). HENRY VIII (1509–47) established the Church of England and incorporated Wales as part of England.

The reign of ELIZABETH I (1558–1603) began a period of colonial expansion; in 1588 British forces defeated the "invincible" Spanish ARMADA. In 1603 James VI of Scotland ascended the English throne, becoming JAMES I, and established a personal union of the two kingdoms. The ENGLISH CIVIL WARS erupted in 1642 between Royalists and Parliamentarians, ending in the execution of CHARLES I (1649). After 11 years of Puritan rule under OLIVER CROMWELL and his son (1649–60), the monarchy was restored with CHARLES II. In 1689, following the GLORIOUS REVOLUTION, Parliament proclaimed the joint sovereigns WILLIAM III and MARY II, who accepted the British BILL OF RIGHTS. In 1707 England and Scotland assented to the Act of UNION, forming the kingdom of Great Britain. The Hanoverians ascended the English throne in 1714, when George Louis, elector of HANOVER, became GEORGE I of Great Britain. During the reign of GEORGE III, Great Britain's North American colonies won independence (1783). This was followed by a period of war (1789–1815) with Revolutionary France and later with the empire of NAPOLEON. In 1801 legislation united Great Britain with Ireland to create the United Kingdom of Great Britain and Ireland. Britain was the birthplace of the INDUSTRIAL REVOLUTION in the late 18th century, and it remained the world's foremost economic power until the late 19th century. During the reign of Queen VICTORIA (1837–1901), Britain's colonial expansion reached its zenith, though the older dominions, including Canada and Australia, were granted independence (1867 and 1901, respectively).

The U.K. entered WORLD WAR I allied with France and Russia in 1914. Following the war, revolutionary disorder erupted in Ireland, and in 1921 the Irish Free State (see IRELAND) was granted dominion status. Six counties of ULSTER, however, remained in the U.K. as Northern Ireland. The U.K. entered WORLD WAR II in 1939. Following the war, the Irish Free State became the Irish republic and left the COMMONWEALTH. India also gained independence from the U.K. Throughout the postwar period and into the 1970s, the U.K. continued to grant independence to its overseas colonies and dependencies. With UN forces, it participated in the KOREAN WAR (1950–53). In 1956 it intervened militarily in Egypt during the SUEZ CRISIS. It joined the EUROPEAN ECONOMIC COMMUNITY, a forerunner of the EUROPEAN UNION, in 1973. In 1982 it defeated Argentina in the FALKLAND ISLANDS WAR. As a result of continuing social strife in Northern Ireland, it joined with Ireland in several peace initiatives, which eventually resulted in an agreement to establish an assembly in Northern Ireland. In 1997 referenda approved in Scotland and Wales devolved power to both countries, though both remained part of the U.K. In 1991 the U.K. joined an international coalition to reverse Iraq's conquest of Kuwait (see First PERSIAN GULF WAR). In 2003 the U.K. and the U.S. attacked Iraq and overthrew the government of ṢADDĀM ḤUSSEIN (see Second PERSIAN GULF WAR). Terrorist bombings in London in July 2005 killed more than 50 people.

British Sovereigns

Kings of Wessex		Richard II (P)	1377–99
Egbert (S)	802–39	Henry IV (P:L)	1399–1413

[3]William and Mary, as husband and wife, reigned jointly until Mary's death in 1694.
[4]Edward VIII succeeded on the death of his father on January 20, 1936, but abdicated on December 11 before his coronation.

United Mine Workers of America (UMWA) U.S. labour union. Founded in 1890, the UMWA grew rapidly under the leadership of John Mitchell (president 1898–1908) despite determined opposition from coal-mine operators. By 1920, when JOHN L. LEWIS took over, the union had half a million members. Lewis capitalized on the pro-labour climate of the NEW DEAL and led numerous strikes to win fair pay, safe working conditions, and benefits. The UMWA was a mainstay of the Congress of Industrial Organizations (see AFL-CIO) in its early years, but Lewis withdrew the union from the CIO in 1942. Unaffiliated for decades, the UMWA finally joined the AFL-CIO in 1989. The UMWA's importance declined

© 2006 Encyclopædia Britannica, Inc.

in the later 20th century with the waning of the labour movement and the rise of alternative sources of fuel, and by the 1990s it had fewer than 200,000 members.

United Nations (UN) International organization founded (1945) at the end of World War II to maintain international peace and security, develop friendly relations among nations on equal terms, and encourage international cooperation in solving intractable human problems. A number of its agencies have been awarded the Nobel Prize for Peace, and the UN was the corecipient, with Kofi Annan, of the prize in 2001. The term originally referred to the countries that opposed the Axis powers. An international organization was discussed at the Yalta Conference in February 1945, and the UN charter was drawn up two months later at the UN Conference on International Organization. The UN has six principal organs: the Economic and Social Council, the United Nations General Assembly, the International Court of Justice, the Secretariat, the United Nations Security Council, and the United Nations Trusteeship Council. It also has 14 specialized agencies—some inherited from its predecessor, the League of Nations (e.g., the International Labour Organization)—and a number of special offices (e.g., the Office of the United Nations High Commissioner for Refugees), programs, and funds (e.g., UNICEF). The UN is involved in economic, cultural, and humanitarian activities and the coordination or regulation of international postal services, civil aviation, meteorological research, telecommunications, international shipping, and intellectual property. Its peacekeeping troops have been deployed in several areas of the world, sometimes for lengthy periods (e.g., they have been in Cyprus since 1964). The UN's world headquarters are in New York City; its European headquarters are in Geneva. In 2005 the UN had 191 member countries. The principal administrative officer of the UN is the secretary-general, who is elected to a five-year renewable term by the General Assembly on the recommendation of the Security Council. The secretaries-general of the UN have been Trygve Lie (1946–53), Dag Hammarskjöld (1953–61), U Thant (1961–71), Kurt Waldheim (1972–81), Javier Pérez de Cuéllar (1982–91), Boutros Boutros-Ghali (1992–96), and Kofi Annan (from 1997).

[1]Czechoslovakia was an original member from 1945. The Czech Republic and the Slovak Republic obtained separate memberships in 1992.
[2]E. Germany and W. Germany were admitted as separate members in 1973; the two countries reunified in 1990.
[3]The seat held by the Soviet Union, a member from 1945, was assumed by Russia in 1991.
[4]Macedonia is referred to in the U.N. as "The former Yugoslav Republic of Macedonia" pending settlement of a dispute over its name.
[5]Tanganyika, a member from 1961, merged in 1964 with Zanzibar, a member from 1963, to form the new country of Tanzania.
[6]N. Yemen, a member from 1947, merged in 1990 with S. Yemen, a member from 1967.

United Nations Children's Fund See UNICEF

United Nations Conference on Trade and Development (UNCTAD) Organ of the United Nations General Assembly, created in 1964 to promote international trade. Its highest policy-making body, the Conference, meets every four years; when the Conference is not in session, the organization is run by its executive body, the Trade and Development Board. UNCTAD's principal functions include the promotion of trade between countries in different stages of development and with different economic systems, initiation of negotiations for trade agreements, and the formulation of international trade policies. In the late 20th and early 21st centuries, UNCTAD's efforts were directed toward the problems created in developing countries by economic globalization, and special attention was given to measures to help the poorest and least-developed countries become integrated into the world economy.

United Nations Development Programme (UNDP) UN organization formed in 1965 to promote environmentally sustainable human development in low-income countries. Based in New York City, the UNDP is headed by an administrator who oversees a 36-member Executive Board representing both developing and developed countries. Recent programs have focused on reducing poverty, developing strategies to treat and combat the spread of HIV/AIDS, promoting environmentally sound energy and economic policies, and expanding communications and technology infrastructure. UNDP resident representatives in more than 125 developing countries help to coordinate the local activities of other UN agencies and programs, as well as those of nongovernmental organizations.

United Nations General Assembly One of six principal components of the United Nations and the only one in which all UN members are represented. It meets annually or in special sessions. It acts primarily as a deliberative body; it may discuss and make recommendations about any issue within the scope of the UN charter. Its president is elected annually on a rotating basis from five geographic groups of members.

United Nations High Commissioner for Refugees, Office of the (UNHCR) Office established in 1951 to give legal, social, economic, and political aid to refugees. The UNHCR is the successor of the International Refugee Organization. Its first efforts focused on Europeans displaced by World War II; it has since assisted refugees in Africa, Asia, Latin America, and Yugoslavia. It is based in Geneva and is financed by voluntary government contributions. The office won the Nobel Prize for Peace in 1954 and 1981.

United Nations Office for the Coordination of Humanitarian Affairs (OCHA) *formerly (1972–92)* **Office of the United Nations Disaster Relief Coordinator,** *(1992–98)* **United Nations Department of Humanitarian Affairs** Agency of the United Nations Secretariat, established in 1972 to coordinate international relief to countries struck by natural or other disaster. Responding to requests from stricken states for disaster assistance, the OCHA directs UN

© 2006 Encyclopædia Britannica, Inc.

assistance and mobilizes aid from nongovernmental organizations such as the International Red Cross. Since the 1980s it has emphasized disaster preparedness and prevention, and it has assisted in executing projects of the United Nations Development Programme.

United Nations Relief and Rehabilitation Administration Administrative body (1943–47) for an extensive social-welfare program for war-ravaged nations. It distributed relief supplies and services, including shelter, food, and medicine, and helped with agricultural and economic rehabilitation. Its functions were later taken over by the International Refugee Organization, the World Health Organization, and UNICEF.

United Nations Resolution 242 Resolution of the United Nations Security Council that ended the 1967 Six-Day War. The Israelis supported the resolution because it called on the Arab states to accept Israel's right "to live in peace within secure and recognized boundaries free from threats or acts of force." All Arab states eventually accepted it (Egypt and Jordan accepted the resolution from the outset) because of its clause calling for Israel to withdraw from the territories conquered in 1967. The Palestine Liberation Organization rejected it until 1988 because it lacked explicit references to Palestinians. Though never fully implemented, it was the basis of diplomatic efforts to end Arab-Israeli conflicts until the Camp David Accords and remains an important touchstone in any negotiated resolution to the Arab-Israeli conflict.

United Nations Secretariat Administrative body that coordinates United Nations activities. Its staff, recruited on the basis of merit, is composed of several thousand permanent professional experts from member states, including translators, clerks, technicians, administrators, project directors, and negotiators, who carry out the UN's day-to-day operations and administer the policies and programs set by the other divisions. They are required to swear an oath of loyalty to the UN and must not take instructions from their home governments.

United Nations Security Council Division of the United Nations whose primary purpose is to maintain international peace and security. The Security Council originally consisted of five permanent members—Taiwan (succeeded in 1971 by China), France, the United Kingdom, the U.S., and the Soviet Union (succeeded in 1991 by Russia)—and six rotating members elected by the United Nations General Assembly for two-year terms. In 1965 the number of nonpermanent members was increased to 10. UN members agree to abide by the Security Council's resolutions when they join. The Security Council investigates disputes that threaten international peace and advises on how to resolve them. To prevent or halt aggression, it may impose diplomatic or economic sanctions or authorize the use of military force. Each of the permanent members holds veto power in decisions on substantive matters, such as the application of sanctions. Decisions on both substantive and procedural matters require nine affirmative votes, including the affirmative vote of all five permanent members (though in practice a permanent member may abstain without impairing the validity of a decision).

United Nations Trusteeship Council One of the main organs of the UN, composed of the five permanent members of the Security Council. It supervised the administration of trust (non-self-governing) territories, including former colonies in Africa and the Pacific. The council's job was to send inspection missions to the territories, examine petitions, review reports, and make recommendations. It suspended operations after the last trust territory, Palau, gained its sovereignty in 1994.

United Netherlands, Republic of the See Dutch Republic

United Provinces See Uttar Pradesh

United States *officially* **United States of America** Country, North America. It comprises 48 conterminous states occupying the midcontinent, Alaska at the northwestern extreme of North America, and the island state of Hawaii in the mid-Pacific Ocean. Area, including the U.S. share of the Great Lakes: 3,676,487 sq mi (9,522,058 sq km). Population (2005 est.): 296,748,000. Capital: Washington, D.C. The population includes people of European and Middle Eastern ancestry, African Americans, Hispanics, Asians, Pacific Islanders, American Indians (Native Americans), and Alaska Natives. Languages: English (predominant), Spanish. Religions: Christianity (Protestant, Roman Catholic, other Christians, Eastern Orthodox); also Judaism, Islam, Buddhism, Hinduism. Currency: U.S. dollar. The country encompasses mountains, plains, lowlands, and deserts. Mountain ranges include the Appalachians, Ozarks, Rockies, Cascades, and Sierra Nevada. The lowest point is Death Valley, Calif. The highest point is Alaska's Mount McKinley; within the conterminous states it is Mount Whitney, Calif. Chief rivers are the Mississippi system, the Colorado, the Columbia, and the Rio Grande. The Great Lakes, the Great Salt Lake, Iliamna Lake, and Lake Okeechobee are the largest lakes. The U.S. is among the world's leading producers of several minerals, including copper, silver, zinc, gold, coal, petroleum, and natural gas; it is the chief exporter of food. Its manufactures include iron and steel, chemicals, electronic equipment, and textiles. Other important industries are tourism, dairying, livestock raising, fishing, and lumbering. The U.S. is a federal republic with two legislative houses; its head of state and government is the president.

The territory was originally inhabited for several thousand years by numerous American Indian peoples who had probably emigrated from Asia. European exploration and settlement from the 16th century began displacement of the Indians. The first permanent European settlement, by the Spanish, was at Saint Augustine, Fla., in 1565. The English settled

Jamestown, Va. (1607); Plymouth, Mass. (1620); Maryland (1634); and Pennsylvania (1681). The English took New York, New Jersey, and Delaware from the Dutch in 1664, a year after English noblemen had begun to colonize the Carolinas. The British defeat of the French in 1763 (see French and Indian War) assured Britain political control over its 13 colonies. Political unrest caused by British colonial policy culminated in the American Revolution (1775–83) and the Declaration of Independence (1776). The U.S. was first organized under the Articles of Confederation (1781), then finally under the Constitution (1787) as a federal republic. Boundaries extended west to the Mississippi River, excluding Spanish Florida. Land acquired from France by the Louisiana Purchase (1803) nearly doubled the country's territory. The U.S. fought the War of 1812 against the British and acquired Florida from Spain in 1819. In 1830 it legalized the removal of American Indians to lands west of the Mississippi River. Settlement expanded into the Far West in the mid-19th century, especially after the discovery of gold in California in 1848 (see gold rush). Victory in the Mexican War (1846–48) brought the territory of seven more future states (including California and Texas) into U.S. hands. The northwestern boundary was established by treaty with Britain in 1846. The U.S. acquired southern Arizona by the Gadsden Purchase (1853). It suffered disunity during the conflict between the slavery-based plantation economy in the South and the industrial and agricultural economy in the North, culminating in the American Civil War and the abolition of slavery under the 13th Amendment. After Reconstruction (1865–77) the U.S. experienced rapid growth, urbanization, industrial development, and European immigration. In 1887 it authorized allotment of American Indian reservation land to individual tribesmen, resulting in widespread loss of land to whites. Victory in the Spanish-American War brought the U.S. the overseas territories of the Philippines, Guam, and Puerto Rico. By the end of the 19th century, it had further developed foreign trade and acquired other outlying territories, including Alaska, Midway Island, the Hawaiian Islands, Wake Island, American Samoa, and the Panama Canal Zone.

The U.S. participated in World War I in 1917–18. It granted suffrage to women in 1920 and citizenship to American Indians in 1924. The stock market crash of 1929 led to the Great Depression, which New Deal legislation combated by increasing the federal government's role in the economy. The U.S. entered World War II after the Japanese bombing of Pearl Harbor (Dec. 7, 1941). The explosion by the U.S. of an atomic bomb on Hiroshima (Aug. 6, 1945) and another on Nagasaki (Aug. 9, 1945), Japan, brought about Japan's surrender. Thereafter the U.S. was the military and economic leader of the Western world. In the first decade after the war, it aided the reconstruction of Europe and Japan and became embroiled in a rivalry with the Soviet Union known as the Cold War. It participated in the Korean War from 1950 to 1953. In 1952 it granted autonomous commonwealth status to Puerto Rico. Racial segregation in schools was declared unconstitutional in 1954. Alaska and Hawaii were made states in 1959. In 1964 Congress passed the Civil Rights Act and authorized U.S. entry into the Vietnam War. The mid- to late 1960s were marked by widespread civil disorder, including race riots and antiwar demonstrations. The U.S. accomplished the first manned lunar landing in 1969. All U.S. troops were withdrawn from Vietnam in 1973. With the dissolution of the Soviet Union in 1991, the U.S. assumed the status of sole world superpower. The U.S. led a coalition of forces against Iraq in the First Persian Gulf War (1991). Administration of the Panama Canal was turned over to Panama in 1999. After the September 11 attacks on the U.S. in 2001 destroyed the World Trade Center and part of the Pentagon, the U.S. attacked Afghanistan's Taliban government for harbouring and refusing to extradite the mastermind of the terrorism, Osama bin Laden. In 2003 the U.S. attacked Iraq, with British support, and overthrew the government of Ṣaddām Ḥussein (see Second Persian Gulf War). See map on following pages.

United States, Bank of the See Bank of the U.S.

United States Air Force (USAF) Major component of the U.S. military organization, with primary responsibility for air warfare, air defense, and military space research. It also provides air services in coordination with the other military branches. U.S. military activities in the air began with army use of balloons for reconnaissance during the Civil War and the Spanish-American War; in 1907 the Aeronautical Division of the Signal Corps was created. In 1920 the Army Reorganization Act created the Air Service (after 1926, Air Corps) as a unit of the Army; in 1941 it became the Army Air Forces. In 1947 the independent U.S. Air Force was created and became part of the newly created Department of Defense in 1949. The Department of the Air Force is headquartered at the Pentagon. Separate operating agencies of the Air Force include the Air Force Reserve, the Air Force Intelligence Service, and the U.S. Air Force Academy. In 2000 there were over 350,000 Air Force personnel on active duty.

United States Air Force Academy Institution for the training of commissioned officers for the U.S. Air Force, located in Colorado Springs, Colorado. Created by an act of Congress in 1954, it opened in 1955. Graduates receive a bachelor's degree and a second lieutenant's commission. Most physically qualified graduates go on to Air Force pilot-training schools. Candidates may come from the ranks of the U.S. Army or Air Force, may be children of deceased veterans of the armed forces, or may be nominated by U.S. senators or representatives or by the president or vice president. All applicants must take a competitive entrance examination.

United States Army Major branch of the U.S. military forces, charged with preserving peace and security and defending the nation. The first regular U.S. fighting force, the Continental Army, was organized by the Continental Congress on June 14, 1775, to supplement local militias in the American Revolution. It was placed under the control of a five-member civilian board, and U.S. military forces have remained in civilian control ever since. The U.S. Constitution named the president as commander in chief, and in 1789 the civilian Department of War was established to administer the armed forces. The Continental Army was officially disbanded in 1783, and a small regular army was established. Thereafter, the army's size increased during times of crisis, swelled by conscription, and decreased during peacetime. The Department of the Army is organized as a military section of the Department of Defense and is headed by the Secretary of the Army. The Army Staff gives advice and assistance to the secretary and administers civil functions, including the civil-works program of the Corps of Engineers. The army also administers the U.S. Military Academy at West Point. In 2000 there were about 400,000 soldiers on active duty.

United States Coast Guard U.S. military service that enforces maritime laws. It is under the jurisdiction of the Department of Homeland Security; in wartime it functions as part of the U.S. Navy. The Coast Guard enforces federal laws on the high seas and waters within U.S. territorial jurisdiction, develops and operates aids to navigation, and maintains a network of lifeboat and search-and-rescue stations using surface vessels and aircraft. It assists in the interdiction of illegal narcotics bound for the U.S. on or over coastal waters. It operates the International Ice Patrol (which maintains surveillance of icebergs in the North Atlantic shipping lanes), gathers data for the National Weather Service, and assists distressed ships and planes. Its wartime duties include ship escort, port security, and transport duty. In 2000 there were some 35,000 Coast Guard personnel on active duty. Cadets are trained at the Coast Guard Academy in New London, Conn.

United States Courts of Appeals In the U.S., the intermediate appellate courts included in the federal judicial system and created by act of Congress. There are 13 courts of appeal, including 12 courts whose jurisdictions are geographically apportioned, and the U.S. Court of Appeals for the Federal Circuit, whose jurisdiction is subject-oriented and nationwide. The Federal Circuit court, located in Washington, D.C., was created by an act of Congress in 1982 and hears appeals from U.S. district and territorial courts primarily in patent and trademark cases, though it also hears appeals in cases in which the United States or its agencies is a defendant, as in alleged breaches of contract or in tax disputes. The courts are empowered to review the decisions of federal district courts (see United States District Court), as well as the decisions of the divisions of the U.S. Tax Court within their jurisdictions and those of the U.S. Bankruptcy Courts. All decisions of the courts are subject to review by the Supreme Court of the United States.

United States District Court In the U.S., any of the 94 trial courts of general jurisdiction in the federal judicial system. Each state, as well as the District of Columbia and the Commonwealth of Puerto Rico, has at least one federal district court. Each court has at least one district judge and can have more than a score of them, as well as a clerk, a U.S. attorney, a U.S. marshal, one or more U.S. magistrates, bankruptcy judges, probation officers, and other staff. Decisions of the district courts are normally subject to appeal, typically to the United States Court of Appeals for the region in which the district court is located.

providing marine troops for seizure and defense of advanced bases and with conducting operations on land and in the air in connection with naval campaigns. It is also responsible for providing detachments for service aboard certain types of naval vessels, as well as security forces for naval shore installations and U.S. diplomatic missions in foreign countries. The corps specializes in amphibious landings, such as those on Japanese-held islands in World War II. Marines have served in every major U.S. naval action since 1775, usually being the first or among the first to fight. In 2000 there were some 175,000 Marines on active duty.

United States Military Academy *known as* **West Point** Institution for the training of commissioned officers for the U.S. Army. Founded in 1802 at the fort at West Point, N.Y., it is one of the oldest service academies in the world. It was established as an apprentice school for military engineers and was, in effect, the first U.S. school of engineering. It was reorganized in 1812, and in 1866 its educational program was expanded considerably. Women were first admitted in 1976. The four-year course of college-level education and training leads to a bachelor of science degree and a commission as second lieutenant in the Army. West Point has trained such leaders as Ulysses S. Grant, William T. Sherman, Robert E. Lee, Stonewall Jackson, Jefferson Davis, John Pershing, Dwight D. Eisenhower, Douglas MacArthur, Omar Bradley, and George Patton.

United States Naval Academy *known as* **Annapolis** Institution for the training of commissioned officers for the U.S. Navy and U.S. Marine Corps. It was founded at Annapolis, Md., in 1845 and reorganized in 1850–51. Women were first admitted in 1976. Graduates are awarded the degree of bachelor of science and a commission as ensign in the Navy or as second lieutenant in the Marine Corps. Annapolis has produced many notable Americans, including George Dewey, Richard E. Byrd, Chester Nimitz, William F. Halsey, Jr., A.A. Michelson, Hyman Rickover, Jimmy Carter, Ross Perot, and several astronauts.

United States Navy Major branch of the U.S. military forces, charged with defending the nation at sea and maintaining security on the seas wherever U.S. interests extend. The Continental Navy was established by the Continental Congress in 1775. It was disbanded in 1784, but the harassment of U.S. merchant ships by Barbary pirates prompted Congress to establish the Department of the Navy in 1798. The navy took part in the War of 1812 and was later important in the Union victory in the American Civil War. Sea victories during the Spanish-American War (1898) led to a period of steady growth. In World War I, its duties were limited to troop transport, minelaying, and escorting merchant ships. The Japanese attack on the naval base at Pearl Harbor (1941) led to U.S. entry into World War II, in which, in addition to antisubmarine and troop transport duties, the navy conducted amphibious assaults in the Pacific theater and along the European coast. Aircraft carriers proved decisive in battles with Japanese forces in the Pacific, and they are still the backbone of the navy's fleets. Since World War II it has remained the largest and most powerful navy in the world. The Department of the Navy, a branch of the Department of Defense, is headed by a secretary of the navy. The navy includes the U.S. Marine Corps and, during wartime, the U.S. Coast Guard. In 2000 there were almost 400,000 Navy personnel on active duty, excluding the Marine Corps and Coast Guard. See also U.S. Naval Academy.

United States Steel Corp. Leading U.S. producer of steel and related products. It was founded in 1901 by Charles M. Schwab, Elbert H. Gary, and J.P. Morgan to consolidate Andrew Carnegie's Carnegie Steel Co., Gary's Federal Steel Co., and other steel and metal companies. As chairman of the board, Gary dominated the corporation in its early years, organizing price agreements among steel producers and opposing unions. An antitrust suit against U.S. Steel went as far as the Supreme Court, which ruled in 1920 that it was not a monopoly in restraint of trade. The corporation recognized the United Steelworkers of America in 1936. The largest U.S. steel producer, U.S. Steel diversified into oil and gas in the later 20th century as well as into chemicals, mining, construction, and transportation. In 1986 the holding company USX Corp. was established to oversee it and other operating units. U.S. Steel Group was spun off from USX in 2002 and again became an independent, publicly traded corporation.

United Steelworkers (USW) historic labour union representing workers in steel, aluminum, and other metallurgical industries for much of the 20th century. In the U.S. it grew out of the Steel Workers Organizing Committee (SWOC), established jointly in 1936 by the Committee for Industrial Organization (see AFL-CIO) and the Amalgamated Association of Iron, Steel, and Tin Workers. Under Philip Murray it developed into a powerful union. In 1942 SWOC became the United Steelworkers of America (USWA), of which Murray served as president until his death in 1952. The USWA absorbed the Aluminum Workers of America in 1944 and by the mid-1950s had more than one million members. It won unprecedented benefits in the postwar period but saw its membership and power decline as the U.S. steel industry shrank from the 1970s onward. In 2005 the USWA combined with the Paper, Allied-Industrial, Chemical and Energy Workers International Union (PACE) and was renamed the United Steel, Paper and Forestry, Rubber, Manufacturing, Energy, Allied Industrial and Service Workers International Union (USW). The USW represents workers in the United States and Canada.

Unity (School of Christianity) Religious movement founded in 1889 by Charles Fillmore (1854–1948) and his wife, Myrtle Fillmore (1845–1931), in Kansas City, Mo., U.S. Believing that spiritual healing had cured Myrtle of tuberculosis, the couple began to endorse spiritual healing. Until 1922, Unity was a member of the International New Thought Alliance. Unlike some New Thought groups, Unity embraces practical Christianity and modern medicine. It has no definite creed and is interdenominational. Its Silent Unity service helps people through counseling and prayer, responding to 2.5 million requests for aid a year via mail, telephone, and Internet. Unity publishes magazines and books, and it conducts classes for prospective Unity ministers.

unity-of-science view See unified science

universal In metaphysics, epistemology, and logic, a general category, such as a property or relation, considered as distinct from the particular things that instantiate or exemplify it. The problem of universals concerns the question of what sort of being should be ascribed to such categories (e.g., is there any such thing as redness apart from particular red things?). The debate over the status of universals stems from Plato's theory of forms. Whereas Plato held that forms (universals) exist independently of particulars, Aristotle argued that forms exist only in the particulars in which they are exemplified. See also realism.

Universal Declaration of Human Rights Declaration adopted by the United Nations General Assembly in 1948. Drafted by a committee chaired by Eleanor Roosevelt, it was adopted without dissent but with eight abstentions. Among its 30 articles are definitions of civil and political rights (including the rights to life, liberty, and a fair trial) as well as definitions of economic, social, and cultural rights (including the right to social security and to participation in the cultural life of one's community), all of which are owed by UN member states to those under their jurisdiction. It has acquired more juridical status than originally intended and has been widely used, even by national courts, as a means of judging compliance with member states' human-rights obligations. The declaration has been the foundation of the work of nongovernmental organizations such as Amnesty International.

Universal Negro Improvement Association (UNIA) Organization founded by Marcus Garvey in 1914. Organized in Jamaica, it was influential in urban African American neighbourhoods in the U.S. after Garvey's arrival in New York City in 1916. It was dedicated to racial pride, economic self-sufficiency, and the formation of an independent black nation in Africa. After Garvey's 1923 conviction on charges of fraud, the UNIA lost influence, but it proved to be a forerunner of black nationalism.

Universal Pictures U.S. film studio. Formed by Carl Laemmle in 1912, it became a top producer of popular, low-budget serials in the 1920s and of horror movies in the 1930s. Its later films include the Abbott and Costello comedies and the Doris Day-Rock Hudson bedroom farces. The studio was bought by MCA in 1962, and in 1966 it became a division of Universal City Studios (now simply Universal Studios), the largest packager of television series.

Universal Product Code (UPC) Standard bar code used to identify grocery and other retail merchandise. In the UPC system, the five digits on the left are assigned to a particular manufacturer or maker and the five digits on the right are used by that manufacturer to identify a specific type or make of product.

Universal Time Mean (solar) time of the Greenwich meridian (0° longitude). Universal Time replaced the designation Greenwich Mean Time in 1928; since 1972 it has been based on international atomic time, a uni-

© 2006 Encyclopædia Britannica, Inc.

form time derived from the frequences of certain atomic transitions and measured by an atomic clock. For most purposes, it is now identical to Greenwich Mean Time.

Universalism Belief in the SALVATION of all SOULS. Arising as early as the time of ORIGEN and at various points in Christian history, the concept became an organized movement in North America in the mid-18th century. It maintains the impossibility that a loving God would bestow salvation on only a portion of humankind while dooming the rest to eternal punishment. It stresses the use of reason in religion and the modification of belief in light of the discoveries of science. Thus, the miraculous elements of traditional CHRISTIANITY are rejected, and JESUS, while a worthy teacher and model, is not held to be divine. Universalist and Unitarian churches in the U.S. merged in 1961 (see UNITARIANISM).

universe Whole cosmic system of matter and energy of which Earth is a part. Its main constituents are the GALAXIES, within which are STARS and stellar groupings and nebulae (see NEBULA). Earth's Sun is one star among the billions of stars in the MILKY WAY GALAXY. All atoms, subatomic particles, and everything they compose are also part of the universe. The universe is governed by four fundamental forces: the STRONG FORCE, the WEAK FORCE, the ELECTROMAGNETIC FORCE, and GRAVITATION. Numerous theories have been proposed for the origin and structure of the universe. See also BIG BANG; COSMOLOGY; EXPANDING UNIVERSE; STEADY-STATE THEORY.

university Institution of higher education, usually comprising a liberal arts and sciences college and graduate and professional schools that confer degrees in various fields. A university differs from a COLLEGE in that it is usually larger, has a broader curriculum, and offers advanced degrees in addition to undergraduate degrees. The first true university was the University of BOLOGNA, founded in the 11th century; the first in northern Europe was the University of PARIS, which served as a model for the universities of OXFORD, CAMBRIDGE, HEIDELBERG, and others. One of the first modern universities, in which secular objectivity and RATIONALISM replaced religious orthodoxy, was the University of Halle (founded 1694 in Halle, Ger.). The liberalism of Halle was adopted by GÖTTINGEN, BERLIN, and many other German universities. The German model of the university as a complex of schools and research institutes also exerted a worldwide influence. The growth of universities in the U.S., where most colleges had been established by religious denominations, was greatly spurred by the MORRILL ACT of 1862.

UNIX \'yü-niks\ OPERATING SYSTEM for DIGITAL COMPUTERS, developed by Ken Thompson of Bell Laboratories in 1969. It was initially designed for a single user (the name was a pun on the earlier operating system Multics). The C language was subsequently developed specifically for UNIX, and the system was rewritten almost entirely in C; it was improved by the addition of multiprogramming and time-sharing capabilities and enhanced portability. UNIX is very popular in universities, where it is used mostly on scientific and engineering workstations, and it is used on most of the SERVERS of INTERNET SERVICE PROVIDERS. Because its modular construction allows it to be easily modified, it has been improved in many ways by academic and industrial institutions (see LINUX).

Unkei \'ün-ˌkā\ (b. 1148?—d. 1223) Japanese sculptor. He established a style of realistic and dynamic Buddhist sculpture that had an immense impact on Japanese art for centuries. Commissioned by the KAMAKURA SHOGUNATE, he made statues for the Kōfuku and Tōdai temples in Nara and is best remembered for the nearly 26-ft (8-m) tall guardian figures at Tōdai temple's Great South Gate. He later produced many portrait sculptures.

Unkiar Skelessi, Treaty of See Treaty of HÜNKÂR İSKELESI

Unser, Bobby and Al *in full* **Robert William Unser** *and* **Alfred Unser** (respectively b. Feb. 20, 1934, Albuquerque, N.M., U.S.; b. May 29, 1939, Albuquerque, N.M., U.S.) U.S. automobile-racing drivers. The Unser brothers were born into a family of drivers and began driving at an early age. Both won the Pikes Peak hill climb and various U.S. Automobile Club races before competing in the INDIANAPOLIS 500, which Bobby won in 1968, 1975, and 1981, and Al in 1970, 1971, 1978, and 1987. Al's son Al Unser, Jr. (b. 1962), won the same race in 1992 and 1994.

Unterwalden \'ün-tər-ˌväl-dən\ Former canton, central Switzerland. It was ruled after 1173 by the HABSBURG counts. In 1291, with Uri and Schwyz, it formed the Everlasting League, which became the nucleus of the Swiss Confederation. In 1340 it divided into two sovereign half cantons, Nidwalden and Obwalden; in 1803 they became demicantons having equal rights.

untouchable Former classification of various low-status persons and those outside the Hindu CASTE system in Indian society. The term Dalit is now used for such people (in preference to MOHANDAS K. GANDHI's term, Harijan, which was considered condescending by the Dalit themselves), and their plight is recognized by the Indian constitution and by legislation. The groups traditionally considered untouchable included people whose occupations or habits of life involved activities considered to be polluting, such as taking life for a living (e.g., fishermen); killing or disposing of dead cattle or working with their hides; coming into contact with human waste (e.g., sweepers); and eating flesh of cattle, pigs, or chickens. Many untouchables converted to other religions to escape discrimination. Indian law now categorizes the Dalit under the term *scheduled castes* and accords them certain special privileges.

upanayana \ˌü-pə-'nə-yə-nə\ Hindu initiation ritual, restricted to the three upper VARNAS. It marks a male's entrance into the life of a student and his acceptance as a full member of the religious community. After a ritual bath, the boy, aged 5–24, is dressed as an ascetic and brought before his GURU, who invests him with various symbolic articles. The initiate receives a sacred thread, worn throughout his life, that identifies him as twice-born, the second birth being effected by receipt of a MANTRA. Observance of upanayana is decreasing and is now largely confined to the BRAHMAN class.

Upanishad \ü-'pä-ni-ˌshäd\ Any of 108 speculative texts of the VEDAS that contain elaborations in poetry and verse. They are believed to have been composed since 500 BC, based on teachings circulated since 1000 BC. They represent the final stage in the tradition of the Vedas, and the teaching based on them is called VEDANTA. Generally the Upanishads are concerned with the nature of reality, the individual soul (ATMAN), and the universal soul (BRAHMAN) and with the theory of the transmigration of souls and the nature of morality.

upasaka \ü-'pä-sə-kə\ Lay devotee of the BUDDHA. Originally the term applied to followers of the Buddha who were not ordained as BHIKSUS; today it is normally applied, mainly in Southeast Asia, to pious individuals who visit the local monastery on the weekly holy days and who undertake special vows. They support the SANGHA with regular offerings and observe the five precepts expected of all Buddhists: to abstain from killing, stealing, sexual misconduct, lying, and using intoxicants.

UPC See UNIVERSAL PRODUCT CODE

Updike, John (Hoyer) (b. March 18, 1932, Shillington, Pa., U.S.) U.S. writer. He attended Harvard University and in 1955 began a long association with *The New Yorker*. His works are known for careful craftsmanship and for their subtle depiction of American middle-class life. His famous "Rabbit" tetralogy—*Rabbit, Run* (1960), *Rabbit Redux* (1971), *Rabbit Is Rich* (1981, Pulitzer Prize), and *Rabbit at Rest* (1990, Pulitzer Prize)—follows a very ordinary American man through the decades of the later 20th century. A Jewish novelist named Bech is the subject of three other novels. Updike's other fiction includes *The Centaur* (1963), *Of the Farm* (1965), *Couples* (1968), *The Witches of Eastwick* (1984; film, 1987), and *In the Beauty of the Lilies* (1996). He has also published short-story collections, including *Pigeon Feathers* (1962), several volumes of reviews and essays, and light verse.

Upper Canada See CANADA WEST

Upper Volta See BURKINA FASO

Uppsala \'üp-ˌsä-ˌlä\ City (pop., 2001 est.: 191,110), Sweden. Located north of STOCKHOLM, it lies near a village which was originally the capital of the ancient pre-Christian kingdom of Svea. By the 13th century it was an important commercial centre. Relinquishing its political primacy to Stockholm, it remained the seat of the archbishop of Sweden; its Gothic cathedral (erected from the 13th–15th centuries) is Sweden's largest. It is also an educational centre, the site of Sweden's oldest university, Uppsala University (founded 1477). It is now an industrial city and transportation hub. CAROLUS LINNAEUS lived there.

'Uqāb, Battle of Al- See Battle of LAS NAVAS DE TOLOSA

Uqṣūr, Al- See LUXOR

Ur \'ər, ůr\ Ancient city and district, SUMER, southern MESOPOTAMIA. It was situated on a former channel of the EUPHRATES RIVER in what is now southern IRAQ. One of the oldest cities of Mesopotamia, it was settled sometime in the 4th millennium BC. In the 25th century BC it was the capital of

© 2006 Encyclopædia Britannica, Inc.

southern Mesopotamia under its first dynasty. Though it later declined, it again became important around the 22nd century BC. It is mentioned in the Bible (as Ur of the Chaldees) as the early home of Hebrew patriarch ABRAHAM (c. 2000 BC). In subsequent centuries it was captured and destroyed by many groups, including the Elamites and Babylonians. Nebuchadrezzar II restored it in the 6th century BC. Excavations, especially in the 1920s and '30s, uncovered remains of great archaeological value.

Northeastern facade (the ascents partly restored) of the ziggurat at Ur, southern Iraq.
HIRMER FOTOARCHIV, MUNCHEN

uracil \'yůr-ə-ˌsil\ Organic compound of the PYRIMIDINE family, often called a base, consisting of a ring containing both nitrogen and carbon atoms. It occurs in combined form in many important biological molecules, including RNA and several COENZYMES active in CARBOHYDRATE metabolism. During synthesis of an RNA strand from DNA, uracil pairs with ADENINE. It or its corresponding NUCLEOSIDE or NUCLEOTIDE may be prepared from RNA by selective techniques of HYDROLYSIS.

Ural \'yůr-əl\ **Mountains** Mountain range, RUSSIA and KAZAKHSTAN. Generally held to constitute the boundary between Europe and Asia, the range extends north-south for some 1,550 mi (2,500 km) from just south of the Kara Sea to the URAL RIVER. The mountains average 3,000–4,000 ft (915–1,220 m) in elevation; the highest peak is Mount Narodnaya at 6,217 ft (1,895 m). The Central and Southern Urals contain one of the largest industrial regions of Russia, producing metal goods, chemicals, and machinery; that region developed rapidly during World War II (1939–45), when many industrial plants were moved from the western part of the Soviet Union to prevent their destruction by the Germans.

Ural River River, Russia and Kazakhstan. Rising at the southern end of the URAL MOUNTAINS, it flows southwest to cross through western Kazakhstan to the CASPIAN SEA at Atyrau. It is 1,509 mi (2,428 km) long and drains an area of 91,500 sq mi (237,000 sq km). Its lower course is navigable.

Uralic \yů-'ra-lik\ **languages** Family of more than 30 languages spoken by some 25 million people in central and northern Eurasia. A primary division is between the FINNO-UGRIC LANGUAGES, which account for most of the languages and speakers, and the Samoyedic languages. The latter languages have historically been spoken in the forest region of northern Siberia and in the tundra and coastal zones from the Ob to the White Sea and east into the Taymyr Peninsula. The known languages are Nganasan, Enets, Nenets, Selkup, Kamas (which became extinct in the late 20th century), and Mator (which became extinct in the 19th century). Of the other languages that are still spoken, Nenets, which has 25,000 speakers and is still being learned by children, is the most viable. The Samoyedic languages share little vocabulary with Finno-Ugric. At its very earliest stages Uralic most probably included the ancestors of the Yukaghir languages, still sometimes included with the PALEO-SIBERIAN LANGUAGES.

Uraninite in pitchblende from Great Bear Lake, Northwest Territories, embedded (for display) in a larger mass of feldspar from Grafton Center, N.H.
COURTESY OF THE FIELD MUSEUM OF NATURAL HISTORY, CHICAGO; PHOTOGRAPH, JOHN H. GERARD

uraninite \yů-'rā-nə-ˌnīt\ Uranium dioxide (UO_2), a major OXIDE MINERAL of URANIUM. Uraninite is radioactive and usually forms black, gray, or brown crystals that are moderately hard and generally opaque. The elements uranium and radium were first extracted from uraninite ore from what is now the Czech Republic. It has also been mined in Germany and Canada, and in the Colorado Plateau (U.S.). See also PITCHBLENDE.

uranium Chemical ELEMENT of the ACTINIDE series (with many TRANSITION ELEMENT properties), chemical symbol U, atomic number 92. A dense, hard, silvery white METAL that tarnishes in air, it is isolated from such ores as PITCHBLENDE. Until the discovery of the first TRANSURANIUM ELEMENT in 1940, uranium was believed to be the heaviest element. RADIOACTIVITY was discovered in uranium by A.-H. BECQUEREL. All its ISOTOPES are radioactive; several have HALF-LIVES long enough to permit determination of the age of the Earth by URANIUM-THORIUM-LEAD DATING and URANIUM-234–URANIUM-238 DATING. NUCLEAR FISSION was discovered in 1938 in uranium bombarded with NEUTRONS, and the self-sustaining nuclear CHAIN REACTION, the ATOMIC BOMB, and the generation of NUCLEAR POWER followed. Uranium has various VALENCES in compounds, some of which have been used as colours in ceramic glazes, in lightbulb filaments, in photography, and as dyes and mordants.

uranium-234-uranium–238 dating Method of age determination that makes use of the radioactive decay of uranium-238 to uranium-234; the method can be used for dating sediments from either a marine or a PLAYA lake environment. Because this method is useful for the period c. 100,000–1.2 million years before the present, it helps in bridging the gap between the CARBON-14 DATING method and the POTASSIUM-ARGON DATING method.

uranium-thorium-lead dating *or* **common-lead dating** Method of dating very old rocks by means of the amount of common lead they contain. Common lead is any lead from a rock or mineral that contains a large amount of lead and a small amount of the radioactive precursors of lead (i.e., the isotopes uranium-235, uranium-238, and thorium-232). By this method, the age of the Earth has been estimated to be c. 4.6 billion years. This figure is in good agreement with the age of meteorites and the age of the Moon as determined independently.

Uranus *or* **Ouranus** \'yůr-ə-nəs, yů-'rā-nəs\ Ancient Greek personification of HEAVEN. When GAEA emerged from CHAOS, she produced Uranus, the mountains, and the sea. Her subsequent union with Uranus produced the TITANS, the Cyclopes, and the Hecatoncheires. Uranus despised his offspring and hid them in Gaea's body. In response to her appeal for vengeance, CRONUS castrated Uranus. From the drops of blood that fell on Earth were born the FURIES, the Giants, and the ash-tree NYMPHS called Meliai. His severed genitals floated on the sea, producing a white foam from which sprang APHRODITE. Uranus also consorted with Clymene, Hemera, HESTIA, and Nyx.

Uranus Seventh planet from the Sun. It was discovered in 1781 by William Herschel (see HERSCHEL FAMILY) and named for the Greek god personifying heaven. A blue-green gas giant, it has almost 15 times the mass of Earth and over 50 times its volume. It is less dense than Earth; the gravity at the top of its atmosphere is 11% weaker. Its equatorial diameter is 31,800 mi (51,100 km). Uranus has 10 sharply defined narrow, dark rings, with broad dust bands between them; the rings consist mainly of boulder-size chunks of dark material. Uranus also has at least 27 moons (most named after Shakespearean characters) and a magnetic field about as strong as Earth's. The planet rotates once every 17 hours around an axis that, unusually, is almost parallel to the ECLIPTIC; from Earth it appears to spin on its side. It takes 84 years to orbit the Sun, at a mean distance of 1.78 billion mi (2.87 billion km). It has no solid surface; its fluid interior is thought to consist of a mixture of rock, ices, and gas, with little or no rocky core. Its upper atmosphere is mostly hydrogen and helium; the blue-green colour comes from absorption of red light by the small amount of methane present.

Urartu \ů-'rär-ˌtü\ Ancient kingdom around Lake VAN, southwestern Asia. Today the region is divided among Armenia, eastern Turkey, and northwestern Iran. The kingdom flourished c. 13th–7th century BC, enjoying considerable power in the Middle East in the 9th–8th century. Archaeological finds date from the time of King Shalmaneser I (c. 1274–45) of Assyria. Repeatedly attacked by Assyrian kings, Urartu declined in the late 8th century. It ceased to exist after invasions by Cimmerians, Scythians, and Medes in the 7th century BC.

Urban II *orig.* **Odo of Châtillon-sur-Marne** (b. c. 1035, Châtillon-sur-Marne, or Lagery, or Lagny, Champagne, France—d. July 29, 1099, Rome) Pope (1088–99). The prior of a Cluniac monastery, he was made

© 2006 Encyclopædia Britannica, Inc.

cardinal by Pope Gregory VII, whose reforms he furthered. Elected pope in 1088, Urban secured his authority against the antipope Clement III and strengthened the role of the papacy in the reform movement. He called for the First Crusade at the Council of Clermont (1095) in response to the appeal of Alexius I Comnenus, promoted the union of the Eastern and Western churches, and supported the Christian reconquest of Spain from the Moors.

Urban VI *orig.* **Bartolomeo Prignano** (b. 1318, Naples—d. Oct. 15, 1289, Rome) Pope (1378–89). Archbishop of Acerenza (1363) and Bari (1377), he became papal chancellor for Gregory XI, whom he was chosen to succeed. This election of an Italian appeased the Romans, who wanted to end the French-dominated Avignon papacy, but his harsh reforms soon angered the French cardinals, prompting them to elect the antipope Clement VII, beginning the Western Schism (1378). Europe was divided in its loyalties, and Urban warred with Naples when its queen backed Clement. Strife over the schism reduced the Papal States to anarchy, and Urban's death may have been from poisoning.

urban climate Any set of climatic conditions that prevails in a large metropolitan area and that differs from the climate of its rural surroundings. Urban climates are distinguished from those of less built-up areas by differences of air temperature, humidity, wind speed and direction, and amount of precipitation. These differences are attributable in large part to the altering of the natural terrain through the construction of artificial structures and surfaces. For example, tall buildings, paved streets, and parking lots affect wind flow, precipitation runoff, and the local energy balance.

urban planning Programs pursued as a means of improving the urban environment and achieving certain social and economic objectives. Evidence of urban planning can be found in the ruins of ancient cities, including orderly street systems and conduits for water and sewage. During the Renaissance, European city areas were consciously planned to achieve circulation of the populace and provide fortification against invasion. Such concepts were exported to the New World, where William Penn, in founding the city of Philadelphia, developed the standard gridiron plan—the laying out of streets and plots of land adaptable to rapid change in land use. Modern urban planning and redevelopment arose in response to the disorder and squalor of the slums created by the Industrial Revolution. The urban planner best known for his transformation of Paris was Georges-Eugène Haussmann. City planners imposed regulatory laws establishing standards for housing, sanitation, water supply, sewage, and public health conditions, and introduced parks and playgrounds into congested city neighbourhoods. In the 20th century, zoning—the regulation of building activity according to use and location—came to be a key tool for city planners. See also Pierre-Charles L'Enfant.

Urbino majolica \mə-'jä-li-kə\ Italian tin-glazed earthenware made in the city of Urbino, which dominated the market from c. 1520. Early wares, mostly dishes, are painted in a range of colours, dominated by brilliant yellow, orange, and brown, and decorated with narrative scenes typically covering the entire surface, a style known as *istoriato*. Scenes are taken from the Bible, mythology, Classical and contemporary history, and poetry. Later wares were decorated in a style called grotesque, adapted from motifs found in Roman excavations. Production declined in the late 17th century. See also majolica.

Urdu \'ür-dü\ **language** Indo-Aryan language used by Muslims in India and Pakistan. In the sociopolitical realm, Urdu and Hindi are different languages, but the colloquial basis of both is identical, and as a written language Urdu differs from Hindi principally in its greater acceptance of Persian-Arabic vocabulary and in some syntactic features. It is written in the Arabic alphabet with modification of some letters to denote specifically Indo-Aryan sounds. As Pakistan's official language, Urdu has been promoted as a token of national unity, though less than 8% of Pakistanis—mainly immigrants and descendants of immigrants from India after the 1947 partition—speak it as a first language.

urea \yù-'rē-ə\ *or* **carbamide** One of the simplest organic compounds and the first synthesized from inorganic raw materials (see inorganic compound), by Friedrich Wöhler (1800–82) in 1828. It is the diamide of carbonic acid (H_2NCONH_2; see amide; carbon dioxide). The chief nitrogenous end product of protein breakdown in mammals and some fishes, it occurs not only in urine but also in blood, bile, milk, and perspiration. It is one of the industrial chemicals produced in vast amounts. With its high nitrogen content and low price, it is a major agricultural fertilizer and animal-feed ingredient. It is also used to make urea-formaldehyde plastics (including foamed plastics; see polyurethanes), to synthesize barbiturates, as a stabilizer in explosives, and in adhesives, hydrocarbon processing, and flameproofing.

uremia \yù-'rē-mē-ə\ Excess nitrogenous waste products in the blood and their toxic effects. Kidney impairment (see Bright disease; diabetes mellitus; hypertension; kidney failure; nephritis) or disorders that hinder urine excretion (e.g., prostatic disorders) allow urea and other protein waste products to accumulate. Symptoms usually start with fatigue and loss of concentration. They may include itching and muscle twitches; dry, flaky, yellowish skin; dry mouth, metallic taste, and ammonia breath; and nausea, vomiting, diarrhea, and constipation. Advanced stages affect the nervous, cardiovascular, and respiratory systems and can lead to hypertension, seizures, heart failure, and death. If the underlying disorder cannot be treated, dialysis or kidney transplant may be required.

Urey \'yůr-ē**, Harold C(layton)** (b. April 29, 1893, Walkerton, Ind., U.S.—d. Jan. 5, 1981, La Jolla, Calif.) U.S. scientist. He received his doctorate from the University of California at Berkeley and thereafter taught at various universities. He was awarded a Nobel Prize in 1934 for discovering deuterium and heavy water. He was a key figure in the development of the atomic bomb; his group worked on the gaseous diffusion process for separation of uranium-235. He devised methods for estimating the temperature of ancient oceans, theorized on the compositions of primordial atmospheres, and studied the relative abundances of the elements, making fundamental contributions to a widely accepted theory of the origin of the Earth and other planets in *The Planets*, (1952).

Uriburu \ˌür-rē-'bü-rü**, José Félix** (b. July 20, 1868, Salta, Arg.—d. April 29, 1932, Paris, Fr.) Argentine soldier and dictator. Nephew of a former president, he was a firm believer in class privileges. A visit to Germany made him an ardent admirer of Prussian militarism. In 1930 he led a coup against Hipólito Irigoyen's liberal regime, replacing the governing class with an elite representing the landed oligarchy, dissolving the legislature, and revising the laws to prohibit liberal-radicals from political participation. In 1931 he arranged a fraudulent election to ensure the oligarchy's continued control and stepped down in favour of a fellow officer, Agustín Justo.

uric acid \'yůr-ik\ Heterocyclic compound of the purine type, the end product of metabolism of the purines in nucleic acids in many animals, including humans. It is excreted by reptiles and birds as the chief nitrogenous end product of protein breakdown. Small quantities are normally found in human blood; in gout, levels are abnormally high. Uric acid is used industrially in organic synthesis.

urinalysis \ˌyůr-ə-'na-lə-səs\ Laboratory examination of a urine sample for clinical information. Abnormal concentrations of substances normally found in urine or presence of those that are not may indicate a disorder. Colour, specific gravity, or volume changes may reveal a specific disease or injury. Significant findings include high glucose and acetone in diabetes mellitus; various nitrogen compounds, pigments, amino acids, and their metabolic products in disorders of the enzymes that act on them; uric acid in gout; and urea, albumins, and globulins in kidney disease. Hormones may be evidence of pregnancy or endocrine imbalance. Urinalysis can also detect poisons and drugs.

urinary system *or* **renal** \'rē-nəl\ **system** System that produces and discharges urine to rid the body of waste products. It consists of the kidneys, which balance electrolytes in blood, retaining and adding needed ones and removing unneeded or dangerous ones for excretion; the ureters, two thin muscular tubes 10–12 in. (25–30 cm) long that move the urine by peristalsis; the hollow, muscular bladder, which receives and stores it; and the urethra, through which it leaves the body. In women the urethra is 1.5 in. (4 cm) long. In men it is longer (since it passes through the penis), about 8 in. (20 cm), and carries semen from the prostate gland as well as urine. Urinary disorders, which can lead to dehydration or edema and to a dangerous buildup of waste and toxic substances, include kidney failure, tumours, and bladder and kidney stones.

urination Process of excreting urine from the bladder (see urinary system). Nerve centres in the spinal cord, brain stem, and cerebral cortex control it through involuntary and voluntary muscles. The need to void is felt when the bladder holds 3.5–5 oz (100–150 ml) of urine and becomes uncomfortable at a volume of 14–15 oz (350–400 ml). The detrusor contracts and the sphincter (muscular constriction) of the urethra relaxes to

© 2006 Encyclopædia Britannica, Inc.

empty the bladder. Normally it empties completely, but bladder stones or PROSTATIC DISORDERS can block outflow; poor muscle tone (especially in older women) or certain nervous system disorders can cause loss of control of urination (INCONTINENCE).

urine Liquid solution of metabolic wastes and other, often toxic, substances filtered from PLASMA. The fluid in the Bowman capsule at the start of each NEPHRON is essentially plasma without the large molecules (e.g., proteins). The concentrated fluid (final urine) that exits the KIDNEY consists of water, UREA, inorganic SALTS, URIC ACID, creatinine, AMMONIA, and broken-down blood pigments, including urochrome, which makes urine yellow, plus any unusual substances not reabsorbed into the blood. This is then excreted. See also HEMATURIA; URINALYSIS; URINARY SYSTEM; URINATION.

URL *in full* **Uniform Resource Locator** Address of a resource on the INTERNET. The resource can be any type of file stored on a server, such as a WEB page, a text file, a graphics file, or an application program. The address contains three elements: the type of PROTOCOL used to access the file (e.g., HTTP for a Web page, ftp for an FTP site); the DOMAIN NAME or IP address of the server where the file resides; and, optionally, the pathname to the file (i.e., description of the file's location). For example, the URL http://www.britannica.com/heritage instructs the browser to use the HTTP protocol, go to the www.britannica.com Web server, and access the file named heritage.

Urmia, Lake *Persian* **Daryācheh-ye Orūmiyyeh** \ˌdär-yä-'che-ye-ù-ˌrü-'mē-yə\ Shallow, saline lake, northwestern Iran. The largest lake in the Middle East, it covers an area that varies from 2,000 to 2,300 sq mi (5,200 to 6,000 sq km). It is about 87 mi (140 km) long and 25–35 mi (40–55 km) wide, with a maximum depth of 53 ft (16 m). There is a cluster of about 50 tiny islands at its southern part. Fed by three rivers, it has no outlet. It has been protected since 1967.

Urnfield culture Late BRONZE AGE culture of Europe, so called because its people placed their cremated dead in urns. This culture spread from east-central Europe and northern Italy in the 12th century BC and later to Ukraine, Sicily, Scandinavia, France, and Spain. In some areas barrows marked the graves. The culture was warlike, with fortified settlements and bronze weapons, including the slashing sword. The uniformity of the culture and the persistence of certain pottery and metal forms apparently had great influence on Early IRON AGE culture.

urogenital malformation Defect in the organs or tissues of the URINARY SYSTEM or in the sex organs (genitals). In polycystic kidney disease (an inherited disease), CYSTS of varying size enlarge one or both KIDNEYS. Kidneys may have abnormal shapes or may be fused. In megaloureter, the ureter's diameter is enlarged. Males may have epispadias or hypospadias, in which the urethra opens on the upper surface or the underside, respectively, of the PENIS, or cryptorchidism (undescended testicles), in which one or both TESTES have not descended from the abdomen into the scrotum before birth. Female genital system malformations include AGENESIS of the OVARIES, VAGINA, or UTERUS and abnormally shaped uterus.

urology \yù-'rä-lə-jē\ Medical specialty dealing with the URINARY SYSTEM and male reproductive organs. It traces its origin to medieval lithologists, itinerant healers who specialized in surgical removal of bladder stones. The Spanish surgeon Francisco Díaz wrote the first treatises on urinary-tract disease (1588) and is regarded as the founder of modern urology. Most modern urological procedures originated in the 19th century. Today, urologists use bladder catheters (see CATHETERIZATION), the cystoscope (to view the inside of the bladder), and various DIAGNOSTIC IMAGING techniques; treat PROSTATIC DISORDERS; perform VASECTOMIES; and may surgically remove stones in the urinary tract and cancers of the kidneys, bladder, and testicles. Urology deals mostly with male patients; the urinary tract in females may be treated by gynecologists (see OBSTETRICS AND GYNECOLOGY).

Urquiza \ür-'kē-sä**, Justo José de** (b. Oct. 18, 1801, Arroyo Urquiza, Viceroyalty of the Río de la Plata—d. April 11, 1870, Entre Ríos province, Arg.) Argentinian soldier and statesman who helped overthrow JUAN MANUEL DE ROSAS. He became governor of Entre Ríos province in 1841 and allied himself with other provincial leaders to overthrow the dictatorial Rosas in 1852. As provisional dictator, he called a constitutional convention that sanctioned a constitution modeled on that of the U.S. All provinces accepted it, but the province of Buenos Aires, determined to lead the nation, refused to join the new union until 1859. Urquiza stepped down in 1860 and led the Argentinian army in the PARAGUAYAN WAR. He and his sons were assassinated by a political rival. See also BARTOLOMÉ MITRE.

Ursula \'ər-syù-lə**, Saint** (fl. 4th century, Rome; feast day October 21) Legendary leader of a band of virgins martyred by the Huns. The number of virgins was originally 11, but, as the story was retold over the years, it increased to 11,000. According to the 13th-century *Golden Legend*, Ursula was an English princess who went on a pilgrimage to Rome with 11,000 virgins and was martyred with them on the homeward journey. Ursula is the patron saint of the order of St. Ursula (Ursulines), a congregation of nuns dedicated to educating girls.

Urubamba \ˌü-rü-'bäm-bä\ **River** River, central Peru. Part of the AMAZON RIVER drainage system, it rises in the ANDES MOUNTAINS and flows northwest for about 450 mi (725 km) to its junction with the APURÍMAC RIVER, the two then forming the UCAYALI RIVER. In the Gorge of Torontoy, the river plunges from about 11,000 ft (3,400 m) above sea level to about 8,000 ft (2,400 m) in 20 mi (32 km).

Uruguay \ˌü-rü-'gwī,\ *English* \'yùr-ə-ˌgwā\ *officially* **Oriental Republic of Uruguay** Country, southeastern South America. Area: 68,037 sq mi (176,215 sq km). Population (2005 est.): 3,256,000. Capital: MONTEVIDEO. People of European ancestry (mostly Spanish and Italian) make up about nine-tenths of the population; most of the remainder are mestizos or people of African-European descent. Few Indians remain. Language: Spanish (official). Religions: Christianity (predominantly Roman Catholic; also other Christians, Protestant), Judaism. Currency: Uruguayan peso. Uruguay is the only South American country lying entirely outside the tropics. Its topography consists mainly of low plateaus and low hilly regions. The principal waterway is the NEGRO RIVER; the URUGUAY RIVER forms the country's entire western border with Argentina. Mineral and energy resources are limited. Pastures, covering almost four-fifths of the land area, support large herds of livestock raised for meat, leather goods, and wool. Chief crops include rice, sugarcane, oranges, wheat, and corn. Other important economic activities are tourism, fishing, and the manufacture of textiles and chemicals. Uruguay is a republic with two legislative houses; its head of state and government is the president. Prior to European settlement, it was inhabited mainly by the Charrúa and Guaraní Indians. The Spanish navigator Juan Díaz de Solís sailed into the Río de la PLATA estuary in 1516. The Portuguese established Colonia in 1680. Subsequently the Spanish established Montevideo in 1726, driving the Portuguese from their settlement; 50 years later Uruguay became part of the Viceroyalty of the RÍO DE LA PLATA. It gained independence from Spain in 1811. The Portuguese regained it in 1821, incorporating it into Brazil as a province. A revolt against Brazil in 1825 led to its being recognized as an independent country in 1828. It sided with Brazil and Argentina against Paraguay in the War of the TRIPLE

© 2006 Encyclopædia Britannica, Inc.

Alliance (1864/65–70). The economy benefited from a demand for raw material during World War II (1939–45) and the Korean War (1950–53). The office of the president was abolished in 1951 and replaced with a nine-member council. The country adopted a new constitution and restored the presidential system in 1966. A military coup occurred in 1973, but the country returned to civilian rule in 1985. The 1990s brought a general upturn in the economy, largely the result of reform measures and membership in Mercosur, the Southern Common Market (1991).

Uruguay River River, southeastern South America. Rising in southern Brazil, it forms the border between Argentina and Brazil and between Argentina and Uraguay. Above Buenos Aires, it combines with the Paraná River to form the great estuary of the Río de la Plata. Its 990-mi (1,593-km) course is interrupted by rapids, but it is navigable by ocean vessels for about 130 mi (210 km) upriver from its mouth.

Uruk See Erech

Ürümqi \œ-'rœm-'chē\ *or* **Urumchi** \ù-'rùm-'chē\ *or* **Wu-lu-mu-ch'i** \'wü-'lü-'mü-'chē\ City (pop., 1999 est.: 1,258,457), capital of Xinjiang autonomous region, northwestern China. Situated along the northern face of the Tien Shan, it first came under Chinese control in the 7th–8th centuries and became an important centre for caravans en route to Turkistan. The Uighurs had control from c. 750 until the resumption of Chinese rule in the 18th century. The city was held by Muslim rebels in 1864–76. When the province of Xinjiang was established in 1884, Ürümqi became its capital. It grew rapidly into the greatest city and centre of trade in Central Asia. It is located in a coal-mining and petroleum-producing area; its chief manufactures include iron and steel, agricultural machinery, and chemicals.

Urundi See Ruanda-Urundi

U.S. See United States

U.S. News & World Report Weekly newsmagazine published in Washington, D.C. *U.S. News* was founded in 1933 by David Lawrence (1888–1973) to cover important domestic events; he founded *World Report* in 1945 to treat world news. The two magazines were merged in 1948. From its start, *U.S. News & World Report* had a somewhat more conservative editorial viewpoint than its larger rivals, *Time* and *Newsweek*, and it paid less attention to sports and the arts. In 1984 it was bought by real-estate developer Mortimer B. Zuckerman, who later purchased the *New York Daily News*. Surveys of higher education are published annually in the popular "America's Best Colleges" rankings.

U.S.S.R. See Union of Soviet Socialist Republics

USA Today National U.S. daily general-interest newspaper, the first of its kind. Launched in 1982 by Allen Neuharth, head of the Gannett newspaper chain, it reached a circulation of one million within a year and surpassed two million in the 1990s. Initially considered gimmicky and insubstantial, it gradually developed a reputation for higher quality while increasing its circulation and advertising revenues at a time when few papers were experiencing growth. The features that originally set it apart—abundant colourful graphics, very brief stories, and a concentration on sports and celebrity—have influenced other newspapers.

USB *in full* **Universal Serial Bus** Type of serial bus that allows peripheral devices (disks, modems, printers, digitizers, data gloves, etc.) to be easily connected to a computer. A "plug-and-play" interface, it allows a device to be added without an adapter card and without rebooting the computer (the latter is known as hot-plugging). The USB standard, developed by several major computer and telecommunications companies, supports data-transfer speeds up to 12 megabits per second, multiple data streams, and up to 127 peripherals.

Usman dan Fodio \ü-'smän-'dän-fō-'dē-ō\ (b. December 1754, Maratta, Gobir, Hausaland—d. 1817, Sokoto, Fulani empire) Fulani mystic, philosopher, and revolutionary reformer. In a jihad (holy war) between 1804 and 1808, he created a new Muslim state, the Fulani empire, in what is now northern Nigeria. He stimulated the growth of Islam throughout the region and founded the important Sokoto caliphate. He also produced a large body of writings in Arabic and Fula that continue to enjoy wide circulation and influence.

Ussuri \ù-'sùr-ē\ **River** *Chinese* **Wusuli Jiang** *or* **Wu-su-li Chiang** River, eastern Asia. Formed by the confluence of two rivers rising in the Sikhote-Alin Mountains of extreme southeastern Siberia (Russia), it flows north, marking part of the border between Russia and China and joining the Amur River near Khabarovsk. It is 565 mi (909 km) long. In the 1960s, and especially in 1969, Soviet and Chinese forces clashed over large sections of the river border. A limited agreement was reached on navigational use of the river in 1977.

Ustinov \'yüs-tə-ˌnȯf**, Sir Peter (Alexander)** (b. April 16, 1921, London, Eng.—d. March 28, 2004, Genolier, Switz.) British actor, director, author, and playwright. He made his professional stage debut at age 17, in which he displayed his talents for vocal mimicry and age affectation, and landed his first major screen role in *The Goose Steps Out* (1942). His film appearances include *Lola Montès* (1955), *Spartacus* (1960, Academy Award), *Topkapi* (1964, Academy Award), and a recurring role as Hercule Poirot in movies based on Agatha Christie's mysteries, beginning with *Death on the Nile* (1978). He both starred in and directed *Billy Budd* (1962), among other films. *Lady L* (1965), with Sophia Loren and Paul Newman, was probably his best-received directorial effort. He wrote successful plays such as *The Love of Four Colonels* (1951) and *Romanoff and Juliet* (1956) and won Emmy Awards for his television performances in *The Life of Samuel Johnson* (1957), *Barefoot in Athens* (1966), and *A Storm in Summer* (1970). Ustinov also wrote several novels and the autobiographical works *Dear Me* (1977), *Ustinov at Large* (1993), and *Ustinov Still at Large* (1994). Noted for his humanitarian efforts, he served as ambassador at large for UNICEF from 1969 until his death. Ustinov was knighted in 1990.

Usumacinta River \ˌü-sü-mä-'sēn-tä\ River, southeastern Mexico and northwestern Guatemala. Rising in northwestern Guatemala, it is formed by the confluence of the Salinas (or Chixoy) and Pasión rivers. It flows northwest and forms a section of the border between Guatemala and Mexico. It then empties into the Grijalva River in Mexico. With the Salinas River, it is about 600 mi (1,000 km) long.

Usumbura See Bujumbura

usury \'yü-zhə-rē\ In law, the crime of charging an unlawfully high rate of interest. In Old English law, the taking of any compensation whatsoever was termed usury. With the expansion of trade in the 13th century, the demand for credit increased, necessitating a modification in the definition of the term. In 1545 England fixed a legal maximum interest, a practice later followed by other Western nations.

Utah State (pop., 2000: 2,233,169), western U.S. It covers 84,904 sq mi (219,901 sq km); its capital is Salt Lake City. Utah is bordered by Idaho to the north, Wyoming to the northeast, Colorado to the east, Arizona to the south, and Nevada to the west. At Four Corners, in the southeast, Utah meets Colorado, New Mexico, and Arizona at right angles, the only such meeting of states in the nation. Utah contains the Great Salt Lake and parts of the middle Rocky Mountains and Uinta Mountains. The western third of the state is a broad desert-like area. About 70% of the land is owned by either the federal or the state government. The region was inhabited as early as 10,000 BC. In c. AD 400 the Pueblo Indians lived throughout Utah; they were followed by other groups, including the Shoshone, Ute, and Paiute Indians. Spanish missionaries visited there in the late 18th century. It passed to Mexico in 1821. U.S. pioneer Jim Bridger was the first white man to see the Great Salt Lake, in 1824. The area's first permanent settlers were Mormons, who were led to the valley of the Great Salt Lake in 1847 by Brigham Young. Acquired by the U.S. after the Mexican War, the region was organized as the Utah Territory in 1850; it had been reduced to the area of the present state by 1868. A conflict between Mormon authorities and the U.S. government known as the Utah War occurred in 1857–58, and statehood was denied until the Mormons renounced polygamy. When they did, Utah entered the Union in 1896 as the 45th state. The Mormon church has officially been politically neutral since the early 20th century, and the influence of economic blocs has become more important. Utah has large reserves of coal and petroleum and is the world's largest producer of beryllium. Major industries include agriculture and tourism.

Utamaro \ù-tä-'mä-rō\ *orig.* **Kitagawa Nebsuyoshi** (b. 1753, Japan—d. Oct. 31, 1806, Edo) Japanese printmaker and painter. He moved from a provincial town to Edo (now Tokyo) in his youth; his early work included many illustrated books. One of the greatest *ukiyo-e* artists, he is known especially for his masterfully composed portraits of sensuous female beauties. Unlike other *ukiyo-e* artists, who favoured prints of women in groups, Utamaro concentrated on half-length single portraits.

© 2006 Encyclopædia Britannica, Inc.

Ute \'yüt\ North American Indians living mostly in Colorado and Utah, U.S. Their language belongs to the Numic branch of the Uto-Aztecan language family, and their name means "hill people." Their traditional homeland included western Colorado, eastern Utah (whose name derives from Ute), and parts of New Mexico. They eventually joined into a loose confederation of seven bands. Until the 19th century, the Ute had no horses and lived in small family clusters, subsisting by food collecting. They were virtually indistinguishable from the Southern Paiute. When the Ute acquired horses in the early 1800s, they became organized as loose bands of hunters, often targeting livestock. After the Indian wars of 1864–70, most Ute were settled on reservations. At the turn of the 21st century, they numbered more than 5,000.

uterine \'yü-tə-rən\ **bleeding** Abnormal bleeding from the uterus not related to menstruation. Most common in the first few years after menarche and as menopause approaches, it is thought to occur when malfunctioning ovaries reduce blood estrogen levels. A malfunctioning hypothalamus or pituitary gland may also cause hormonally induced uterine bleeding, as can birth-control pills or hormone-replacement therapy. Some tumours produce estrogen and can alter the menstrual cycle, causing bleeding. Tumours in the uterus often bleed easily. Other causes include injury to the uterus, stress, obesity, chronic illness, psychological problems, and blood and cardiovascular disorders. Treatment is directed toward the underlying cause.

uterine cancer Malignant tumour of the uterus. Cancers affecting the lining of the uterus (endometrium) are the most common cancers of the female reproductive tract. Risk factors include absence of pregnancy, early age of first menstruation (before age 12), late onset of menopause (after age 52), obesity, diabetes, and estrogen replacement therapy. Additional risk factors are a personal history of breast or ovarian cancer, age (over age 40), and a family history of uterine cancer. Whites are more likely to develop uterine cancer than are blacks. The major symptom is vaginal bleeding or discharge. Treatment may begin with simple or radical hysterectomy. Some uterine cancers are treated in part by hormonal therapy, radiation therapy, or chemotherapy.

uterus *or* **womb** Inverted-pear-shaped organ of the female reproductive system, in which the embryo and fetus develop during pregnancy. Lying over and behind the bladder, it is 2.5–3 in. (6–8 cm) long and about 2.5 in. (6 cm) across at the top, where the fallopian tubes enter it; at the other end, the cervix extends down into the vagina. The uterine lining (endometrium), a moist mucous membrane, changes in thickness during the menstrual cycle (see menstruation), being thickest at ovulation in readiness for a fertilized egg. The uterine wall, about 1 in. (2.5 cm) thick, expands and becomes thinner as a fetus develops inside. The cervix expands to about 4 in. (10 cm) for delivery. Disorders of the uterus include infections, benign and malignant tumours, prolapse, endometriosis, and fibroids (leiomyomas; see muscle tumour).

ʿUthmān ibn ʿAffān \ùth-'män-ˌi-bən-af-'fän\ (d. June 17, 656, Medina, Arabia) Third caliph of the Umayyad dynasty. Born into the powerful Umayyad clan of Mecca, he became a wealthy merchant before converting to Islam; he was the first convert of high social and economic standing. He married a daughter of Muhammad. On the death of ʿUmar ibn al-Khaṭṭāb (644), ʿUthmān was chosen as his successor. His reign as caliph was marked by nepotism and personal profit, and he made many enemies. His accomplishments included centralizing the administration of the caliphate and establishing an official version of the Qu'rān. His death at the hands of rebels marked the beginning of the first fitnah.

Utica \'yü-ti-kə\ Ancient Phoenician settlement, North Africa. Considered the oldest Phoenician settlement, it was located in what is now modern Tunisia. After its founding (c. 8th century BC), it grew rapidly and was second in importance only to Carthage. Made the capital of the Roman province of Africa after the Third Punic War (149–146 BC), it later declined after the emperor Augustus rebuilt Carthage. Excavations have uncovered Phoenician graves dating from the 8th century BC and a substantial residential section of the Roman city. See also Punic Wars.

utilitarianism Ethical principle according to which an action is right if it tends to maximize happiness, not only that of the agent but also of everyone affected. Thus, utilitarians focus on the consequences of an act rather than on its intrinsic nature or the motives of the agent (see consequentialism). Classical utilitarianism is hedonist, but values other than, or in addition to, pleasure (ideal utilitarianism) can be employed, or—more neutrally, and in a version popular in economics—anything can be regarded as valuable that appears as an object of rational or informed desire (preference utilitarianism). The test of utility maximization can also be applied directly to single acts (act utilitarianism), or to acts only indirectly through some other suitable object of moral assessment, such as rules of conduct (rule utilitarianism). Jeremy Bentham's *Introduction to the Principles of Morals and Legislation* (1789) and John Stuart Mill's *Utilitarianism* (1863) are major statements of utilitarianism.

Uto-Aztecan \ˌyü-tō-'az-ˌte-kən\ **languages** Family of more than 30 American Indian languages spoken in pre-Columbian times from the northern Great Basin to Central America. Geographically, Uto-Aztecan can be divided into a northern and a southern branch. The northern branch, spoken from Oregon and Idaho to southern California and Arizona, includes the languages of the Northern and Southern Paiutes, Utes, Northern and Eastern Shoshone, Comanche, and Hopi. The southern branch includes the languages of the O'odham (Pima and Papago) in Arizona, and of a number of Mexican Indian peoples, including the Tarahumara of Chihuahua, the Yaqui of northwestern Mexico and Arizona, and the Cora and Huichol of Nayarit and Jalisco; its southernmost extension includes Nahuatl.

utopian socialism Political and social idea of the mid-19th century. Adapted from such reformers as Robert Owen and Charles Fourier, utopian socialism drew from early communist and socialist ideas. Advocates included Louis Blanc, noted for his theory of worker-controlled "social workshops," and John Humphrey Noyes, founder of the Oneida Community in the U.S. Utopian settlements were also attempted by religious groups such as the Mennonites, Shakers, and Mormons. See also Brook Farm.

Utrecht \'ü-ˌtrekt, 'yü-ˌtrekt\ City (pop., 2001 est.: 256,420), central Netherlands. The site of successive Roman, Frisian, and Frankish fortresses, it became an episcopal see in 696 under St. Willibrord. It was most prosperous during the 11th and 12th centuries, when it was an important commercial centre. In 1527 it was transferred to Holy Roman Emperor Charles V and became part of the Habsburg dominions. It was ruled by Spain until the 1570s, when it became a centre of Protestant resistance. It was the site of the signing of the Union of Utrecht (1579), which established a league of northern Dutch provinces against Spain; the league was the basis of the future Netherlands kingdom. Occupied by the French (1795–1813), it was the residence of Louis Bonaparte, king of Holland (1806–10). The only Dutch pope, Adrian VI, was born in Utrecht. It is a transportation, financial, and insurance centre.

Utrecht, Peace of (1713–14) Series of treaties concluding the War of the Spanish Succession. One series was signed between France and other European powers; another series was signed between Spain and other powers. France concluded treaties with Britain, the Dutch Republic, Prussia, Portugal, and Savoy, in which it ceded various territories, including regions in Canada, to Britain. France also recognized Queen Anne as the British sovereign, acknowledged Frederick I's royal title, and recognized Victor Amadeus II as king of Sicily. Spain ceded Gibraltar to Britain. In a separate accord, the *asiento* agreement, Spain gave Britain the exclusive right to supply the Spanish colonies with African slaves for 30 years. Emperor Charles VI concluded a separate peace with France in the Treaty of Rastatt and Baden. The Spanish succession was settled in favour of the Bourbon Philip V. The treaties gave Britain the largest portion of colonial and commercial spoils and made it the leader in world trade.

Utrecht school Principally a group of three Dutch painters from Utrecht—Dirck van Baburen (c. 1590–1624), Gerrit van Honthorst, and Hendrik Terbrugghen—who were greatly influenced by Caravaggio's art during travels to Rome. They used their newly learned technique in artwork with primarily religious subject matter, but also produced brothel scenes and pictures in sets, such as five works devoted to the senses. The numerous candles, lanterns, and other sources of artificial light in their paintings also differentiate them from Caravaggio, who never used such devices. Honthorst enjoyed the widest reputation at the time, but Terbrugghen is now considered the most talented and versatile of the group.

Utrillo \ü-trē-'yō,\ *English* \yü-'tri-lō**, Maurice** (b. Dec. 25, 1883, Paris, Fr.—d. Nov. 5, 1955, Le Vésinet) French painter. When he became an alcoholic in his teens, his mother, the painter and model Suzanne Valadon, encouraged him to take up painting as therapy; it soon became his obsession. He had no formal artistic training and was interested primarily in reproducing what he saw as faithfully as possible. Most of his compositions depict the old, deteriorating houses and streets of the Montmartre district of Paris. His best work is that of his "white period" (c. 1908–14), so called for his lavish use of zinc white in heavy layers to build up aging, cracked walls. See photograph on opposite page.

Uttar Pradesh \'ù-tər-prə-'dāsh\ *formerly* **United Provinces of Agra and Oudh** State (pop., 2001: 166,197,921), north-central India. It is bordered by Nepal, the states of Bihar, Jharkhand, Madhya Pradesh, Rajasthan, Haryana, and Uttaranchal, and Delhi national capital territory and covers an area of 93,933 sq mi (243,286 sq km); its capital is Lucknow. The state, the most populous in the country, lies largely in the plains formed by the Ganges and Yamuna rivers. The region was the setting of two great Sanskrit epics, the Mahabharata and Ramayana, and the scene of the rise of Buddhism after the 6th century BC. It was ruled by the Mauryan emperor Ashoka in the mid-3rd century BC, the Gupta dynasty (c. AD 320–c. 415), and King Harsa (606–647). The Mughals gained control in the 16th century, at which time the city of Agra became a chief centre. The British arrived in the late 18th century; by the 1830s they held sway and eventually formed the North-Western Provinces, to which Oudh was later annexed. The area was the main scene of the Indian Mutiny of 1857. The current province was formed in 1902 and became a state of India in 1947. In 2000 the northern portion of it was made into the state of Uttaranchal. Uttar Pradesh is a major silica-producing state, yet agriculture is its most important economic sector. Its noted tourist meccas are Agra and Varanasi.

Uttaranchal State (pop., 2001 prelim.: 8,479,562), northern India. It is bordered by Tibet (China) and Nepal and the states of Uttar Pradesh, Haryana, and Himachal Pradesh and covers an area of 19,739 sq mi (51,125 sq km); its capital is Dehra Dun. The state lies in the Himalayas, and some of India's highest peaks rise in its northern areas. The upper reaches of the Ganges (Ganga) and Yamuna rivers flow southward through the state. In the south are hill resorts such as Mussoorie, Naini Tal, and Ranikhet. The area now constituting Uttaranchal was a part of Uttar Pradesh state after Indian independence in 1947 until it was made into a separate state in 2000. The population is mostly engaged in agriculture, although tourism is also important.

Uvarov \ü-'vär-əf**, Sergey (Semyonovich), Count** (b. Sept. 5, 1786, Moscow, Russia—d. Sept. 16, 1855, Moscow) Russian administrator. Uvarov served as a diplomat (1806–10), head of the St. Petersburg educational district (1811–22), and deputy minister of education (1832) before being named minister of education in 1833 under Tsar Nicholas I. In an influential report, Uvarov declared that education must adhere to the "principles of orthodoxy, autocracy, and nationality," which was adopted as an ideology rooted in loyalty to dynastic rule, traditional religious faith, and glorification of the Russian homeland. Uvarov was also president of the Academy of Science from 1818 until his death.

uveitis \ˌyü-vē-'ī-təs\ Inflammation of the uvea, the middle coat of the eyeball. Anterior uveitis, involving the iris or ciliary body (containing the muscle that adjusts the lens) or both, can lead to glaucoma and blindness. Posterior uveitis, involving the choroid (which contains the eye's blood supply), can cause bleeding, lens clouding, and eyeball atrophy. Granulomatous uveitis (persistent inflammation with a grainy surface) causes vision impairment, pain, watery eyes, and sensitivity to light; nongranulomatous uveitis causes less pain and sensitivity, with a better chance of recovery. Causes include generalized infections and other diseases, allergic reactions, and injury. Rarely, the uninjured eye also has symptoms, with a risk of blindness in both eyes. Treatment aims to eliminate infection, reduce inflammation, and preserve vision.

Uxmal \üz-'mäl, üsh-'mäl\ Ancient city, Yucatán state, southeastern Mexico. It was the chief city of the later Maya empire (600–c. 900 AD). After c. 1000, major construction in the city ceased, although it continued to be occupied and was a participant in the political League of Mayapan. When the league ended, Uxmal, like the other great cities of the north, was abandoned (c. 1450). Maya ruins include a pyramid, palace, and quadrangle.

Uygur See Uighur

Uzbekistan \ùz-ˌbe-ki-'stan\ *officially* **Republic of Uzbekistan** Country, Central Asia. The autonomous republic of Qoraqalpoghiston (Karakalpakstan) is within its borders. Area: 172,700 sq mi (447,400 sq km). Population (2005 est.): 26,593,000. Capital: Tashkent. The Uzbeks constitute three-fourths of the population; Russians, Tajiks, Kazakhs, Tatars, and Karakalpaks make up the remainder. Languages: Uzbek (official), Russian, Tajik, Kazakh. Religions: Islam (predominantly Sunni); also Eastern Orthodox. Currency: sum. Uzbekistan lies largely between the Amu Darya and Syr Darya rivers. Although it contains fertile oases and high mountain ranges in the south and east, almost four-fifths of the country consists of flat, sunbaked lowlands. Two-thirds of the Aral Sea extends into Uzbekistan. It is a major producer and exporter of natural gas and has sizable reserves of petroleum, coal, and various metallic ores. It is a leading grower of cotton and also produces fruits and vegetables and Karakul sheep. It is the main manufacturer of machinery and heavy equipment in Central Asia. It is a republic with one legislative body; its head of state is the president, and the head of government is the prime minister. A grandson of Mongol leader Genghis Khan received the territory as his inheritance in the 13th century. The Mongols ruled over a number of Turkic tribes, who would eventually intermarry with the Mongols to form the Uzbeks and other Turkic peoples of Central Asia. In the early 16th century a federation of Mongol-Uzbeks invaded and occupied settled regions, including an area called Transoxania that would become the permanent Uzbek homeland. By the early 19th century the region was dominated by the khanates of Khiva, Bukhara, and Kokand, all of which eventually succumbed to Russian domination. The Uzbek S.S.R. was created in 1924. In June 1990 Uzbekistan became the first Central Asian republic to declare sovereignty. It achieved full independence from the Soviet Union in 1991. Its economy subsequently became the strongest in Central Asia.

Uzi submachine gun \'ü-zē\ Compact automatic weapon used throughout the world as a police and special-forces firearm. It was named for its designer, Uziel Gal, an Israeli officer who developed it after the Arab-Israeli War of 1948. It is 25.6 in. (650 mm) long with its folding metal butt fully extended. The barrel is only 10 in. (260 mm) long. When loaded with a 25- or 32-round magazine of 9-mm pistol ammunition, it weighs about 9 lbs (4 kg). It has also been made in miniature versions as short as 18 in. (460 mm).

© 2006 Encyclopædia Britannica, Inc.

V-1 missile *or* **flying bomb** *or* **buzz bomb** German MISSILE of World War II. The forerunner of modern CRUISE MISSILES, it was about 25 ft (8 m) long and had a wingspan of about 18 ft (5.5 m). It was launched from catapult ramps or sometimes from aircraft; it carried an explosive warhead of almost 1,900 lbs (850 kg) and had an average range of 150 mi (240 km). More than 8,000 V-1s were launched against London in 1944–45, and a smaller number against Belgium. See also V-2 MISSILE.

V-2 missile German liquid-fueled ballistic MISSILE of World War II, forerunner of modern space LAUNCH VEHICLES (see also ROCKET) and long-range missiles. Developed starting in 1936 under WERNHER VON BRAUN, it was fired against Paris, Great Britain, and Belgium in 1944 and 1945. After the war, the U.S. and the Soviet Union captured large numbers of V-2s and used them in research that led to the development of their missile and space-exploration programs. See also V-1 MISSILE.

Vaal \'väl\ **River** River, South Africa. Rising in Mpumalanga province, it flows west 750 mi (1,210 km), forming part of the boundary between Mpumalanga and Free State provinces, to empty into the ORANGE RIVER in Northern Cape province. It is primarily used for irrigation.

vaccine Preparation containing either killed or weakened live microorganisms or their toxins, introduced by mouth, by injection, or by nasal spray to stimulate production of ANTIBODIES against an infectious agent. This confers IMMUNITY to that agent, since the B LYMPHOCYTES remain sensitized to it and respond to later INFECTION by producing more antibodies. The first vaccine, against SMALLPOX, was introduced by EDWARD JENNER in 1798. Vaccines have been developed against diseases caused by BACTERIA (e.g., TYPHOID, WHOOPING COUGH, TUBERCULOSIS) and by VIRUSES (e.g., MEASLES, INFLUENZA, RABIES, POLIOMYELITIS). Effectiveness varies, and a small percentage of people have adverse reactions. Those with IMMUNODEFICIENCY disorders should not receive live vaccines.

vacuole \'vak-yə-ˌwōl\ Space within a cell that is empty of CYTOPLASM, lined with a membrane, and filled with fluid. Especially in PROTOZOANS, vacuoles perform functions such as storage, ingestion, digestion, excretion, and expulsion of excess water. The large central vacuoles often found in plant cells enable them to attain a large size without accumulating the bulk that would make metabolism difficult.

vacuum Space in which there is no MATTER or in which the PRESSURE is so low that any particles in the space do not affect any processes being carried on there. It is a condition well below normal ATMOSPHERIC PRESSURE and is measured in units of pressure (the pascal). A vacuum can be created by removing air from a space using a vacuum pump or by reducing the pressure using a fast flow of fluid, as in BERNOULLI'S PRINCIPLE.

vacuum tube Electron tube consisting of a sealed glass or metal enclosure from which the air has been withdrawn. It was used in early electronic circuitry to control a flow of electrons. In the first half of the 20th century, vacuum tubes allowed the development of radio broadcasting, long-distance telephone service, television, and the first electronic digital computers, which were the largest vacuum-tube systems ever built. TRANSISTORS have replaced them in virtually all applications, but they are still occasionally used in display devices for television sets and computers (CATHODE-RAY TUBES), in microwave ovens, and as high-frequency transmitters on space satellites.

Vadim \vä-'dēm\ **(Plemiannikov), Roger** (b. Jan. 26, 1928, Paris, France—d. Feb. 11, 2000, Paris) French film director. After working briefly as a stage actor in the mid-1940s, he began his film career as an assistant on *Juliette* (1953). He directed and cowrote the highly successful erotic film *And God Created Woman* (1956), which established his wife, BRIGITTE BARDOT, as a sex symbol. He duplicated this winning formula with two later wives, Annette Stroyberg in *Dangerous Liaisons* (1959) and JANE FONDA in *Barbarella* (1968), and his lover, CATHERINE DENEUVE, in *Vice and Virtue* (1962).

Vadodara \və-'dō-də-ˌrä\ *or* **Baroda** \bə-'rō-də\ City (pop., 2001 prelim.: 1,306,035), southeastern GUJARAT state, west-central India. It was known by many different names before receiving its present one in 1971. The earliest record of the city dates from a charter of AD 812, and during the succeeding centuries it came under various rulers, including those of the Muslim Delhi sultanate and the MUGHAL DYNASTY. Its varied products include cotton textiles, chemicals, machinery, and furniture.

Vaduz \fä-'düts\ City (pop., 1997 est.: 5,000), capital of Liechtenstein. Located on the RHINE RIVER, it was greatly damaged in 1499 in a war between the Swiss and Holy Roman Emperor MAXIMILIAN I, but it was subsequently rebuilt. The Liechtenstein family gained possession in the early 18th century. It is a flourishing tourist centre and the residence of the ruling prince, whose castle overlooks the town. The town's Fürst Liechtensteinische Gemäldegalerie displays parts of the world-famous art collection of the princes of Liechtenstein.

Vaganova \və-'gä-nə-və**, Agrippina (Yakovlevna)** (b. July 6, 1879, St. Petersburg, Russia—d. Nov. 5, 1951, Leningrad) Russian ballet dancer and teacher. In 1897 she joined the MARIINSKY THEATRE company, where she worked until 1917. She began teaching at the Leningrad Choreographic (formerly Imperial Ballet) school in 1921 and became its director in 1934. Her system of ballet instruction combined classic technique with the athletic, acrobatic post-Revolution style. She wrote the widely used textbook *Fundamentals of the Classic Dance* (1934).

vagina \və-'jī-nə\ Genital canal in females. Together with the cavity of the UTERUS, it forms the birth canal. In most virgins, its external opening is partially closed by a thin fold of tissue (hymen), which has various forms, not all of which significantly obstruct the opening. The vagina's lining thickens and thins during the menstrual cycle (see MENSTRUATION) in response to ESTROGEN from the OVARIES, being thickest and most elastic during ovulation and pregnancy. Its normally slightly acid environment discourages disease-causing microorganisms. Thick, elastic muscle walls accommodate movement of the penis during intercourse and passage of a child during delivery. A mucuslike fluid seeps through them for lubrication during sexual arousal. Vaginal disorders include bacterial and fungal infections (e.g., SEXUALLY TRANSMITTED DISEASES, CANDIDA), VAGINITIS, sores (see ULCER), and PROLAPSE.

vaginitis \ˌva-jə-'nī-təs\ INFLAMMATION of the VAGINA. The chief symptom is a whitish or yellowish vaginal discharge. Treatment depends on the cause: appropriate drugs for SEXUALLY TRANSMITTED DISEASES (often from *Gardnerella* bacteria or TRICHOMONADS) or YEAST infections; ESTROGEN cream for atrophy of the vaginal lining, which may dry out after MENOPAUSE; and avoidance of any chemicals found to trigger irritation or allergy.

vagrancy Act of wandering about without employment or identifiable means of support. Traditionally a vagrant was thought to be one who was able to work for his maintenance but preferred instead to live idly, often as a beggar. Punishment ranged from branding and whipping to conscription into the military services and transportation to penal colonies. In the U.S., laws against vagrancy were used by police and prosecutors to proscribe a wide range of behaviours. Many such laws were struck down as unconstitutionally vague, thus largely decriminalizing vagrancy, though in the 1990s many local laws were implemented to curtail aggressive panhandling, begging, and other activities by vagrants on city streets.

Váh \'väk̲\ **River** River, western Slovakia. Rising in the Tatra Mountains, it flows west and south for 242 mi (390 km) before entering the DANUBE RIVER at Komárno. There are numerous hydroelectric-power stations along it.

Vail Town (pop., 2000: 4,531), west-central Colorado, U.S. Located in the ROCKY MOUNTAINS west of DENVER, it was founded as a resort town in 1962 and built in the style of an Alpine village. The skiable terrain around Vail Mountain extends for 15 sq mi (39 sq km), making Vail the largest ski resort in North America.

Vairocana \vī-'rō-chə-nə\ In MAHAYANA and tantric BUDDHISM, the supreme buddha who is the cosmic counterpart of SAKYAMUNI in his teaching mode. He is the most prominent of the five self-born bud-

Dainichi Nyorai ("Great Sun Buddha") by Unkei, lacquered wood sculpture, 1175; in the Enjō-ji, Nara, Japan

dhas, those who were born as humans to propagate the DHARMA. Though without canonical basis, Vairocana holds a special place in Tibetan BUDDHISM and has a special role in the AVATAMSAKA-SUTRA, in which he is the solar buddha who is both the ultimate reality of the cosmos and the one who pervades its component parts.

Vaisheshika \vī-'shā-shi-kə\ One of the six orthodox systems, or DARSHANS, of Indian philosophy. Founded c. 2nd–3rd century AD, it fused with NYAYA in the 11th century, forming the Nyaya-Vaisheshika school. Vaisheshika attempts to identify, inventory, and classify the entities that present themselves to human perception. It lists seven categories of being. It holds that the universe's smallest, indivisible, indestructible unit is the atom, which is made active through God's will, and that all physical things are a combination of the atoms of earth, water, fire, and air.

Vaishnavism \'vīsh-nə-ˌvi-zəm\ Worship of VISHNU as the supreme deity, as well as of his incarnations, mainly RAMA and KRISHNA. Vaishnavism is one of the major forms of modern HINDUISM, along with SHAIVISM and SHAKTISM, and is probably the most popular and most widely practiced. Characterized by an emphasis on BHAKTI, its goal is to escape from the cycle of birth and death in order to enjoy the presence of Vishnu. The philosophical schools into which Vaishnavism is divided are distinguished by their varying interpretations of the relationship between individual souls and God, and include aspects of MONISM and DUALISM.

Vaishya \'vīsh-yə\ Third highest of the four VARNAS of India. Traditionally described as commoners, Vaishyas are connected with productive labour, such as trade, agriculture, and pastoralism. According to legend, they sprang from the thighs of PRAJAPATI, after the BRAHMANS and the KSHATRIYAS but before the SHUDRAS. Like the two higher classes, they are "twice-born" (see UPANAYANA). They are credited historically with favouring the rise of the reformist religious beliefs of BUDDHISM and JAINISM. In modern times they have become a symbol of middle-class prestige, and many rise to higher classes.

Vajiravudh \ˌvä-jē-rä-'vüd\ *or* **Phramongkutklao** \ˌprä-ˌmōŋ-kůt-'klaů\ *or* **Rama VI** (b. Jan. 1, 1881, Bangkok, Siam—d. Nov. 26, 1925, Bangkok) King of Siam (Thailand; 1910–25). Educated at Oxford, Vajiravudh undertook numerous social reforms as king, including making monogamy the only legal form of marriage. In 1921 he made primary education free and compulsory. He alienated both liberals and conservatives at home but was successful in foreign policy, restoring full fiscal autonomy to Siam. A prolific writer and translator, he introduced Western forms to Thai literature, translated WILLIAM SHAKESPEARE's works, and composed about 50 original plays.

Vajpayee, Atal Bihari (b. Dec. 15, 1924, Gwalior, Madhya Pradesh, India) Leader of India's pro-Hindu BHARATIYA JANATA PARTY (BJP) and prime minister of India in 1996 and from 1998 to 2004. Politically active as a teenager, he was briefly jailed by British colonial authorities. He was first elected to parliament in 1957 as a member of the Bharatiya Jana Sangh, a forerunner of the BJP. He served as foreign minister in the late 1970s and helped formally establish the BJP in 1980. In 1992 he was one of the few Hindu leaders to speak out against the destruction of the historic Babri Masjid mosque by anti-Muslim extremists. Elected prime minister in May 1996, he was unable to form a government and resigned after 13 days. In 1998 and 1999 he was again elected prime minister as head of a BJP-led coalition. In May 1998 nuclear weapons tests ordered by Vajpayee drew international condemnation and economic sanctions. In 2000 his government began an extensive program of divestment of public funds from several key state-run industries. Under his leadership India achieved steady economic growth and became a world leader in information technology. In 2004 his coalition was defeated in parliamentary elections, and he resigned from office.

vajra \'vəj-rə\ Five-pronged ritual object extensively employed in the ceremonies of TIBETAN BUDDHISM. It is fashioned out of brass or bronze, the four prongs at each end curving around the central fifth to form a lotus-bud shape. In Sanskrit the word means both thunderbolt and diamond: like a thunderbolt it cuts through ignorance, and like a diamond it destroys but is itself indestructible. Originally a symbol of INDRA, it was used to conquer the non-Buddhist deities of Tibet. In ritual use, it is often employed in conjunction with a bell in the execution of MUDRAS.

Vajrayana \ˌvəj-rə-'yä-nə\ Form of tantric BUDDHISM that emerged in India in the first millennium AD and spread to Tibet, where it is the predominant tradition in TIBETAN BUDDHISM. Philosophically, Vajrayana is a blend of the YOGACARA and MADHYAMIKA disciplines. It aims to recapture the enlightenment experience of the BUDDHA Gautama, and it places special emphasis on the notion that enlightenment arises from the realization that seemingly opposite principles are in truth one. It introduced innovations involving the use of MANTRAS and MANDALAS as aids to meditation, and, in rare cases, the use of yogically disciplined sexual activities.

Vakataka \'vä-kə-tə-kə\ **dynasty** Indian ruling house that originated in the central Deccan in the mid-3rd century AD. The Vakataka empire is believed to have extended from Malwa and Gujarat in the north to the Tungabhadra in the south and to have spanned the peninsula from west to east. In the 4th century the Vakatakas were allied by marriage to the GUPTA DYNASTY, and Gupta cultural influence was significant. The Vakatakas are noted for having encouraged arts and letters.

Valdemar \'vål-də-mär\ **I** *known as* **Valdemar the Great** (b. Jan. 14, 1131, Denmark—d. May 12, 1182, Denmark) King of Denmark (1157–82). On ascending the throne, he ended more than 25 years of civil wars, and he defeated the Wends (Slavs) by 1169, freeing Danish ships from piracy. He acknowledged the overlordship of FREDERICK I Barbarossa and accepted his antipope Victor IV; he later acknowledged Pope ALEXANDER III (c. 1165) and rejected Frederick. He gained church approval for hereditary rule by his dynasty, the Valdemars, and in 1181 he allied with Frederick as an equal, aided by the marriage of their children.

Valdemar IV Atterdag \'åt-tər-ˌdåg\ (b. c. 1320, Denmark—d. Oct. 24, 1375, Schleswig) King of Denmark (1340–75). A son of King Christopher II, he sought to free Danish lands from foreign domination. He sold Estonia (1346), gained control of Zealand (1349), and subdued a revolt in Jutland (1350). By regaining Skåne from Sweden, he completed the reunification of his father's kingdom (1360). His aggressive foreign policy led to conflict with Sweden, North German principalities, and the HANSEATIC LEAGUE, which defeated him in 1368, forcing him to concede trading privileges but allowing his kingdom to remain intact. The marriage of his daughter Margaret to the Norwegian king Haakon VI made possible the unification of Denmark and Norway.

Valdes \vål-'des\ *or* **Peter Waldo** (d. c. 1205) French religious leader. A successful merchant, Valdes (Peter Waldo was a later form of his name) underwent a religious conversion, gave away his wealth, and began to preach a doctrine of voluntary poverty in Lyon around 1170. In 1179 his vow of poverty was confirmed by Pope ALEXANDER III, but he was subsequently forbidden to preach by Pope Lucius III. In 1182 or 1183 Valdes and his followers—called the Poor, or the Poor of Lyon—were excommunicated for violating the ban on preaching and were banished from the city. They were formally condemned at a church council in 1184 along with other heretics, including the CATHARI, against whom Valdes had earlier preached. The severe persecution of the so-called WALDENSES in the 13th century forced them to begin traveling and teaching in secret. During the Protestant REFORMATION, the Waldenses accepted Genevan forms of worship and church organization.

Valdés Leal \bäl-'dās-lē-'äl**, Juan de** (b. May 4, 1622, Sevilla, Spain—d. Oct. 15, 1690, Sevilla) Spanish painter. Son of a Portuguese father, he was educated in Córdoba and worked there and in Sevilla. After the death of BARTOLOMÉ ESTEBAN MURILLO, he was Sevilla's leading painter. His early works are marked by exotic colours, dramatic lighting, and vigorous brushstrokes. Later paintings such as *Vanitas* (1660) and *Triumph of Death* (1672) are characterized by their macabre subject matter, dynamic energy, and theatrical violence.

Valdivia \val-'dē-vē-ə**, Pedro de** (b. c. 1498, Extremadura, Spain—d. January 1554, Tucapel, Viceroyalty of Peru) Spanish conquistador. After serving with the Spanish army in Italy and Flanders, he was sent to South America in 1534, where he served under FRANCISCO PIZARRO in Peru. In 1540 he led an expedition of 150 Spaniards into Chile, where he defeated a large force of Indians and founded Santiago in 1541. He extended Spanish rule south to the Bío-Bío River in 1546, fought again in Peru (1546–48), and returned to Chile as governor in 1549. He began to conquer Chile south of the Bío-Bío and founded Concepción in 1550. He was killed in a campaign against the Araucanian Indians.

valence \'vā-ləns\ Number of bonds (see BONDING) an ATOM can form. Hydrogen (H) always has valence 1, so other ELEMENTS' valences equal the

© 2006 Encyclopædia Britannica, Inc.

number of hydrogen atoms they combine with. Thus, oxygen (O) has valence 2, as in water (H_2O); nitrogen (N) has valence 3, as in ammonia (NH_3); and chlorine (Cl) has valence 1, as in hydrochloric acid (HCl). The valence depends on the number of unpaired ELECTRONS in the outermost (and, in TRANSITION ELEMENTS, the next) shell of the atom's structure. The sharing of the unpaired (valence) electrons in a bond mimics the stable configuration of the NOBLE GASES, whose outer shells are full. Elements that can achieve stable configurations by various combinations have more than one valence.

Valencia Autonomous community (pop., 2001: 4,162,776), eastern Spain. Encompassing the provinces of Alicante, Castellón, and Valencia, it covers 8,979 sq mi (23,255 sq km); its capital is the city of VALENCIA. A generally mountainous region with salt lagoons on the coast, the area was conquered successively by Romans, Visigoths, and Moors. Part of the caliphate of CÓRDOBA (11th century), it subsequently became an independent Moorish kingdom. It was held by the Spanish commander the CID (1094–99); after the Cid's death Valencia again was lost to the Moors, until King James I of ARAGON took it in 1238. One of the richest farming regions in the Mediterranean basin, it produces oranges, rice, grapes, and olives; it also has many manufacturing facilities.

Valencia City (pop., 2001: city, 738,441; metro. area, 1,397,809), capital of the autonomous community of VALENCIA, eastern Spain. First mentioned as a Roman settlement in 138 BC, it was later taken by the Visigoths in AD 413 and the Moors in 714. It became the seat of the newly established independent Moorish kingdom of Valencia in 1021. After 1238 it was part of the dominions of ARAGON. The first Spanish printing press was established in Valencia in 1474; during the next two centuries the city was the seat of the Valencian school of painting. It was severely damaged in the PENINSULAR WAR, during the SPANISH CIVIL WAR, and by flood in 1957. Its port ships agricultural produce and manufactured items.

Valencia City (pop., 2000 est.: 1,338,833), northwestern Venezuela. It is located near the western shore of Lake VALENCIA. Founded in 1555, it rivaled CARACAS as the region's major city well into the 19th century. In 1814, during the struggle for Venezuela's independence, it was the site of a bloody battle between Spanish and opposition forces. It served as national capital in 1812, 1830, and 1858. One of Venezuela's principal industrial and transportation centres, it produces textiles, pharmaceuticals, and automobiles.

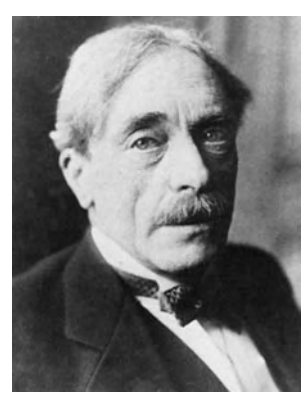
Valencia, Lake *formerly* **Tacarigua** \ˌtä-kä-ˈrē-gwä\ Lake, Carabobo and Aragua states, northern Venezuela. Its total area of 141 sq mi (364 sq km) makes it the second largest natural lake in Venezuela, after Lake MARACAIBO. It lies in an agricultural region and popular resort area.

Valens (b. c. AD 328—d. Aug. 9, 378) Eastern Roman emperor (364–378). His older brother, VALENTINIAN I, appointed Valens to be coemperor and assigned him to rule the eastern part of the empire, while Valentinian took the throne in the West. An Arian Christian, Valens persecuted Catholics and waged war on the pagan Procopius (366), the VISIGOTHS (367–369), and the Persians (c. 376). When the Visigoths again rebelled against the Romans, Valens's poor tactics led to his defeat and death in the great Battle of ADRIANOPLE.

Valentine, Saint (d. 3rd century, Rome; feast day February 14) Christian martyr whose legend inspired the lover's holiday Valentine's Day. According to tradition, he was a Roman priest and physician who died during the persecution of Christians by the emperor Claudius II Gothicus and was buried on the Via Flaminia. The priest signed a letter to his jailer's daughter, whom he had befriended and with whom he had fallen in love, "from your Valentine." The legend of the bishop of Terni, Italy—also called Valentine and also martyred in Rome—may refer to the same person.

Valentine's Day Lovers' holiday celebrated on February 14, the feast day of St. Valentine, one of two 3rd-century Roman martyrs of the same name. St. Valentine is considered the patron of lovers and especially of those unhappily in love. The feast day became a lovers' festival in the 14th century, probably as an extension of pagan love festivals and fertility rites celebrated in mid-February. Today it is marked by the exchange of romantic cards (valentines), flowers, and other gifts.

Valentinian I \ˌva-lən-ˈti-nē-ən\ *in full* **Flavius Valentinianus** (b. AD 321, Cibalae, Pannonia—d. Nov. 17, 375, Brigetio, Pannonia Inferior) Roman emperor (364–375). He served in the military in Africa under his father. Proclaimed emperor by the army, he made his brother VALENS ruler in the East while he ruled the West. Both showed religious toleration. Valentinian defeated the Alemanni in Gaul in 365, then moved to support the defense of Britain. He named his nine-year-old son GRATIAN coemperor (367) to ensure succession. In Germany he fortified the Rhine; he went on to fight the Quadi in Pannonia, where he fell sick and died. Despite his achievements, he was known for his cruelty and poor choice of ministers.



Valentino, Rudolph *orig.* **Rodolfo Guglielmi di Valentina d'Antonguolla** (b. May 6, 1895, Castellaneta, Italy—d. Aug. 23, 1926, New York, N.Y., U.S.) Italian-born U.S. film actor. He immigrated to the U.S. in 1913 and worked as a dancer before moving to Hollywood in 1918. He played small parts in movies until his role in *The Four Horsemen of the Apocalypse* (1921) made him a star. His popularity, promoted by skillful press agents, soared among women as he played the handsome, mysterious lover in romantic dramas such as *The Sheik* (1921), *Blood and Sand* (1922), *The Eagle* (1925), and *The Son of the Sheik* (1926). His sudden death at 31 from a ruptured ulcer caused worldwide hysteria, several suicides, and riots at his funeral.

Valera, Eamon de See Eamon DE VALERA

Valerian *Latin* **Publius Licinius Valerianus** (d. AD 260) Roman emperor (253–260). He served as consul under SEVERUS ALEXANDER (r. 222–235). Later a commander on the upper Rhine, he supported the emperor Gallus (r. 251–253) in the conflict with a rival emperor but arrived with his legions too late to save Gallus from death at the hands of his own troops. Elected emperor by his soldiers (253), Valerian renewed the persecution of the Christians and executed Pope Sixtus II in 258. After appointing his son PUBLIUS LICINIUS GALLIENUS to rule the western part of the empire, he marched east to repel the Persian invasion. At first successful, he was later defeated by the Persian king Shapur I and died in captivity.

valerian Any of the more than 400 species of annual and perennial herbaceous plants in about 10 genera that make up the family Valerianaceae. A few are outstanding as ornamentals, salad or potherbs, or as sources of medicines and perfumes. Greek valerian is Jacob's ladder (*Polemonium caeruleum*), in the family Polemoniaceae. The true valerians (native to the temperate zones, the Andes Mtns., and Africa) have tubular flowers, often spurred at the base and clustered in tight heads. The largest genus, *Valeriana*, contains about 200 species and is best known for common valerian (*V. officinalis*), used by modern herbalists to calm the nerves.

Valéry \ˌva-lə-ˈrē**, (Ambroise-) Paul (-Toussaint-Jules)** (b. Oct. 30, 1871, Sète, France—d. July 20, 1945, Paris) French poet, essayist, and critic. A student of law, Valéry wrote many poems during 1888–91, some published in magazines of the SYMBOLIST MOVEMENT. After 1894 he wrote daily in his notebooks, later published as the famous *Cahiers*. He revised his early work to create his greatest poem, *La Jeune Parque* (1917). It was followed by *Album de vers anciens, 1890–1900* (1920) and *Charmes ou poèmes* (1922), containing "Le Cimetière marin," which established him as the outstanding French poet of his time. His works are typically variations on the theme of the tension within the human consciousness between the desire for contemplation and the will to action. He later became a prominent public personage, writing many essays and occasional papers on literary topics and taking a great interest in science and political problems.

Paul Valéry.
EB INC.

Valhalla \val-ˈha-lə, väl-ˈhä-lə\ In GERMANIC RELIGION, the hall of slain warriors who live blissfully under the leadership of ODIN. Valhalla is depicted as a splendid palace, roofed with shields, where the warriors feast on the flesh of a boar slaughtered daily and made whole again each evening. They drink liquor that flows from the udders of a goat, and their sport is to fight one another every day, with the slain being revived in the evening. Thus they will live until the RAGNAROK, when they will leave Valhalla to fight at the side of Odin against the Giants. See also ASGARD, FREYJA, VALKYRIE.

© 2006 Encyclopædia Britannica, Inc.

validity In LOGIC, the property of an argument consisting in the fact that the truth of the premises logically guarantees the truth of the conclusion. Whenever the premises are true, the conclusion must be true, because of the form of the argument. Some arguments that fail to be valid are acceptable on grounds other than formal logic (e.g., inductively strong arguments), and their conclusions are supported with less than logical necessity. Where the support yields high probability of the conclusion relative to the premises, such arguments are sometimes called inductively valid. In other purportedly persuasive arguments, the premises actually provide no rational grounds for accepting the conclusion; such defective forms of argument are called fallacies (see FALLACY, FORMAL AND INFORMAL).

valine \'va-ˌlēn, 'vā-ˌlēn\ One of the essential AMINO ACIDS, found in most PROTEINS. Produced industrially by HYDROLYSIS of proteins or by chemical synthesis, it is used in biochemical and nutritional research and as a dietary supplement.

Valium Trademark for a preparation of diazepam. A tranquillizing drug used to treat anxiety and tension states and as an aid in sedation, first introduced in 1963, it belongs to the group of chemically related compounds called benzodiazepines, the first of which was synthesized in 1933. Side effects include drowsiness and muscular incoordination; physical dependence can result after prolonged use. The discovery of Valium and similar drugs led to a new era in psychopharmacology.

Valkyrie \val-'kir-ē, 'val-kə-rē\ In GERMANIC RELIGION, any of a group of maidens sent by ODIN to select slain warriors worthy of a place in VALHALLA. They rode to the battlefield on horses or, in some accounts, flew through the air and sea. Some had the power to cause the death of warriors they disliked; others guarded the lives and ships of those they favoured. According to various myths, they were either purely supernatural or human with supernatural powers; they were associated with fairness, brightness, and gold as well as with bloodshed.

Valla \'väl-lä**, Lorenzo** (b. 1407, Rome, Papal States—d. Aug. 1, 1457, Rome) Italian humanist, philosopher, and literary critic. Unable to find a post as a papal secretary, Valla left Rome in 1430 and spent five years traveling in northern Italy. He was royal secretary and historian for ALFONSO V of Aragon (1435–48). In his polemical style, he criticized the works of BOETHIUS (for his viewpoint), ARISTOTLE (for his "barbarisms," among other things), and CICERO (for his prose style). Found heretical by the INQUISITION for his refusal to believe that the Apostles' Creed was composed by the 12 Apostles, he narrowly avoided being burned at the stake. His *Elegantiae linguae Latinae* (printed 1471; "Elegances of the Latin Language") was the first textbook of Latin grammar written since late antiquity. His *Annotations on the New Testament* (printed 1505) was his last major work.

Valladolid \ˌva-lə-də-'lid,\ *Spanish* \ˌbäl-yä-thō-'lēth\ City (pop., 2001: 316,580), capital of the autonomous community of CASTILE-LEÓN, Spain. First mentioned in 1074, it was the seat of the Castilian court until c. 1600. The Catholic Monarchs, ISABELLA of Castile and FERDINAND of Aragon, were married there in 1469. It suffered heavy damage by fire in 1561 and by the French during the PENINSULAR WAR. Industry and commerce are economic mainstays. It has many medieval buildings, and its university (founded 1346) is one of Spain's oldest. CHRISTOPHER COLUMBUS died in Valladolid in 1506.

Vallandigham \və-'lan-di-gəm**, Clement L(aird)** (b. July 29, 1820, Lisbon, Ohio, U.S.—d. June 17, 1871, Lebanon, Ohio) U.S. politician. He served in the U.S. House of Representatives (1857–63), where he became a leader of the antiwar COPPERHEADS and the secret Knights of the Golden Circle (later Sons of LIBERTY). As a result of his vociferous criticism of Pres. ABRAHAM LINCOLN's administration and its pursuit of the American Civil War, he was arrested and found guilty of treasonable sentiments (1863) and was sentenced to exile in the South. He soon made his way to Canada and later illegally to Ohio. While in Canada he was nominated for governor by the Ohio Peace Democrats, but he was easily defeated. He later criticized the RECONSTRUCTION policy of the Republicans as both unconstitutional and tyrannical.

Valle d'Aosta \ˌvä-lā-dä-'ōs-tə\ Autonomous region (pop., 2001 prelim.: 119,356), northwestern Italy. Covering an area of 1,259 sq mi (3,262 sq km), it is enclosed on three sides by the ALPS; the capital is AOSTA. Originally the territory of the Celtic Salassi, it was annexed by the Romans. After the fall of the Western Roman Empire in the 5th century, it formed part of the Burgundian and Frankish kingdoms. It was acquired in the 11th century by the house of SAVOY. The autonomous region of Valle d'Aosta was created in 1945, in recognition of the area's special French linguistic and cultural orientation. It is important for dairy products and tourism.

Valle-Inclán \'bäl-yā-ēŋ-'klän**, Ramón María del** *orig.* **Ramón Valle y Villanueva de Arosa** (b. Oct. 28, 1866, Villanueva de Arosa, Spain—d. Jan. 5, 1936, Santiago de Compostela) Spanish novelist, playwright, and poet. Early on he was influenced by the SYMBOLIST MOVEMENT, and his first four works, collectively called the *Sonatas* (1902–05), are evocatively written in a tone of refined and elegant decadence. Some later plays and novels take an intentionally absurdist and cruelly satiric tone to express what he saw as the Spanish deformation of European civilization; representative are the play *Bohemian Lights* (1921) and the novel *The Court of Miracles* (1927).

Vallee \'val-ē**, Rudy** *orig.* **Hubert Prior Vallée** (b. July 28, 1901, Island Pond, Vt., U.S.—d. July 3, 1986, North Hollywood, Calif.) U.S. singer and entertainer. He performed as a musician while at Yale University and in 1928 formed a dance band, the Yale Collegians (later the Connecticut Yankees). A singing bandleader, he used his trademark megaphone to amplify his suave, light-toned voice. He made his screen debut in *The Vagabond Lover* (1929) and evolved into a light comedian and character actor. On radio he hosted the first major network variety hour, *The Rudy Vallee Show* (1929–43), and discovered new talent such as Alice Faye and EDGAR BERGEN.

Vallejo \və-'lā-ō\ City (pop., 2000: 116,760), western California, U.S. It is located on San Pablo Bay, near OAKLAND. Settled in 1850, it served as the state capital for seven days in January 1852 and for a month in 1853. The Mare Island Naval Shipyard (established 1854; closed 1996) ensured the city's survival. It is now a commuter and transportation hub for the North Bay Area. It is home to the California Maritime Academy (founded 1929).

Valletta \və-'le-tə\ Seaport city (pop., 1999 est.: 7,100), capital of MALTA. It is located on a rocky promontory with harbours on either side. Built after the Great Siege of Malta (1565), which checked the advance of OTTOMAN power in southern Europe, it was named after Jean Parisot de la Valette, grand master of the KNIGHTS OF MALTA. It became the Maltese capital in 1570. After 1814 it was made the principal base of the British Mediterranean naval fleet and remained important through World War II, during which it suffered heavy damage from bombing raids. Several 16th-century buildings still exist. The city's economy relies mainly on trade and tourism.

valley Elongate depression of the Earth's surface. Valleys are commonly drained by rivers and may be in a relatively flat plain or between ranges of hills or mountains. Valleys formed by rivers and slope denudation are typically V-shaped; those formerly occupied by glaciers are characteristically U-shaped. Valley evolution is controlled mainly by climate and rock type. Very narrow, deep valleys cut in resistant rock and having steep, almost vertical sides are called canyons. Smaller valleys of similar appearance are called gorges.

Valley Forge National Historical Park Preserve, southeastern Pennsylvania, U.S. The 3,468-ac (1,404-ha) park commemorates the site where Gen. GEORGE WASHINGTON camped with his Continental Army in the winter of 1777–78 during the AMERICAN REVOLUTION. The park was established in 1976.

Valley of the Kings See Valley of the KINGS

Valois \vȧl-'wä\ Medieval county and duchy, northern France. It corresponds to the southeastern quarter of the modern *département* of Oise, with an adjacent portion of Aisne. It was under the Merovingian kings (c. 500–751) and their successors, the Carolingians, until it became a hereditary countship. In 1214 King PHILIP II AUGUSTUS annexed it to the royal domain. The duchy's last representative, Henry III, was succeeded in 1589 by the house of BOURBON. In 1790 it was abolished in the redivision of France into *départements*.

buildings have survived a succession of pirate raids, storms, fires, floods, and earthquakes. After Chilean independence in 1818, the city's port developed with the growth of the Chilean navy. In 1884 a treaty was signed there by which Bolivia ceded to Chile a coastal region containing principal nitrate deposits (see War of the Pacific). As Chile's principal seaport, it handles the bulk of the country's imports, and it is still a naval facility. It also produces chemicals and textiles. Chile's bicameral parliament, the National Congress, has been situated there since it was reestablished in 1990.

value-added tax (VAT) Government levy on the amount a firm adds to the price of a goods or services as value is added—that is, at each step of their production and distribution. In the most common method of calculation, the seller subtracts the sum of taxes paid on items being purchased from the sum of all taxes that have been collected on the items being sold; the net tax liability is the difference between the tax collected and the tax paid. The burden of the value-added tax, like that of other sales taxes, tends to be passed on to the consumer. To limit the VAT's regressiveness, most countries set lower rates for consumer necessities than for luxury items. In 1954 France became the first country to adopt the value-added tax on a large scale. Though complex to calculate, the tax served as an improvement on earlier systems by which a product was taxed repeatedly at every stage of production and distribution. It has since been adopted throughout much of Europe and in many countries in South America, Asia, and Africa. All European Union member countries have a VAT. See also regressive tax.

valve In mechanical engineering, a device for controlling the flow of fluids (liquids, gases, slurries) in a pipe or other enclosure. It exerts control by means of a movable element that opens, shuts, or partially blocks an opening in a passageway. Valves are of seven main types: globe, gate, needle, plug (cock), butterfly, poppet, and spool. Some valves operate automatically; check (or nonreturn) valves, for example, are self-acting valves that permit flow in only one direction. Safety valves open at a predetermined pressure; the movable element usually has a weighted lever or a spring strong enough to hold the valve closed until a particular pressure is reached.

A globe valve controls the flow of a fluid through a pipe, inlet, or outlet. To stop the flow completely, the threaded stem is turned to lower a sealing gasket onto the seat.

vampire In popular legend, a bloodsucking creature that rises from its burial place at night, sometimes in the form of a bat, to drink the blood of humans. By daybreak it must return to its grave or to a coffin filled with its native earth. Tales of vampires are part of the world's folklore, most notably in Hungary and the Balkan Peninsula. The disinterment in Serbia in 1725 and 1732 of several fluid-filled corpses that villagers claimed were behind a plague of vampirism led to widespread interest and imaginative treatment of vampirism throughout western Europe. Vampires are supposedly dead humans (originally suicides, heretics, or criminals) who maintain a kind of life by biting the necks of living humans and sucking their blood; their victims also become vampires after death. These "undead" creatures cast no shadow and are not reflected in mirrors. They can be warded off by crucifixes or wreaths of garlic and can be killed by exposure to the sun or by an oak stake driven through the heart. The most famous vampire is Count Dracula from Bram Stoker's novel *Dracula* (1897).

Bela Lugosi with Frances Dade in *Dracula* (1931).

vampire bat Any of three species (family Desmodontidae) of tailless, brown, blood-eating bats native to the New World tropics. They grow to 2–3.5 in. (6–9 cm) long and weigh 0.5–2 oz (15–50 g). They run swiftly and leap with agility. They live in colonies in caves, hollow trees, and culverts, leaving after dark to forage low on the ground. They feed on quietly resting birds and mammals, including the occasional human, making a small cut with their sharp incisor teeth, often without disturbing the prey, and lapping the blood. The wounds are not serious but may transmit rabies or other diseases.

Van City (pop., 1997: 226,965), eastern Turkey, on the eastern shore of Lake Van. The ruins of stone buildings there date from the 8th century BC, when it was the chief centre of the kingdom of Urartu. After the fall of Nineveh (612 BC), it was occupied in succession by the Medes, the kings of Pontus, Arabs (7th century AD), and Armenians (8th century AD). It fell to the Seljūq dynasty after 1071 AD and to the Ottoman Empire in 1543. Russian forces held it (1915–17) during World War I. It has a large Kurdish population. It once had a large Armenian population that was brutally expelled following the war (see Armenian massacres). Van is a shipping point for hides, grains, fruits, and vegetables.

Van, Lake Salt lake, eastern Anatolia. The largest lake in Turkey, it covers an area of 1,434 sq mi (3,713 sq km) and is more than 74 mi (119 km) across at its widest point. Its greatest depth exceeds 330 ft (100 m). It is fed by precipitation and meltwater as well as by several small tributaries. It has no apparent outlet, and its brackish waters are unsuitable for either drinking or irrigation.

Van Allen radiation belts Two doughnut-shaped zones of highly energetic charged particles (see electric charge) trapped at high altitudes in Earth's magnetic field. Named for James A. Van Allen (b. 1914), who discovered them in 1958, they are most intense over the Equator and effectively absent above the poles. The two zones merge gradually, with the flux of charged particles showing two regions of maximum density. The inner one, mostly protons thought to be produced by primary cosmic rays striking the atmosphere, is centred about 3,700 mi (6,000 km) above Earth's surface. The outer region includes some helium ions from the solar wind and is centred about 12,500 mi (20,000 km) above Earth's surface. Intense solar activity (see solar cycle) causes disruptions of the belts, linked in turn with such phenomena as auroras and magnetic storms.

Van Buren, Martin (b. Dec. 5, 1782, Kinderhook, N.Y., U.S.—d. July 24, 1862, Kinderhook) Eighth president of the U.S. (1837–41). He served in the New York Senate (1812–20) and as state attorney general (1816–19). An informal group of his political supporters came to be known as the Albany Regency because they dominated state politics even while Van Buren was in Washington. He was elected to the U.S. Senate (1821–28), where he supported states' rights and opposed a strong central government. After John Quincy Adams became president, he joined with Andrew Jackson and others to form a group that later became the Democratic Party. He was elected governor of New York (1828) but resigned to become U.S. secretary of state (1829–31). He was nominated for vice president at the first Democratic Party convention (1832) and served under Jackson (1833–37). As Jackson's chosen successor, he defeated William H. Harrison to win the 1836 election. His presidency was marked by an economic depression, the Maine-Canada border dispute (see Aroostook War), the Seminole Wars in Florida, and debate over the annexation of Texas. He was defeated in his bid for reelection and failed to win the Democratic nomination in 1844 because of his antislavery views. In 1848 he was nominated for president by the Free Soil Party but failed to win the election and retired.

Van Cortlandt, Stephanus (b. May 7, 1643, New Amsterdam—d. Nov. 25, 1700, New York City) American colonial official. He was a

wealthy merchant in New Amsterdam. After the colony came under British rule (1664), he was appointed to the governor's council (1674). He became the first native-born mayor of New York City (1677, 1686–87) and later served as associate justice and chief justice of the New York supreme court (1691–1700).

Van de Graaff, Robert J(emison) (b. Dec. 20, 1901, Tuscaloosa, Ala., U.S.—d. Jan. 16, 1967, Boston, Mass.) U.S. physicist. He worked as an engineer, then as a physics researcher at the University of Oxford (1925–29). From 1931 he continued his research at MIT, as a professor (1934–60). He developed a high-voltage electrostatic generator (later called the Van de Graaff generator) that served as a type of PARTICLE ACCELERATOR. In 1946 he cofounded the High Voltage Engineering Corp. to manufacture his accelerator. Widely used in atomic research, the device was also adapted to produce high-energy X rays for medical and industrial uses.

van der Waals \'van-dər-ˌwȯlz**, Johannes Diederik** (b. Nov. 23, 1837, Leiden, Neth.—d. March 9, 1923, Amsterdam) Dutch physicist. As professor at the University of Amsterdam (1877–1907), he extended the classical ideal-gas law (see GAS LAWS) to describe the behaviour of real gases, deriving the van der Waals EQUATION OF STATE in 1881. His work led to the liquefying of several common gases and made possible the study of temperatures near absolute zero. The VAN DER WAALS FORCES were named in his honour. He received a 1910 Nobel Prize.

van der Waals forces Relatively weak electrical forces that attract neutral (uncharged) MOLECULES to each other in GASES, liquefied and solidified gases, and almost all organic LIQUIDS and SOLIDS. Solids held together by van der Waals forces typically have lower MELTING POINTS and are softer than those held together by IONIC, COVALENT, or metallic bonds (see BONDING). The forces arise because neutral molecules, though uncharged, are usually ELECTRIC DIPOLES, which have a tendency to align with each other and to induce further polarization in neighbouring molecules, resulting in a net attractive force. They are somewhat weaker than the forces involved in HYDROGEN BONDING. See also JOHANNES D. VAN DER WAALS.

van der Weyden, Rogier See Rogier van der WEYDEN

Van Der Zee, James (Augustus Joseph) (b. June 29, 1886, Lenox, Mass., U.S.—d. May 15, 1983, Washington, D.C.) U.S. photographer. In 1906 he moved with his family to Harlem in New York City. After a brief stint at a portrait studio in Newark, N.J., he returned to Harlem to set up his own studio. The portraits he took from 1918 to 1945 chronicled the HARLEM RENAISSANCE; among his many renowned subjects were COUNTEE CULLEN, BILL ROBINSON, and MARCUS GARVEY. After World War II his fortunes declined until the Metropolitan Museum of Art exhibited his photographs in 1969.

van Doesburg, Theo See Theo van DOESBURG

Van Doren, Carl (Clinton) and Mark (respectively b. Sept. 10, 1885, Hope, Ill., U.S.—d. July 18, 1950, Torrington, Conn.; b. June 13, 1894, Hope, Ill.—d. Dec. 10, 1972, Torrington, Conn.) U.S. writers and teachers. Carl, who taught at Columbia University from 1911 to 1930, edited the *Cambridge History of American Literature* (1917–21) and journals. His critical works include the biography *Benjamin Franklin* (1938, Pulitzer Prize). Mark taught at Columbia from 1920 to 1959. He published more than 20 volumes of verse, including *Spring Thunder* (1924) and *Collected Poems (1922–38)* (1939, Pulitzer Prize). He wrote three novels and several volumes of short stories and edited anthologies. His literary criticism includes works on JOHN DRYDEN, WILLIAM SHAKESPEARE, and NATHANIEL HAWTHORNE as well as *Introduction to Poetry* (1951), which examines shorter classic poems of English and American literature.

Van Dyck \van-'dīk**, Sir Anthony** (b. March 22, 1599, Antwerp, Belg.—d. Dec. 9, 1641, London, Eng.) Flemish painter. Son of a well-to-do silk merchant, he was apprenticed to an Antwerp painter at 10. He soon came under the influence of PETER PAUL RUBENS, for his early works are painted in Rubens's Baroque style, though with darker and warmer colour, more abrupt chiaroscuro, and more angular figures. He was a master in the Antwerp artists' guild by 19, at which time he was also working with Rubens. He spent over five years in Italy (1621–27); on his return, he received many commissions for altarpieces and portraits. He also executed works on mythological subjects and was a fine draftsman and etcher, but he is chiefly known for his portraits, in which he idealized his models without sacrificing their individuality. In Britain in 1632, he was appointed court painter by CHARLES I. He gained a comfortable income from the many portraits he painted in Britain, and his life matched his clients' in luxury. His influence was pervasive and lasting; Flemish, Dutch, and German portraitists imitated his style and technique, and the 18th-century English portraitists, especially THOMAS GAINSBOROUGH and JOSHUA REYNOLDS, were deeply indebted to him.

Van Dyke, Dick *orig.* **Richard Wayne Van Dyke** (b. Dec. 13, 1925, West Plains, Mo., U.S.) U.S. actor and comedian. In 1947–53 he played in nightclubs with his pantomime act, "The Merry Mutes," before making his Broadway debut in 1959. He starred in the musical *Bye Bye Birdie* (1960–61, Tony Award; film, 1963), and then in the successful television comedy series *The Dick Van Dyke Show* (1961–66)—winning several Emmy Awards—*The New Dick Van Dyke Show* (1971–74), and the drama series *Diagnosis Murder* (1993–2001). He has starred in such movies as *Mary Poppins* (1964) and *Chitty, Chitty, Bang, Bang* (1968).

van Eyck, Jan See Jan van EYCK

van Gogh, Vincent See Vincent van GOGH

Van Heusen \van-'hyü-zən**, Jimmy** *orig.* **Edward Chester Babcock** (b. Jan. 26, 1913, Syracuse, N.Y., U.S.—d. Feb. 7, 1990, Rancho Mirage, Calif.) U.S. songwriter. He began working in radio in his teens. In the early 1930s he worked in TIN PAN ALLEY and later collaborated on songs such as "Darn That Dream" and "Polka Dots and Moonbeams." With Johnny Burke he wrote the songs for 23 BING CROSBY films. In 1954 he began collaborating with SAMMY CAHN. He composed 76 songs for his friend FRANK SINATRA, including "The Tender Trap" and "Come Fly with Me," and won Academy Awards for "Swinging on a Star," "All the Way," "High Hopes," and "Call Me Irresponsible."

van Ostade, Adriaen See Adriaen van OSTADE

vanadium \və-'nā-dē-əm\ Metallic chemical ELEMENT, one of the TRANSITION ELEMENTS, chemical symbol V, atomic number 23. A silvery white, soft METAL found (always combined) in various minerals, coal, and petroleum, it is used in alloys with steel and iron for high-speed tool steel, high-strength low-alloy steel, and wear-resistant CAST IRON. Unalloyed, it is used in high-temperature applications, as a target in X-ray applications, and as a catalyst. Its compounds, in which it has various VALENCES, have many beautiful colours in solution and are used as catalysts and mordants (see DYE).

Vanbrugh \'van-ˌbrük, van-'brü**, Sir John** (baptized Jan. 24, 1664, London, Eng.—d. March 26, 1726, London) English dramatist and architect. He began writing while serving as a soldier. He specialized in the COMEDY OF MANNERS; his successful plays include *The Relapse* (1696) and *The Provok'd Wife* (1697). He also wrote lively adaptations from the French, more farce than comedy, including *The Country House* (performed 1703) and *The Confederacy* (1705). In 1702 he designed Castle Howard, Yorkshire, with Nicholas Hawksmoor (1661–1736). His masterpiece, again with Hawksmoor, was Blenheim Palace (1705–16), Oxfordshire, which brought the English baroque style to its culmination.

Vance, Cyrus (Roberts) (b. March 27, 1917, Clarksburg, W.Va., U.S.—d. Jan. 12, 2002, New York, N.Y.) U.S. public official. After receiving his law degree from Yale University in 1942, he enlisted in the navy and served until 1946, when he joined a law firm in New York City. He was appointed general counsel for the U.S. Department of Defense in 1960. In 1962 he became secretary of the army, and in 1963 Pres. LYNDON B. JOHNSON named him deputy secretary of defense. Initially a vigorous supporter of U.S. involvement in the VIETNAM WAR, his viewed changed after his resignation in 1967, and by 1968 he was urging Johnson to stop the bombing of North Vietnam. In that year he was sent to Paris with W. AVERELL HARRIMAN to negotiate peace with the North Vietnamese. As secretary of state (1977–80) under Pres. JIMMY CARTER, he worked to obtain the STRATEGIC ARMS LIMITATION TALKS II (SALT II) arms-control treaty and was instrumental in the CAMP DAVID ACCORDS. He resigned in 1980 in protest of Carter's plan to send a secret military mission to rescue American hostages held in Tehrān, Iran (see IRAN HOSTAGE CRISIS).

Vancouver City (pop., 2001: metro. area, 1,986,965), southwestern British Columbia, Canada. Located on a fine natural harbour, it originated as a lumber-processing settlement in the 1870s. It recovered from a disas-

© 2006 Encyclopædia Britannica, Inc.

trous fire (1886) to become Canada's principal seaport. Its development was aided by completion of the transcontinental railroad in 1887 and the opening of the Panama Canal in 1914, which made it economically feasible to export grain and lumber from Vancouver to the North American east coast and Europe. Economic activities include producing lumber and plywood, oil refining, fishing, and shipbuilding.

Vancouver, George (b. June 22, 1757, King's Lynn, Norfolk, Eng.—d. May 10, 1798, Richmond, Surrey) English navigator. He entered the Royal Navy at age 13 and sailed with James Cook on his second and third voyages (1772–75, 1776–79) to the Pacific. In 1791 he commanded an expedition that explored the coasts of Australia, New Zealand, Tahiti, and Hawaii before reaching the Pacific coast of North America in 1792; over the next two years he meticulously mapped a major portion of the coast. His maps and a lengthy account of his voyages were published in 1798.

Vancouver \'van-'kü-vər\ **Island** Island (pop., 2001: 705,000) off southwestern British Columbia, Canada. It is the largest island (12,079 sq mi [31,285 sq km]) on the Pacific coast of North America. It has several peaks of more than 7,000 ft (2,100 m), as well as several fine harbours. The chief city is Victoria. It was inhabited by coastal Indians for several millennia before it was visited by early Spanish and English explorers, including Capt. James Cook in 1778. It was surveyed in 1792 by George Vancouver and was held by the Hudson's Bay Co. until it was made a British crown colony in 1849. It united with British Columbia in 1866. The island's main industries include lumbering, fishing, agriculture, and tourism.

Vandal Any member of a Germanic people who ruled a kingdom in North Africa from 429 to 534 and who sacked Rome in 455. Fleeing westward from the Huns, they invaded Gaul before settling in Spain (409). Under King Gaiseric (r. 428–477) they migrated to North Africa and became federates of Rome (435). Four years later Gaiseric threw off Roman overlordship and captured Carthage. The Vandals later annexed Sardinia, Corsica, and Sicily, and their pirate fleets controlled much of the western Mediterranean. When they invaded Italy and captured Rome (455), they plundered the city and its artworks, and their name has remained a synonym for willful desecration and destruction. The Vandals were Arian Christians (see Arianism) who persecuted Roman Catholics in Africa. They were conquered when the Byzantines invaded North Africa (533–534).

Vandenberg, Arthur H(endrick) (b. March 22, 1884, Grand Rapids, Mich., U.S.—d. April 18, 1951, Grand Rapids) U.S. politician. Editor of the *Grand Rapids Herald* (1906–28), he was elected as a Republican to the U.S. Senate (1928–51). He was a critic of Pres. Franklin D. Roosevelt's foreign policy but revised his isolationist position after the attack on Pearl Harbor. In a 1945 Senate speech he advocated U.S. participation in international alliances, and he was a delegate to the UN organizing conference. He led Republican congressional support for legislative measures introduced by Pres. Harry Truman, including the Marshall Plan, the Truman Doctrine, and NATO.

Vanderbilt, Cornelius (b. May 27, 1794, Port Richmond, Staten Island, N.Y., U.S.—d. Jan. 4, 1877, New York, N.Y.) U.S. shipping and railroad magnate. He began a passenger ferry business in New York harbour in 1810 with one boat; he added several others during the War of 1812 in order to supply government outposts. He sold his boats to work as a steamship captain (1818–29), then started his own steamship company on the Hudson River. By cutting fares and offering luxurious accommodations, he soon controlled the river traffic. He then provided transportation along the eastern seacoast. By 1846 he was a millionaire. He formed the Accessory Transit Co. to transport passengers and freight from New York to the California gold fields via Nicaragua. He again undercut his competitors, and they bought him out at a high price (1858). Turning to railroads, he acquired controlling stock in the New York and Harlem Railroad. After losing a battle for control of the Erie Railroad (1868), he bought and consolidated the Hudson River and the New York Central railroads (1869). After buying the Lake Shore and Michigan Southern Railroad (1873), he provided the first rail service between New York and Chicago. At his death, he had a fortune of more than $100 million, the largest sum accumulated in the U.S. to that date. He gave $1 million to Central University (later Vanderbilt University). He left almost all the rest to his son William H. Vanderbilt (1821–85), who greatly expanded the New York Central network, acquired other railroads, and doubled the family fortune.

Vanderbilt University Private university in Nashville, Tennessee, U.S. It was founded in 1873 and named for benefactor Cornelius Vanderbilt. Baccalaureate degrees are awarded through its college of arts and sciences, school of engineering, and school of music. Master's, doctoral, and professional degree programs are offered through these and other schools, such as Vanderbilt's graduate school, divinity school, and schools of law, management, medicine, and nursing. Research institutes include centres for the study of education and human development, public policy, and the humanities.

Vanderlyn, John (b. Oct. 15, 1776, Kingston, N.Y., U.S.—d. Sept. 23, 1852, Kingston) U.S. painter. He studied with Gilbert Stuart and later at the École des Beaux-Arts. He remained in Paris, where he enjoyed great popularity for his paintings in the Neoclassical style (including *Ariadne Asleep on Naxos*, 1812). At age 40 he returned to the U.S., but failing to receive the federal commissions he had anticipated, he retired embittered to Kingston. In 1832 he finally received a government commission for a full-length portrait of George Washington and in 1839 another for *The Landing of Columbus* in the U.S. Capitol Rotunda.

Vane, Sir Henry *known as* **Sir Henry Vane the Younger** (b. 1613—d. June 14, 1662, London, Eng.) English politician. Son of the royal adviser Henry Vane the Elder (1589–1655), he was converted to Puritanism and in 1635 sailed to New England, where he served as governor of Massachusetts (1636–37). After returning to England, he became treasurer of the navy (1639), then served with his father in the Long Parliament, where they helped secure the impeachment of Thomas Wentworth, 1st earl of Strafford. The chief English negotiator of the Solemn League and Covenant, Vane became leader of the House of Commons (from 1643) and a member of the Commonwealth's Council of State (1649–53). After the Restoration, he was arrested, imprisoned (1660–62), and executed for treason.

Vänern \'va-nərn\ Lake, southwestern Sweden. The largest lake in Sweden and the third largest in Europe, it is about 90 mi (145 km) long, as much as 322 ft (98 m) deep, and covers an area of 2,156 sq mi (5,585 sq km). Fed by numerous rivers, it drains into the Kattegat strait via the Göta River.

Vanguard Any of three unmanned U.S. experimental satellites. Vanguard I (1958), the second U.S. satellite placed in orbit around Earth (after Explorer 1), was a tiny 3.25-lb (1.47-kg) sphere with two radio transmitters. Its flight path revealed that Earth is almost imperceptibly pear-shaped, confirming earlier theories. Vanguard II (1959) carried light-sensitive photocells to provide information about Earth's cloud cover, but its tumbling motion rendered the data unreadable. Vanguard III (1959) was used to map Earth's magnetic field.

vanilla Any member of a group of tropical climbing orchids that make up the genus *Vanilla*, and the flavouring agent extracted from its seedpods. The plant has a long, fleshy climbing stem that attaches itself by aerial rootlets to trees; roots also penetrate the soil. Numerous flowers open a few at a time and last only a day. The fruit, a bean pod about 8 in. (20 cm) long at maturity, is harvested as soon as it turns golden green at the base. Curing and processing turn the pods a deep chocolate brown. Vanilla is used in a variety of sweet foods and beverages as well as in perfumery.

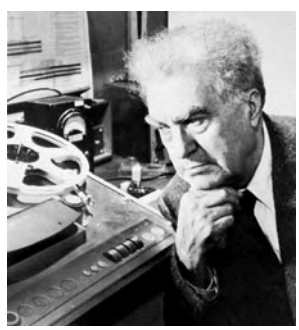
Vanir \'vä-ˌnir\ In Germanic religion, the group of gods responsible for wealth, fertility, and commerce. They included Njörd and his children, Freyr and Freyja, among others. They were originally subordinate to the warlike Aesir, but, after defeating the Aesir in battle, they were granted equal status. The Vanir sent Njörd and Freyr to live with the Aesir and received Hoenir and Mimir in exchange. The birth of Kvasir resulted from the peace ritual between the two groups.

Vanua Levu \ˌvän-ˌwä-'lā-vü\ Island (pop., including adjacent islands, 1996: 139,526), Fiji. Fiji's second largest island, it is 2,137 sq mi (5,535 sq km) in area. Sighted by the Dutch navigator Abel Janszoon Tasman in 1643, the volcanic Vanua Levu (meaning "Great Land") has a central mountain range, culminating at Mount Nasorolevu (3,386 ft [1,032 m]), which divides the island into wet and dry sections. The chief river is the Ndreketi.

Vanuatu \ˌvan-wä-'tü\ *officially* **Republic of Vanuatu** Island country, South Pacific Ocean. It consists of a chain of 13 principal and many smaller islands. Area: 4,707 sq mi (12,190 sq km). Population (2005 est.): 211,000. Capital: Vila. The population is nearly all indigenous Melane-

© 2006 Encyclopædia Britannica, Inc.

sian. Languages: Bislama, English, French (all official); Melanesian languages and dialects. Religions: Christianity (mostly Protestant; also Roman Catholic); also traditional beliefs. Currency: vatu. Extending north-south some 400 mi (650 km), Vanuatu includes the islands of Espíritu Santo, Pentecost (Pentecôte), Malakula, Éfaté, Ambrym, Erromango, Tanna, Aoba, Épi, and Maéwo. The larger islands are volcanic in origin and mountainous; there are several active volcanoes. Some of them, especially Éfaté and Malakula, have good harbours. The highest point is Mount Tabwémasana (6,165 ft [1,879 m]) on Espíritu Santo. The developing free-market economy is based mainly on agriculture, cattle raising, and fishing. Tourism is increasingly important. Vanuatu is a republic with a single legislative house; its chief of state is the president, and the head of government is the prime minister. The islands were inhabited for at least 3,000 years by Melanesian peoples before being discovered in 1606 by the Portuguese. They were rediscovered by French navigator Louis-Antoine de Bougainville in 1768, then explored by English mariner Capt. James Cook in 1774 and named New Hebrides. Sandalwood merchants and European missionaries arrived in the mid-19th century; they were followed by British and French cotton planters. Control of the islands was sought by both the French and British, who agreed in 1906 to form a condominium government. During World War II a major Allied naval base was on Espíritu Santo; Vanuatu escaped Japanese invasion. New Hebrides became the independent Republic of Vanuatu in 1980. Much of its history since then has been marked by political instability.



vapor lamp See electric discharge lamp

vaporization Conversion of a substance from the liquid or solid phase into the gaseous (see gas), or vapour, phase. It includes boiling, in which vapour bubbles form in a liquid, and sublimation, in which a solid is converted directly to vapour. Vaporization requires that heat (the substance's latent heat of vaporization) be supplied to the liquid or solid; the same amount of heat is released by the substance in condensation, the reverse of vaporization. If the surroundings do not supply enough heat, the temperature of the remaining substance undergoing vaporization drops. See also evaporation.

Varanasi \vä-'rä-nə-sē\ *or* **Benares** \'bə-'när-əs\ City (pop., 2001 prelim.: 1,100,748), Uttar Pradesh, India. Located on the Ganges River in southeastern Uttar Pradesh, it is one of the oldest continuously inhabited cities in the world and was the site of an Aryan settlement before the 2nd millennium BC. It is one of the seven sacred cities of Hinduism and has numerous shrines, temples, and palaces and miles of steps for ritual bathing. More than a million Hindus visit the city each year. Just north of Varanasi is Sarnath, where the Buddha delivered his first sermon.

Vardan Mamikonian \'vär-dən-ˌma-mi-'kō-nē-ən**, Saint** (died 451) Armenian military commander. The Persian attempt to impose Zoroastrianism on the Armenians provoked a rebellion, which ended when Vardan and his companions were slain at the Battle of Avarayr. Despite their victory the Persians renounced their plans to convert Armenia by force, and they deposed the traitorous Armenian governor.

Vardon, Harry (b. May 9, 1870, Grouville, Jersey, Channel Islands—d. March 20, 1937, Totteridge, Hertfordshire, Eng.) British golfer. While working as a manservant for an affluent amateur golfer on the island of Jersey, Vardon learned golf, and he turned professional at age 20. A technical innovator, he won the British Open six times (1896, 1898, 1899, 1903, 1911, and 1914) and the U.S. Open once (1900). The Vardon Trophy is awarded annually by the Professional Golfers' Association of America to the professional with the best scoring average.

Edgard Varèse.
THE BETTMANN ARCHIVE

Varèse \vä-'rez**, Edgard (-Victor-Achille-Charles)** (b. Dec. 22, 1883, Paris, France—d. Nov. 8, 1965, New York, N.Y., U.S.) French-born U.S. composer. Forbidden to study music by his father, he secretly continued his studies and entered the Schola Cantorum with the help of his cousin, the pianist Alfred Cortot (1877–1962). He soon moved to Berlin, where he met Ferruccio Busoni and Richard Strauss, musicians in tune with his forward-looking ideas. His *Bourgogne* (1907) caused a scandal because of its dissonance. His budding conducting career was interrupted by World War I, and he moved to the U.S. In 1921 he cofounded the International Composers Guild. His output was small, but every piece became a classic, including *Offrandes*, *Amériques* (both 1921), *Hyperprism*, *Octandre* (both 1923), *Arcana* (1927), and *Ionisation* (1931), works remarkable for the way they used instruments, especially percussion, to create blocks of sound. After the early 1950s, when he finally gained access to the electronic sound equipment he desired, he concentrated on electronic music.

Vargas \'vär-gəs**, Getúlio (Dorneles)** (b. April 19, 1883, São Borja, Braz.—d. Aug. 24, 1954, Rio de Janeiro) President of Brazil (1930–45, 1951–54). He was elected governor of Rio Grande do Sul in 1928 and ran unsuccessfully for president in 1930, but later that year he overthrew the government to become head of state. In 1937 he abolished the constitutional government and set up the totalitarian New State, under which the previously autonomous states became dependent on central authority. He enacted labour reforms and social-security laws, introduced extensive educational reforms, enfranchised women, and granted the secret ballot. Deposed by a coup in 1945, he was elected president again in 1951; restrained by a congress and public opinion, he was unable to hold support and, faced with forced retirement, took his own life.

Vargas Llosa \'bär-gäs-'yō-sä**, (Jorge) Mario (Pedro)** (b. March 28, 1936, Arequipa, Peru) Peruvian writer. Vargas Llosa worked as a journalist and broadcaster before publishing *The Time of the Hero* (1963), his widely acclaimed first novel. It describes adolescents striving for survival in the hostile environment of a military school, the corruption of which reflects the larger malaise afflicting Peru. His commitment to social change is evident in his early novels, essays, and plays. He turned increasingly conservative, especially in the face of the Maoist Shining Path insurgency, and in 1990 he ran for president of Peru. His best-known works include *The Green House* (1965), *Aunt Julia and the Scriptwriter* (1977), and *The War of the End of the World* (1981), an account of a 19th-century Brazilian religious movement. In 1994 he won the Cervantes Prize (a prestigious literary award given for Spanish-language literature).

variable In algebra, a symbol (usually a letter) standing in for an unknown numerical value in an equation. Commonly used variables include x and y (real-number unknowns), z (complex-number unknowns), t (time), r (radius), and s (arc length). Variables should be distinguished from coefficients, fixed values that multiply powers of variables in polynomials and algebraic equations. In the quadratic equation $ax^2 + bx + c = 0$, x is the variable, and a, b, and c are coefficients whose values must be specified to solve the equation. In translating word problems into algebraic equations, quantities to be determined can be represented by variables.

variable, complex See complex variable

variable, random See random variable

variable star Star whose observed brightness varies noticeably in intensity. Pulsating variables expand and contract in cycles, pulsating rhythmically in brightness and size. Explosive variables include novas and supernovas, which brighten rapidly due to sudden outbursts of radiant energy; the increased brightness lasts a short time, followed by relatively slow dimming. Eclipsing variable stars are variable only because light from one star is blocked by another in Earth's direction. Hundreds of thousands of variable stars are known. See also binary star; Cepheid variable; flare star; pulsar; T Tauri star.

variation In biology, any difference between cells, individual organisms, or groups of organisms within a species caused either by genetic differences (variation in genotype) or by the effect of environmental factors on the expression of genetic potentials (variation in phenotype). Variation may be shown in physical appearance, metabolism, fertility, mode of reproduction, behaviour, learning and mental ability, and other obvious or measurable characters. Genotypic variations are caused by differences in number or structure of chromosomes or by differences in the genes carried by the chromosomes. Eye colour, body form, and disease resistance are genotypic variations. Phenotypic variations may result from factors such as climate, food supply, and actions of other organisms. Phenotypic variations also include stages in an organism's life cycle and seasonal variations in an individual. Because they do not involve hereditary alteration and in general are not transmitted to future generations, phenotypic variations are not important in evolution. See also polymorphism.

© 2006 Encyclopædia Britannica, Inc.

variation In music, basic technique consisting of changing the music melodically, harmonically, or contrapuntally. The simplest variation type is the variation set, in which two or more sections are based on the same musical material, which is treated with different variational techniques in each section. The practice, originally involving use of a repeated bass line (basso ostinato, or ground bass), began in early 16th-century dance music in Italy and Spain. Ground-bass forms include the chaconne and passacaglia, both of which usually employ a brief bass line repeated many times. In the 17th century, organ and harpsichord variations became a standard form in Germany. Keyboard variations in the 19th century often employed popular tunes or opera melodies; variation form was also commonly used in symphonies, quartets, and sonatas. It declined in importance after the classical era but has never ceased to be employed by composers. The music of certain non-Western cultures also uses variational techniques. The art music of southern India is built on the concept of a string of pieces, each a variation on a given "theme." A somewhat different concept of multilevel variation is found in the GAMELAN (orchestra) music of Indonesia. The variations are not consecutive but are simultaneous, a technique called heterophony.

varicella See CHICKEN POX

varicose \'var-ə-ˌkōs\ **vein** *or* **varix** Twisted VEIN distended with blood. Varix also covers ARTERIES and lymphatic vessels (see LYMPHATIC SYSTEM). Varicose veins occur mostly in the legs, when malfunctioning valves let blood pool in veins near the skin. Causes include hereditary valve and vein wall weakness and internal or external pressure on veins. Varices are common in pregnancy, suggesting that hormone abnormalities play a role. Symptoms include a heavy feeling, with leg cramps and swelling after standing a long time. Complications include skin ULCERS and THROMBOSIS. Treatment involves strong support hose, injection therapy, or surgery. Varices in the ESOPHAGUS, which often occur in liver disease, can ulcerate and bleed. See also HEMORRHOID.

variety theatre See MUSIC HALL AND VARIETY THEATRE

variola See SMALLPOX

Varmus, Harold (Elliot) (b. Dec. 18, 1939, Oceanside, N.Y., U.S.) U.S. virologist. He joined the faculty of UC–San Francisco in 1970. With J. MICHAEL BISHOP, he discovered that, under certain circumstances, normal genes in healthy body cells can cause cancer. These oncogenes ordinarily control cell division and growth, but viruses or carcinogens can activate them. Their research superseded a theory that cancer is caused by viral genes, distinct from a cell's normal genetic material, that lie dormant until activated by carcinogens. For their work, the two shared a 1989 Nobel Prize. Varmus later served as director of the National Institutes of Health (1993–99) and became president of Memorial Sloan-Kettering Cancer Center.

Varna Seaport city (pop., 2001: 314,539), Bulgaria, on the Black Sea coast. Founded as Odessus by Milesian Greeks in the 6th century BC, it later was Thracian, Macedonian, and Roman. In AD 681 it became part of the first Bulgarian empire (c. 679–1018) and was named Varna. It came under OTTOMAN domination in 1391. In 1444 it was the scene of a battle between Turkish and Hungarian armies in which Władysław III, king of Poland and Hungary, was killed. Varna was ceded to Bulgaria by the 1878 Treaty of Berlin (see Congress of BERLIN). It is an important administrative, economic, cultural, and resort centre. Shipbuilding and manufacturing are important industries.

varna \'vər-nə\ Any of the four traditional social classes of Hindu India. One of the hymns of the RIGVEDA declares that the BRAHMAN, the KSHATRIYA, the VAISHYA, and the SHUDRA issued forth at creation from the mouth, arms, thighs, and feet of PRAJAPATI. Traditional lawmakers specified a set of obligations, observed mainly in theory only, to each varna: the Brahman, to study and advise; the Kshatriya, to protect; the Vaishya, to cultivate; and the Shudra, to serve. An unofficial fifth class, the *pancama*, was created to include certain UNTOUCHABLES and tribal groups falling outside this system. The relationship of the CASTE system to the class system is complex; individual castes, of which there are dozens, have sought to raise their social rank by identifying with a particular varna, demanding the associated privileges of rank and honour.

Varna, Battle of (November 10, 1444) Turkish victory over the Hungarians that marked the end of the European effort to protect Constantinople. The Hungarians under JANOS HUNYADI broke a truce and marched to Varna (in present-day Bulgaria), where they fought the Turks under Sultan Murad II and were defeated; the Hungarian king Ulászló I (also ruler of Poland) was killed in the battle. The victory enabled the Ottoman Empire to gain control of the Greek Peloponnese, conquer Constantinople (1453), and reabsorb Serbia (by 1459).

Varro \'var-ō**, Marcus Terentius** (b. 116, probably Reate [Italy]—d. 27 BC) Roman scholar and satirist. Varro was active in public life, rising to the office of praetor. He sided with POMPEY THE GREAT but later reconciled with Julius CAESAR. A prolific writer, he sought in his writings to inculcate moral virtues and to link Rome's future with its glorious past. He is best known for his *Saturae Menippeae* ("Menippean Satires"), medleys in mixed prose and verse that mock the absurdities of modern times. He wrote some 75 works in more than 600 books on a wide range of subjects—jurisprudence, astronomy, geography, education, and literary history—as well as in a variety of genres—satires, poems, orations, and letters.

Varus \'var-əs**, Publius Quintilius** (d. AD 9) Roman general. He was born a patrician; his father was one of the murderers of Julius CAESAR. Varus crushed the rebellion in Judaea (4 BC) and reestablished Roman control. Assigned to the frontiers east of the Rhine, he tried to assert Roman jurisdiction, but he was overwhelmed by a German attack in the TEUTOBURG FOREST and lost three legions. Disgraced, he killed himself by falling on his sword. His defeat led to the loss of all Roman possessions east of the Rhine.

varved deposit \'värvd\ Any form of repetitive sedimentary rock stratification that was deposited within a year. This annual deposit usually consists of paired contrasting layers (varves) of alternately finer (darker) and coarser (lighter) silt or clay, reflecting seasonal variations in SEDIMENTATION (winter and summer) within the year. Varved deposits are most commonly found in glacial lakes, but they can also be found in nonglacial lakes and marine settings.

varying hare See SNOWSHOE HARE

Vasa dynasty Swedish (and Polish) royal dynasty. Its founder was Gustav Eriksson Vasa, regent of Sweden (1521) and king (1523) as GUSTAV I VASA. His descendants reigned in Sweden until 1818, the last being CHARLES XIII. A grandson of Gustav became king of Poland (1587–1632) as SIGISMUND III VASA, also ruling Sweden in the years 1592–99. He was succeeded as king of Poland by his sons, Władysław IV Vasa (r. 1632–48) and John II Casimir Vasa (r.1648–68), after which the dynasty ended in Poland.

Vasarely \ˌva-zə-'re-lē**, Victor** *orig.* **Viktor Vásárhelyi** (b. April 9, 1908, Pécs, Hung.—d. March 15, 1997, Paris, France) Hungarian French painter. Trained in Budapest in the BAUHAUS tradition, he moved to Paris in 1930 and supported himself as a commercial artist. In the 1930s he was influenced by CONSTRUCTIVISM, but by the 1940s he was painting animated surfaces of geometric forms and interacting colours. His style reached maturity in the mid 1950s and 1960s, with the use of more vibrant colours to increase the sense of movement through optical illusion, as in *Sirius II* (1954), and he became one of the leading figures of the OP ART movement.

Vasari \vä-'zä-rē**, Giorgio** (b. July 30, 1511, Arezzo—d. June 27, 1574, Florence) Italian painter, architect, and writer. Though he was a prolific painter in the MANNERIST style, he is more highly regarded as an architect (he designed the Uffizi Palace, now the UFFIZI GALLERY), but even his architecture is overshadowed by his writings. His *Lives of the Most Eminent Architects, Painters, and Sculptors* (1550) offers biographies of early to late RENAISSANCE artists. His style is eminently readable and his material is well researched, though when facts were scarce he did not hesitate to fill in the gaps. In his view, GIOTTO had revived the art of true representation after its decline in the early Middle Ages, and succeeding artists had brought that art progressively closer to the perfection achieved by MICHELANGELO. The work's second edition (1568) has proved an invaluable resource for art historians.

Vasconcelos \ˌbäs-kōn-ˈsā-lōs**, José** (b. Feb. 28, 1882, Oaxaca, Mex.—d. June 30, 1959, Mexico City) Mexican educator, politician, essayist, and philosopher. He campaigned for the revolutionary candidates Francisco Madero and Pancho Villa. As minister of education (1920–24) he initiated major reforms in Mexico's school system, especially expansion of the rural school program. He ran unsuccessfully for president in 1929. Vasconcelos's political activism forced him into exile several times. He regarded the indigenous Indian culture as transcending Western culture. His autobiography (5 vol., 1935–59), abridged as *A Mexican Ulysses* (1962), is one of the finest sociocultural studies of 20th-century Mexico.

vascular plant *or* **tracheophyte** \ˈtrā-kē-ə-ˌfīt\ Any plant that has a specialized conducting system consisting mostly of phloem (food-conducting tissue) and xylem (water-conducting tissue), collectively called vascular tissue. Ferns, gymnosperms, and flowering plants are all vascular plants. In contrast to the nonvascular bryophytes, the more conspicuous generation among vascular plants is the sporophyte (see alternation of generations). Because they have vascular tissues, these plants have true stems, leaves, and roots, modifications of which enable species of vascular plants to survive in a variety of habitats under diverse, even extreme, environmental conditions. This ability to flourish in so many different habitats is the primary reason that vascular plants have become dominant among terrestrial plants.

vasectomy \və-ˈsek-tə-mē\ Severing of the vas deferens, which carries sperm from the testes to the prostate gland, to cause sterility or prevent infection. This relatively simple procedure, which can be performed in a doctor's office with local anesthetics, removes the ability to father children without affecting ability to achieve erection or orgasm. The vas is cut near its beginning, in the scrotum. The cut ends may be sealed off or left open. Reversal is more likely to succeed in the latter case; microsurgery has improved the success rate.

Vasily \ˈva-sə-lē\ **I** *Russian* **Vasily Dmitriyevich** (b. 1371—d. February 1425, Moscow) Grand prince of Moscow (1389–1425). After helping the Tatar khan Tokhtamysh fight Timur, he succeeded his father as grand prince of Moscow and Vladimir. He enlarged his realm to include Nizhny Novgorod and Murom in the central Volga region, but his efforts to expand westward brought him into conflict with Lithuania and Novgorod. He prepared to fight Timur in 1395, but the Mongol leader withdrew from Russian lands without a battle. Vasily kept his state independent until the Tatars reasserted control in 1408.

Vasily II *Russian* **Vasily Varilyevich** *known as* **Vasily the Blind** (b. 1415—d. March 27, 1462, Moscow) Grand Prince of Moscow (1425–62). At age 10 he was named to succeed his father, Vasily I, but for many years his uncle and cousins struggled to wrest the throne from him. Despite being blinded by his cousin Dmitry Shemyaka, he regained power in 1447 and ruled Muscovy for another 15 years. Vasily quelled internal strife in his realm by 1452 and enlarged his state's territory by absorbing nearby principalities. During his reign the Russian church asserted its independence from the patriarch at Constantinople. Vasily signed a treaty with Lithuania (1449) but fought Tatar hordes on his southern and eastern borders.

Vassar College Private liberal arts college in Poughkeepsie, N.Y. It was founded as a college for women by Matthew Vassar (1792–1868) in 1861 but did not open until 1865. It became coeducational in 1968. Vassar offers undergraduate studies in most major disciplines, and it has master's degree programs in biology, chemistry, and drama. The F.L. Loeb Art Center houses one of the oldest art collections in the U.S.

Vatican City *in full* **State of the Vatican City** Independent papal state, southern Europe, within the commune of Rome, Italy. Area: 109 acres (44 hectares). Population (2005 est.): 800. Its medieval and Renaissance walls form its boundaries except on the southeast at St. Peter's Square. Within the walls is the world's smallest independent nation-state, with its own diplomatic missions, newspaper, post office, radio station, banking system, army of 100 Swiss Guards, and publishing house. Extraterritoriality of the state extends to Castel Gandolfo and to several churches and palaces in Rome proper. Its independent sovereignty was recognized in the Lateran Treaty of 1929. The pope has absolute executive, legislative, and judicial powers within the city. He appoints the members of the Vatican's government organs, which are separate from those of the Holy See, the name given to the government of the Roman Catholic Church. The many imposing buildings include St. Peter's Basilica, the Vatican Palace, and the Vatican Museums. Frescoes by Michelangelo in the Sistine Chapel, by Pinturicchio in the Borgia Apartment, and by Raphael in the Stanze (rooms in the papal apartments) are also there. The Vatican Library contains a priceless collection of manuscripts from the pre-Christian and Christian eras. The pope and other representatives of the papal state travel widely to maintain international relations.

Vatican Council, First (1869–70) 20th ecumenical council of the Roman Catholic Church. It was convoked by Pope Pius IX (1846–78) to address the rising influence of rationalism, materialism, and liberalism. The council, which was never formally dissolved, promulgated two doctrinal constitutions: *Dei filius*, which deals with faith, reason, and their interrelations; and *Pastor aeternus*, which treats the authority of the pope. After long debate, the council approved the doctrine of papal infallibility. The council recessed in the summer of 1870 but was unable to reconvene because Italian troops had occupied Rome. Pius suspended the council indefinitely on Oct. 20, 1870.

Vatican Council, Second (1962–65) 21st ecumenical council of the Roman Catholic church, announced by Pope John XXIII. It has come to symbolize the church's readiness to acknowledge the circumstances of the modern world. Among the most notable of the 16 documents enacted were the "Dogmatic Constitution on the Church," which treats church hierarchy and provides for greater involvement of laypeople in the church; the "Dogmatic Constitution of Divine Revelation," which maintains an open attitude toward scholarly study of the Bible; the "Constitution on the Sacred Liturgy," which provides for the use of vernacular languages in the mass in place of Latin; and the "Pastoral Constitution on the Church in the World of Today," which acknowledges the profound changes humanity has experienced in the modern world and attempts to relate the church to contemporary culture. Observers from other Christian churches were invited to the council in a gesture of ecumenism.

Vatican Museums and Galleries Institutions and papal palaces in Vatican City housing the art collections of the popes since the beginning of the 15th century. Among the many separate museums are the 18th-century Pio-Clementino Museum, which exhibits the collection of Classical sculpture that originated in 1503–13 with Julius II; the exhibition rooms in the Vatican Library; and the Sistine Chapel. The Vatican collections are most famous for their Classical statues (including *Apollo Belvedere*, *Belvedere Torso*, and *Laocoön*) but also contain important examples of Egyptian and early Christian art. The Pinacoteca ("Picture Gallery"), founded by Pius VI in 1797, contains Italian religious paintings and Russian and Byzantine art. In 1956 a modern-art collection was begun with secular works by such artists as Pierre-Auguste Renoir, Georges Seurat, Vincent van Gogh, Henri Matisse, and Pablo Picasso. The Vatican collections are among the largest and most important in the world.

Vatican Palace Pope's residence since the late 14th century, located north of St. Peter's Basilica in the Vatican. First enclosed in 850, the irregularly walled compound contains gardens (begun by Nero), courtyards, living quarters, galleries, the Vatican Museums and Library, and other facilities. The residence, with more than 1,400 rooms, was begun in the

© 2006 Encyclopædia Britannica, Inc.

13th century by Pope Nicholas III. Nicholas V founded the Vatican Library. Under Julius II, Giovanni dei Dolci built the Sistine Chapel, noted for its spectacular interior artwork including Michelangelo's ceiling; Donato Bramante completed the palace's northern facade and planned the immense Belvedere court; and Raphael painted his masterpieces in the palace. Antonio da Sangallo the Younger, employed by Paul III, designed the Sala Regia (Royal Hall) and Pauline Chapel, decorated by Michelangelo. Several chapels, along with Ottaviano Mascherino's famous Gallery of Maps, date from the late 16th century. Domenico Fontana added a wing of apartments and the present library building under Sixtus V. In the Baroque period, Urban VIII built the Matilda Chapel and, under Alexander VII, Gian Lorenzo Bernini built the Scala Regia (Royal Stairway).

Vatnajökull \'vät-nä-ˌyœ̄-kü-tˢl\ Extensive ice field, southeastern Iceland. It covers an area of 3,200 sq mi (8,400 sq km) and has an average ice thickness of more than 3,000 ft (900 m). It contains several mountains, including Hvannadalshnúkur (6,952 ft, or 2,119 m), the highest peak in Iceland. There are numerous active volcanoes throughout the ice field.

Vättern \'ve-tərn\ Lake, south-central Sweden, southeast of Lake Vänern. With a length of 81 mi (130 km), a width of about 19 mi (31 km), and an area of 738 sq mi (1,912 sq km), it is Sweden's second largest lake, though only one-third the size of Vänern. Its maximum depth is 420 ft (130 m). Known for its dangerous currents, it is connected with the Baltic Sea by the Gota Canal.

Vauban \vō-'bäⁿ**, Sébastien Le Prestre de** (b. May 15, 1633, Saint-Léger-de-Foucherest, France—d. March 30, 1707, Paris) French military engineer. After fighting with the forces of the Condé family (1651–53), he switched to the royalist side and joined the newly formed engineer corps, becoming engineer in chief at the siege of Gravelines (1658). He designed fortifications for numerous French towns and outposts and devised tactics that led to many successes in the French wars of Louis XIV's reign; his innovations revolutionized the art of siege tactics and defensive fortification. He also introduced the tactic of ricochet gunfire and invented the socket bayonet. His treatises on fortification and siege-craft were studied for more than 100 years. He was made a marshal of France in 1703.

Vaucanson \vō-käü-'sōⁿ**, Jacques de** (b. Feb. 24, 1709, Grenoble, France—d. Nov. 21, 1782, Paris) French inventor. In 1739 he constructed an automaton, "The Duck," which imitated not only the motions of a live duck but also the motions of drinking, eating, and "digesting." An inspector of silk manufacture, Vaucanson automated the loom by means of perforated cards that guided hooks connected to the warp yarns (see weaving). His innovation was ignored for decades until J.-M. Jacquard reconstructed and improved on it; the Jacquard loom became one of the most important inventions of the Industrial Revolution.

Vaucheria \vō-'kir-ē-ə\ Genus of yellow-green algae. It is characterized by oil food reserves and tubular branches that have multiple nuclei and lack cross-walls except in association with reproductive organs or an injury. *Vaucheria* reproduce both asexually and sexually. The spherical female sex organ and the slender, hook-shaped male sex organ are usually produced on branches close to each other. After fertilization, the zygote may enter a resting phase for several weeks before developing into a new plant. Though most species occur in freshwater or are terrestrial, some are marine and others live in ice.

vaudeville \'vōd-ˌvil\ Light entertainment popular in the U.S. in the late 19th and early 20th centuries. It consisted of 10–15 unrelated acts featuring magicians, acrobats, comedians, trained animals, singers, and dancers. The form developed from the coarse variety shows held in beer halls for a primarily male audience. Tony Pastor established a successful "clean variety show" at his New York City theatre in 1881 and influenced other managers to follow suit. By 1900 chains of vaudeville theatres around the country included Martin Beck's Orpheum Circuit, of which New York's Palace Theatre was the most famous (1913–32). Among the many entertainers who began in vaudeville were Mae West, W.C. Fields, Will Rogers, Buster Keaton, Charlie Chaplin, the Marx Brothers, Bud Abbott and Lou Costello, Milton Berle, and Bob Hope. See also music hall and variety theatre.

Vaugelas \vō-zhə-'lä**, Claude Favre, lord de** (b. Jan. 6, 1585, Meximieux, France—d. February 1650, Paris) French grammarian. He played a major role in standardizing the French language of literature and of polite society. His *Remarks on the French Language, Useful for Those Who Wish to Speak Well and Write Well* (1647) became an authoritative guide to French usage, and his writings formed the basis of the rules for pure and elegant French promulgated by the Académie Française, of which he was an original member.

Vaughan \'vȯn, 'vän**, Henry** (b. April 17, 1622, Llansantffraed, Breconshire, Wales—d. April 23, 1695, Llansantffraed) Anglo-Welsh poet and mystic. Vaughan studied law but from the 1650s practiced medicine. After writing two volumes of secular poems, he read the religious poet George Herbert and gave up "idle verse." He is chiefly remembered for the spiritual vision or imagination evident in his fresh and convincing religious verse and is considered one of the major practitioners of Metaphysical poetry. Works that reveal the depth of his religious convictions include *Silex Scintillans* (1650, enlarged 1655; "The Glittering Flint") and the prose *Mount of Olives* (1652). He also translated short moral and religious works and two medical works.

Vaughan, Sarah (Lois) (b. March 27, 1924, Newark, N.J., U.S.—d. April 3, 1990, Hidden Hills, Calif.) U.S. jazz singer. Vaughan won an amateur contest at Harlem's Apollo Theatre in 1942 and soon joined Earl Hines's big band as vocalist and second pianist. Joining Billy Eckstine's band in 1944, she gained exposure to the new bebop style; she was especially influenced by Dizzy Gillespie and Charlie Parker and recorded with them in 1945. Alternating between popular song and jazz, she worked as a soloist for the rest of her career. A vast range and wide vibrato in the service of her harmonic sensitivity enabled Vaughan to use her voice with a seemingly instrumental approach, often improvising as a jazz soloist.

Vaughan Williams \vȯn-'wil-yəms**, Ralph** (b. Oct. 12, 1872, Down Ampney, Gloucestershire, Eng.—d. Aug. 26, 1958, London) British composer. He attended the Royal College of Music and Cambridge University, and he also studied in Berlin with the composer Max Bruch. Having collected English folk songs for his academic work, he combined folk melody with modern approaches to harmony and rhythm, forging a musical style at once highly personal and deeply English. His nine symphonies, including *Sea Symphony* (1909), *London Symphony* (1913), and *Sinfonia Antarctica* (1952), were his most exploratory works. Other popular pieces include *The Lark Ascending* (1914) and *Serenade to Music* (1938); he also wrote five operas, including *Riders to the Sea* (1936). He conducted extensively throughout his life, and he edited *The English Hymnal* (1904–06).

vault In building construction, an arched structure forming a ceiling or roof. The masonry vault exerts the same kind of thrust as the arch, and must be supported along its entire length by heavy walls with limited openings. The basic barrel vault, in effect a continuous series of arches, first appeared in ancient Egypt and the Middle East. Roman architects discovered that two barrel vaults intersecting at right angles (a groin vault) could, when repeated in series, span rectangular areas of unlimited length. Because the groin vault's thrusts are concentrated at the four corners, its supporting walls need not be massive. Medieval European builders developed the rib vault, a skeleton of arches or ribs on which the masonry could be laid. The fan vault, popular in the English Perpendicular style, used fan-shaped clusters of tracery-like ribs springing from pendants or columns. The 19th century saw the use of large iron skeletons as frameworks for vaults of lightweight materials (see Crystal Palace). An important modern innovation is the reinforced-concrete shell vault, which, if its length is three or more times its transverse section, behaves as a deep beam and exerts no lateral thrust. See illustration opposite.

vaulting Gymnastics exercise in which the athlete leaps over a form that was originally intended to mimic a horse. At one time, the pommel horse was used in the vaulting exercise, with the pommels (handles) removed. The sanctioning body for gymnastic sport, the Fédération Internationale de Gymnastique (FIG), decreed in 2001 that a vaulting table would be introduced to replace the horse. In men's vaulting the height of the table is 1.35 m (4.43 ft) from the floor; for women, the height is 1.20 m (3.94 ft). A

Reuther board, a type of springboard, is placed in front of the near end of the apparatus. The gymnast runs, gathers momentum while nearing the apparatus, rebounds off the springboard, and, supporting the hands on the apparatus, vaults over it and performs an acrobatic maneuver.

Vavilov \vəv-'yē-ləf**, Nikolay (Ivanovich)** (b. Nov. 25, 1887, Moscow, Russian Empire—d. Jan. 26, 1943, Saratov, Russia, U.S.S.R.) Russian plant geneticist. Through expeditions to many parts of the world, Vavilov amassed an immense plant collection and conceived the theory that a cultivated plant's centre of origin would be found in the region in which wild relatives of the plant showed maximum adaptiveness. He eventually proposed 13 world centres of plant origin. Though widely considered one of the greatest specialists in botanical populations, he was publicly condemned by Trofim Lysenko at successive plant-breeding congresses (1934–39) as peddling "Mendelist-Morganist genetics" (see Gregor Mendel; Thomas Hunt Morgan), and he died in a concentration camp.

vCard Electronic business card that automates the exchange of personal information typically found on a traditional business card. The vCard is a file that contains the user's basic business or personal data (name, address, phone number, URLs, etc.) in a variety of formats such as text, graphics, video clips, and audio clips. It can be attached to an e-mail or exchanged between computers or on the Internet, where, for example, the user can drag-and-drop his or her vCard to a registration or order form on a Web page so that it can automatically complete the form. It is used in such applications as voice mail, Web browsers, call centres, video conferencing, pagers, faxes, and smart cards.

VCR *in full* **videocassette recorder** Electromechanical device that records, stores on a videotape cassette, and plays back on a TV set recorded images and sound. The first commercial VCRs were marketed by Sony Corp. in 1969. VCRs are used to record broadcast TV programs for later viewing and to play commercially recorded cassettes. They have from two to seven tape heads that read and inscribe video and audio tracks on magnetic tape. Home movies can be made with a camcorder system, a VCR connected to a simple video camera.

veal Meat of young calves. It is usually pale grayish white in colour, firm and fine-grained, with a velvety texture. Calves bred to yield veal are usually raised indoors under controlled temperatures and intensively fed on milk, high-protein calf meal, or both. Herbaceous foods are excluded, which results in an iron deficiency that produces the desirable light colour in the meat. In recent decades, animal-rights groups have denounced calf farming as cruel.

Four common types of vault. A barrel vault (also called a cradle vault, tunnel vault, or wagon vault) has a semicircular cross section. A groin (or cross) vault is formed by the perpendicular intersection of two barrel vaults. A rib (or ribbed) vault is supported by a series of arched diagonal ribs that divide the vault's surface into panels. A fan vault is composed of concave sections with ribs spreading out like a fan.

Veblen \'veb-lən**, Thorstein (Bunde)** (b. July 30, 1857, Manitowoc county, Wis., U.S.—d. Aug. 3, 1929, near Menlo Park, Calif.) U.S. economist. He grew up in Minnesota and earned a Ph.D. in philosophy from Yale University. Although he taught economics at the University of Chicago and other universities, he was unable to keep any position for long because of his unconventional ideas and the disorder in his personal life. In 1899 he published his classic work *The Theory of the Leisure Class*, which applied Darwin's evolutionary theories to the study of modern economic life, highlighting the competitive and predatory nature of the business world. With dry humour he identified the markers of American social class, and he coined the term "conspicuous consumption" to describe the display of wealth made by the upper class. His reputation was highest in the 1930s, when the Great Depression was seen as a vindication of his criticism of the business system.

vector In mathematics, a quantity characterized by magnitude and direction. Some physical and geometric quantities, called scalars, can be fully defined by a single number specifying their magnitude in suitable units of measure (e.g., mass in grams, temperature in degrees, time in seconds). Quantities like velocity, force, and displacement must be specified by a magnitude and a direction. These are vectors. A vector quantity can be visualized as an arrow drawn in a specific direction, whose length is equal to the magnitude of the quantity represented. A two-dimensional vector is specified by two coordinates, a three-dimensional vector by three coordinates, and so on. Vector analysis is a branch of mathematics that explores the utility of this type of representation and defines the ways such quantities may be combined. See also vector operations.

vector operations Extension of the laws of elementary algebra to vectors. They include addition, subtraction, and three types of multiplication. The sum of two vectors is a third vector, represented as the diagonal of the parallelogram constructed with the two original vectors as sides. When a vector is multiplied by a positive scalar (i.e., number), its magnitude is multiplied by the scalar and its direction remains unchanged (if the scalar is negative, the direction is reversed). The multiplication of a vector $\mathbf{a}$ by another vector $\mathbf{b}$ leads to the dot product, written $\mathbf{a} \cdot \mathbf{b}$, and the cross product, written $\mathbf{a} \times \mathbf{b}$. The dot product, also called the scalar product, is a scalar real number equal to the product of the lengths of vectors $\mathbf{a}$ ($|\mathbf{a}|$) and $\mathbf{b}$ ($|\mathbf{b}|$) and the cosine of the angle (θ) between them: $\mathbf{a} \cdot \mathbf{b} = |\mathbf{a}|\,|\mathbf{b}| \cos\theta$. This equals zero if the two vectors are perpendicular (see orthogonality). The cross product, also called the vector product, is a third vector ($\mathbf{c}$), perpendicular to the plane of the original vectors. The magnitude of $\mathbf{c}$ is equal to the product of the lengths of vectors $\mathbf{a}$ and $\mathbf{b}$ and the sine of the angle (θ) between them: $|\mathbf{c}| = |\mathbf{a}|\,|\mathbf{b}| \sin\theta$. The associative law and commutative law hold for vector addition and the dot product. The cross product is associative but not commutative.

vector space In mathematics, a collection of objects called vectors, together with a field of objects (see field theory), known as scalars, that satisfy certain properties. The properties that must be satisfied are: (1) the set of vectors is closed under vector addition; (2) multiplication of a vector by a scalar produces a vector in the set; (3) the associative law holds for vector addition, $\mathbf{u} + (\mathbf{v} + \mathbf{w}) = (\mathbf{u} + \mathbf{v}) + \mathbf{w}$; (4) the commutative law holds for vector addition, $\mathbf{u} + \mathbf{v} = \mathbf{v} + \mathbf{u}$; (5) there is a $\mathbf{0}$ vector such that $\mathbf{v} + \mathbf{0} = \mathbf{v}$; (6) every vector has an additive inverse (see inverse function), $\mathbf{v} + (-\mathbf{v}) = \mathbf{0}$; (7) the distributive law holds for scalar multiplication over vector addition, $n(\mathbf{u} + \mathbf{v}) = n\mathbf{u} + n\mathbf{v}$; (8) the distributive law also holds for vector multiplication over scalar addition, $(m + n)\mathbf{v} = m\mathbf{v} + n\mathbf{v}$; (9) the associative law holds for scalar multiplication with a vector, $(mn)\mathbf{v} = m(n\mathbf{v})$; and (10) there exists a unit vector $\mathbf{1}$ such that $\mathbf{1v} = \mathbf{v}$. The set of all polynomials in one variable with real coefficients is an example of a vector space.

Ved-ava \'vā-dä-vä\ Divine ruler of the waters and their bounty, common to several Baltic and Finno-Ugric peoples traditionally dependent on fishing. She was also responsible for promoting fertility in humans and in livestock. In appearance, she resembled a mermaid, having long hair, large breasts, and a fishlike lower body. Fishermen sacrificed to her the first of their catch and observed numerous taboos while fishing. Seeing Ved-ava generally boded misfortune, most often drowning. She has been regarded as the spirit of a drowned person or simply as a personification of the water itself.

Veda \'vā-də\ Any of a group of sacred hymns and verses composed in archaic Sanskrit, probably in the period 1500–1200 BC. Together they form a body of liturgical literature that grew up around the cult of the soma

© 2006 Encyclopædia Britannica, Inc.

ritual. They extol the hereditary deities that personified various natural and cosmic phenomena. The entire corpus of Vedic literature, including the Upanishads, was considered the product of divine revelation. The Vedas were handed down orally for many generations before being committed to writing. Even today, several are recited with intonation and rhythm associated with the early days of Vedic religion. See also Rig Veda, Vedanta.

Vedanta \vā-'dän-tə\ One of the six orthodox systems (darshans) of Indian philosophy and the one that forms the basis of most modern schools of Hinduism. Its three fundamental texts are the Upanishads, the Bhagavadgita, and the Brahma Sutras, which are very brief interpretations of the doctrine of the Upanishads. Several schools of Vedanta have developed, differentiated by their conception of the relationship between the self (atman) and the absolute (Brahman). They share beliefs in samsara and the authority of the Vedas as well as the conviction that Brahman is both the material and instrumental cause of the world and that the atman is the agent of its own acts and therefore the recipient of the consequences of action (see karma).

Vedic religion \'vā-dik\ *or* **Vedism** Ancient religion of India that was contemporary with the composition of the Vedas and was the precursor of Hinduism. The religion of the Indo-European-speaking peoples who entered India c. 1500 bce from the region of present-day Iran, it was a polytheistic system in which Indra was the highest-ranked god. It involved the worship of numerous male divinities connected with the sky and natural phenomena. Ceremonies centred on ritual sacrifice of animals and on the use of soma to achieve trancelike states. These ceremonies, simple in the beginning, grew to be so complex that only trained Brahmans could carry them out correctly. Out of Vedism developed the philosophical concepts of atman and Brahman. The spread (8th–5th century bce) of the related concepts of reincarnation, karma, and release from the cycle of rebirth through meditation rather than sacrifice marked the end of the Vedic period and the rise of Hinduism. The Hindu initiation ceremony, upanayana, is a direct survivor of Vedic tradition.

Veeck \'vek**, Bill** *in full* **William Louis Veeck** (b. Feb. 9, 1914, Hinsdale, Ill., U.S.—d. Jan. 2, 1986, Chicago, Ill.) U.S. baseball-club executive and owner. The son of a sportswriter who was also president of the Chicago Cubs (1919–33), Veeck became co-owner of the minor league Milwaukee Brewers (1941–45) and later the major league Cleveland Indians (1946–48), St. Louis Browns (1949–53), and Chicago White Sox (1959–68; 1976–81). Believing that baseball was a form of entertainment and should not be treated as a business, he introduced many innovations in promotion, was almost always able to improve a team's attendance, and usually bettered its performance.

Vega \'vā-gə**, Lope de** *in full* **Lope Félix de Vega Carpio** (b. Nov. 25, 1562, Madrid, Spain—d. Aug. 27, 1635, Madrid) Spanish playwright, the outstanding dramatist of the Spanish Golden Age. After serving with the Spanish Armada, he lived in Madrid, serving as secretary to a series of nobles, including the duke of Sessa (from 1605). Called the "Phoenix of Spain," the phenomenally prolific Vega wrote as many as 1,800 plays, of which 431 survive, and established the *comedia* (tragicomic social drama), which typified the new Golden Age drama. He wrote two major types of drama, both Spanish in setting: the historical play based on a national legend (e.g., *Peribáñez* and *The King, the Greatest Alcalde*) and the "cloak-and-sword" drama of contemporary manners and intrigue, which turned on some "point of honour" (e.g., *The Gardener's Dog*). He established the comic character, or *gracioso*, as a commentator on the follies of his social superiors. *All Citizens Are Soldiers* is his best-known work outside Spain. He also wrote 21 volumes of nondramatic works in verse and prose, including *The New Art of Writing Plays* (1609).

vegetable In the broadest sense, all plant life and plant products (vegetable matter); in common, narrow usage, the fresh edible portion of herbaceous plants (roots, stems, leaves, flowers, or fruit), either eaten fresh or prepared in some way. Almost all current vegetables were cultivated in ancient Old or New World civilizations, though some have been greatly modified. Vegetables are good sources of minerals (especially calcium and iron), vitamins (especially A and C), and dietary fiber. All the amino acids needed to synthesize protein are available in vegetables. Fresh vegetables quickly age and spoil, but their storage life can be extended by such preservation methods as dehydration, canning, freezing, fermenting, and pickling.

vegetable oyster See salsify

vegetarianism Theory or practice of eating only plants. The vegetarian diet includes grains, vegetables, fruits, and nuts; it excludes meat, poultry, and fish, but some vegetarians eat dairy products (lactovegetarians), egg products (ovovegetarians), or both (ovolactovegetarians). Those who eat no animal products (including honey) are called vegans. Motivations vary and include ethics (both unwillingness to kill animals and abhorrence of modern methods of raising animals for meat), self-denial or religious taboo, ecology (including concern about the wastefulness and environmental costs of beef farming), and health. Vegetarians point to the many health benefits of their diet, including low rates of heart disease, diabetes, colon cancer, and obesity. While obtaining sufficient protein is seldom a problem in affluent societies, vegetarians must be careful to consume enough iron and, especially for vegans, calcium and vitamins D and B_{12}. The most influential early proponent of vegetarianism was Pythagoras, in the 6th century bc. Many Hindu sects and most Buddhists are vegetarian, and much of the world eats hardly any meat because it is unavailable. The Enlightenment led to a humane concern for animals; in the 19th century Britain became a major centre of vegetarianism, and vegetarian movements soon arose in Germany, the U.S., and other countries.

Veii \'vē-yī, 'vā-yē\ Ancient Etruscan town. It was located about 10 mi (16 km) northwest of Rome, near modern Veio. An important city of the Etruscan confederation and the foremost 6th-century producer of Etruscan terra-cotta sculptures, it had hegemony over Rome in the 7th–6th centuries bc. A subsequent series of wars ended in its destruction by Rome in 396 bc after a 10-year siege. Under Augustus it was made a municipium, and up to the 3rd century ad it continued as a religious centre.

vein Vessel that carries blood to the heart. Except for the pulmonary veins, veins bear deoxygenated blood from capillaries, which converge into threadlike venules and then veins, finally emptying into the venae cavae (see cardiovascular system; vena cava). Blood moves through veins by contraction of the surrounding muscles. Backflow is prevented by valves in most veins' inner layer (tunica intima), which lacks the elastic membrane lining of arteries. The thin middle layer (tunica media) is mostly collagen fibres, and the thick outer layer (tunica adventitia) is mostly connective tissue. See also circulation; varicose vein.

Velasco \bā-'läs-kō\ **(Alvarado), Juan** (b. June 16, 1910, Piura, Peru—d. Dec. 24, 1977, Lima) President of Peru (1968–75). Commander in chief of the army, he came to power by overthrowing Pres. Fernando Belaúnde Terry. His government was unusual among military regimes for its reformist and populist character. He nationalized transportation, communications, and electric power and converted millions of acres of private farms into workers' cooperatives. He defied the U.S. in nationalizing U.S.-owned oil fields and capturing and fining U.S. boats fishing within Peru's 200-mi (322-km) coastal limit. He was deposed in 1975 because of discontent with his restrictions on political participation.

Velasco Ibarra \bā-'läs-kō-ē-'bär-rä**, José (María)** (b. March 19, 1893, Quito, Ecua.—d. March 30, 1979, Quito) Five-time president of Ecuador. Born into a wealthy family, he was first elected to the presidency in 1933. In response to Congress's lack of support for his land reform program, he assumed dictatorial powers, imprisoning opposition leaders and censoring the press. Deposed by the army and forced into exile, he returned to the presidency in 1944, but his repressive policies alienated his liberal followers and again he was forced into exile. He returned and was elected three more times before his death in 1979, only once (1952–56) being permitted to serve out a full term.

Velázquez \və-'las-kəs,\ *Spanish* \bā-'lath-kāth**, Diego (Rodríguez de Silva)** (baptized June 6, 1599, Sevilla, Spain—d. Aug. 6, 1660, Madrid) Spanish painter. He was apprenticed to Francisco Herrera the Elder before being trained by Francisco Pacheco. His early works were mostly religious or genre scenes. After arriving in Madrid in 1623, he painted a portrait of Philip IV that won him immediate success and an appointment as court painter. His position gave him access to the royal collections, including works by Titian, who exerted the greatest influence on his style. In his portraits from this period, only the faces and hands of the figures are accentuated, and the dark figures stand out against a light background. A visit to Italy (1629–31) further developed his style, and on his return to Madrid he entered his most productive period. Velázquez created a new type of informal royal portrait for Philip's hunting lodge, and his portraits of court dwarfs display the same discerning eye as those of his royal subjects. On a second visit to Rome (1649–51) he painted a portrait of Pope

Innocent X. The powerful head, brilliant combinations of crimson of the curtain, chair, and cope are painted with fluent technique and almost imperceptible brushstrokes that go far beyond the late manner of Titian and announce the last stage in Velázquez's development. This portrait was copied innumerable times and won him immediate and lasting renown in Italy. In his last years he created his masterpiece, *Las Meninas* (*The Maids of Honour*, 1656). In this casual scene, the artist is shown painting the king and queen in the presence of the infanta Margarita and her attendants; the nearly life-size figures are painted in more or less detail according to their relation to the central figure of the infanta and to the source of light, creating a remarkable illusion of reality never surpassed by Velázquez or any other artist of his age. He is universally acknowledged as one of the giants of Western art.

Velde, Henri van de (b. April 3, 1863, Antwerp, Belg.—d. Oct. 25, 1957, Zürich, Switz.) Belgian architect, designer, and teacher. Sharing the philosophy of William Morris and the Arts and Crafts Movement, van de Velde believed in creating beautiful everyday objects. Increasingly occupied by a philosophy of total design, in 1895 he designed Bloemenwerf, a house for his wife and himself outside of Brussels for which he also designed all the interiors and furnishings. In 1896 he designed furniture and interiors for the Paris art galleries of Samuel Bing; because of the curving, delicate nature of these designs, van de Velde is credited with bringing the Art Nouveau style to Paris. (Van de Velde himself is generally associated with the Jugendstil movement, which was the German branch of Art Nouveau design.) In Weimer in 1902 he reorganized the arts and crafts school and the academy of fine art and thus laid the foundations for the amalgamation of the two bodies into the Bauhaus in 1919. He designed his best-known structure, the curving, sinuous Werkbund Theatre in Cologne, in 1914. His later work includes the Belgian pavilions at the international exhibitions in Paris (1937) and New York (1939). He also created graphic design work, generally in the curvilinear Art Nouveau style, and he spread his ideas through lecturing and teaching.

Velde \'vel-də**, Willem van de, the Elder** (b. 1611, Leiden, Neth.—d. December 1693, London, Eng.) Dutch marine painter. He sailed with the Dutch fleet and painted its engagements with the English. Settling in England in 1672, he continued to paint marine subjects, often in collaboration with his son, Willem the Younger (1633–1707), who became the foremost marine painter of his time. The latter was appointed court painter by Charles II in 1677 and was commissioned to paint England's naval battles; many of his works are housed in London's National Maritime Museum.

Velikovsky \ˌve-li-'kȯf-skē**, Immanuel** (b. June 10, 1895, Vitebsk, Russia—d. Nov. 17, 1979, Princeton, N.J., U.S.) Russian-born U.S. writer. He earned various degrees in Moscow and Edinburgh before moving to the U.S. in 1939. In his first book, *Worlds in Collision* (1950), he hypothesized, relying on legends of ancient peoples, that Venus and Mars had approached Earth closely c. 1500 BC, disturbing its rotation, axis inclination, and magnetic field. His claim was widely discredited by astronomers, and the book's publication caused U.S. scientists to threaten a boycott of his publisher. Later works set out other controversial theories about ancient history and catastrophic occurrences.

Velociraptor \və-'lä-sə-ˌrap-tər\ Genus of clawed theropod dinosaur (family Dromaeosauridae) that flourished in central and eastern Asia during the Late Cretaceous Epoch (99–65 million years ago). It was related to an Early Cretaceous (144–99 million years ago) North American genus, *Deinonychus*. Both genera had a sickle-shaped claw on each foot and ossified tendon reinforcements in the tail that enabled them to keep their balance while striking and slashing at prey. Swift, agile predators of small herbivores, they grew up to 6 ft (1.8 m) long and weighed up to 100 lb (45 kg).

velocity Quantity that designates the speed and direction in which a body moves. It can be represented graphically by an arrow (pointing in the direction of the motion), the length of which is proportional to the magnitude, or speed. For an object in circular motion, the direction at any instant is tangential to the circle at that point, and so is perpendicular to the radius at that point. The instantaneous speed of a vehicle, such as an automobile, can be determined by a speedometer, or mathematically by differential calculus. The average speed is the ratio of the distance traveled in any given time interval divided by the time taken.

velvet Fabric having a short, dense pile, used in clothing and upholstery. Velvet is made in the pile weave (see weaving), of silk, cotton, or synthetic fibres and is characterized by a soft, downy surface formed by clipped yarns (see shearing). Its "wrong" side is smooth and shows the weave used. Velvets can be made water-repellent and crush-resistant. They are also occasionally patterned or embossed.

vena cava \ˌvē-nə-'kā-və\ Either of two major veins that deliver oxygen-depleted blood to the right side of the heart. The superior vena cava drains the upper body, and the inferior vena cava drains the lower body. See also cardiovascular system, circulation.

Venda Bantu-speaking people who inhabit the northeastern corner of South Africa and neighbouring Zimbabwe. The Venda, today numbering more than 750,000, were the last of the peoples in the area to come under European control. Agriculture dominates their economy; cattle raising has increased in importance. Venda chiefs are traditionally custodians of the land, while local headmen permit household groups to occupy and work tracts of land.

Venda Former black enclave, northeastern South Africa. Located near the Zimbabwe border, it attracted the Venda people, who migrated into the region in the early 1700s from what is now Zimbabwe. It was annexed to Transvaal in 1898 and was a distinct administrative unit within South Africa when the country designated it a homeland for Venda-speaking people in 1962. The territory was granted partial self-government in 1973 and became an independent republic in 1979; it never received international recognition. After apartheid was abolished, Venda was reincorporated into South Africa in 1994 as part of the newly created Northern (now Limpopo) province.

Vendée \vä^{n}-'dā**, Wars of the** (1793–96) Insurrections in the west of France during the French Revolution. In the religious and impoverished area known as the Vendée, discontent with the new government grew after it instituted strict controls over the Catholic church (1790). An uprising began in opposition to the conscription acts (1793) and spread throughout the region, where peasants were joined by royalists to form the Catholic and Royal Army. Led by the nobleman François Charette de La Contrie (1763–1796), the Vendéan army of 65,000 occupied several towns, but was defeated at Cholet by government troops and forced to retreat. After further defeats at Le Mans (about 15,000 rebels killed) and at Savenay, the general warfare ended in December 1793. Vicious reprisals by the government provoked further resistance, until an amnesty was announced (1794) and the Vendée was granted freedom from conscription (1795). Charette joined a British-backed landing of exiled French nobles in Brittany (1795), but after their defeat and his execution (1796) the counter-revolutionary struggle ended.

Vendémiaire \vä^{n}-dā-'myer\ First month in the French republican calendar. It also was the name given to the event of 13 Vendémiaire of the year IV (Oct. 5, 1795), when Gen. Napoleon Bonaparte led the French Revolutionary troops that stopped an insurrection of Parisians as they marched against the government.

vending machine Machine from which various goods may be purchased, either with coin, paper currency, or electronic payment card. The first vending machines were introduced in 18th-century England to sell snuff and tobacco. From the late 19th century they have been widely used in many countries. Vending service is typically provided by a company that owns the machines and places them in businesses, schools, and the like. These operators provide the products and service either without cost to the owner of the premises on which a machine is located or in return for a servicing charge.

Vendsyssel-Thy \'ven-ˌsȳ-səl-'tȳ\ Island, northern end of Jutland, Denmark. It is known as Vendsyssel in the east and Thy in the west. The Limfjorden separates it from the mainland, to which it was attached until 1825, when water erosion cut a channel through the narrow isthmus at Thyborøn. It has an area of 1,809 sq mi (4,686 sq km). Frederikshavn, the main port, lies on the east coast facing Göteborg, Swed. The island is a holiday resort.

veneer Extremely thin sheet of rich-coloured wood (such as mahogany, ebony, or rosewood) or precious materials (such as ivory or tortoiseshell) cut in decorative patterns and applied to the surface of a piece of furniture. Though veneering was practiced in Classical antiquity, its use lapsed in the Middle Ages. It was revived in the 17th century, reaching its apogee in France and spreading from there to other European countries. The considerable craftsmanship involved in artistic veneering is most evident in the 18th and early 19th centuries, when Thomas Chippendale, George

© 2006 Encyclopædia Britannica, Inc.

Hepplewhite, and Thomas Sheraton used mahogany and satinwood veneers. By the mid-19th century mechanical saws allowed the veneering process to be used in mass production to cover defects in cheap furniture.

Venera \vyi-'nyer-ə\ *English* \və-'nar-ə\ Any of a series of unmanned Soviet planetary probes sent to Venus 1965–83. Venera 2 flew to within 25,000 mi (40,000 km) of Venus in 1966; a few days later, Venera 3 crash-landed on its surface, becoming the first spacecraft to strike another planet. Later missions analyzed Venus's atmosphere, made soft landings, detected certain long-lived radioactive isotopes (chiefly uranium and thorium), sent back the first close-up photographs of the planet's surface, and mapped the surface of the northern hemisphere with radar (by Venera 15 and 16, the last two of the series).

Venetian glass Variety of glassware made in Venice from the 13th century to the present. In the 15th century efforts were concentrated on the perfection of *cristallo* (clear glass that approximated rock crystal in appearance). By the 16th century Venetian glassmakers mastered techniques of adding colour and of removing the smoky tint produced by metal in the glass material. These and other secrets were guarded closely, and defecting workers were severely punished. But eventually many Venetian glassmakers did defect, and the techniques became common knowledge in France, Germany, The Netherlands, and England.

Ewer made of *calcedonio,* Venice, early 16th century; in the Museum für Kunsthandwerk, Frankfurt am Main, Ger.

COURTESY OF THE MUSEUM FUR KUNSTHANDWERK, FRANKFURT AM MAIN, GER.; PHOTOGRAPH, FOTO MARBURG-ART RESOURCE/EB INC.

Venetian school Renaissance artists of Venice whose work is characterized by a love of light and colour. Jacopo Bellini was the first in this influential line, followed by his son Gentile Bellini, the instructor of Venice's great High Renaissance painters, including Giorgione and Titian. In due course Titian became the dominant force in Venetian painting, and his rich colours and painterly technique were widely imitated. Other 16th-century masters included Veronese, known for his vast, brilliantly coloured, pageantlike canvases, and Tintoretto, who combined the Mannerists' rapidly receding diagonals and dramatic foreshortenings with the Venetian love of light as a means of defining form and heightening drama. Giovanni Battista Tiepolo was the last important Venetian figure painter and one of the greatest artists of the Rococo period.

Veneto \'ve-nə-ˌtō\ Region (pop., 2001 prelim.: 4,490,586), northern Italy. It covers an area of 7,090 sq mi (18,364 sq km); its capital is Venice. Bordered by Austria, the Adriatic Sea, and Lake Garda, the northern part is mountainous, while the southern part consists of a fertile plain. Parts were under Roman rule c. 2nd–1st centuries BC (see Padua and Verona) and later were subject to the Lombards. In the Middle Ages, several city-states gained importance, but most subsequently were subject to Venice. The area began to slip from Venetian hold after the French Revolution, and in the early 19th century Veneto came under Austrian rule. It was returned and joined to Italy in the 1860s. Agriculture is an economic mainstay, and industrial works are found around Veneto's major cities.

Veneziano, Domenico See Domenico Veneziano

Venezuela *officially* **Bolivarian Republic of Venezuela** Country, northern South America. Area: 353,841 sq mi (916,445 sq km). Population (2005 est.): 26,749,000. Capital: Caracas. About two-thirds of the people are mestizos; most of the rest are of European or African descent. Languages: Spanish (official), some 25 Indian languages. Religion: Christianity (predominantly Roman Catholic). Currency: bolívar. Mountain ranges and plains dominate Venezuela's geography. In the west, a northeastern spur of the Andes Mountains rises to Bolívar Peak. The Llanos (plains) occupy one-third of the country's central region. The Orinoco

River system drains almost the entire country and has an extensive and thickly wooded delta. The highest waterfall in the world, Angel Falls, is in Venezuela. Lakes include Maracaibo and Valencia. Principal mineral resources are petroleum and natural gas. Other mineral reserves include iron, bauxite, gold, and diamonds. Industries include steel, chemicals, textiles, and oil refining. Agricultural products—notably sugar, coffee, corn, bananas, and cacao—are important. Venezuela is a republic with a unicameral legislature; its head of state and government is the president. Venezuela has been inhabited by indigenous peoples for millennia. In 1498 Christopher Columbus sighted it; European explorers named the region Venezuela (Spanish: "Little Venice") after observing local Indian houses on stilts along the shores of Lake Maracaibo. A Spanish missionary established the first European settlement at Cumana c. 1523. In 1717 it was included in the Viceroyalty of New Granada. Venezuelan Creoles led by Francisco de Miranda and Simón Bolívar spearheaded the South American independence movement, and, though Venezuelans had declared independence from Spain as early as 1797, it was not assured until the last royalist forces surrendered in 1823. Military dictators generally ruled the country from 1830 until the overthrow of Marcos Pérez Jiménez in 1958. A new constitution adopted in 1961 marked the beginning of democracy. As a founding member of OPEC (Organization of Petroleum Exporting Countries), Venezuela enjoyed relative economic prosperity from oil production during the 1970s, but its economy has remained dependent on fluctuations in the world petroleum market. The government of Hugo Chávez promulgated a new constitution in 1999, the year in which a devastating rainstorm killed thousands in and around Caracas—one of the deadliest events in Venezuelan history. Despite an increase in oil prices in the early 21st century, the country experienced great political turmoil.

Venice *Italian* **Venezia** \vā-'nēt-syä\ City (pop., 2004 est.: 271,663), capital of Veneto region, northern Italy. Built on a lagoon, Venice encompasses some 118 islands, the whole 90-mi (145-km) perimeter of the lagoon, and two industrial mainland boroughs. Refugees from northern invasions of the mainland founded settlements in the 5th century AD that were built uniquely on islands as protection against raids. Venice was a vassal of the Byzantine Empire until the 10th century. Beginning with control of a trade route to the Levant, Venice emerged from the Fourth Crusade (1202–04) as ruler of a colonial empire which included Crete, Euboea, the Cyclades, the Ionian Islands, and footholds in Morea and Epirus. In 1381 it defeated Genoa after a century-long struggle for commercial supremacy in the Levant and eastern Mediterranean. In the 15th century, with the acquisition of neighbouring regions, the Republic of Venice became an extensive Italian state. It gradually lost its eastern possessions to Ottoman Turks, with

© 2006 Encyclopædia Britannica, Inc.

whom Venice fought intermittently from the 15th to the 18th century; it gave up its last hold in the Aegean in 1715. The republic dissolved and the territory was ceded to Austria in 1797. Incorporated into Napoleon's Kingdom of Italy in 1805, it was restored to Austria in 1815. A revolt against Austria (1848–49) eventually resulted in Venice being ceded to Italy in 1866. It suffered little damage during World War II, but flooding along its many miles of canals caused severe damage in 1966. The waters of the lagoon rise and flood the city on a regular basis, complicating efforts to preserve its architecture, which includes Italian, Arabic, Byzantine, and Renaissance forms. There are some 450 palaces and homes of major historic importance in Venice. Notable among its 400 bridges is the Bridge of Sighs (built c. 800) and among its churches St. Mark's Basilica. Most of the city's workers find employment in tourism and related industries, though Venice also plays a key market role within the vibrant economic system of the Veneto region.

Venice, Gulf of Northern section of the Adriatic Sea. It extends eastward for 60 mi (95 km) from the Po River delta, Italy, to the coast of Istria. Marshes, lagoons, and sandspits border the gulf's shores as far as Trieste, Italy. A northeast wind, called the bora, causes rough seas and creates shipping hazards in the gulf.

Venice, Peace of (1177) Agreement in which Holy Roman Emperor Frederick I Barbarossa acknowledged Alexander III as the true pope. Frederick's decisive defeat by the Lombard League at the Battle of Legnano (1176) had obliged him to abandon his Italian campaign and sign a truce. In the Peace of Venice, Frederick agreed to withdraw support from the antipope and to restore church property he had seized. He received the kiss of peace from the pope in front of St. Mark's.

Venice, Treaty of (1201) Treaty negotiated between crusaders in the Fourth Crusade and Enrico Dandolo of Venice to provide transport for 85,000 marks. The crusaders' failure to fulfill their monetary obligation was a major factor in the diversion of the crusade to Zara and Constantinople.

Venice Biennale \ˌbē-en-ˈnä-lā\ International art exhibition held in the Castello district of Venice every two years and juried by an international committee. It was founded in 1895 as the International Exhibition of Art of the City of Venice to promote "the most noble activities of the modern spirit without distinction of country." The first Biennale, which achieved worldwide prestige, included artists from 16 nations; the committee included Edward Burne-Jones, Gustave Moreau, and Pierre Puvis de Chavannes. After World War II it became the leading showplace for the international avant-garde. Usually held in the summer months, it attracts many tourists and visitors.

Venizélos \ˌven-yə-ˈze-lōs**, Eleuthérios (Kyriakos)** (b. Aug. 23, 1864, Mourniés, Crete, Ottoman Empire—d. March 18, 1936, Paris, France) Greek revolutionary leader. Son of a Cretan revolutionary, he served in the government of autonomous Crete as minister of justice (1899–1901), then led an insurrection that forced the autocratic high commissioner to leave Crete (1905). In Athens, he led the Military League opposition group and effected the union of Crete with Greece. As premier of Greece (1910–15) he helped form the Balkan League. During the Balkan Wars, his policies doubled Greece's area and population. In World War I he supported the Allies; he resigned when opposed by the pro-German King Constantine, led the opposition that forced the king into exile, and again became premier (1917–20), aligning Greece with the Allies and successfully protecting Greek interests at the Paris Peace Conference. He served three more stints as premier (1924, 1928–32, 1933), but he was forced into exile when the monarchy was restored in 1935.

venom Poison secreted by an animal, produced by specialized glands often associated with spines, teeth, or stings. It may be primarily for paralyzing or killing prey or may be purely defensive. Some venoms also function as digestive fluids. Their effects can range from localized skin inflammation to almost immediate death; they include nervous-system excitation (cramps, vomiting, convulsions) or depression (paralysis, respiratory or cardiac depression or arrest), hemorrhage, red-blood-cell breakdown, circulatory collapse, and allergic reactions (including hives and inflammation). Many major groups of animals contain venomous species: snakes (cobras, mambas, vipers, pit vipers); fish (stingrays, spiny sharks, certain catfish, puffers); lizards (Gila monsters, beaded lizards); scorpions; spiders (black widow spiders, brown recluse spiders); social insects (bees, wasps, some ants); and marine invertebrates (sea anemones, fire corals, jellyfish, sea urchins). See also antidote.

ventilating Natural or mechanically induced movement of fresh air into or through an enclosed space. The hazards of poor ventilation were not clearly understood until the early 20th century. Expired air may be laden with odors, heat, gases, or dust. Mechanical ventilation systems typically include a fan and filter to remove particles. A mechanically powered inlet of air, when combined with a natural exhaust, tends to cause a slight positive pressure within an enclosed space, so that the air leakage is outward. A mechanical exhaust with a natural air inlet causes a slight negative pressure, so that air moves inward. Such systems are often used to confine fumes or smells to a particular area of a building (e.g., laboratories, kitchens, bathrooms) and exhaust them to the outside.

ventricular fibrillation Uncoordinated contraction of the muscle fibres of the heart's ventricles (see arrhythmia). Causes include heart attack, electric shock, anoxia, abnormally high potassium or low calcium in the blood, and digitalis or epinephrine poisoning (see drug poisoning). Death soon follows if circulation is not restored with electric shocks (defibrillation) or drugs supplemented by chest compressions (as in cardiopulmonary resuscitation). See also atrial fibrillation.

ventriloquism Art of "throwing" one's voice in such a way that the sound seems to come from a source other than the speaker. A dummy or doll is commonly used to assist in the deception, with the ventriloquist moving the dummy's mouth while speaking through closed lips. Ventriloquists date from ancient times and include Eurycles of Athens. Such peoples as the Maoris, Zulus, and Eskimos are adept ventriloquists. The art was long a feature of puppet shows as well as of variety entertainment such as vaudeville. Notable ventriloquists included Edgar Bergen in the U.S. and Robert Lamouret in France.

Ventris \ˈven-trəs**, Michael (George Francis)** (b. July 12, 1922, Wheathampstead, Hertfordshire, Eng.—d. Sept. 6, 1956, near Hatfield, Hertfordshire) British architect and cryptographer. At age 14 he heard a lecture on the continuing mystery of Linear B script (see Linear A and Linear B) and resolved to decipher it. In 1952 he determined that Linear B was Greek in its oldest known form, dating from c. 1400–1200 BC. He collaborated with John Chadwick (1920–98) on *Documents in Mycenaean Greek* (1956), published a few weeks after his own death in an auto accident.

Venturi, Robert (Charles) (b. June 25, 1925, Philadelphia, Pa., U.S.) U.S. architect. He studied at Princeton University and in Rome at the American Academy. After working with Eero Saarinen and Louis Kahn, he formed a partnership with his wife, Denise Scott Brown, and John Rauch. His philosophy, set forth in the influential books *Complexity and Contradiction in Architecture* (1966) and *Learning from Las Vegas* (1972), called for openness to the multiple influences of historical tradition, ordinary commercial architecture, and Pop art. He had such a profound impact on younger architects who were beginning to find similar constraints and limitations in the Modernist architectural aesthetic, that he became the unofficial dean of the postmodern movement in architecture. His buildings often exhibit ironic humour. Important commissions include buildings for Princeton and the University of Pennsylvania, the Seattle Art Museum (1985–91), and the Sainsbury Wing of London's National Gallery (1986–91). He won the 1991 Pritzker Architecture Prize.

venturi \ven-ˈtůr-ē\ **tube** Short pipe with a constricted inner surface, used to measure fluid flows and as a pump. The effects of constricted channels on fluid flow were first investigated by Giovanni Battista Venturi (1746–1822), but it was Clemens Herschel (1842–1930) who devised the instrument in 1888. Fluid passing through the tube speeds up as it enters the tube's narrow throat, and the pressure drops. There are countless applications for the principle, including the carburetor, in which air flows through a venturi channel at whose throat gasoline vapour enters through an opening, drawn in by the low pressure. The pressure differential can also be used to measure fluid flow (see flow meter).

venue In law, the place or county in which the events giving rise to a legal action take place and from which a jury may be drawn to try the case. Venue statutes usually specify that a trial must take place in the district that has jurisdiction over the matter. The grounds for a change of venue are also specified; they include fear of biased jurors due to media coverage, danger of violence, and racial prejudice.

Venus Roman goddess of cultivated fields and gardens, later associated with Aphrodite. She was the daughter of Jupiter and Dione, the wife of Vulcan, and the mother of Cupid. She was famous for her romantic intrigues and affairs with both gods and mortals, and she became asso-

© 2006 Encyclopædia Britannica, Inc.

ciated with many aspects of femininity. The planet Venus, originally the star of Ishtar, came to be named for Venus through her association with Ishtar. She has been a favourite subject in art since ancient times, notably in the statue known as *Venus de Milo* (c. 150 BC)and in Sandro Botticelli's painting *The Birth of Venus* (c. 1485).

Venus Second major planet from the Sun. Named for the Roman goddess, Venus is, after the Moon, the most brilliant natural object in the night sky. Venus comes closer to Earth—about 26 million mi (42 million km)—than any other planet. Its orbit around the Sun is nearly circular at a distance of about 67 million mi (108 million km) and takes 225 days; its rotation, in retrograde motion, takes even longer (243 days). As viewed from Earth, Venus undergoes phase changes similar to the Moon's, going through one cycle of phases in 584 days. It is seen only near sunrise or sunset and has long been known as both the morning star and the evening star. Venus is a near twin of Earth in size and mass but is completely enveloped by thick clouds of concentrated sulfuric acid droplets. Its surface gravity is about 90% that of Earth. Its atmosphere is over 96% carbon dioxide, with a pressure about 95 times Earth's. The dense atmosphere and thick cloud layers trap incoming solar energy so efficiently that Venus has the highest surface temperature of any of the Sun's planets, more than 860 °F (460 °C). Radar imaging indicates that the surface is dry and rocky, consisting mostly of gently rolling plains, broad depressions, and two large elevated regions analogous to continents on Earth; Venus also has impact craters, extensive lava fields, and massive shield volcanos. The interior is thought to be similar to that of Earth, with a metal core, a dense rocky mantle, and a less-dense rocky crust. Unlike Earth, Venus has no intrinsic magnetic field.

Venus's-flytrap *or* **Venus flytrap** Flowering perennial plant (*Dionaea muscipula*), sole member of its genus, in the sundew family, notable for its unusual habit of catching and eating insects and other small animals (see carnivorous plant). Native to a small region of North and South Carolina, it is common in damp, mossy areas. Growing from a bulblike rootstock, the plant bears hinged leaves with spiny teeth along their margins and a round cluster of small white flowers at the tip of an erect stem 8–12 in. (20–30 cm) tall. When an insect alights on a leaf and stimulates its sensitive hairs, the leaf snaps shut in about half a second. Leaf glands secrete a red sap that digests the insect's body and gives the entire leaf a red, flowerlike appearance. After 10 days of digestion, the leaf reopens. The trap dies after capturing three or four insects.

Venus's-flytrap (*Dionaea muscipula*)
JACK DERMID

Veracruz \ˌver-ə-ˈkrüz\ *in full* **Veracruz Llave** City (pop., 2000: 411,582) and port on the Gulf of Mexico, east-central Veracruz state, east-central Mexico. Hernán Cortés founded La Villa Rica de la Veracruz as the first Mexican municipality in 1519, but the site was twice abandoned because of its unhealthy conditions; the present city dates from c. 1600. As the chief link between colonial Mexico and Spain, Veracruz prospered as a port and became the most "Spanish" of Mexican cities. It was attacked and captured repeatedly, first by privateers, then by French and U.S. forces (see Veracruz incident). It was renamed Veracruz Llave in honour of Gen. Ignacio de la Llave, governor of Veracruz state (1857–60). Both the 1857 and 1917 Mexican constitutions were proclaimed there. A revolt against Pres. Francisco Madero occurred there in 1912. It is one of Mexico's chief seaports and a commercial centre for the Gulf coast.

Veracruz State (pop., 2000: 6,908,975), east-central Mexico. Bordering the Gulf of Mexico, it occupies 27,683 sq mi (71,699 sq km); its capital is Jalapa. The state's low, sandy gulf area rises inland to a central plateau, where the volcano Citlaltépetl, Mexico's highest peak, reaches 18,406 ft (5,610 m) high. The area was inhabited by pre-Columbian cultures, including the Olmec. The first European landing was made by Hernán Cortés in 1519. A state since 1824, Veracruz has more than one-fourth of Mexico's petroleum reserves and several of the country's refineries. Its economy is supplemented by agriculture, forestry products, and manufacturing.

Veracruz incident (1914) Occupation of Veracruz, Mex., by U.S. marines. In April 1914, after the crew of a U.S. ship that had anchored in Tampico was briefly detained for landing in a forbidden area, Pres. Woodrow Wilson demanded an apology from the Mexican government. When Mexican president Victoriano Huerta refused, Wilson sent a fleet to the Gulf of Mexico. After learning of an arms shipment to Huerta from Germany, Wilson ordered the port of Veracruz seized. By July the invasion had caused 200 Mexican casualties and had enabled the rival Constitutionalists under Venustiano Carranza (who had denounced the seizure by the U.S.) to take over the government. Huerta was forced into exile, and the U.S. marines were withdrawn on November 14.

Veralden-radien \ˈvā-ä-ˌräl-dān-ˈrä-dē-en\ Deity believed by the Sami to be the closest to the starry heaven. Because he is associated with the pillar supporting the heavens, he is also responsible for the continuance of life. He imparts the souls of unborn children to Madderakka and takes the souls of the departed to the realm of the dead. He was also the subject of a phallic cult; each year the genitalia and blood of a bull reindeer were smeared on his statue. His worship has many Scandinavian features, which has led scholars to seek his origin in Norse mythology.

verbena \vər-ˈbē-nə\ Plant genus (*Verbena*) that contains about 250 species, almost all of them native to the New World tropics and subtropics. Two species are indigenous to the Old World. The familiar garden verbena (*V. hortensis*, or *V. hybrida*) is a creeping plant that has square stems and bears flat heads of phloxlike flowers, in a wide range of colours. Many U.S. species of *Verbena* are low-growing, small-flowered, somewhat weedy plants more commonly called vervains. The shrub lemon verbena (*Aloysia triphylla*), notable for its fragrant oil, is a member of the verbena, or vervain, family (family Verbenaceae), which contains more than 2,600 species in about 100 genera. Members of the family have opposite or whorled leaves that are usually undivided. The flowers, in spikes or clusters, usually consist of a tube flaring into four or five almost equally cut lobes. The family also includes teak.

Vercingetorix \ˌvər-sən-ˈje-tə-ˌriks\ (d. 46 BC) Chieftain of the Gallic tribe of the Arverni. Julius Caesar had almost subjugated Gaul (see Gallic Wars) when Vercingetorix, acclaimed king of his people, led the Gauls against him (52 BC), using guerrilla tactics and picking battle sites favourable to his own forces. After winning a major victory at Gergovia, his later attack on the Roman army failed; besieged at Alesia, he was forced to surrender. Taken to Rome in chains, he was displayed in Caesar's triumph and executed six years later.

Verdi \ˈver-dē**, Giuseppe (Fortunato Francesco)** (b. Oct. 9/10, 1813, Roncole, near Busseto, duchy of Parma—d. Jan. 27, 1901, Milan, Italy) Italian composer. He was the son of an innkeeper, and he showed talent early. While earning a living as an organist, he began to write operas in Milan; in 1839 his *Oberto* was successfully performed at La Scala, and it initiated Verdi's long association with the publisher Giulio Ricordi. His next opera, *Un giorno di regno* (1840), was a failure. Much worse, Verdi's two young daughters and his wife died. He overcame his despair by composing *Nabucco* (1842); it was a sensational success and was followed by the equally successful *I Lombardi* (1843). For the rest of the decade he wrote a hit opera every year. Rejecting the prevailing structure of Italian opera—a patchwork of open-ended scenes and inserted arias, duets, and trios—he began conceiving of an opera as a series of integrated scenes, then as unified acts. Specializing in stories in which people's private and public lives come into conflict, he produced a series of masterworks, including *Rigoletto* (1851), *Il trovatore* (1853), *La traviata* (1853), *Don Carlos* (1867), and *Aïda* (1871). A fervent nationalist, he was regarded as a great national figure. After composing his *Requiem* (1874), he retired, but when Ricordi brought him together with the poet and composer Arrigo Boito, initially to revise *Simon Boccanegra*, their mutual esteem led to the two great operas of Verdi's old age, *Otello* (1886) and *Falstaff* (1890).

Verdigris \ˈvər-də-grəs\ **River** River, southeastern Kansas and northeastern Oklahoma, U.S. It rises in east-central Kansas and flows south across the Oklahoma border, emptying into the Arkansas River northeast of Muskogee, Okla. It is 350 mi (560 km) long.

Verdun \vər-ˈdən**, Battle of** (Feb. 21–July 1916) Major engagement of World War I between Germany and France. As part of its strategy of war by attrition, Germany selected the fortress of Verdun as the site it believed France would defend to the last man. After a massive bombardment, the Germans advanced with little opposition for four days before the reinforced French army under Philippe Pétain slowed their advance. For two months the hills west of the Meuse River and north of Verdun were bombarded, attacked, and counterattacked. By July, Germany, which was

© 2006 Encyclopædia Britannica, Inc.

also engaged in the Battle of the Somme, had abandoned its strategy of attrition, and France gradually regained its forts and territory. The devastating losses included more than 400,000 French casualties and nearly as many German casualties.

Verdun, Treaty of (843) Treaty partitioning the Carolingian empire among the three surviving sons of Louis I (the Pious). It marked a first stage in the dissolution of Charlemagne's empire and a step toward the formation of the modern countries of western Europe. The treaty was signed following three years of civil war between the three brothers. Lothar I received the imperial title and Francia Media, which included much of Italy as well as parts of several other present-day European countries. Louis the German received Francia Orientalis, the land east of the Rhine River, and Charles II (the Bald) received Francia Occidentalis, the remainder of modern France.

Verga \'vär-gä**, Giovanni** (b. Sept. 2, 1840, Catania, Sicily—d. Jan. 27, 1922, Catania) Italian writer, the most important of the *verismo* (realist) school of novelists. Born to a family of landowners, Verga left Sicily for the mainland, where he remained until 1893. There he developed a writing style noted for its terse accuracy and intensity of feeling. His best works include the short stories of *Little Novels of Sicily* (1883), the novels *The House by the Medlar Tree* (1881) and *Mastro-Don Gesualdo* (1889), and the play *Cavalleria rusticana* (1884; "Rustic Chivalry"), which became immensely popular when it was adapted as an opera by Pietro Mascagni. His influence on the post-World War II generation of Italian Neorealist writers was particularly marked (see Neorealism).

Vergennes \ver-'zhen**, Charles Gravier, count de** (b. Dec. 28, 1719, Dijon, France—d. Feb. 13, 1787, Versailles) French statesman. As ambassador to Ottoman Turkey (1754–68), he ably defended French policies during the Seven Years' War. As Louis XVI's minister of foreign affairs (1774–87), he advocated French financial and military support for the colonists in the American Revolution, concluded an alliance with them (1778), and helped negotiate the Treaty of Paris (1783). He also worked to establish a stable balance of power in Europe by mediating the peace in the War of the Bavarian Succession.

Verghina *or* **Vergina** \ver-'gē-nä\ Archaeological site and ancient capital of Macedonia, northern Greece. Built on a site in use from the Stone Age, it was first called Balla. The palace of Palatista, partly destroyed by fire, dates from the reign of Antigonus III Doson (c. 263–221 BC). An Iron Age cemetery that dates from the 10th–7th centuries BC is near the palace. The 4th-century-BC royal tomb of Philip II of Macedon also is at Verghina.

Vergil See Virgil

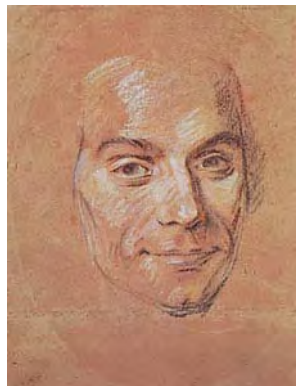
Verhaeren \ver-'hä-ren, ver-ä-'ren**, Émile** (b. May 21, 1855, Saint Amand lez-Puers, Belg.—d. Nov. 27, 1916, Rouen, France) Belgian poet. He wrote in French, producing more than 30 collections of poetry outstanding for its strength and range. His first book, *Les Flamandes* (1883), contains violently naturalistic poems. Later he began to show a growing concern for social problems. His major works include *The Sunlit Hours* (1896), *The Evening Hours* (1911), and *Belgium's Agony* (1915). His three main themes are Flanders, human energy, and his tender, understanding love for his wife. He also published plays and books on art. He was one of the group in Brussels who brought about the literary and artistic renaissance of the 1890s.

verifiability principle Criterion of meaningfulness associated with logical positivism and the Vienna Circle. Moritz Schlick's formulation "The meaning of a [declarative sentence] is the method of its verification" was close to the view held in pragmatism, and later in operationalism, that an assertion has factual meaning only if there is a difference in principle, open to test by observation, between the affirmation and the denial of the assertion. Thus, the statements of ethics, metaphysics, religion, and aesthetics were held to be meaningless. The verifiability criterion of meaningfulness was in part inspired by Albert Einstein's abandonment of the ether hypothesis and the notion of absolute simultaneity.

Verlaine \ver-'len**, Paul (-Marie)** (b. March 30, 1844, Metz, France—d. Jan. 8, 1896, Paris) French lyric poet. After entering the civil service, he was first associated with the Parnassian poets, contributing to the first volume of the anthology *Le Parnasse contemporain* (1866). His early collections, *Poèmes saturniens* (1866), *Fêtes galantes* (1869), *La Bonne chanson* (1870), and *Romances sans paroles* (1874), show the intense lyricism and musicality that would mark all his verse. His marriage was shattered by his infatuation with Arthur Rimbaud, and the two scandalized Paris with their behaviour in 1872–73. While in prison in Belgium (1873–75) for shooting Rimbaud when the latter threatened to leave him, he converted to Catholicism and probably composed the famous "Art poétique," adopted in 1882 by the poets of the Symbolist movement. *Sagesse* (1880) expresses his religious faith and his emotional odyssey. He later taught French and English; he spent his late years in poverty, but just before his death he was sponsored for a major international lecture tour. His *Les Poètes maudits* (1884; "The Accursed Poets") consists of short biographical studies of six poets, including Stéphane Mallarmé and Rimbaud. He is regarded as the third great member (with Charles Baudelaire and Mallarmé) of the so-called Decadents.

Vermeer \vər-'mer, vər-'mir**, Johannes** (b. Oct. 31, 1632, Delft, Neth.—d. Dec. 15, 1675, Delft) Dutch painter. His parents were tavern keepers. He twice served as head of the Delft artists' guild but seems to have depended on his activities as an art dealer to support his family. He painted mainly interior genre subjects, depicting members of aristocratic and upper-middle-class society. About half of these paintings show solitary figures of women absorbed in some ordinary, everyday activity. His interiors combine a microscopic observation of objects with a meticulous depiction of the gradations of daylight on varied shapes and surfaces. His masterpieces (none dated) include *View of Delft*, *Young Woman Reading a Letter*, and *Allegory of Painting*, his most symbolically complex work. He manages to be unique within a typically Dutch genre. Few foreign influences can be sensed in his work. His work was not widely appreciated in his own time, and he remained in obscurity until 1866, when Théophile Thoré celebrated his work and attributed 76 paintings to him; later authorities have reduced the number to between 30 and 35, while proclaiming him one of the greatest painters of all time.

Vermont State (pop., 2000: 608,827), northeastern U.S. One of the New England states, it covers 9,614 sq mi (24,900 sq km); its capital is Montpelier. On the north, Vermont borders Quebec, Can., on the south, Massachusetts, and on the west, New York. From the Canadian to the Massachusetts border, the Connecticut River separates Vermont from New Hampshire on the east. The Green Mountains extend through the centre of Vermont. The highest point is Mount Mansfield, at 4,393 ft (1,339 m). Most of the rivers drain into Lake Champlain. Settled originally by Abenaki Indians, the region was explored by Samuel de Champlain, who in 1609 discovered the lake that now bears his name. The French established the first permanent European settlement in 1666 on Isle La Motte. Both the Dutch and the British established settlements in the 18th century, but the area fell exclusively to the British in 1763. Disputes arose between New York and New Hampshire concerning jurisdiction of the area; New Hampshire had awarded grants to settlers. In 1770 Ethan Allen organized the Green Mountain Boys to repel encroachers from western New York. In 1775, at the start of the American Revolution, Allen and his group, fighting for the colonies, captured Fort Ticonderoga from the British. Vermonters created an independent republic in 1777, and in 1791 it became the 14th U.S. state. In 1864, during the American Civil War, it was the site of the only action north of Pennsylvania when a band of Confederates raided St. Albans from Canada. Dairying and the mining of granite and marble contribute to the economy. In the 1930s the first ski runs were built, and by the 1960s a winter tourist industry had developed.



vernacular architecture Common domestic architecture of a region, usually far simpler than what the technology of the time is capable of maintaining. In highly industrialized countries such as the U.S., for example, barns are still being built according to a design employed in Europe in the 1st millennium BC. Vernacular structures are characterized by inexpensive materials and straightforwardly utilitarian design.

Verne, Jules (b. Feb. 8, 1828, Nantes, France—d. March 24, 1905, Amiens) French writer. He studied law then worked as a stockbroker while writing plays and stories. The first of his romantic adventures (*voyages extraordinaires*), *Five Weeks in a Balloon* (1863), was highly successful. His subsequent *voyages*—with increasingly fantastic yet carefully conceived scientific wonders that often anticipated 20th-century technological achievements—include *A Journey to the Centre of the Earth* (1864), *Twenty Thousand Leagues Under the Sea* (1870), and *Around the World in Eighty Days* (1873). Verne's work shaped the entire development of science fiction.

Vernet \ver-'nā**, (Claude-) Joseph** (b. Aug. 14, 1714, Avignon, France—d. Dec. 3, 1789, Paris) French painter. Son of a decorative

© 2006 Encyclopædia Britannica, Inc.

painter, he catered to a new taste for idealized, somewhat sentimentalized landscapes. His shipwrecks, sunsets, and conflagrations reveal a subtle observation of light and atmosphere. His series of 15 *Ports of France* (1754–65), his finest works, constitute a remarkable record of 18th-century life. His son Carle (1758–1836) produced vast battle scenes for Napoleon, but his real talent was for intimate genre scenes and drawing. His long series of fashionable studies, often satirizing contemporary manners and costume, were widely reproduced as engravings. After the restoration of the monarchy he became court painter to Louis XVIII. Carle's son Horace (1789–1863) developed a remarkable facility for working on a grand scale and became one of France's most important military painters.

vernier \'vər-nē-ər\ *or* **vernier caliper** Instrument for making very accurate linear or angular measurements. Introduced in 1631 by Pierre Vernier (c. 1580–1637), it uses two graduated scales: a main scale similar to that on a ruler, and a specially graduated scale, the vernier, that slides parallel to the main scale and enables readings to be made to a fraction of a division on the main scale.

Verona City (pop., 2001 prelim.: 243,474), northern Italy. Located on the Adige River, it became a Roman colony in 89 BC and was the birthplace of the poet Catullus. It was captured by the Goths after the fall of the Roman Empire and was the site of Odoacer's defeat by the Ostrogothic king Theodoric in 489. It was occupied by Charlemagne in 774. Verona came under the della Scala family (1260–1387), the era recalled in William Shakespeare's *Romeo and Juliet*. It passed in 1405 to Venice, which held it almost continuously until 1797, when it was ceded to Austria. It became part of the Kingdom of Italy in 1866. It is noted for its ancient Roman amphitheatre (1st century AD), now used for opera, and for Romanesque and Gothic buildings.

Verona, Congress of (1822) Last of the meetings held by the Quadruple Alliance (Russia, Prussia, Austria, and Britain). The congress met in Verona, Italy, to consider a request by the alliance's ally, France, to intervene in the revolutionary situation in Spain. The congress agreed to support France if it were attacked by Spain and authorized a French expedition into Spain. However, Britain threatened to use its sea power to prevent interference with the revolts in Spanish America. Increasing discord caused a breakdown in the congress system begun by the alliance in 1815.

Veronese \ˌver-ə-'nā-sē**, Paolo** *orig.* **Paolo Caliari** (b. 1528, Verona, Republic of Venice—d. April 9, 1588, Venice) Italian painter. Son of a stonecutter from Verona, he was apprenticed at 13 to a painter. After 1553, when he received the first of many commissions in Venice, he became a major painter of the 16th-century Venetian school, a group of Renaissance artists known for their splendid use of colour and pageant-like compositions. His first works in Venice, ceiling paintings for the Doges' Palace, employ skillful foreshortenings that make figures appear to be floating in space. He decorated the villas and palaces of the Venetian nobility and received many commissions for frescoes, altarpieces, and devotional paintings, including numerous "suppers" (e.g., *The Pilgrims of Emmaus* and *Feast in the House of the Pharisees*) that allowed him to compose large groups of figures in complex Renaissance architectural settings. In decorating a villa built by Andrea Palladio at Maser (c. 1561), he brilliantly interpreted its architectural structure, breaking through the walls with illusionistic landscapes and opening the ceilings to blue skies with figures from Classical mythology. Whimsical details in his *Last Supper* (commissioned 1573) caused him to be summoned before the Inquisition. Painters from the 16th century on were inspired by his use of colour to express exuberance as well as to model form.

Verrazzano \ˌver-ə-'zä-nō**, Giovanni da** (b. 1485, Tuscany, Italy—d. 1528, Lesser Antilles) Italian navigator and explorer for France. Educated in Florence, he moved to Dieppe, France, where he entered the maritime service. In 1524 he was sent to find a westward passage to Asia and reached North America. He explored the eastern coast from Cape Fear northward and became the first European to explore the sites of present-day New York Harbor and Narragansett Bay. He sailed along the coast to Newfoundland, then returned to France. He later led expeditions to Brazil (1527) and to the Caribbean, where he was killed and eaten by cannibals.

Verres \'ver-ˌēz**, Gaius** (b. c. 115—d. 43 BC) Roman magistrate. As quaestor, Verres embezzled funds. He helped the governor of Cilicia, Gaius Dolabella, plunder the province (80–78), and then he helped convict Dolabella at Rome. He became praetor by bribery and abused his power. As governor of Sicily (73–71) his corruption was extreme; he was prosecuted so effectively by Cicero (70) that his lawyer had no reply. He fled into exile but was murdered, perhaps at the orders of Mark Antony, who then acquired his art collection.

Verrocchio \və-'rô-kē-ˌō**, Andrea del** (b. 1435, Florence—d. 1488, Venice) Italian sculptor and painter. Little is certain about his early life. His most important works were executed in his final two decades under the patronage of the Medici in his native Florence. His reputation as a master spread early, and many well-known artists studied at his studio, including Leonardo da Vinci and Perugino; the young Leonardo probably painted an angel and part of the distant landscape in Verrocchio's *Baptism of Christ* (c. 1470). Verrocchio's reputation as one of the great relief sculptors of the Renaissance was established with his cenotaph in the cathedral at Pistoia; while it remained unfinished at his death and was later changed by others, the relief's arrangement of figures into a dramatically unified composition anticipates the Baroque sculpture of the 17th century. His bronze statue of the military officer Bartolomeo Colleoni (commissioned 1483, erected in Venice 1496) is one of the greatest equestrian statues of the Renaissance.

BROGI—ALINARI FROM ART RESOURCE

vers de société \ˌver-də-sȯs-yā-'tā\ *French* **"society verse"** Witty, typically ironic, light verse, written with polish and ease of expression to amuse a sophisticated audience. It has flourished in cultured societies, particularly in court circles and literary salons, from the time of Anacreon (6th century BC). Trivial subjects are treated in an intimate, witty manner, and even when social issues form the theme, the light mood prevails. The poetry of Ogden Nash, with its theme of self-ironic adult helplessness, is a 20th-century example.

Versace, Gianni (b. Dec. 2, 1946, Reggio Calabria, Italy—d. July 15, 1997, Miami Beach, Fla., U.S.) Italian fashion designer. He was born to a dressmaker mother. After working for several Italian ateliers in Milan, in 1978 Versace established his own company, Gianni Versace SpA. Throughout the 1980s and '90s he built a fashion empire by producing ensembles that oozed sensuality and sexuality. He staged his seasonal fashion shows like rock concerts at his lavish design headquarters in Milan. On July 15, 1997, Versace was shot and killed on the front steps of his Miami Beach, Fla., home, allegedly by the serial killer Andrew Cunanan. At the time of his death, many believed that the designer's 25-year career was at a peak.

Versailles \ver-'sī**, Palace of** Baroque palace southwest of Paris built chiefly under Louis XIV. It was the principal residence of the French kings and the seat of government from 1682 to 1789, with some 1,000 courtiers and 4,000 attendants residing there. Originally a hunting lodge, it was enlarged by Louis XIII and Louis XIV. Louis Le Vau (1612–70), with Charles Le Brun and André Le Nôtre, began work on the palace in the 1660s. A masterpiece of formal grandeur intended as the visible expression of the glory of France, Versailles became the palatial ideal throughout Europe and the Americas. Le Nôtre's inventive arrangement of earth forms, plantings, and fountains created vistas, terraces, formal gardens, and wooded areas that celebrated the delights of both open and intimate space. After Le Vau's death, Jules Hardouin-Mansart (1646–1708) was

© 2006 Encyclopædia Britannica, Inc.

commissioned to triple the size of the palace and built the northern and southern wings, the Orangerie, and the Grand Trianon. Later additions include the Classically restrained Petit Trianon, built 1761–64 for Louis XV and Madame de Pompadour. The first scenes of the French Revolution were enacted at Versailles, which had become a symbol of royal extravagance. In 1837 Louis-Philippe restored the palace and turned it into a museum.

Versailles, Treaty of International agreement, signed in 1919 at the Palace of Versailles, that concluded World War I. It was negotiated primarily by the U.S., Britain, and France, without participation by the war's losers. Germany was forced to accept blame for Allied losses and to pay major reparations. Its European territory was reduced by about 10%, its overseas possessions were confiscated, and its military establishment was reduced. Although some of the treaty's terms were eased in the 1920s, the bitterness it created helped to foster an environment that led to the growth of fascism in Italy and the rise of the Nazi Party in Germany. The treaty also established the League of Nations, the International Labour Organization, and the Permanent Court of International Justice (later the International Court of Justice). See also Fourteen Points.

vertebral \vər-'tē-brəl, 'vərt-ə-brəl\ **column** *or* **spinal column** *or* **spine** *or* **backbone** Flexible column extending the length of the torso. In humans, it consists of 32–34 vertebrae, with different shapes and functions in each of five regions: 7 cervical, in the neck (including the atlas and axis, modified for free movement of the skull); 12 thoracic, in the chest; 5 lumbar, in the lower back; 5 sacral (fused into the sacrum, part of the pelvic girdle); and 3 to 5 coccygeal (vestigial tailbones fused into the coccyx). The body of each vertebra is separated from its neighbours by cushioning intervertebral disks of cartilage. Behind the body is a Y-shaped vertebral (neural) arch with structures extending up and down to form joints with the adjacent vertebrae and to the back and sides to provide attachment points for muscles and ligaments. The spine supports the torso and protects the spinal cord.

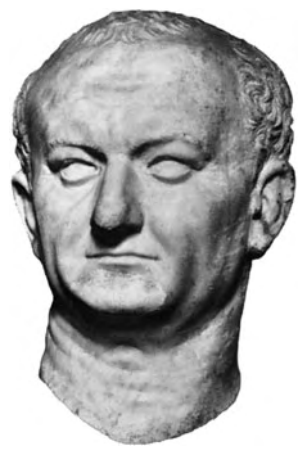
vertebrate Any animal of the chordate subphylum Vertebrata, which includes the fishes, amphibians, reptiles, birds, and mammals. Vertebrates have an internal skeleton formed of cartilage, bone, or both. The skeleton consists of a backbone (vertebral column), which partly encloses a spinal cord; a skull, which encloses the brain; and usually two pairs of limbs. Nerves extending from the spinal cord and brain permeate the skin, muscles, and internal organs. The muscular system consists primarily of bilaterally paired masses attached to bones or cartilage. Skin and scales, feathers, fur, or hair cover the outer surface. See also invertebrate.

vertical integration Form of business organization in which all stages of production of a good, from the acquisition of raw materials to the retailing of the final product, are controlled by one company. A current example is the oil industry, in which a single firm commonly owns the oil wells, refines the oil, and sells gasoline at roadside stations. In horizontal integration, by contrast, a company attempts to control a single stage of production or a single industry completely, which lets it take advantage of economies of scale but results in reduced competition.

vertigo \'vər-tə-ˌgō\ Feeling that one is spinning or that one's surroundings are spinning around one, causing confusion and difficulty keeping one's balance, sometimes accompanied by nausea and vomiting. Vertigo is normal after actual spinning, since inner-ear fluid continues to move once the body has stopped, producing a mismatch between visual and internal sensations. Lack of a stable visual reference point also contributes to this effect. Other causes include concussion and abnormalities of the inner ear (e.g., labyrinthitis; see otitis), of the nerves that carry signals from it, or of the brain centers that receive them (e.g., stroke). Vertigo is often confused with a feeling of faintness (see syncope), since both are called dizziness. See also motion sickness, proprioception, spatial disorientation.

vervain See verbena

vervet monkey *or* **vervet** Any of several African races of slim, arboreal, diurnal Old World monkeys of the guenon species *Cercopithecus aethiops* and *C. pygerythrus* (family Cercopithecidae). They have large cheek pouches. The arms and legs are long, and the nonprehensile tail is longer than the head-and-body length of 12–26 in. (30–65 cm). The soft, dense fur of many species has a speckled effect and bold markings of white or bright colours. The face, chin, hands, and feet of *C. aethiops* races are black.



Verwoerd \fər-'vürt**, Hendrik (Frensch)** (b. Sept. 8, 1901, Amsterdam, Neth.—d. Sept. 6, 1966, Cape Town, S.Af.) Dutch-born South African prime minister (1958–66). He was taken to South Africa as an infant by his missionary parents. After studying at the University of Stellenbosch, he became a professor there, and in 1937 he became editor of the Afrikaner nationalist daily in Johannesburg. Appointed senator (1948) and then minister of native affairs (1950), he was responsible for much of the country's new apartheid legislation. When he became prime minister in 1958, his apartheid program was strictly enforced, and he pushed through legislation resettling blacks in reservations. His policies provoked demonstrations, sometimes violent. In 1960 white voters approved his recommendation that South Africa leave the British Commonwealth, and his dream of a republic came true. He was stabbed to death in the parliamentary chamber by a parliamentary messenger of mixed descent.

Very Large Array (VLA) Radio telescope system consisting of 27 parabolic dishes. The most powerful radio telescope in the world, it has been operated on the plains of San Agustin near Socorro, N.M., U.S., by the National Radio Astronomy Observatory since 1980. Each dish is 82 ft (25 m) in diameter and can be moved independently by transporter along rails laid out in an enormous Y pattern whose arms are about 13 mi (21 km) long. The radio signals received by the dishes are integrated by computer, so the entire array acts as a single radio antenna (an interferometer). The VLA, which has a maximum angular resolution better than a tenth of an arc second, has been responsible for producing many of the most detailed radio images of quasars; galaxies; supernovas; and the Milky Way Galaxy's nucleus.

Vesalius \və-'sā-lē-əs**, Andreas** *Flemish* **Andries van Wesel** (b. Dec. 1514, Brussels—d. June 1564, island of Zacynthus, Republic of Venice) Flemish physician. Born into a family of physicians, he studied medicine at the University of Paris. As a lecturer in surgery, he insisted on dissecting corpses himself, instead of relying on untrained assistants, to learn anatomy. Comparing his observations with ancient texts led him to question the theories of Galen, at that time still considered authoritative. Vesalius's own complete textbook of human anatomy, the momentous *De humani corporis fabrica libri septem* (1543; "Seven Books on the Structure of the Human Body"), commonly called the *Fabrica*, was the most extensive and accurate description of the human body that had ever been published.

Vesey \'vē-zē**, Denmark** (b. c. 1767, probably St. Thomas, Danish West Indies—d. July 2, 1822, Charleston, S.C., U.S.) U.S. insurrectionist. Born into slavery, he was sold to a Bermuda slaver captain, with whom he sailed on numerous voyages. They settled in Charleston, S.C., and Vesey was allowed to purchase his freedom for $600 in 1800. After reading antislavery literature, he determined to oppose the oppression of slaves. He organized city and plantation blacks (up to 9,000 by some estimates) for an uprising in which they would attack arsenals, seize arms, kill all whites, burn Charleston, and free the slaves on surrounding plantations. After a house servant warned the authorities, the insurrection was forestalled and 130 blacks were arrested; Vesey was tried and hanged with 35 others.

Vespasian \ves-'pā-zhən\ *in full* **Caesar Vespasianus Augustus** *orig.* **Titus Flavius Vespasianus** (b. Nov. 17?, AD 9, Reate, Latium—d. June 24, 79) Roman emperor (69–79), founder of the Flavian dynasty. Although of humble birth, he won military glory in Britain and was awarded a triumph by Claudius. In 63 he became proconsul of Africa. He reconquered Judaea except for Jerusalem (67–68) but stopped fighting on the death of Nero (68). After the murder of Galba, Vespasian was proclaimed emperor by the legions, while Vitellius claimed the title in Cologne; Vespasian's forces soon defeated Vitellius in Italy. Although he claimed absolute power and took every possible office for himself and his sons, he was a

Vespasian, bust found at Ostia; in the Museo Nazionale Romano, Rome

© 2006 Encyclopædia Britannica, Inc.

popular emperor and lived simply. He increased provincial taxation to pay for the deficits incurred by Nero and the civil wars, built the Temple of Peace and began the Colosseum, and reformed the army and Praetorian Guard. He ended the Jewish war (70) and the Rhineland revolt, adding lands in Germany and Britain and pacifying Wales. He was succeeded by his son Titus.

Vespucci \ves-'pü-chē**, Amerigo** (b. 1454, Florence—d. 1512, Sevilla) Italian-born Spanish navigator and explorer of the New World. He entered the Medici family business and in 1491 was sent to Sevilla, where he helped outfit the ships for the expeditions of Christopher Columbus. By 1496 he was manager of the Sevilla agency. He took part in two (or four—the number is disputed) voyages to the New World; he was navigator on a Spanish expedition (1499–1500) that probably discovered the mouth of the Amazon River, and he led a Portuguese expedition (1501–02) that discovered Guanabara Bay (Rio de Janeiro) and the Río de la Plata. In the accounts of the voyages (published 1507), the terms America and New World were first used to describe the lands visited by Amerigo Vespucci (in Latin, Americus Vespucius). As chief navigator for the Sevilla-based Commercial House for the West Indies (from 1508), he prepared maps of newly discovered lands from data supplied by ships' captains.

Vesta In Roman religion, the goddess of the hearth, identified with the Greek Hestia. Because maintaining a hearth fire was important in ancient times, she was worshiped in every household. Her state worship was elaborate: her temple in Rome had a perpetual fire that was attended by the Vestal Virgins. The fire was officially extinguished and renewed annually on March 1st; its extinction at any other time was viewed as a portent of disaster to Rome.

Vesta (seated on the left) with Vestal Virgins, classical relief sculpture; in the Palermo Museum, Italy
COURTESY OF THE PALERMO MUSEUM, ITALY

Vestal Virgin In Roman religion, any of six priestesses, representing the daughters of the royal house, who tended the state cult of Vesta. Chosen between the ages of 6 and 10, they served for 30 years, during which time they had to remain virgins; violation of the vow of chastity was punishable by burial alive. Their duties included tending the perpetual fire in the Temple of Vesta, fetching water from a sacred spring, preparing ritual food, caring for objects in the temple's inner sanctuary, and officiating at the public worship of Vesta. They enjoyed many honours and privileges, including emancipation from their fathers' rule.

Vestris, (Marie-Jean-) Auguste (b. March 27, 1760, Paris, Fr.—d. Dec. 5, 1842, Paris) French ballet dancer. He was trained by his father, Gaétan Vestris, before making his formal debut in 1776. His dazzlingly athletic dancing set a new style of ballet. In his last years he was a revered teacher.

Vestris, Gaétan *orig.* **Gaetano Appolino Baldassare** (b. April 18, 1729, Florence, Italy—d. Sept. 23, 1808, Paris, Fr.) French ballet dancer and teacher. His style was flamboyant while respecting traditional courtly technique. Vestris later became renowned as the most distinguished teacher of his day. His most celebrated pupil was his son Auguste Vestris.

Vesuvius Active volcano, eastern side of the Bay of Naples, southern Italy. It originated about 200,000 years ago; its current height of 4,198 ft (1,280 m) has varied considerably after each of its major eruptions; in 1900 it was 4,275 ft (1,303 m) high; in 1906, 3,668 ft (1,118 m) high; and in the 1960s, 4,203 ft (1,281 m) high. The cone is half-encircled on the northern side by Mount Somma, part of the wall of a large crater in which the present cone has formed. There have been numerous destructive eruptions; in AD 79 Pompeii and Herculaneum were destroyed, and in 1631 about 3,000 people were killed. The last major eruption occurred in 1944. More than two million people live in the area of Vesuvius, whose fertile slopes are covered with vineyards and orchards.

vetch Any of about 150 species of herbaceous plants in the genus *Vicia* of the pea family (see legume). A few species are cultivated as important fodder and cover crops and as green manure. Trailing or climbing stems grow 1–4 ft (0.3–1.2 m) tall, bearing compound leaves with several pairs of leaflets. Magenta, bluish-white, white, or yellow flowers are borne singly or in clusters. The pods contain 2–10 seeds. Like other legumes, vetches add nitrogen to the soil through nitrogen fixation. See also crown vetch.

Vetch (*Vicia cracca*)
WALTER DAWN

Veterans Day U.S. holiday celebrated on November 11, honouring veterans of the U.S. armed forces and those killed in battle. Originally called Armistice Day, it began as a commemoration of the ending of World War I on Nov. 11, 1918. After World War II it was recognized as a day to pay tribute to all service members, and in 1954 it was designated as Veterans Day. It is usually observed with parades, speeches, and flowers placed on military graves and memorials. The holiday is called Remembrance Day in Canada and Remembrance Sunday (on the Sunday nearest to November 11) in Britain.

veterinary science Medical field dealing with animals and with diseases that are contagious between animals and humans. It was a medical specialty in ancient Egypt and Babylonia but went through a period of virtual nonexistence in medieval Europe before reappearing in the mid-18th century with the founding of the first veterinary schools. Veterinarians practice internal medicine, surgery, and preventive medicine, using the same techniques used on humans. Many specialize in either small animals (pets) or large ones (livestock); a few specialize in wild animals.

Viagra First oral drug for male impotence, generic name sildenafil. Before the FDA approved Viagra in 1998, impotence was treated with surgical implants, suppositories, pumps, and drugs injected into the penis. Taken as a pill shortly before sexual intercourse, Viagra selectively dilates blood vessels in the penis, improving blood flow and allowing a natural sexual response. It works in about 70% of cases; it should not be used by anyone taking nitroglycerin or with heart problems, hypotension, hypertension, recent stroke, or certain eye disorders.

viatical settlement Arrangement by which a terminally ill patient's life-insurance policy is sold to provide funds while the insured (viator) is living. The buyer (funder), usually an investment company, pays the patient a lump sum of 50–80% of the policy's face value, pays the premiums until the patient dies, and receives the death benefit. Viatical settlements (from Latin *viaticum*, "provisions for a journey") appeared in the 1980s, when people with AIDS had high medical bills and policies nominally sufficient to cover them but whose funds would not be available until they died.

vibraphone *or* **vibraharp** Percussion instrument with tuned metal bars, arranged keyboard-style like the xylophone. Felt or wool beaters are used to strike the bars, giving a soft, mellow tone quality. Each bar has a resonating tube suspended vertically below it to sustain the tone; small electrically powered spinning disks at the top of the resonators produce a vibrato effect by rapidly closing and opening the resonators. Invented c. 1920, it soon became a popular jazz instrument.

vibration Periodic back-and-forth motion (see periodic motion) of the particles of an elastic body or medium. It is usually a result of the displacement of a body from an equilibrium condition, followed by the body's response to the forces that tend to restore equilibrium. Free vibrations occur when a system is disturbed but immediately allowed to move without restraint, as when a weight suspended by a spring is pulled down and then released. Forced vibrations occur when a system is continuously driven by an external agency, as when a child's swing is pushed on each downswing. Because all systems are subject to friction, they are also subject to damping. In the example of free vibration, damping would cause the amplitudes of the spring's vibrations to diminish until eventually the system came to rest. See also resonance.

vibrio \'vib-rē-ō\ Any of a group of aquatic, comma-shaped bacteria in the family Vibrionaceae. Some species cause serious diseases in humans and other animals. They are gram-negative (see Gram stain), highly capable of movement (with one to three flagella at one end), and do not

© 2006 Encyclopædia Britannica, Inc.

require oxygen. Their cells are curved rods, single or strung together in S-shapes or spirals. Two species are of significance to humans: one causes CHOLERA, the other acute bacterial diarrhea.

viburnum \vī-'bər-nəm\ Any of about 200 shrubs and small trees that make up the genus *Viburnum* in the HONEYSUCKLE FAMILY, native to temperate and subtropical Eurasia and North America. Many species are cultivated for their ornamental foliage, fragrant clusters of usually white flowers, and colourful blue-black fruits. Familiar garden shrubs in this family include Chinese snowball (*V. macrocephalum* variety *sterile*) and Japanese snowball (*V. plicatum*), each with large balls of white to greenish white flowers.

Vicente \vē-'sāⁿn-tə**, Gil** (b. c. 1465, Portugal—d. 1536/37) Portuguese playwright. His first plays were produced in 1502, and for the next 34 years he acted as court dramatist and poet laureate, staging his plays to celebrate great events and religious occasions. Regarded as the founder of Portuguese drama, he wrote in both Portuguese and Spanish. His 44 extant plays reflect the change and upheaval of his era; they may be divided into religious plays, court plays, pastoral plays, popular farces, and romantic comedy. His works include *Exhortation to War* (1513), *The Forge of Love* (1524), and *The Pilgrimage of the Aggrieved* (1533).

Vichy \'vē-shē\ **France** *officially* **French State** *French* **État Français** (July 1940–September 1944) French regime in WORLD WAR II after the German defeat of France. The Franco-German armistice (June 1940) divided France into two zones: one under German military occupation and one under nominal French control (the southeastern two-fifths of the country). The National Assembly, summoned at Vichy to ratify the armistice, was persuaded by PIERRE LAVAL to grant PHILIPPE PÉTAIN authority to assume full powers in the French State. The antirepublican Vichy government collaborated with the Germans and became increasingly a tool of German policy, especially after the Germans occupied the whole of France in 1942. By early 1944 the RESISTANCE movement against the GESTAPO and Vichy militias created a period of civil war in France, and after the liberation of Paris the Vichy regime was abolished.

Vicksburg Campaign (1862–63) Engagements fought at Vicksburg, Miss., in the AMERICAN CIVIL WAR. Confederate forces held the fortified city against Union naval bombardment from the Mississippi River (1862) and attempts to attack by land. In April 1863 ULYSSES S. GRANT used the Union ships to ferry troops across the river at night. He quickly took nearby Port Gibson and Grand Gulf to prevent Confederate forces under JOSEPH JOHNSTON from aiding those in the city. Unable to take Vicksburg directly, Grant besieged the city for six weeks. On July 4 Gen. John Pemberton (1814–1881) surrendered his force of 30,000, leaving the Mississippi River completely under Union control and splitting the Confederacy in half.

Vico \'vē-kō**, Giambattista** (b. June 23, 1668, Naples—d. Jan. 23, 1744, Naples) Italian philosopher of cultural history and law. In his major work, *New Science* (1725), he attempted to combine history and the more systematic social sciences into a single science of humanity. He described human societies as passing through stages of growth and decay. The first is a "bestial" condition, from which emerges "the age of the gods," in which man is ruled by fear of the supernatural. "The age of heroes" is the consequence of alliances formed by family leaders to protect against internal dissent and external attack; in this stage, society is rigidly divided into patricians and plebeians. "The age of men" follows, as the result of class conflict in which the plebeians achieve equal rights, but this stage encounters the problems of corruption, dissolution, and a possible reversion to primitive barbarism. His work is recognized as a forerunner of CULTURAL ANTHROPOLOGY.

Victor III *orig.* **Dauferi** (b. 1027, Benevento, principality of Benevento—d. Sept. 16, 1087, Montecassino, principality of Capua; beatified July 23, 1887; feast day September 16) Pope (1086–87). As abbot of MONTE CASSINO from 1058, he promoted manuscript illumination, established a school of mosaic, and reconstructed the abbey. He served as papal vicar in southern Italy, negotiating peace between the Normans and the papacy. He was proclaimed pope against his will and was soon driven from Rome by supporters of Emperor HENRY IV and the antipope Clement III. In 1087, after briefly retiring to his abbey, Victor resumed his papal authority and promoted the reforms of his predecessor, Pope GREGORY VII. After sending an army to defeat the Saracens at Tunis (1087), he called a synod at Benevento and excommunicated Clement. He fell ill and returned to Monte Cassino, where he died.

Victor Amadeus \ˌäm-ə-'dā-əs\ **II** *Italian* **Vittorio Amedeo** (b. May 14, 1666, Turin, Savoy—d. Oct. 31, 1732, Moncalieri, near Turin) King of Sicily (1713–20) and of Sardinia (1720–30). The son of Charles Emmanuel II, he inherited his father's title as duke of Savoy in 1675 and grew up under a regency headed by his mother, who pursued a pro-French policy. In the War of the SPANISH SUCCESSION he sided with France, but in 1703 he shifted to the Habsburg side. With the French defeat at Turin (1706) he secured his position in Italy. The Treaty of UTRECHT (1713) gave him the title of king of Sicily, which he was obliged to exchange for Sardinia in 1720. As the first king of Sardinia, which also included Piedmont and Savoy, he established the foundation for the future Italian national state.

Victor Emmanuel I *Italian* **Vittorio Emanuele** (b. July 24, 1759, Turin, Kingdom of Sardinia—d. Jan. 10, 1824, Moncalieri, near Turin) King of Sardinia (1802–21). Son of Victor Amadeus III and great-grandson of VICTOR AMADEUS II, he led Sardinian forces against the French (1792–97). He became duke of Savoy and king of Sardinia in 1802 when his brother Charles Emmanuel IV abdicated. His kingdom, except for the island of Sardinia, was occupied by France (1802–14), then restored with the addition of Genoa by the Congress of VIENNA (1815). He abdicated in 1821 in favour of his brother Charles Felix (1765–1831).

Victor Emmanuel II *Italian* **Vittorio Emanuele** (b. March 14, 1820, Turin, Piedmont, Kingdom of Sardinia—d. Jan. 9, 1878, Rome, Italy) King of Sardinia (1849–61) and first king of a united Italy (1861–78). The son of CHARLES ALBERT, he took part in the war against Austria (1848) and became king when his father abdicated in 1849. Assisted by his minister CAMILLO CAVOUR, he strengthened the kingdom and supported the RISORGIMENTO movement for unity. In the war with Austria (1859–61), he commanded troops to victories in the Battles of MAGENTA and SOLFERINO. He secretly encouraged GIUSEPPE DE GARIBALDI in the conquest of Sicily and Naples and led the invasion of the Papal States. He assumed the title of king of Italy (1861) and later acquired Venetia (1866) and Rome (1870).

Victor Emmanuel III *Italian* **Vittorio Emanuele** (b. Nov. 11, 1869, Naples, Italy—d. Dec. 28, 1947, Alexandria, Egypt) King of Italy (1900–46). Son of UMBERTO I, he came suddenly to the throne on his father's assassination (1900). He accepted a Liberal cabinet and readily agreed to Italy's war against Turkey (1911–12) and entry into World War I. After the war, he failed to prevent the rise of BENITO MUSSOLINI and the fascist seizure of power, which turned him into a figurehead sovereign. In 1943, after disastrous Italian military losses and the Allied invasion of Sicily, he had Mussolini arrested and replaced by PIETRO BADOGLIO as premier. In 1944 he relinquished power to his son Umberto and, in an unsuccessful attempt to preserve the monarchy, abdicated in Umberto's favour in 1946 (see UMBERTO II). When the Italian republic was declared in 1946, father and son went into exile.

Victoria *orig.* **Alexandrina Victoria** (b. May 24, 1819, Kensington Palace, London, Eng.—d. Jan. 22, 1901, Osborne, near Cowes, Isle of Wight) Queen of the United Kingdom of Great Britain and Ireland (1837–1901) and Empress of India (from 1876). The only child of Edward, duke of Kent, she succeeded her uncle, WILLIAM IV, in 1837. She was first guided as queen by the Whig prime minister Lord MELBOURNE and then by her husband, Prince ALBERT, whom she married in 1840. Devoted to him, she accepted his decisions on all issues in the period sometimes called the "Albertine monarchy." They had nine children, through whose marriages descended many of the royal families of Europe. From 1861 Victoria deeply mourned Albert's death and thereafter made royal decisions as she believed he would have advised. She was frequently at odds with Prime Minister WILLIAM E. GLADSTONE and welcomed his replacement by BENJAMIN DISRAELI in 1874. Her reign, called the Victorian age, was marked by a period of British expansion and a restoration of dignity and

© 2006 Encyclopædia Britannica, Inc.

popularity to the monarchy, as shown by her Jubilees of 1887 and 1897. She remains the longest reigning monarch in British history.

Victoria State (pop., 2001: 4,822,663), southeastern Australia. It covers an area of 87,810 sq mi (227,420 sq km); its capital is Melbourne. The state's western and northwestern parts are sandy desert and lowland, while the central and eastern parts are highlands forming the southern end of the Australian Alps. The southwestern coastal region is known as Gippsland. The Murray River forms almost the entire boundary between the state and New South Wales. Australian Aboriginal peoples had lived in the region for at least 40,000 years before contact with Europeans. Some 60 years after Capt. James Cook first sighted its coastline (1770), the area was settled by immigrants from Tasmania, who brought in their wake diseases that decimated much of the Aboriginal population. Victoria became a separate colony in 1851. In 1901 it became a state of the Commonwealth of Australia. Boosting its economy is a highly productive agricultural hinterland.

Victoria City (pop., 2001: metro. area, 311,902), capital of British Columbia, Canada. It is located on the southeastern tip of Vancouver Island, overlooking Juan de Fuca Strait. It was founded in 1843 by the Hudson's Bay Co. as a fur-trading post known as Fort Camosun; it was later renamed Fort Victoria to honour the English queen. It was selected as the capital in 1866 when Vancouver Island united with British Columbia. It is now one of the province's largest business centres and a tourist resort and retirement community. A major port, it is the Pacific headquarters of the Canadian navy.

Victoria Seaport, urban district, administrative centre of Hong Kong special administrative region, China. It lies on the northern shore of Hong Kong Island (pop., 2001: 1,335,469). It has extensive wharves and is connected to the mainland by ferry and by automobile and railway tunnels. It is the chief administrative, commercial, and cultural centre of Hong Kong and is the headquarters for numerous international banks and corporations.

Victoria Town (pop., 1997: metro. area, 24,701), capital of the Republic of Seychelles. Located on the northeastern coast of Mahé Island in the Indian Ocean, it is the only port of the archipelago and the only town of any size in Seychelles. It is the country's business and cultural centre.

Victoria, Lake *or* **Victoria Nyanza** Largest lake in Africa and chief reservoir of the Nile River, east-central Africa. The southern half lies in Tanzania, the northern half in Uganda; it borders Kenya in the northeast. With an area of 26,828 sq mi (69,484 sq km), it is the second largest freshwater lake in the world (after Lake Superior in North America). It is about 210 mi (337 km) long, 150 mi (240 km) wide, and up to 270 ft (82 m) deep. Though the Kagera River is its largest tributary, the most important source of water for the lake is rainfall. Its only outlet is the Victoria Nile. John Hanning Speke, searching for the source of the Nile in 1858, was the first European to sight it. He named it for Queen Victoria; the Arabs had called it Ukerewe. Henry Morton Stanley circumnavigated it in 1875. It became a reservoir when the water level was raised after completion of Owen Falls Dam in 1954.

Victoria, Tomás Luis de (b. c. 1548, near Avila, Spain—d. Aug. 27, 1611, Madrid) Spanish composer. He went to Rome c. 1565 as an organist and singer, and he may have studied with Giovanni Pierluigi da Palestrina, eventually becoming kapellmeister for a Jesuit congregation (1573–77). Ordained a priest (1575), he was associated with St. Philip Neri's group (1578–85). During this time he published his books of motets, masses, Magnificats, and hymns. In 1587 he returned to Spain as chaplain to the dowager empress Maria, in whose convent he served as organist and choirmaster until his death. He wrote 21 masses (including a *Pope Marcellus Mass*), several Magnificats, and 44 motets (including *O magnum mysterium*). His music is mystical, impressive, and moving, and he was renowned as the greatest Spanish composer of the Renaissance.

Victoria, University of Public university in Victoria, British Columbia, Canada, founded in 1903. It has faculties of arts and sciences, education, engineering, fine arts, graduate studies, human and social development, and law, as well as schools of business, music, nursing, and other specializations.

Victoria and Albert Museum Museum of decorative arts in London. It was conceived by Prince Albert as a way to improve the standards of British design by making the finest models available for study. The core collection, consisting of objects purchased at the 1851 Crystal Palace exhibition, was originally called the Museum of Ornamental Art and was opened by Queen Victoria in 1857. A new building was later designed by Sir Aston Webb, and the museum was renamed when Victoria laid the cornerstone in 1899; it was opened to the public by Edward VII in 1909. It houses vast collections of European sculpture, ceramics, furniture, metalwork, jewelry, textiles, and musical instruments from medieval times to the present; remarkable Chinese ceramics, jade, and sculpture; the premier collection of Italian Renaissance sculpture outside Italy; and the outstanding national collection of British watercolours, miniatures, prints, and drawings. It is regarded as the world's greatest decorative-arts museum. Its branch museums include the Bethnal Green Museum of Childhood, the Theatre Museum, and the Wellington Museum.

Victoria Desert See Great Victoria Desert

Victoria Falls Waterfall, at the border between Zambia and Zimbabwe. Approximately twice as wide and twice as deep as Niagara Falls, the falls span the entire breadth of the Zambezi River at one of its widest points (more than 5,500 ft [1,700 m]). There the river plunges over a precipice, split by islands and promontories, to a drop of 355 ft (108 m). Two national parks, Victoria Falls in Zimbabwe and Mosi-oa-Tunya in Zambia, are adjacent to the falls. Victoria Falls was designated a World Heritage site in 1989. The first European sighting of the falls was in 1855 by David Livingstone, who named them after Queen Victoria.

Victoria Falls See Iguazú Falls

Victoria Island Second largest island of the Arctic Archipelago, Canada. About 320 mi (515 km) long and 170–370 mi (270–600 km) wide, it has an area of 83,896 sq mi (217,291 sq km). Discovered in 1838 by Thomas Simpson, it was named for Queen Victoria and was first explored by John Rae in 1851. It is divided administratively between the Northwest Territories and the territory of Nunavut.

Victoria Nile River that forms the upper section of the Nile River. Some 260 mi (420 km) long, it issues from the northern end of Lake Victoria, then flows over the Owen Falls Dam, through Lake Kyoga, and over Kabalega Falls (118 ft [36 m]) before entering the northeastern corner of Lake Albert. It is about 300 mi (480 km) long.

Victoria River Longest river in Northern Territory, Australia. The Victoria River flows northwest for about 350 mi (560 km) to enter the Joseph Bonaparte Gulf of the Timor Sea. Its last 100 mi (160 km) are tidal. Captain J.C. Wickham of HMS *Beagle* reached the river in 1839 and named it in honour of Queen Victoria.

Victoria Strait Channel of the Arctic Ocean. It is located between southeastern Victoria Island and King William Island, off the northern Canada mainland in Nunavut. At about 100 mi (160 km) long and from 50–80 mi (80–130 km) wide, it connects Queen Maud Gulf with McClintock Channel and Franklin Strait.

vicuña \vi-'kün-yə, vī-'kü-nə\ South American lamoid (see alpaca), the smallest species (*Vicugna vicugna*) in the camel family, found in semiarid grasslands of the central Andes at altitudes of 12,000–16,000 ft (3,600–4,800 m). The remarkably long, soft, lustrous coat is cinnamon to white; a dense, silky, white fleece hangs from the flanks and base of the neck. Vicuñas are about 36 in. (90 cm) high and weigh over 100 lbs (50 kg). Small bands of females, led by a male, graze on low grasses, ruminate while at rest, and spit often and noisily. They mark their territory with communal dung heaps. Vicuñas are untamable but have been hunted for centuries; they are now protected as an endangered species.

Vidal \'vē-ˌdäl, vē-'däl**, Gore** *orig.* **Eugene Luther Vidal** (b. Oct. 3, 1925, West Point, N.Y., U.S.) U.S. novelist, playwright, and essayist. Vidal began publishing his writings soon after his wartime army service. Though he wrote stage plays and television and film screenplays, he is best known for his irreverent and intellectually adroit novels. *The City and the Pillar* (1948) became notorious for its homoerotic subject matter. *Myra Breckenridge* (1968) was acclaimed for its wild satire. His other novels, many of them historical and most of them best-sellers, include *Julian* (1964), *Washington, D.C.* (1967), *Burr* (1974), *1876* (1976), and *Lincoln* (1984). He also published several essay collections and the memoir *Palimpsest* (1996). Known for his iconoclastically leftist political analyses, he twice ran unsuccessfully for Congressional office.

video card Integrated circuit that generates the video signal sent to a computer display. The card is usually located on the computer mother-

© 2006 Encyclopædia Britannica, Inc.

board or is a separate circuit board, but is sometimes built into the computer display unit. It contains a digital-to-analog module, as well as MEMORY chips that store display data. All video cards (also known as video adapters, video boards, and video controllers) adhere to a display standard, such as SVGA or XGA.

videocassette recorder See VCR

videodisc Rigid circular plate of either metal or plastic used to record video and audio signals for playback. It resembles a phonograph record and can be played on a machine attached to a conventional television receiver. There are two major classes of videodiscs, magnetic and nonmagnetic. Magnetic videodiscs have an oxide-coated surface onto which input signals are recorded as magnetic patterns in spiral tracks. Nonmagnetic videodiscs use either a mechanical recording system analogous to that used in phonograph records, or optical technology that uses a laser to read data coded as a sequence of pits on the disc. The most common type of videodisc today is the DVD.

videotape Magnetic tape used to record visual images and sound, or the recording itself. There are two types of videotape recorders, the transverse (or quad) and the helical. The transverse unit uses four heads rotating on an axis perpendicular to the direction in which the tape is fed. The transverse format achieves 1,500-in.-per-minute head-to-tape speed, necessary for high picture quality. The helical unit uses tape traveling around a drum in the form of a helix. VCRs use a helical format, known as VHS (Video Home System), consisting of two helical bands and tape 1/2 in. (1 cm) wide.

Vidor \'vē-dȯr**, King (Wallis)** (b. Feb. 8, 1894, Galveston, Texas, U.S.—d. Nov. 1, 1982, Paso Robles, Calif.) U.S. film director. He worked as a prop boy, scriptwriter, newsreel cameraman, and assistant director before directing his first feature film, *The Turn in the Road* (1919). He won acclaim for *The Big Parade* (1925) and *The Crowd* (1928), considered a silent-movie classic. His films, which deal with themes such as idealism and disillusionment in contemporary life, include the first all-African American film, *Hallelujah!* (1929), as well as *Our Daily Bread* (1934) and *The Citadel* (1938). His later movies include the western epic *Duel in the Sun* (1946), *The Fountainhead* (1949), and *War and Peace* (1956).

Vieira \'vyā-ē-rə**, António** (b. Feb. 6, 1608, Lisbon, Port.—d. July 18, 1697, Salvador, Braz.) Portuguese-born Brazilian missionary, orator, diplomat, and writer. He was raised in Brazil, where he became a Jesuit priest. His sermons exhorting all races to join in repelling Dutch invaders are considered the first expression of the Brazilian concept of forming a new race of mixed blood. He worked among the Indians and black slaves until 1641, mastering several of their languages. Returning to Portugal, he became an important figure in the court of John IV, where he advocated toleration for Jewish converts to Christianity. He was imprisoned by the Inquisition (1665–67) but returned to Brazil in 1681.

Vienna *German* **Wien** City (pop., 2001: 1,550,123; metro. area, 1,825,287), capital of Austria. Located on the DANUBE RIVER, it was founded by the Celts; it became a Roman military station in the 1st century BC. Ruled by many—including the Franks in the 6th century AD and the Magyars in the 10th century—Vienna was an important trade centre during the CRUSADES. It was the seat of the HOLY ROMAN EMPIRE (1558–1806), of the Austrian (and HABSBURG) Empire (1806–67), and of the Austro-Hungarian Empire until 1918. In 1814–15 it was the seat of the Congress of VIENNA. The administrative centre of German Austria (1938–45), it was frequently bombed during World War II by the Allies, and the city was taken by Soviet troops in 1945. It was under joint Soviet-Western Allied occupation from 1945 to 1955. The STRATEGIC ARMS LIMITATION TALKS (SALT) between the U.S. and Soviet Union took place in Vienna in the 1970s. The commercial and industrial centre of Austria, it also is a cultural centre renowned for its architecture and music. It was the birthplace of the composers FRANZ SCHUBERT, JOHANN STRAUSS (the Younger), and ARNOLD SCHOENBERG, and the home of WOLFGANG AMADEUS MOZART, LUDWIG VAN BEETHOVEN, JOHANNES BRAHMS, and GUSTAV MAHLER. It also was the home of SIGMUND FREUD, GUSTAV KLIMT, OSKAR KOKOSCHKA, and JOSEF HOFFMANN. Vienna is the headquarters of many international organizations, including the International Atomic Energy Agency, the UN Industrial Development Organization, and the Organization of Petroleum Exporting Countries (OPEC).

Vienna, Congress of (1814–15) Assembly that reorganized Europe after the NAPOLEONIC WARS. The powers of the QUADRUPLE ALLIANCE had concluded the Treaty of CHAUMONT just before Napoleon's first abdication and agreed to meet later in Vienna. There they were joined by Bourbon France as a major participant and by Sweden and Portugal; many minor states also sent representatives. The principal negotiators were Klemens, prince von METTERNICH, representing FRANCIS II (Austria); ALEXANDER I (Russia); FREDERICK WILLIAM III and Karl August, prince von HARDENBERG (Prussia); Viscount CASTLEREAGH (Britain); and CHARLES-MAURICE DE TALLEYRAND (France). The Congress reduced France to its 1789 borders. A new kingdom of Poland, under Russian sovereignty, was established. To check possible future aggression by France, its neighbours were strengthened: the kingdom of The Netherlands acquired Belgium, Prussia gained territory along the Rhine River, and the Italian kingdom acquired Genoa. The German states were joined loosely in a new GERMAN CONFEDERATION, subject to Austria's influence. For its part in the defeat of NAPOLEON, Britain acquired valuable colonies, including Malta, the Cape of Good Hope, and Ceylon. The Vienna settlement was the most comprehensive treaty that Europe had ever seen, and the configuration of Europe established at the congress lasted for more than 40 years.

Vienna, Siege of (July 17–Sept. 12, 1683) Attempted capture of Vienna by Ottoman Turkey. On appeal from the Hungarian Calvinists to attack the Habsburg capital, the Turkish grand vizier, Kara Mustafa (1634–83), and his army of 150,000 laid siege to Vienna in July 1683, after capturing its outer fortifications. Pope Innocent XI convinced JOHN III SOBIESKI of Poland to lead a combined army of 80,000 to relieve the siege. On Sept. 12, 1683, Sobieski, aided by Charles of Lorraine, led the attack from the surrounding hills and after 15 hours drove the Turks from their trenches around the city. Thousands were slaughtered or taken prisoner. The event marked the beginning of the decline of Turkish domination in eastern Europe.

Vienna, University of State-financed university at Vienna, Austria. Founded in 1365 on the model of the University of PARIS, it is the oldest university in the German-speaking world. It was reorganized in 1384, becoming particularly noted for its faculties of medicine, law, and theology. It was a centre of revolution during the uprising of 1848, when Metternich was forced from power. The modern university includes faculties of theology, social sciences and economics, medicine, sciences, mathematics, and natural sciences.

Vienna Circle *German* **Wiener Kreis** \'vē-nər-'krīs\ Group of philosophers, scientists, and mathematicians formed in the 1920s that met regularly in Vienna to investigate scientific language and SCIENTIFIC METHOD. It formed around Moritz Schlick (1882–1936), who taught at the University of Vienna; its members included Gustav Bergmann, Philipp Frank, RUDOLF CARNAP, KURT GÖDEL, Friedrich Waismann, Otto Neurath, Herbert Feigl, and Victor Kraft. The movement associated with the Circle has been called LOGICAL POSITIVISM. Its members' work was distinguished by their attention to the form of scientific theories, their formulation of a VERIFIABILITY PRINCIPLE of meaning, and their espousal of a doctrine of UNIFIED SCIENCE. The group dissolved after the Nazis invaded Austria in 1938.

Vientiane \,vyen-'tyän\ *Laotian* **Viangchan** \,vyeŋ-'chän\ City (pop., 1999 est.: 534,000), capital of Laos. It is located north of the MEKONG RIVER. Founded in the late 13th century, it was made the administrative centre of an early Laotian kingdom in the mid-16th century. In 1778 it came under Siamese (Thai) control; in 1828 it was destroyed when the Laotian king revolted against the Siamese. The French made it the capital of their colony on their takeover of the region in the 1890s; it remained the administrative centre after Laos gained independence in 1953. It is the commercial centre of the region and Laos's principal port of entry.

Vierordt \'fēr-ˌȯrt**, Karl von** (b. July 1, 1818, Lahr, Baden—d. Nov. 22, 1884, Tübingen, Ger.) German physician. He started a medical practice in 1842 and began teaching at the University of Tübingen in 1849. He discovered a way to make an exact red-blood-cell count (see BLOOD ANALYSIS) and invented the sphygmograph, the first instrument to produce a pulse tracing, and the hemotachometer, which monitors blood flow velocity.

Viet Cong *in full* **Viet Nam Cong San** *English* **"Vietnamese Communists"** Guerrilla force that sought to reunify North and South Vietnam under communist leadership from the late 1950s through 1975. Originally a collection of various groups opposed to the government of South Vietnam's Pres. NGO DINH DIEM, the Viet Cong became the military arm of the National Liberation Front (1960) and later of the Provisional Revolutionary Government (PRG; 1969). Members were recruited largely from South Vietnam, but they received guidance, weapons, and reinforce-

© 2006 Encyclopædia Britannica, Inc.

ments from the north. The Viet Cong's guerrilla war against the South Vietnamese government and its powerful U.S. allies was successful; the U.S. withdrew its troops from Vietnam between 1969 and 1973, and the PRG assumed power in South Vietnam in 1975, following a full-scale invasion. It became part of a National United Front the following year.

Viet Minh \'vyet-'min\ *in full* **Viet Nam Doc Lap Dong Minh Hoi** *English* **"League for the Independence of Vietnam"** Organization that led the struggle for Vietnamese independence from French rule. Formed in 1941 by Ho Chi Minh, it was a national organization open to people of all political leanings, though it was led by communists. In 1943 the Viet Minh began guerrilla operations against the occupying Japanese; when the Japanese surrendered to the Allies, the Viet Minh seized Hanoi and proclaimed Vietnam's independence. In the First Indochina War that followed, the Viet Minh (and the Vietnamese Workers' Party [Lao Dong] that succeeded them) defeated the French. Elements of the Viet Minh also joined the Viet Cong to fight the U.S. in the Vietnam War. See also Vo Nguyen Giap.

Vietnam *officially* **Socialist Republic of Vietnam** Country, Southeast Asia. Area: 128,379 sq mi (332,501 sq km). Population (2005 est.): 82,628,000. Capital: Hanoi. The great majority of the population is

Vietnamese; minorities include Chinese, Hmong, Thai, Khmer, and Cham. Languages: Vietnamese (official), French, Chinese, English, Khmer. Religions: Buddhism, new religions, traditional beliefs, Christianity. Currency: new dong. Vietnam is about 1,025 mi (1,650 km) long, 210–340 mi (340–550 km) wide at its widest parts, and 30 mi (50 km) wide at its narrowest part. Northern Vietnam is mountainous; Fan Si Peak, the country's highest mountain, rises to 10,312 ft (3,143 m). The Red River is the principal river. Southern Vietnam is dominated by the Mekong River delta. A long, relatively narrow coastal plain connects the two major river deltas. The densely forested Annamese Cordillera extends through west-central Vietnam. Northern Vietnam is rich in mineral resources, especially anthracite coal and phosphates. Some petroleum deposits exist off the southern coast. Significant food crops include rice, sugarcane, coffee, tea, and bananas. Food processing and fishing are important industries, as are the manufacture of steel and phosphates. Vietnam is a socialist republic with one legislative house; its head of state is the president, and its head of government is the prime minister.

A distinct Vietnamese group began to emerge c. 200 BC in the independent kingdom of Nam Viet, which was later annexed to China in the 1st century BC. The Vietnamese were under continuous Chinese control until the 10th century AD. The southern region was gradually overrun by Vietnamese from the north in the late 15th century. The area was divided into northern and southern dynasties in the early 17th century, and in 1802 these two parts were unified under a single dynasty. Following several years of attempted French colonial expansion in the region, the French captured Saigon (now Ho Chi Minh City) in 1859 and later the rest of the area, controlling it until World War II (see French Indochina). The Japanese occupied Vietnam in 1940–45 and allowed the Vietnamese to declare independence at the end of the war, a move the French opposed. The First Indochina War ensued and lasted until French forces with U.S. financial backing were defeated by the Vietnamese at Dien Bien Phu in 1954; evacuation of French troops followed. After an international conference at Geneva (April–July 1954), Vietnam was partitioned along latitude 17° N, with the northern part under the communist leadership of Ho Chi Minh and the southern part under the U.S.-supported former emperor Bao Dai; the partition was to be temporary, but the reunification elections scheduled for 1956 were never held. An independent South Vietnam (Republic of Vietnam) was declared, while the communists established North Vietnam (Democratic Republic of Vietnam). The activities of North Vietnamese guerrillas and procommunist rebels in South Vietnam led to U.S. intervention and the Vietnam War. A cease-fire agreement was signed in 1973 and U.S. troops withdrawn, but the civil war soon resumed; in 1975 North Vietnam invaded South Vietnam, and the South Vietnamese government collapsed. In 1976 the two Vietnams were united as the Socialist Republic of Vietnam. From the mid-1980s the government enacted a series of economic reforms and began to open up to Asian and Western nations. In 1995 the U.S. officially normalized relations with Vietnam.

Vietnam Veterans Memorial Monument in Washington, D.C., designed by Maya Lin. It consists of two low, black granite walls that meet to form a wide V shape. Engraved on the mirrorlike surface are the names of the more than 58,000 U.S. dead and missing-in-action who served in the Vietnam War, listed by date of casualty. When Lin's abstract design was announced, several veterans groups and others protested; eventually a traditional statue depicting three servicemen with a flag was commissioned, to stand at the entrance to the site. Since its dedication in 1982, the controversial wall has become one of the city's most visited and most affecting tourist attractions.

Vietnam War (1955–75) Protracted effort by South Vietnam and the U.S. to prevent North and South Vietnam from being united under communist leadership. After the First Indochina War, Vietnam was partitioned to separate the warring parties until free elections could be held in 1956. Ho Chi Minh's popular Viet Minh party from the north was expected to win the elections, which the leader in the south, Ngo Dinh Diem, refused to hold. In the war that ensued, fighters trained in the north (the Viet Cong) fought a guerrilla war against U.S.-supported South Vietnamese forces; North Vietnamese forces later joined the fighting. At the height of U.S. involvement, there were more than half a million U.S. military personnel in Vietnam. The Tet Offensive of 1968, in which the Viet Cong and North Vietnamese attacked 36 major South Vietnamese cities and towns, marked a turning point in the war. Many in the U.S. had come to oppose the war on moral and practical grounds, and Pres. Lyndon B. Johnson decided to shift to a policy of "de-escalation." Peace talks were begun in Paris. Between 1969 and 1973 U.S. troops were withdrawn from Vietnam, but the war was expanded to Cambodia and Laos in 1970. Peace talks, which had reached a stalemate in 1971, started again in 1973, producing a cease-fire agreement. Fighting continued, and there were numerous truce violations. In 1975 the North Vietnamese launched a full-scale invasion of the south. The south surrendered later that year, and in 1976 the country was reunited as the Socialist Republic of Vietnam. More than 2,000,000 people (including 58,000 Americans) died over the course of the war, about half of them civilians.

Vietnamese language Mon-Khmer language, the native language of 60–65 million people in Vietnam and a second language for many members of Vietnam's more than 50 minority ethnic groups, with some 2 million speakers outside the country. For much of Vietnam's history, Classical Chinese was the dominant literary language, and Chinese vocabulary given a Vietnamese pronunciation ("Sino-Vietnamese") remains a significant part of the language's lexicon. By the 13th century Chinese characters were adapted to write native Vietnamese words. In the 17th century Roman Catholic missionaries introduced a system of writing Vietnamese in the Latin alphabet with diacritics distinguishing vowel qualities and tones, a system that was widely adopted only in the 20th century.

Viganò \vē-'gä-nō**, Salvatore** (b. March 25, 1769, Naples, Kingdom of Naples—d. Aug. 10, 1821, Milan, Austrian Habsburg domain) Italian

© 2006 Encyclopædia Britannica, Inc.

dancer and choreographer. He studied dance with his father and toured in Spain (1788) and Vienna (1793–95, 1799–1803), where he began to choreograph works in a style synthesizing dance and mime, similar to Jean-Georges Noverre's *ballet d'action*, which he called "coreodramma." He created more than 40 works, including *The Creatures of Prometheus* (1801), *Gli strelizzi* (1809), *Otello* (1818), and *The Titans* (1819). In 1811 he became ballet master at La Scala in Milan, where he promoted the development of ballet in Italy.

Vigée-Lebrun \vē-ˈzhā-lä-ˈbrœⁿ**, (Marie-Louise-) Élisabeth** (b. April 16, 1755, Paris, France—d. March 30, 1842, Paris) French painter. Taught first by her father, a pastel portraitist, she was also advised by Joseph Vernet. In 1779 she was summoned to Versailles to paint Marie-Antoinette, whom she would paint at least 25 more times. At the outbreak of the French Revolution, she left France and traveled abroad, painting portraits of such notables as Lord Byron and Germaine de Staël and playing a leading role in society. Her paintings are notable for their freshness, charm, and sensitivity, and she was one of the most technically fluent portraitists of her era.

Vigny \vē-ˈnyē**, Alfred-Victor, count de** (b. March 27, 1797, Loches, France—d. Sept. 17, 1863, Paris) French poet, dramatist, and novelist. Vigny embarked on a military career but turned to writing Romantic poetry; his verse was critically and popularly acclaimed. His *Cinq-Mars* (1826) was the first important historical novel in French. Growing disillusioned, he wrote *Stello* (1832), on the advisability of separating the poetic life from the political. *Chatterton* (1835), his best play and one of the finest Romantic dramas, glorifies the anguish of the misunderstood artist. His pessimism was manifest also in *The Military Necessity* (1835), whose first and third stories are his prose masterpieces. In middle age he withdrew from Paris society. His later writings include poetry collected posthumously in *Les Destinées* (1864).

Vigo \vē-ˈgō**, Jean** (b. April 26, 1905, Paris, France—d. Oct. 5, 1934, Paris) French film director. The son of a militant anarchist who died in prison under suspect circumstances, he spent an unhappy childhood in boarding schools. His first film was the satiric social documentary *À propos de Nice* (1930). He explored the subject of freedom versus authority in his celebrated *Zero for Conduct* (1933), which was branded "anti-French" by the censors and withdrawn from theatres. His last film, *L'Atalante* (1934), tells the story of an unhappy marriage and is also regarded as a masterpiece. Vigo's films blend lyricism with realism and Surrealism and distinguished him as an original talent.

Vijayanagar \ˌvi-jə-yə-ˈnə-gər\ Former Hindu kingdom, southern India, south of the Krishna River. Founded in 1336 by leaders of the Kanarese people, it became the greatest empire of southern India and for more than two centuries served as a barrier against Muslim raiders from the north. It was an important center of Brahman culture and Dravidian art. Its downfall began with the defeat at Talikota (1565) by a confederacy of Deccan Muslim sultans; the empire dissolved c. 1614. The kingdom's capital, Vijayanagar, was destroyed in 1565. Its ruined site is located at modern Hampi, in southeastern Karnataka.

Viking Either of two unmanned U.S. spacecraft launched by NASA in 1975. After nearly yearlong journeys, Vikings 1 and 2 entered orbits around Mars and released landers that touched down on the planet and relayed measurements of properties of its atmosphere and soil, as well as colour photographs of its surface. Experiments designed to detect evidence of living organisms provided no convincing evidence of life on the surface. The orbiters transmitted photographs of large expanses of the Martian surface.

Viking 2 lander (foreground) on Mars, photographed by one of the spacecraft's own cameras, 1976.
NASA/JPL

Viking *or* **Norseman** Member of the Scandinavian seafaring warriors who raided and colonized wide areas of Europe from the 9th to the 11th century. Overpopulation at home, ease of conquest abroad, and their extraordinary capacity as shipbuilders and sailors inspired their adventures. In 865 Vikings conquered East Anglia, Northumbria, and much of Mercia. Wessex under Alfred the Great made a truce in 878 that led to Danish control of much of England. Alfred defeated fresh Viking armies (892–899), and his son continued his reconquest, recovering lands in Mercia and East Anglia by 924; Viking Northumbria fell in 954. Renewed raids in 980 brought England into the empire of Canute, and it remained as such until 1042, when native rule was restored.The Vikings permanently affected English social structure, dialect, and names. In the western seas, Vikings had settled in Iceland by 900, whence they traveled to Greenland and North America. They invaded Ireland in 795, establishing kingdoms at Dublin, Limerick, and Waterford. The Battle of Clontarf (1014) ended the threat of Scandinavian rule. France suffered periodic Viking raids but no domination. In Russia Vikings briefly dominated Novgorod, Kiev, and other centres, but they were quickly absorbed by the Slav population. As traders they made commercial treaties with the Byzantines (912, 945), and they served as mercenaries in Constantinople. Viking activity ended in the 11th century.

Vila \vē-ˈlä\ *or* **Port-Vila** \ˌpȯr-vē-ˈlä\ Seaport, capital, and largest town (pop., 2003 est.: 33,987) of Vanuatu, southwestern South Pacific Ocean. Although French in appearance, the town has a multinational population including British, French, and Vietnamese. It served as a base for the U.S. in World War II and subsequently became the commercial centre of Vanuatu.

villa Country estate, complete with house, grounds, and subsidiary buildings. The term particularly applies to the suburban summer residences of the ancient Romans and their later Italian imitators. Roman villas frequently were asymmetrical in plan and built with elaborate terracing on hillsides; they had long colonnades, towers, gardens with reflecting pools and fountains, and extensive reservoirs. In Britain the term has come to mean a small detached or semidetached suburban home. See also Hadrian's Villa, Andrea Palladio.

Villa \ˈvē-yə**, Pancho** *orig.* **Doroteo Arango** (b. June 5, 1878, Hacienda de Río Grande, San Juan del Río, Mex.—d. June 20, 1923, Parral) Mexican guerrilla leader. He was orphaned at a young age and spent his adolescence as a fugitive, having murdered a landowner in revenge for an assault on his sister. An advocate of radical land reform, he joined Francisco Madero's uprising against Porfirio Díaz. His División del Norte joined forces with Venustiano Carranza to overthrow Victoriano Huerta (1854–1916), but he soon broke with the moderate Carranza and in 1914 was forced to flee with Emiliano Zapata. In 1916, to demonstrate that Carranza did not control the north, he raided a town in New Mexico. A U.S. force led by Gen. John Pershing was sent against him, but his popularity and knowledge of his home territory made him impossible to capture. He was granted a pardon after Carranza's overthrow (1920) but was assassinated three years later. See also Mexican Revolution; Alvaro Obregon.

Villa-Lobos \ˌvē-lə-ˈlō-bōsh**, Heitor** (b. March 5, 1887, Rio de Janeiro, Braz.—d. Nov. 17, 1959, Rio de Janeiro) Brazilian composer. He was exposed to folk music as a child, and his later extensive ethnomusicological studies (1905–12) had great influence on his own works. Self-taught as a composer, he met Darius Milhaud in 1917, and Artur Rubinstein later promoted his music and helped support him. A "week of modern art" in São Paulo (1922) brought his music to national attention, and he was given a grant to go to Paris (1923–30), where his music was received enthusiastically. On his return he became a leader in musical education—founding the Ministry of Education conservatory (1942) and the Brazilian Academy of Music (1945)—and Brazil's semiofficial ambassador to the world. His many works include his 9 *Bachianas brasileiras* for various ensembles and his 14 *Chôros*, based on a popular form of street music.

Villafranca \ˌvē-lä-ˈfräŋ-kä**, Peace of** (1859) Preliminary peace treaty between France's Napoleon III and Austria's emperor Francis Joseph that ended the Franco-Piedmontese war against Austria. Napoleon III made peace after the costly Battle of Solferino without consulting the Piedmontese king, Victor Emmanuel II. By the peace terms, Lombardy was ceded to France and then to Piedmont, and the dukes of Parma, Modena, and Tuscany were restored to their thrones after being deposed by nationalists. Though decried by Italian nationalists, the peace marked the beginning of Italy's unification under Piedmontese leadership.

© 2006 Encyclopædia Britannica, Inc.

Villahermosa \ˌbē-yä-er-ˈmō-sä\ City (pop., 2000: 330,846), capital of Tabasco state, southeastern Mexico. Founded in 1596 as Villa Felipe II, it has also been known as San Juan de Villa Hermosa and as San Juan Bautista; it was given its present name in 1915. The cathedral was built in 1614. The archaeological museum is one of the best in Mexico. Villahermosa is the state's chief distributing, processing, and agricultural city. There are Maya archaeological ruins in the area.

Villanovan \ˌvi-lə-ˈnō-vən\ **culture** Early Iron Age culture in Italy, named after the village where the first site was found in 1853. It appeared in the 10th or 9th century BC as a branch of the Urnfield cultures. Its dead were cremated and the ashes put in a decorated pottery two-story urn covered with a bowl or a helmet-shaped lid, or in a so-called hut urn, a terracotta vessel. Expert metalworkers, the Villanovans controlled Tuscany's copper and iron mines. In the later 8th century BC their art and burials were influenced by Greece. Their culture began to fade in the 7th century.

Villard de Honnecourt \vē-ˈlȧr-də-ȯ-nə-ˈkür\ (b. c. 1225, Picardy, France—d. c. 1250) French architect. He is remembered mainly for the sketchbook he compiled while traveling in search of work as a master mason. The book contains sketches and writings concerning architectural practices of the time. He includes sections on technical procedures and mechanical devices, as well as notes on the buildings and monuments he had seen, offering insights into the variety of interests and work of the 13th-century master mason and providing an explanation for the spread of Gothic architecture in Europe.

Villard \və-ˈlärd**, Henry** *orig.* **Ferdinand Heinrich Gustav Hilgard** (b. April 10, 1835, Speyer, Bavaria—d. Nov. 12, 1900, Dobbs Ferry, N.Y., U.S.) German-born U.S. journalist and financier. In 1853 he immigrated to the U.S., where he first found work with German-language newspapers. During the Civil War he was a correspondent for two New York City newspapers. In 1881 he purchased the *Nation* magazine and the *New York Evening Post*. In the 1870s he organized several railroads in Oregon, and from 1881 to 1884 he was president of the Northern Pacific, a transcontinental railroad completed under his management despite large cost overruns; he later served as chairman of the board (1888–93). He bought two Edison companies and created the Edison General Electric Co. in 1889, serving as president until its reorganization in 1892 as the General Electric Co.

Villars \vi-ˈlär**, Claude-Louis-Hector, duke de** (b. May 8, 1653, Moulins, France—d. June 17, 1734, Turin, Sardinia) French soldier. He distinguished himself in France's war against the Dutch (1672–78) and in the War of the Grand Alliance. After leading French forces to early victories in the War of the Spanish Succession, he was made a marshal of France (1702) and a duke (1705). He continued successful military campaigns in Germany (1705–08), inflicted heavy losses on the duke of Marlborough's forces at Malplaquet (1709), and defeated Eugene of Savoy at Denain (1712). He served on the regency council for the young Louis XV. At the outbreak of the War of the Polish Succession, he was given the exceptional title of marshal general of France (1733) and sent to attack Austrian lands in northern Italy.

Villella \vi-ˈle-lə**, Edward** (b. Oct. 1, 1936, New York, N.Y., U.S.) U.S. ballet dancer, choreographer, and director. He trained at the School of American Ballet and joined the New York City Ballet in 1957, becoming a principal dancer in 1960. He danced leading roles in many of George Balanchine's ballets, notably *The Prodigal Son* (1960), displaying a powerful technique. After retiring from dancing in 1983, he became artistic director of Ballet Oklahoma (1983–86). In 1986 he founded the Miami City Ballet, where he continues as artistic director.

Villella in *The Prodigal Son*.
MARTHA SWOPE

Villemin \vēl-ˈmaⁿ**, Jean Antoine** (b. Jan. 28, 1827, Prey, Vosges, France—d. Oct. 6, 1892, Paris) French physician. As an army doctor, he observed that healthy young men often developed tuberculosis (TB) living in the close quarters of the barracks. Aware that a similar disease in horses was transmitted by inoculation, he gave TB to rabbits by inoculating them with material from sick humans and cows, proving that it was an infectious disease. His contagion theory, published in 1867, was initially ignored but was later corroborated by other scientists' experiments.

Villiers, George See 1st Duke of Buckingham

Villon \vē-ˈyōⁿ, vē-ˈlȯn**, François** *orig.* **François de Montcorbier** *or* **François des Loges** (b. 1431, Paris, France—d. after 1463) French lyric poet. Villon was a rigorously trained scholar who led a life of criminal excess; he killed a priest in 1455, then joined a criminal organization and became involved in robbery, theft, and brawling. Incarcerated several times, in 1462 he received a death sentence that was commuted to banishment. He was never heard from again. His works, published posthumously, include the poem *Le Petit testament* (1489), which takes the form of ironic bequests to friends and acquaintances; *Le Testament* (1489), which reviews his life with great emotional and poetic depth; and various ballades, chansons, and rondeaux. His themes range from drunkenness and prostitution to a humble ballade-prayer to the Virgin written at his mother's request. Villon's verse makes a direct, unsentimental appeal to the emotions but also displays remarkable control of rhyme and disciplined composition.

Vilnius \ˈvil-nē-əs\ City (pop., 2001: 542,287), capital of Lithuania. Founded in the 10th century, it became the capital of Lithuania in 1323. It was destroyed in 1377 by the Teutonic Knights but was rebuilt. Vilnius passed to Russia in 1795, and for several centuries was a noted European centre for Jewish learning. It was occupied by the Germans in World Wars I and II and suffered heavy damage. From 1920 to 1939 it was part of Poland; taken by Soviet troops in 1939, it was restored to Lithuania, which the Soviets annexed in 1940. One result of the World War II German occupation was the decimation of the city's Jewish population, which dropped from 80,000 in 1941 to 6,000 in 1945. In 1991 it became the capital of the newly independent Lithuania. An important industrial centre, it also has many historic buildings representing Gothic, Renaissance, and Baroque styles of architecture.

Vilnius dispute Conflict between Poland and Lithuania over possession of the city of Vilnius. After World War I, the new Lithuanian government established itself at Vilnius. It was forced out by Soviet forces in 1919, and the city was then occupied by Polish forces (1919) and again by the Soviets, which ceded it to Lithuania in 1920. An armistice was arranged by the League of Nations, but Poland took Vilnius in 1920 and controlled the city and its surrounding region until they were restored to Lithuania in 1939.

Vilyuy River *or* **Viliui** \vil-ˈyü-ē\ **River** River, east-central Siberia. The longest tributary of the Lena River, it is 1,647 mi (2,650 km) long. It joins the Lena about 200 mi (320 km) northwest of Yakutsk. It is navigable for about 900 mi (1,450 km). In 1954 rich diamond deposits were discovered near the river.

Viña del Mar \ˈbēn-yä-del-ˈmär\ City (pop., 2002 prelim: 330,000), central Chile. It is a residential suburb of Valparaíso. Located on the Pacific Ocean, Viña del Mar is a resort city with a gaming casino, beaches, museums, and theatres. Army and navy garrisons and petroleum depots add to the city's economic base.

Vinaya Pitaka \ˈvi-nə-yə-ˈpi-tə-kə\ Oldest and smallest division of the Tripitaka. It lays out the 227 rules of monastic life for bhiksus, along with an account of the occasion that led the Buddha to formulate the rule. It varies less from school to school than does the Sutta Pitaka or the Abhidhamma Pitaka. It includes an exposition of the rules, which are divided into classes according to the severity of the punishment for breaking them; texts that deal with such matters as admission to and expulsion from the order; and a classified digest of the rules in the other Vinaya texts.

Vincennes \vaⁿ-ˈsen\ **ware** Pottery made at Vincennes, France, from 1740 until 1756 (three years after it had become the royal manufactory), when the enterprise moved to Sèvres, near Versailles. Typical Vincennes pottery included biscuit (white, unglazed soft-paste) figures and soft-paste flowers on wire stems or applied to vases. From 1756 to 1770 pottery continued to be made at Vincennes, both tin-glazed earthenware (officially) and soft-paste porcelain (clandestinely, in defiance of a Sèvres monopoly). See also Sèvres porcelain.

Vincent de Paul, Saint (b. April 24, 1581, Pouy, France—d. Sept. 27, 1660, Paris; canonized 1737; feast day September 27) French religious leader. Educated by the Franciscans at Dax, he was ordained in 1600 and graduated from the University of Toulouse in 1604. It is said that he

© 2006 Encyclopædia Britannica, Inc.

was captured at sea by Barbary pirates but escaped. In 1625 he founded the Congregation of the Mission (also called Lazarists or Vincentians) in Paris as a preaching and teaching order. He also established the Confraternities of Charity, associations of laywomen who nursed the sick. With St. Louise de Marillac he cofounded the Daughters of Charity (Sisters of Charity of St. Vincent de Paul).

Vincent of Beauvais \bō-'vā\ (b. 1190, Beauvais?, France—d. 1264, Paris) French scholar and encyclopaedist. A Dominican priest (c. 1220), he became lector and chaplain to the court of King Louis IX. By 1244 he had compiled *Speculum majus* ("Great Mirror"), an 80-book compendium of knowledge that included human history from the Creation to the time of Louis IX, natural history and science known to the West, and a compendium of European literature, law, politics, and economics. His work influenced scholars and poets up to the 18th century. See also encyclopaedia.

Vinci, Leonardo da See Leonardo da Vinci

vine Plant whose stem requires support and that climbs by tendrils or twining or creeps along the ground, or the stem of such a plant. Examples include bittersweet, most grapes, some honeysuckles, ivy, lianas, and melons.

vinegar Sour liquid obtained by fermentation of dilute alcoholic liquids. Probably first made from wine (French *vinaigre* means "sour wine"), vinegar may also be made from malted barley, rice, cider, or other substances. The source substance, which must contain sugar, is fermented by yeast to produce alcohol. The alcohol is then aerated, which causes it to convert, through the action of *Acetobacter* bacteria, to acetic acid, water, and various other compounds. Vinegar is used in pickling meat, fish, fruits, and vegetables and in creating marinades, dressings, and other sauces.

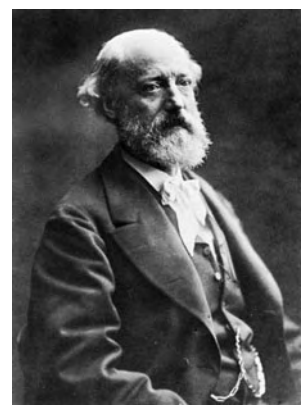
Vingt \'vaⁿ**, Les** *or* **Les XX** *French* **The Twenty** Group of Symbolist artists, including James Ensor, Fernand Khnopff, and Henry van de Velde, who exhibited in Belgium during 1891–93. Belgian Symbolist painting employed simplified forms, heavy outlines, a subjective use of colour, and a heightened spiritual content inspired by religious, exotic, and "primitive" cultures. The styles of various members of Les Vingt eventually merged into the new Art Nouveau style.

Vinland Wooded land in North America visited and named by Leif Eriksson the Lucky c. AD 1000. It was probably located along the Atlantic coast of what is now eastern or northeastern Canada. The Vikings' visits to Vinland (named "wine land" for its wild grapes) are recorded in the Norse sagas. Leif Eriksson is said to have led the first expedition, and his brother Thorvald a second one c. 1003. A colonizing expedition of 130 Vikings c. 1004 was abandoned after warfare with the native Indians. The final expedition was led c. 1013 by Erik the Red's daughter Freydis. In 1963 the remains of a Norse settlement were discovered at L'Anse aux Meadows, at the northernmost tip of Newfoundland.

Vinson, Fred(erick Moore) (b. Jan. 22, 1890, Louisa, Ky., U.S.—d. Sept. 8, 1953, Washington, D.C.) U.S. jurist. He served in Congress for all but two years during the period 1923 to 1938. After serving on the U.S. Court of Appeals (1938–43), he held high executive positions, including secretary of the treasury under Pres. Harry Truman. He helped establish the International Bank for Reconstruction and Development and the International Monetary Fund. From 1946 to 1953 he was chief justice of the Supreme Court of the United States. During his tenure he favoured Truman's internal security policies and upheld the equal-protection rights of racial minorities.

Vinson Massif Mountain, Sentinel Range, central Ellsworth Mountains, western Antarctica. Rising 16,066 ft (4,897 m), the Vinson Massif is the highest mountain on the continent. It was discovered in 1935 by U.S. explorer Lincoln Ellsworth.

vinyl chloride *or* **chloroethylene** Colourless, flammable, toxic gas ($H_2C{=}CHCl$), belonging to the family of organic compounds of halogens. It is produced in very large quantities and used principally to make PVC, as well as in other syntheses and in adhesives. Prolonged exposure to vinyl chloride is linked to several kinds of cancer.



viol \'vī-əl, 'vī-ˌōl\ *or* **viola da gamba** \vē-ˌō-lə-də-'gäm-bə\ Bowed stringed instrument of the 16th–18th centuries. The viols are distinguished from the violin family particularly by a fretted fingerboard, sloping shoulders, flat back, six strings, and milder tone. They exist in four sizes: treble, tenor, bass, and double bass (violone). They are played vertically, the body of the instrument being held between the legs or rested on the knee. The viol family appeared in the late 15th century and soon became widely popular and acquired a large repertory. Throughout the Baroque era, the bass viol joined the harpsichord in the basso continuo. The contemporaneous violin family, having a more penetrating tone, gradually displaced the viols in the 18th century.

viola \vī-'ō-lə, vē-'ō-lə\ Stringed instrument, the tenor member of the violin family. In appearance it is almost identical to the violin but slightly larger; its strings are tuned a fifth lower. It is a member of many chamber music ensembles, and the modern orchestra uses 6 to 10 violas. Its tone is darker, warmer, and less powerful than the violin's, and it is rarely employed as a solo instrument. The viola d'amore is an 18th-century instrument with six or seven melody strings, under which are strung several sympathetic strings that resonate in concord with the sounded pitches.

violet Any of the approximately 500 species of herbaceous plants or low shrubs that make up the genus *Viola*, which includes the small, solid-coloured violets and the larger-flowered, often multicoloured violas and pansies. Many *Viola* species have two types of flowers: the showy spring flower is infertile; the less conspicuous summer flower is self-fertilizing. The best-known species of *Viola* have heart-shaped leaves. The popular florist's violets, consisting of several hybrids (many of them *V. odorata*), are usually called sweet violets. The family Violaceae, to which *Viola* belongs, has members worldwide; they are typically small trees and shrubs that grow as low vegetation beneath the taller trees of forests. The so-called African violet belongs to the gesneriad family. See also dogtooth violet.

violin Bowed stringed instrument. The violin is the highest-pitched member of a family of instruments that includes the viola, cello, and double bass. It has a fretless fingerboard, four strings, and a distinctively shaped wooden body whose "waist" permits freedom of bowing. The violin is held on the shoulder and bowed with the right hand. It has a wide range of more than four octaves. It evolved in Italy in the 16th century from the medieval fiddle and other instruments. Its average proportions were settled by the 17th century, but innovations in the 18th–19th centuries increased its tonal power. With its brilliance, agility, and singing tone, the violin has been immensely important in Western art music, and it has the largest and most distinguished repertoire of any stringed instrument. From the mid-17th century it has been the foundation of the symphony orchestra, which today usually includes 20–26 violins, and it is also widely used in chamber music and as a solo instrument. It is played as a folk instrument in many countries, folk violins being often called fiddles.

Viollet-le-Duc \ˌvē-ə-'lā-lə-'dük**, Eugène-Emmanuel** (b. Jan. 27, 1814, Paris, France—d. Sept. 17, 1879, Lausanne, Switz.) French Gothic Revival architect, restorer, and writer. After studying architecture and training as an archaeologist, he was placed in charge of restoring the abbey church at Vézelay (1840). He assisted in restoring the Sainte-Chapelle (1840) and Notre-Dame de Paris (1845) and supervised the restoration of many other medieval buildings, including Amiens Cathedral (1849) and the fortifications of Carcassonne (1852). In his later restorations he often added new elements of his own design, intrusions for which he was criticized in the 20th century. He is most distinguished for his writings, which include the *Dictionnaire raisonné de l'architecture française du XIe au XVIe siècle* (1854–68) and *Entretiens sur l'architecture* (1858–72). His theories of rational architectural design linked the revivalism of the Romantic period to 20th-century Functionalism and influenced the architects of the Chicago School.

Eugène-Emmanuel Viollet-le-Duc.

violoncello See cello

vipassana \vi-'pä-sə-nə\ In Theravada Buddhism, a method of insight meditation. It aims at developing understanding of the nature of reality by focusing a sharply concentrated mind on physical and mental processes. The meditator comes to understand, through personal experience,

© 2006 Encyclopædia Britannica, Inc.

the truths of *dukkha* (suffering), *anicca* (impermanence), and *anatta* (lack of an enduring self). It is a process of mental purification that leads to abandonment of the roots of unwholesome actions, eradication of ignorance, and attainment of NIRVANA.

viper Any of about 200 species (family Viperidae) of venomous snakes in two subfamilies: Viperinae (Old World vipers of Europe, Asia, and Africa) and Crotalinae (PIT VIPERS). Two long, hollow, venom-injecting fangs attached to the movable bones of the viper's upper jaw can be folded back in the mouth when not in use. Vipers range in length from less than 12 in. (30 cm) to more than 10 ft (3 m). They eat small animals and hunt by striking, then trailing, their prey. Many Old World vipers are terrestrial; a few are arboreal or burrowers. Most bear live young.

Viracocha \ˌbē-rä-ˈkō-chä\ Creator god of the pre-Inca inhabitants of Peru, later assimilated into the Inca pantheon. A god of rain, he was believed to have created the Sun on the waters and foam of Lake TITICACA. After forming the rest of the heavens and the earth, he wandered through the world teaching humankind the arts of civilization. At Manta (Ecuador) he walked westward across the Pacific Ocean, promising to return one day. His cult was extremely ancient, and he is probably the weeping god sculpted in the megalithic ruins at TIWANAKU.

viral \ˈvī-rəl\ **diseases** Diseases caused by VIRUSES. Long-term IMMUNITY usually follows viral childhood diseases (see chickenpox). The common COLD recurs into adulthood because many different viruses cause its symptoms, and immunity against one does not protect against others. Some viruses mutate fast enough to reinfect people after recovery (see INFLUENZA) or to keep the IMMUNE SYSTEM from fighting them off (see AIDS). Certain CANCERS are caused by viruses. VACCINES can prevent some viral diseases. Most recently developed antiviral drugs work only against specific viruses; antibiotics are ineffective against viral diseases. See also POLIOMYELITIS; SMALLPOX.

Virchow \ˈfir-kō**, Rudolf (Carl)** (b. Oct. 13, 1821, Schivelbein, Pomerania, Prussia—d. Sept. 5, 1902, Berlin) German pathologist, anthropologist, and statesman. In 1847 he cofounded the pathology journal now named for him (*Virchows Archiv*). He held the first chairs of pathological anatomy at the Universities of Würzburg (1849–56) and Berlin (1856–1902). In 1861 he was elected to the Prussian Diet and founded the Progressive Party. He coined the terms *thrombosis* and *embolism* while disproving the theory that PHLEBITIS causes most diseases. His work supported emerging ideas on cell division and metabolism, pointing out that cell division accounted for the multiplication of cells to form tissues. His rejection of the theory that bacteria cause disease and of IGNAZ SEMMELWEIS's advocacy of antisepsis delayed the use of antiseptics. Virchow also founded two anthropological societies and accompanied HEINRICH SCHLIEMANN to Troy (1879) and Egypt (1888).

vireo \ˈvir-ē-ˌō\ Any of 42 species (family Vireonidae) of New World songbirds with a stout, slightly notched, hook-tipped bill that has fine bristles at the base. Vireos are 4–7 in. (10–18 cm) long and are plain gray or greenish, with white or yellow touches. They glean insects from foliage in woodlands and thickets, repeating loud short phrases over and over. The nest is a cuplike structure suspended from a small fork in a branch. The red-eyed vireo (*Vireo olivaceus*), which breeds from southern Canada to Argentina, is 6 in. (15 cm) long and has a black-outlined, white eye stripe that contrasts with its gray crown.

Virgil *or* **Vergil** \ˈvər-jil\ *orig.* **Publius Vergilius Maro** (b. Oct. 15, 70, Andes, near Mantua—d. Sept. 21, 19 BC, Brundisium) Greatest of Roman poets. The well-educated son of a prosperous provincial farmer, Virgil led a quiet life, though he eventually became a member of the circle around Octavian (later Caesar AUGUSTUS) and was patronized by MAECENAS. His first major work, the 10 pastoral *Eclogues* (42–37), may be read as a prophecy of tranquility, and one has even been read as a prophecy of Christianity. The *Georgics* (37–30) point toward a Golden Age in the form of practical goals: the repopulation of rural lands and the rehabilitation of agriculture. His great epic, the *Aeneid* (begun c. 29, but unfinished at his death), is one of the masterpieces of world literature. A celebration of the founding of Rome by the legendary AENEAS at the request of Augustus, whose consolidation of power in 31–30 unified the Roman world, it also explores the themes of war and the pathos of unrequited love. In later centuries his works were regarded in the Roman Empire as virtually sacred. He was taken up reverently by Christians as well, including DANTE, who, in his poem *The Divine Comedy*, made Virgil his guide through hell and purgatory.

Virgin Birth Fundamental doctrine of orthodox Christianity that JESUS had no natural father but was conceived by MARY through the power of the HOLY SPIRIT. Based on the infancy narratives in the GOSPELS of Matthew and Luke, the doctrine was universally accepted in the Christian church by the 2nd century. It remains a basic article of belief in Roman Catholicism, Eastern Orthodoxy, most Protestant churches, and Islam. A corollary of its dogma is the doctrine of Mary's perpetual virginity, accepted by the Orthodox and Roman Catholic churches and by some Lutheran and Anglican theologians. See also IMMACULATE CONCEPTION.

Virgin Islands, British British overseas territory (pop., 2005 est.: 27,200), WEST INDIES. Part of the Virgin Islands chain, it consists of the islands of Tortola, Anegada, Virgin Gorda, and Jost Van Dyke and 32 smaller, mostly uninhabited islands. The chief town and port is Road Town on Tortola. The majority of British Virgin Islanders are of African or African-European descent. English is the chief language. Religion: Christianity (predominantly Protestant). The islands are generally hilly, and many have lagoons with coral reefs and barrier beaches. Tourism is the mainstay of the economy. The Virgin Islands probably were originally settled by ARAWAK Indians but were inhabited by CARIBS by the time CHRISTOPHER COLUMBUS visited in 1493. The islands were a haunt for pirates, and Tortola was held by Dutch buccaneers until it was taken by English planters in 1666; it was annexed by the British-administered LEEWARD ISLANDS in 1672. The British sugar plantations declined after slavery was abolished in the 19th century. The islands were part of the Colony of the Leeward Islands from 1872 until 1956, when the British Virgin Islands became a separate colony. Its status was changed to an overseas territory in 2002.

Virgin Islands National Park Conservation area, St. John, U.S. VIRGIN ISLANDS. Covering 14,696 acres (5,947 hectares), it has steep mountains, white beaches, and coral reefs. Though most of the tree cover was removed for sugarcane cultivation in the 17th–18th century, the land has reverted to forest. Some 100 species of birds and the only native land mammal, the bat, can be found there. It has remains of ARAWAK Indian villages.

Virgin Islands of the U.S. Unincorporated U.S. island territory (pop., 2005 est.: 108,700), WEST INDIES. Part of the Virgin Islands chain, it consists of the islands of SAINT CROIX, Saint John, and SAINT THOMAS and about 50 small islets. Area: 136 sq mi (352 sq km). Capital: CHARLOTTE AMALIE. The great majority of the population is of African descent; most of the remainder are Hispanic (mainly Puerto Rican) or recent immigrants from the U.S. The people are U.S. citizens and elect a nonvoting representative to the U.S. House of Representatives, but they do not vote in U.S. national elections. Languages: English (official), French, Spanish. Religion: Christianity (mainly Protestant; also Roman Catholic, other Christians). The islands are hilly and surrounded by coral reefs. Tourism dominates the economy. The islands probably were originally settled by ARAWAK Indians but were inhabited by the CARIBS by the time CHRISTOPHER COLUMBUS landed on St. Croix in 1493. St. Croix was occupied by the Dutch, English, French, and Spanish and at one time was owned by the Knights of Malta. Denmark occupied St. Thomas, St. John, and St. Croix and established them as a Danish colony in 1754. The U.S. purchased the Danish West Indies in 1917 for $25 million and changed the name to the Virgin Islands. They were administered by the U.S. Department of the Interior from 1931. In 1954 the Organic Act of the Virgin Islands created the current governmental structure, and in 1970 the first popularly elected governor took office. The area suffered extensive damage by a major hurricane in 1995.

English virginal (with jack rail removed) made by Robert Hatley, London, 1664; in the Benton-Fletcher Collection, the National Trust, Hampstead, London

FROM THE BENTON-FLETCHER COLLECTION AT THE NATIONAL TRUST PROPERTY, FENTON HOUSE, HAMPSTEAD, LONDON

virginal *or* **virginals** Small rectangular HARPSICHORD with a single set of strings and a single manual. The derivation of its name is uncertain. The virginal's strings run parallel to the keyboard, which occupies only a portion of the longer side. Combination virginals include a smaller portable virginal that can be placed on top of the larger keyboard to create a two-manual instrument. The vir-

ginal was particularly popular in 16th–17th-century England, where much music was written for it by William Byrd, Thomas Morley, Thomas Weelkes, and others.

Virginia State (pop., 2000: 7,078,515), southeastern U.S. It is bordered by Maryland to the northeast, North Carolina and Tennessee to the south, Kentucky to the west, West Virginia to the northwest, and the Atlantic Ocean to the east. Located on the central Atlantic seaboard, it covers an area of 40,600 sq mi (105,154 sq km); its capital is Richmond. The coastal plain, also known as the Tidewater, lies in the east; the Piedmont province, a region of rolling hills, is in the middle of the state; and the Blue Ridge and Appalachian mountains lie to the west. The Potomac, Shenandoah, James, and Roanoke rivers flow through the state. Virginia was inhabited by American Indians when England's first American colony was founded there in 1607 at Jamestown. Virginia's citizens were among the leaders of the American Revolution, and the state later contributed four of the country's first five presidents. In 1788 it became the 10th state to ratify the U.S. Constitution. Slavery was an important part of Virginia's economy; Nat Turner's slave insurrection occurred there in 1831. In 1861, soon after the start of the American Civil War, Virginia seceded from the Union. Richmond became the capital of the Confederacy (see Confederate States of America), and Virginia was the chief battleground throughout the war. The western part of the state refused to secede; it split off to become West Virginia in 1863. Virginia was readmitted to the Union in 1870. Strife over state debt took over political life for the next decades, but after World War I the state's prosperity increased. World War II brought thousands to Virginia's military camps and caused the Norfolk area to experience rapid growth. The federal government is the state's largest employer, while manufacturing is the second largest. Hampton Roads is one of the nation's leading ports. Tourism is important; Virginia's many historical sites include Colonial Williamsburg, George Washington's Mount Vernon, Thomas Jefferson's Monticello, Civil War battlefields, and Gen. Robert E. Lee's house, located within the grounds of what is now Arlington National Cemetery. The College of William and Mary (founded 1693) is the country's second oldest college; the University of Virginia was largely the creation of Thomas Jefferson.

Virginia, University of U.S. public university founded in Charlottesville by Thomas Jefferson. It was chartered in 1819 and opened in 1825. Jefferson designed its beautiful campus and buildings, planned the curriculum, and selected the faculty. By the time of the Civil War, the university was second only to Harvard in size of faculty and student body. It first admitted women in 1970. In addition to its college of arts and sciences, it has schools of architecture, education, engineering and applied sciences, and nursing, as well as a business school, a graduate school, and schools of law and medicine.

Virginia and Kentucky Resolutions (1788–89) Measures passed by the legislatures of Virginia and Kentucky as a protest against the Alien and Sedition Acts. Drafted by James Madison and Thomas Jefferson (though their role went unknown for 25 years), the resolutions protested limitations on civil liberties and declared the right of states to decide on the constitutionality of federal legislation. Though their authors applied the resolutions to the specific issues of the day, Southern states later used the measures to support the theories of nullification and secession.

Virginia Beach City (pop., 2000: 425,257), southeastern Virginia. It is situated on the Atlantic Ocean and Chesapeake Bay. Founded in 1887, it developed as a resort after a railroad was built linking it with Norfolk. After World War I it became an important base in the national coastal defense system. In 1963 it and the former Princess Anne county merged to become the City of Virginia Beach. Its economy is based on tourism and military installations. Cape Henry Memorial is in the city and the Cape Henry Lighthouse (1791) is nearby.

Virginia Company English trading company chartered by James I in 1606 to colonize the eastern coast of North America. Its shareholders were residents of London. Approximately 105 colonists in three ships reached Virginia in 1607 and founded Jamestown. The company expanded its territory with new charters (1609, 1612) and authorized a two-house legislature (1619), including a House of Burgesses. The colony survived many hardships, but the company was divided by internecine disputes and was dissolved in 1624, whereupon Virginia became a royal colony. See also Plymouth Company.

Virginia Declaration of Rights Measure adopted by the colony of Virginia (June 12, 1776). Drafted by George Mason, it stated that "all men are by nature equally free and independent and have certain inherent rights" and specified such civil liberties as freedom of the press and freedom of religion. It became a model for the Bill of Rights.

Virginia deer See white-tailed deer

Virgo \'vər-gō\ *Latin* **"Virgin" or "Maiden"** In astronomy, the constellation lying between Leo and Libra; in astrology, the sixth sign of the zodiac, governing approximately the period August 23–September 22. Its symbol is a maiden carrying a sheaf of wheat. She has been identified with fertility goddesses such as Ishtar or with Persephone.

Virgo cluster Closest large cluster of galaxies at a distance of about 50 million light-years in the direction of the constellation Virgo. About 200 bright galaxies and thousands of faint ones reside in the cluster. In turn, the Virgo cluster lies at the approximate centre of a larger gravitationally bound structure, called the Local Supercluster, which also includes the Local Group of galaxies, to which the Milky Way Galaxy belongs. Near the centre of the Virgo cluster is the giant elliptical galaxy M87 (or Virgo A), one of the strongest radio sources in the sky and also a powerful X-ray source. Images of M87s active galactic nucleus, obtained in 1994, revealed gas orbiting at such high speeds that astronomers believe a supermassive black hole must be present.

virion \'vī-rē-ˌän\ Entire virus particle, consisting of an outer protein shell (called a capsid) and an inner core of nucleic acid (either RNA or DNA). The core gives the virus infectivity, and the capsid provides specificity (i.e., determines which organisms the virus can infect). In virions whose capsids are further encased by a fatty membrane, the virion can be inactivated by exposure to a solvent such as ether or chloroform. Many virions have capsids with 20 triangular faces and the nucleic acid densely coiled within; others have capsids consisting of surface spikes, with the nucleic acid loosely coiled within. Virions of most plant viruses are rod-shaped.

viroid \'vī-ˌrȯid\ Infectious particle that is smaller than any of the known viruses. The particle consists of an extremely small circular RNA molecule that lacks the protein coat of a virus. Viroids appear to be transmitted mechanically from one cell to another through cellular debris. They are of much interest because of their subviral nature and their unknown mode of action. Viroids are agents of certain plant diseases; whether they occur in animal cells is uncertain.

virology \vī-'rä-lə-jē\ Branch of microbiology that deals with the study of viruses. Viruses were not closely examined until 1892, when a Russian bacteriologist observed that the agent of tobacco mosaic disease could pass through a filter that did not permit the passage of bacteria. Modern virology began in the early 20th century, when the existence of bacteriophages was discovered. Direct visualization of viruses became possible after the electron microscope was introduced (c. 1940).

virtual reality Use of computer modeling and simulation to enable a person to interact with an artificial three-dimensional visual or other sensory environment. A computer-generated environment simulates reality by means of interactive devices that send and receive information and are worn as goggles, headsets, gloves, or body suits. The illusion of being in the created environment (telepresence) is accomplished by motion sensors that pick up the user's movements and adjust his or her view accordingly, usually in real time. The basis of the technology emerged in the 1960s in simulators that taught how to fly planes, drive tanks, shoot artillery, and generally perform in combat. It came of commercial age in the 1980s and is now used in games, exhibits, and aerospace simulators. It has potential for use in many fields, including entertainment, medicine and biotechnology, engineering, design, and marketing.

virtue Practical dispositions in conformity with standards of excellence or with principles of practical reason. The seven cardinal virtues of the Christian tradition include the four "natural," or cardinal, virtues, those inculcated in the old pagan world that spring from the common endowment of humanity, and the three "theological" virtues, those specifically prescribed in Christianity and arising as special gifts from God. The natural virtues are prudence, temperance, fortitude, and justice; this enumeration, said to go back to Socrates, is found in Plato and Aristotle. To these St. Paul added the theological virtues of faith, hope, and love—virtues which, in Christian teaching, do not originate naturally in humanity but are instead imparted by God through Christ and then practiced by the believer.

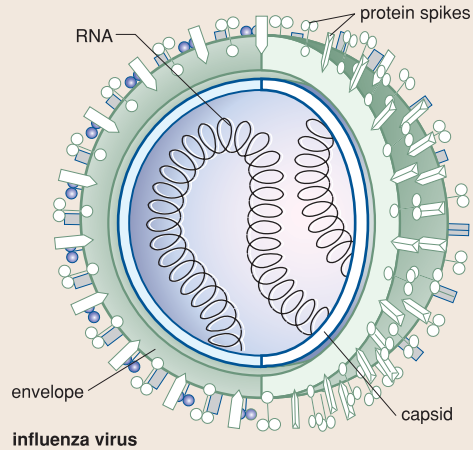
virtue ethics Approach to ethics that takes the notion of virtue (often conceived as excellence) as fundamental. Virtue ethics is primarily con-

© 2006 Encyclopædia Britannica, Inc.

cerned with traits of character that are essential to human flourishing, not with the enumeration of duties. It falls somewhat outside the traditional dichotomy between DEONTOLOGICAL ETHICS and CONSEQUENTIALISM: It agrees with consequentialism that the criterion of an action's being morally right or wrong lies in its relation to an end that has intrinsic value, but more closely resembles deontological ethics in its view that morally right actions are constitutive of the end itself and not mere instrumental means to the end. See also EUDAEMONISM.

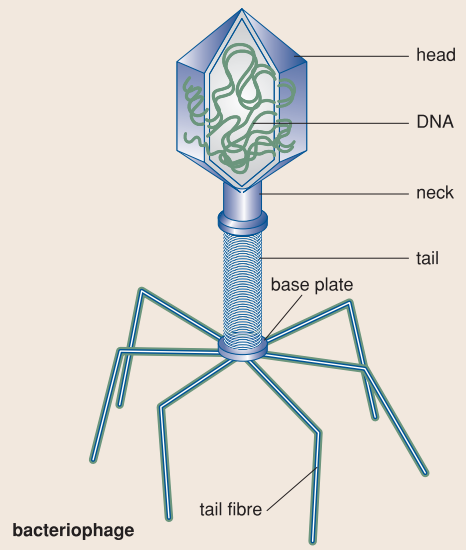
Virunga \vē-'rüŋ-gä\ **Mountains** Volcanic range, east-central Africa. Located north of Lake KIVU, it extends for about 50 mi (80 km) along the borders of Congo (Kinshasa), Rwanda, and Uganda. Of its eight major volcanic peaks, the highest is KARISIMBI, while NYIRAGONGO is at the western end of the chain; in 1861 JOHN HANNING SPEKE was the first European to spot them. Parts of the range are in VIRUNGA NATIONAL PARK, Volcanoes National Park (Rwanda), and Gorilla National Park (Uganda).

Virunga National Park *formerly* **Albert National Park** Game preserve and gorilla sanctuary, northeastern Congo (Kinshasa). Established in 1925, it has an area of about 3,050 sq mi (7,900 sq km). Its southern tip touches the northern shore of Lake KIVU, and much of its central region is occupied by Lake EDWARD. The VIRUNGA MOUNTAINS lie between the two lakes. The park has been a UNESCO World Heritage Site since 1979.



virus Microscopic, simple infectious agent that can multiply only in living cells of animals, plants, or bacteria. Viruses are much smaller than bacteria and consist of a single- or double-stranded NUCLEIC ACID (DNA or RNA) surrounded by a PROTEIN shell called a capsid; some viruses also have an outer envelope composed of LIPIDS and proteins. They vary in shape. The two main classes are RNA viruses (see RETROVIRUS) and DNA viruses. Outside of a living cell, a virus is an inactive particle, but within an appropriate host cell it becomes active, capable of taking over the cell's metabolic machinery for the production of new virus particles (VIRIONS). Some animal viruses produce latent infections, in which the virus persists in a quiet state, becoming periodically active in acute episodes, as in the case of the HERPES SIMPLEX virus. An animal can respond to a viral infection in various ways, including fever, secretion of INTERFERON, and attack by the immune system. Many human diseases, including INFLUENZA, the common COLD, and AIDS, as well as many economically important plant and animal diseases, are caused by viruses. Successful VACCINES have been developed to combat such viral diseases as MEASLES, MUMPS, POLIOMYELITIS, SMALLPOX, and RUBELLA. Drug therapy is generally not useful in controlling established viral infections, since drugs that inhibit viral development also inhibit the functions of the host cell. See also ADENOVIRUS; ARBOVIRUS; BACTERIOPHAGE; PICORNAVIRUS; PLANT VIRUS; POXVIRUS. See illustration opposite.

virus, computer See COMPUTER VIRUS



Visayan \vi-'sī-ən\ **Islands** Group of islands, central Philippines. Covering 23,944 sq mi (62,015 sq km), they are surrounded by the Visayan, Samar, and Camotes seas. The main islands are BOHOL, CEBU, LEYTE, MASBATE, NEGROS, PANAY, and SAMAR. These islands and their smaller neighbours make up the central group of the Ph ilippine archipelago. Agriculture and fishing are important. The major urban centres are CEBU CITY on Cebu and ILOILO City on Panay.

Visby City (pop., 1994 est.: 21,462), southeastern Sweden. Located on the northwestern coast of the island of GOTLAND, it was the site of a Stone Age settlement c. 2000 BC. By the 12th century AD it was a member of the HANSEATIC LEAGUE, and in the 13th century it was one of the leading commercial centres of Europe; the city coined its own money and developed an international maritime code. It declined after the Danish conquest of Gotland in 1361. A seaside resort, it has remains of medieval walls. Because of its remarkably well-preserved medieval ramparts and buildings, Visby was designated a protected monument in 1810 and a UNESCO WORLD HERITAGE SITE in 1995.

viscometer \vis-'kä-mə-tər\ Instrument for measuring the VISCOSITY (resistance to internal flow) of a FLUID. In one type, the time taken for a given volume of fluid to flow through an opening is recorded. In the capillary-tube viscometer, the pressure needed to force the fluid to flow at a specified rate through a narrow tube is measured. Other types depend on measurements of the time taken for a sphere to fall through the fluid, or of the force needed to rotate the inner cylinder of a pair (the space between the two cylinders being filled with the fluid under test), or of the rate at which oscillations of a disk vibrating in the fluid die out.

influenza virus

bacteriophage

The influenza virus possesses both a protein shell (capsid) and a lipid and protein envelope. The protein spikes of the envelope facilitate adherence and entry into the host cell. The capsid proteins determine the influenza virus type (A, B, C), and the highly variable proteins of the spikes and envelope determine the different strains within each type. The bacteriophage (bacterial virus) shown here has a head shaped like an icosahedron (with 20 sides). The tail fibres attach the virus to the bacterium, bringing the base plate into contact with the surface. The tail contracts, and DNA from the head is injected into the host.

Visconti \vēs-'kōn-tē**, Gian Galeazzo** *known as* **Count of Valor** (b. 1351, Milan—d. Sept. 3, 1402, Melegnano, near Milan) Leader of Milan who brought the Visconti dynasty to its height. The son of Galeazzo II Visconti, who shared the rule of Milan with his brother, Gian Galeazzo united all the Visconti lands, added the march of Treviso (1387), and became a prince of the HOLY ROMAN EMPIRE through bribery. By 1402 he held Pisa, Siena, Umbria, and Bologna. He was close to becoming ruler of all of northern Italy and was planning an attack on Florence when he died of the plague.

Visconti, Luchino *orig.* **Don Luchino Visconti, count di Modrone** (b. Nov. 2, 1906, Milan—d. March 17, 1976, Rome) Italian film and theatre director. Born into the nobility, he became an assistant to JEAN RENOIR in 1935. He directed his first film, *Ossessione* (1942), in a style foreshadowing the NEOREALISM of ROBERTO ROSSELLINI and VITTORIO DE SICA. His later films include the documentary-style drama *La terra trema*

© 2006 Encyclopædia Britannica, Inc.

(1948), *Senso* (1954), *Rocco and His Brothers* (1960), *The Leopard* (1963, Golden Palm), *The Damned* (1969), and *Death in Venice* (1971). As a stage director, he introduced to Italy works by Jean Cocteau, Arthur Miller, and Tennessee Williams, and he staged operas starring Maria Callas that combined realism and spectacle.

viscosity \vis-'kä-sə-tē\ Resistance of a fluid to a change in shape, or movement of neighbouring portions relative to one another. Viscosity denotes opposition to flow. It may also be thought of as internal friction between the molecules. Viscosity is a major factor in determining the forces that must be overcome when fluids are used in lubrication or transported in pipelines. It also determines the liquid flow in spraying, injection molding, and surface coating. The viscosity of liquids decreases rapidly with an increase in temperature, while that of gases increases with an increase in temperature. The SI unit for viscosity is the newton-second per square metre ($N\text{-}s/m^2$).

viscount \'vī-ˌkaůnt\ European title of nobility, ranking immediately below a count, or earl. The wife of a viscount is a viscountess. In the Carolingian period, the *vicecomes* were deputies or lieutenants of the counts (*comes*), whose official powers they exercised by delegation. In the 11th century most of Normandy was divided into *vicomtés*, but the viscountcy was not introduced into the English peerage until nearly 400 years after the Norman conquest.

Viscount Melville \'vī-ˌkaůnt-'mel-ˌvil\ **Sound** *formerly* **Melville Sound** Body of water, northern Canada. Located in the Arctic Archipelago, between Melville and Victoria islands, the sound is 250 mi (400 km) long and 100 mi (160 km) wide. Its discovery, when reached from the east (1819–20) by William E. Parry and from the west (1850–54) by Robert McClure, proved the existence of the Northwest Passage. The sound is navigable only under favourable weather conditions.

vise Device consisting of two parallel jaws for holding a workpiece. One of the jaws is fixed, and the other can be moved by a screw, lever, or cam. Vises used for holding a workpiece during hand operations (such as filing, hammering, or sawing) are usually permanently bolted to a bench. In vises designed to hold metallic workpieces, the faces of the jaws are hardened steel plates, often removable, with teeth that grip the workpiece. Woodworking vises have smooth jaws, often of wood, and rely on friction alone rather than on teeth.

Vishnu \'vish-nü\ Principal Hindu deity worshiped as the protector and preserver of the world and restorer of dharma. He is known chiefly through his avatars, particularly Rama and Krishna. In theory, he manifests himself anytime he is needed to fight evil, and his appearances are innumerable, but in practice 10 are most common. His various names, numbering about 1,000, are repeated as acts of devotion by his worshipers.

Visigoth \'vi-zə-ˌgäth\ Western division of the Goths. Separated from the Ostrogoths (Eastern Goths) in the 4th century AD, the Visigoths were driven from Dacia by the Huns (376) and crossed the Danube into the Roman empire. Oppressed by Roman taxation, they revolted and plundered the Balkan provinces, defeating Valens and his army at the Battle of Adrianople (378). Theodosius I settled them in Moesia (382) to defend the frontier. Converted to Arian Christianity, they left Moesia in 395 under Alaric and invaded Greece and Italy, sacking Rome (410) and settling in southern Gaul and Spain (415). Recalled from Spain by Constantius III, they lost their first king, Theodoric I, in a battle against Attila (451). They were federates of Rome until King Euric declared independence (475). He extended their kingdom from the Loire to the Pyrenees and the lower Rhône, including most of Spain. In 507 they were defeated by the Franks under Clovis; retaining only Septimania (a strip from the Pyrenees to the Rhône), they held it and much of Spain until defeated by the Muslims in 711.

vision See photoreception

vision, computer See computer vision

vision quest Essential rite of passage for adolescent boys of the Eastern Woodlands and Plains Indian peoples. The youth was sent out from the camp on a solitary vigil involving fasting and prayer in order that he might gain some sign, often through a dream, of the presence and nature of his guardian spirit. Upon receiving these visions, he returned home and communicated them to a shaman or elder, who helped interpret them.

Visistadvaita \vi-'shish-täd-'vī-tə\ Principal school of Vedanta. Its seminal figure was Ramanuja, the first Vedanta thinker to establish as the cornerstone of his system the identification of a personal God with the Brahman of the Upanishads. For him, soul and matter depended on God for their existence. Exclusive devotion to God can elicit his grace, assisting the devotee in gaining release from the cycle of rebirth. After Ramanuja, a schism developed over the role of grace, giving rise to different schools. The spread of Visistadvaita was important in the devotional renaissance of Vaishnavism. In southern India the philosophy remains a major intellectual influence.

Vistula \'vis-chə-lə\ **River** *Polish* **Wisła** \'vē-swä\ River, Poland. It rises on the northern slope of the Carpathian Mountains in southwestern Poland, flows in a curve through Warsaw and Torun, then empties into the Baltic Sea at Gdańsk. Most of its 651 mi (1,047 km) are navigable. Poland's largest river, its tributaries include the Bug and Dunajec rivers.

visual-field defect Blind spot (scotoma) or area in the normal field of vision. It may be persistent or temporary and shifting, as in a migraine aura. The field may narrow, as in glaucoma. The normally small blind spot corresponding to the point where the optic nerve enters the eye can enlarge if fluid accumulates at that point (papilledema). Methanol or quinine poisoning, diseases of the nerve sheaths, deficiency diseases, and atherosclerosis can also cause blind spots. Tumours pressing on the optic nerves in different locations can cause loss of different halves or quarters of the visual field of each eye. See also macular degeneration.

vitamin Organic compound required in small amounts in the diet to maintain normal metabolic functions. The term *vitamine* (1911) was changed to *vitamin* when it was realized that not all vitamins are amines (i.e., not all contain nitrogen). Many vitamins act as or are converted to coenzymes. They neither provide energy nor are incorporated into tissues. Water-soluble vitamins (vitamin B complex, vitamin C) are excreted quickly. Fat-soluble vitamins (vitamin A, vitamin D, vitamin E, and vitamin K) require bile salts for absorption and are stored in the body. The normal functions of many vitamins are known. Deficiency of specific vitamins can lead to diseases (including beriberi, neural tube defect, pernicious anemia, rickets, and scurvy). Excess amounts, especially of fat-soluble vitamins, can also be dangerous: e.g., too much vitamin A causes liver damage, an effect not seen with beta-carotene, which the body converts into vitamin A. Several vitamins are now known to support the immune system. Most vitamins are adequately supplied by a balanced diet, but people with higher requirements may need supplements.

vitamin A *also called* **retinol** Fat-soluble alcohol, most abundant in fatty fish and especially in fish-liver oils. It is not found in plants, but many vegetables and fruits contain beta-carotene (see carotene), which is readily converted in the body to vitamin A. It functions directly in vision, especially night vision. A derivative, retinaldehyde, is a component of the visual pigments, including rhodopsin, in the retina. Humans require vitamin A in very small amounts. Unlike carotenes, it is toxic in large amounts and is readily destroyed by exposure to heat, light, or air.

vitamin B complex Water-soluble organic compounds with loosely similar properties, distribution in natural sources, and physiological functions. Most are coenzymes, and all appear essential to the metabolic processes of all animal life. They include thiamin (B_1), riboflavin (B_2), niacin, vitamin B_6, pantothenic acid, folic acid, biotin, and vitamin B_{12} (cobalamin); some authorities also include choline, carnitine, lipoic acid, inositol, and *para*-aminobenzoic acid. Vitamin B_6 is needed for metabolism of amino acids and prevention of skin and nerve disorders. Vitamin B_{12} prevents pernicious anemia and is involved in nucleic-acid synthesis, fat metabolism, and conversion of carbohydrate to fat. The B complex vitamins are particularly abundant in cereal grains, meats, nuts, and some fruits and vegetables.

vitamin C *or* **ascorbic acid** Water-soluble organic compound important in animal metabolism. Most animals produce it in their bodies, but humans, other primates, and guinea pigs need it in the diet to prevent scurvy. It is essential in collagen synthesis, wound healing, blood-vessel maintenance, and immunity. Some studies have found a moderate benefit of vitamin C in reducing the duration and severity of the common cold. It works as an antioxidant in the body and is used as a preservative. It is easily destroyed by oxygen. Excellent sources are citrus fruits and fresh vegetables.

© 2006 Encyclopædia Britannica, Inc.

vitamin D Any of a group of fat-soluble ALCOHOLS important in CALCIUM METABOLISM in animals to form strong bones and teeth and prevent RICKETS and OSTEOPOROSIS. It is formed by ultraviolet radiation (sunlight) of sterols (see STEROID) present in the skin. The most important of these sterols are 7-dehydrocholesterol, formed by metabolic processes in animals, and ergosterol, present in vegetable oils. The action of sunlight on the skin converts these two compounds, respectively, to cholecalciferol (vitamin D_3) and ergocalciferol (vitamin D_2). Vitamin D is added to margarine, milk, and cereals for the benefit of those who may not get enough sunlight in winter. As little as 5 micrograms each day appear adequate for children. Because the body cannot excrete it, prolonged high intake can cause a toxic reaction including fatigue, nausea, and abnormal calcium accumulation.

vitamin E *or* **tocopherol** \tō-'kä-fə-ˌrȯl\ Fat-soluble organic compound found principally in certain plant oils and leaves of green vegetables. Vitamin E acts as an ANTIOXIDANT in body tissues and may prolong life by slowing oxidative destruction of MEMBRANES. Certain rodents require it for normal reproduction. Besides uses in foods and in nutritional research and supplements, it is used to retard rancidity in FATS, especially vegetable oils.

vitamin K Any of several fat-soluble compounds essential for the clotting of blood. A deficiency of vitamin K in the body leads to an increase in clotting time. In 1929 a previously unrecognized fat-soluble substance present in green leafy vegetables was found to be required for COAGULATION of the blood; its letter name comes from the Danish word *koagulation*. A pure form was isolated and analyzed structurally in 1939; several related compounds having vitamin-K activity have since been isolated and synthesized. The form of vitamin K that is important in mammalian tissue is of microbial origin. A synthetic vitamin K precursor called menadione is used as a vitamin supplement.

Vitellius \vi-'tel-ē-əs**, Aulus** (b. AD 15—d. Dec. 20, 69, Rome) Roman emperor (69), the last of NERO's three short-lived successors. Vitellius was commander of the Lower German army when Nero died and was proclaimed emperor by his troops. When he marched on Italy, Otho, a rival emperor, committed suicide. Vitellius entered Rome but there had to contend with VESPASIAN, whose army had also proclaimed him emperor; the troops of Vitellius lost to those of Vespasian. Vitellius's PRAETORIAN GUARD prevented him from abdicating, but he was captured by troops, dragged through the streets, tortured, and killed.

Viti Levu \'vē-tē-'lā-vü\ Island (pop., including adjacent islands, 1996: 594,791), Fiji, South Pacific Ocean. The country's largest island, it has an area of 4,011 sq mi (10,388 sq km). SUVA, the Fijian capital, is situated on the island's southeastern coast. It was sighted by Capt. WILLIAM BLIGH in 1789. A central mountain range divides the island into wet and dry sections. Mount Tomanivi, the highest point in Fiji, rises 4,341 ft (1,323 m). Islanders grow sugar, pineapples, cotton, rice, and tobacco. There is a goldfield in the north-central part of the island.

vitiligo \ˌvit-ᵊl-'ī-gō\ *or* **leukoderma** Skin disorder manifested by smooth, white spots on various parts of the body. Though the pigment-making cells of the skin, or melanocytes, are structurally intact, they have lost the ability to synthesize the pigment. The reason for the condition is unclear. Individuals with vitiligo (about 1% of the adult population) are usually in good general health, but vitiligo presents a cosmetic problem that can be serious in dark-skinned individuals. Normal skin color rarely returns, and there is no known cure.

Vitória \vē-'tōr-yə\ City (pop., 2002 est.: 299,400), eastern Brazil. Located on the western side of Vitória island in Espírito Santo Bay, it was founded by the Portuguese in 1535 and was made a provincial capital in 1823. It was Brazil's leading port for exporting iron ore until the 1960s. Its economy is based now on textile factories, sugar refineries, and other small manufacturing plants as well as on the shipment of coffee.

Vitoria \vē-'tōr-ē-ə\ **-Gasteiz** City (pop., 2001: 216,852), capital of BASQUE COUNTRY autonomous community, northeastern Spain. The official name derives from the combined Spanish (Vitoria) and Basque (Gasteiz) names for the city. Founded as Victoriacum by the Visigothic king Leovigild in 581, it was granted a charter in the 12th century. In 1200 Alfonso VIII captured it and incorporated it into his kingdom. In 1813 it was the scene of a battle in which allied forces under English Gen. Arthur Wellesley (later duke of WELLINGTON) defeated the French, driving them from Spain and leading to the end of the PENINSULAR WAR. Now a manufacturing centre, it retains several medieval buildings.

vitriol, oil of See SULFURIC ACID

Vitruvius \və-'trü-vē-əs\ *in full* **Marcus Vitruvius Pollio** (fl. 1st century BC) Roman architect, engineer, and author of the celebrated treatise *De architectura*, a handbook for Roman architects. Little is known of his life except what can be gathered from his writings. The treatise is divided into 10 books covering almost every aspect of architecture and city planning. His wish was to preserve the Classical Greek tradition in the design of temples and public buildings, and his prefaces contain many pessimistic remarks about the architecture of the time. His work was the chief authority on ancient CLASSICAL ARCHITECTURE throughout the antique revival of the Renaissance, the Classical phase of the Baroque, and the Neoclassical period.

Vitsyebsk \'vēt-syipsk\ *Russian* **Vitebsk** \'vē-tipsk\ City (pop., 2001 est.: 349,000), northeastern Belarus. First mentioned in 1021, it was a major fortress and trading centre and was the chief town of an independent principality for some 200 years. It passed to Lithuania in 1320, later to Poland, and then to Russia in 1772. It was destroyed by the Poles in the 16th century, by the Swedes in the Great Northern War, by Napoleon in 1812, and by the Germans in World War II. There are two museums dedicated to MARC CHAGALL, a native of the city. A major industrial centre, it produces machine tools, electrical instruments, and a range of consumer goods.

Vittorini \ˌvēt-'tō-'rē-nē**, Elio** (b. July 23, 1908, Syracuse, Sicily, Italy—d. Feb. 13, 1966, Milan) Italian novelist, translator, and critic. He left school at age 17 and later learned English while working as a proofreader. He became, with CESARE PAVESE, a pioneer in translating the works of U.S. and English writers into Italian. His novels of NEOREALISM mirror Italy's experience of fascism and the social, political, and spiritual agonies of the 20th century. *Conversation in Sicily* (1941), which clearly expresses his antifascist feelings, is his most important novel.

Vivaldi \vi-'väl-dē**, Antonio (Lucio)** (b. March 4, 1678, Venice, Republic of Venice—d. July 28, 1741, Vienna, Austria) Italian composer. He was taught violin by his father. In 1703 he was ordained a priest (and later became known as the "Red Priest" for his red hair). He spent most of his career teaching violin and leading the orchestra at a Venetian girls' orphanage. After c. 1718 he became more involved in opera as both composer and impresario. His concertos were highly influential in setting the genre's three-movement (fast-slow-fast) form, with a returning theme (*ritornello*) for the larger group set off by contrasting material for the soloists, and he popularized effects such as pizzicato and muting. His *L'estro armonico* (1711), a collection of concerti grossi, attracted international attention. His *La stravaganza* (c. 1714) was eagerly awaited, as were its successors, including *The Four Seasons* (1725). In all he wrote more than 500 concertos. His most popular sacred vocal work is the *Gloria* (1708). Though often accused of repeating himself, Vivaldi was in fact highly imaginative, and his works exercised a strong influence on JOHANN SEBASTIAN BACH.

Vivarini \ˌvē-vä-'rē-nē\ **family** Family of 15th-century Venetian painters. Antonio Vivarini (b. c. 1415—d. c. 1480) collaborated from 1441 with his brother-in-law, Giovanni d'Alemagna (d. 1450), on altarpieces, four of which survive in the churches of San Zaccaria (1443) and San Pantalon (1444), and on a large three-part canvas in the Accademia (1446). Their large-scale polyptychs feature stiff, archaic figures and heavily ornamented frames. In 1447–50 they lived in Padua and worked with ANDREA MANTEGNA on a cycle of frescoes for the Church of the Eremitani (destroyed in World War II). Antonio's younger brother and pupil Bartolomeo (b. c. 1432—d. c. 1499) collaborated with Antonio after 1450. His work, more progressive than his brother's, was imitative of Mantegna. From 1459 he worked independently. His most distinguished works include the altarpieces in the churches of SS. Giovanni e Paolo (1473), Santa Maria dei Frari (1474), and San Giovanni Bragora (1478) and in the Accademia (1477). Antonio's son Alvise (b. c. 1445—d. c. 1505) came under the influence of the BELLINI FAMILY, with whom he worked on paintings (now lost) for the Doges' Palace (1488). The overlapping careers of Antonio, Bartolomeo, and Alvise recapitulate the overall development of Venetian painting from the late Gothic period to the threshold of the High Renaissance.

Vivekananda \'vē-vā-kə-'nən-də\ *orig.* **Narendranath Datta** (b. Jan. 12, 1863, Calcutta—d. July 4, 1902, Calcutta) Hindu spiritual leader and reformer. He received a Western education. He later joined the BRAHMO SAMAJ and became the most notable disciple of RAMAKRISHNA. By stressing the universal and humanistic aspects of the VEDA and emphasizing service over dogma, he attempted to infuse vigour into Hinduism. He was a moti-

© 2006 Encyclopædia Britannica, Inc.

vating force behind the Vedānta movement in the U.S. and England, lecturing and proselytizing in both countries. In 1897 he founded the Ramakrishna Mission, which carries out extensive educational and philanthropic work in India and expounds Vedānta in Western countries.

vivisection Operation on a living animal for experimental rather than healing purposes; more broadly, all experimentation on live animals. It is opposed by many as cruelty and supported by others on the ground that it advances medicine; a middle position is to oppose unnecessarily cruel practices, use alternatives when possible, and restrict experiments to necessary medical research (as opposed, for example, to cosmetics testing). Surgery on animals without anesthesia was once common; many people, most significantly Rene Descartes, claimed that animals did not really feel pain. Testing chemicals on animals to find the lethal dose still occurs despite alternative methods (computer simulations, tissue culture tests). An antivivisection movement in the late 19th century broadened its scope to include prevention of all cruelty to animals and later gave rise to the animal rights movement.

vizier \və-'zir\ *Arabic* **wazīr** Chief minister of the ʿAbbāsid caliphs and later a high government official in various Muslim countries. The office was originally held and defined by the Barmakids in the 8th century; they acted as the caliph's representative to the public, later serving a similar function for various sultans. In the Ottoman Empire the title could be held by several people at once; under Mehmed II the position of grand vizier, the absolute representative of the sultan, was created.

Vladimir \'vla-də-mər,vlə-'dē-mir\ **I, Saint** *Russian* **Vladimir Svyatoslavich** (b. 956, Kiev, Kievan Rus—d. July 15, 1015, Berestova, near Kiev; feast day July 15) Grand prince of Kiev (980–1015). He became prince of Novgorod in 970, and after his father's death in 972 he seized Kiev from his brother. He consolidated the Kievan realm from Ukraine to the Baltic Sea by 980 and fortified its frontiers against Baltic and Eastern nomads. Originally a pagan, Vladimir made a pact (c. 987) with Basil II, providing him with military aid in exchange for marriage to Basil's sister and promising to convert to Christianity. He adopted the Byzantine rite for his realm, forcibly converting Kiev and Novgorod and ordering pagan idols cast into the Dnieper River.

Vladimir-Suzdal school \'vla-də-mər-'süz-dəl\ School of Russian medieval mural and icon painting, with origins in Kievan Byzantine art, that flourished in the 12th–13th century around the cities of Vladimir and Suzdal, in northeastern Russia. Its works, while maintaining Byzantine illusionistic modeling and solid proportions that lack the elongation that characterizes all later Russian art, move toward a more Russian expression: the emotion is intensely ascetic, the anatomy of the figures is uncertain and the hands are typically small, and the facial expressions portray a range of emotions. This brilliant artistic development ended with the mid-13th-century Mongol invasions.

"The Archangel Michael," icon by an anonymous artist of the Vladimir-Suzdal school, egg tempera on panel, c. 1300; in the State Tretyakov Gallery, Moscow

Vladivostok \ˌvla-də-və-'stäk, ˌvla-də-'väs-ˌtäk\ Seaport city (pop., 2001 est.: 598,600), southeastern Russia, in Asia. Founded in 1860 as a Russian military outpost, it became the main Russian naval base on the Pacific Ocean in 1872. It became a free commercial port in 1904 and grew rapidly as a military base after the Russian Revolution of 1917. During the Soviet era it was the home of the Pacific fleet; its military importance was such that it was closed to foreign shipping from the late 1950s. After the collapse of the U.S.S.R. in 1991, it reemerged as a commercial port, with industries such as ship repair and fish and meat processing. A cultural centre, it is the eastern terminus of the Trans-Siberian Railroad.

Vlaminck \vlə-'maŋk**, Maurice de** (b. April 4, 1876, Paris, France—d. Oct. 11, 1958, Rueil-la-Gadelière) French painter. Noted for his brash temperament as well as his flair for landscapes, he began in 1900 to share a studio with André Derain, a friend from childhood. In 1905 he first exhibited at the Salon des Indépendants. His experiments with pure, intense colour applied in thick daubs earned him an association with Fauvism, but by 1908 he had turned to painting landscapes of thickly applied whites, grays, and deep blues, and his style moved closer to that of Paul Cézanne. He began c. 1915 to develop a personal, strongly stated style that placed him solidly in the realm of French Expressionism.

Vlissingen \'vli-siŋ-ə\ Seaport city (pop., 2001 est.: 44,776), southwestern Netherlands. As a medieval trading town, its importance lay in its position controlling the approach to Antwerp. In 1572 it was the first Netherlands town to rebel against Spanish rule. It was turned into a naval base by Napoleon during the French occupation (1795–1814). The city was heavily damaged during World War II, when the area was flooded in 1944 by the Allies to clear the way to Antwerp. Since rebuilt, it is now a commercial port, fishing harbour, seaside resort, and naval base.

Vltava \'vəl-tə-və\ **River** *German* **Moldau** River, Czech Republic. The Czech Republic's longest river, it flows 270 mi (435 km). The river rises in southwestern Bohemia from two headstreams in the Bohemian Forest. It flows first southeast, then north across Bohemia and empties into the Elbe River.

Vo Nguyen Giap \'vò-'ŋwē-ən-'zyȧp,\ *English* \'vō-en-gī-'en-jē-'ap\ (b. 1912, An Xa, Viet.) Vietnamese military leader. He began to work for Vietnamese autonomy as a youth and attended the same high school as Ho Chi Minh. As a professor of history in Hanoi, he converted many colleagues and students to his political views. He fled to China in 1939 when the French banned the Indochinese Communist Party, but returned in 1941. In 1945 he led the Viet Minh forces that defeated the Japanese, who occupied Vietnam during World War II. He brought French colonial rule to an end by winning the Battle of Dien Bien Phu (1954) in the First Indochina War, and he led the North Vietnamese forces that defeated the U.S. and South Vietnam in the Vietnam War (1955–75). He served in various roles in the postwar government of Vietnam until the early 1990s.

vocal cord Either of two folds of mucous membrane that extend across the interior cavity of the larynx and are primarily responsible for voice production. Sound is produced by the vibration of the folds in response to the passage between them of air exhaled from the lungs. The pitch of sound varies with the degree of vocal-cord tension. Sounds are then modified by the tongue, palate, and lips to produce speech. When at rest, the vocal cords lie apart, forming a V-shaped opening (glottis) through which air is breathed. The folds located just above the vocal cords are termed the vestibular or false vocal cords because they are not involved in voice production. Inflammation (as from excessive use) limits the normal contraction of the vocal cords, resulting in hoarseness.

vodka Colourless distilled liquor of neutral spirits usually made from a grain mash (generally rye or wheat). Potato vodka originated in Russia in the 14th century. Today most vodka is distilled from cereal grains. It is highly neutral, most flavouring substances having been eliminated during distillation and filtration, the latter process employing charcoal purifiers. Distilled water is usually added before bottling in order to lower alcohol content to 40–43% by volume (80–86 proof). Vodka is not aged. It is traditionally consumed unmixed and chilled, in small glasses; in the U.S. and elsewhere, it is often used in mixed drinks.

Vodou \vō-'dün\ *or* **voodoo** National folk religion of Haiti. It combines theological and magical elements of African religions and ritual elements of Roman Catholicism. Practitioners profess belief in a supreme God but give more attention to a large number of spirits called the loa, which can be identified as local or African gods, deified ancestors, or Catholic saints. The loa demand ritual service and attach themselves to individuals or families. In turn, they act as helpers, protectors, and guides. In ritual services, a priest or priestess leads devotees in ceremonies involving song, drumming, dance, prayer, food preparation, and animal sacrifice. The loa possess worshipers during services, dispensing advice, performing cures, or displaying special physical feats. A well-known aspect of Vodou is the zombie. See also Macumba; Santería.

voice In grammar, the form of a verb indicating the relation between the participants (subject, object) in a narrated event and the event itself. English grammar distinguishes between the active voice ("The hunter

© 2006 Encyclopædia Britannica, Inc.

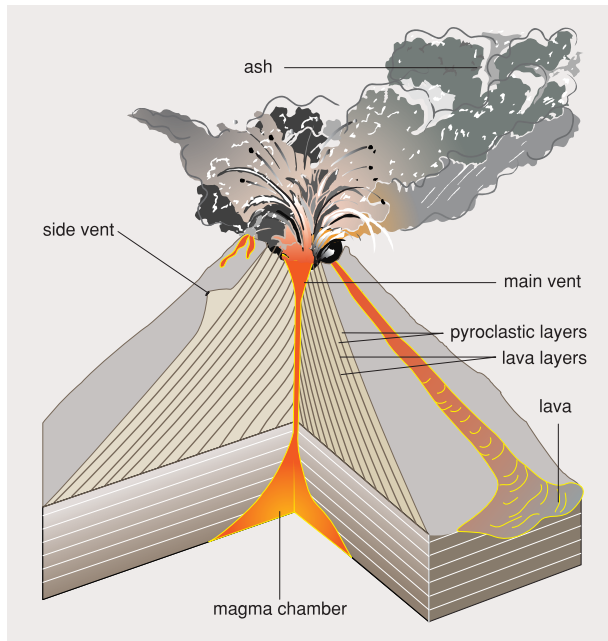
killed the bear") and the passive voice ("The bear was killed by the hunter"). In the active voice, the emphasis is on the subject of the active verb (the agent performing the action named), whereas the passive voice indicates that the subject receives the action.

voice box See LARYNX

voice mail Electronic system for recording oral messages sent by telephone. Typically, the caller hears a prerecorded message and then has an opportunity to leave a message in return. The person called can then retrieve the message at a later time by entering specific codes on his or her telephone. Voice mail is distinguished from an answering machine by its ability to provide service to multiple phone lines and by the more sophisticated functions that it offers in addition to recording messages.

Voice of America Radio broadcasting network of the U.S. government. Its function is to promote understanding of the U.S. and spread democratic values. Its daily broadcasts include news reports, editorials, and discussions of U.S. political and cultural events. Its first broadcast, in German, took place in 1942 to counter Nazi propaganda. By the end of World War II, it was broadcasting 3,200 programs in 40 languages every week. During the Cold War it focused its message at the communist countries of eastern and central Europe. It became part of the U.S. Information Agency when that agency was formed in 1953.

voice recognition See SPEECH RECOGNITION



voir dire \'vwär-'dir\ *Anglo-French* **"to speak the truth"** In law, the act or process of questioning prospective jurors to determine whether they are qualified and suitable for service on a JURY. The questioning attorneys may dismiss a juror for cause, such as when bias or preconceived notions of guilt or innocence are in evidence; they also have a limited number of peremptory challenges that they can use to dismiss a juror for any or no reason.

Vojvodina \'vȯi-vȯ-ˌdē-nä\ Province (pop., 1999 est.: 1,954,432), within the republic of SERBIA, SERBIA AND MONTENEGRO. It covers 8,304 sq mi (21,506 sq km), and its chief city is NOVI SAD. Slavs settled there in the 6th and 7th centuries, followed by Hungarian nomads in the 9th and 10th centuries. Ottoman Turks controlled the region from the early 16th to the late 18th century, when it became part of the Austrian HABSBURG empire. By then it was a centre of Serbian Orthodox culture. In 1849 portions of the historic regions of Backa and Banat were united as the Vojvodina under Croatia-Slavonia. In 1867 it reverted to Hungary, and in 1918 it was made part of the Kingdom of SERBS, CROATS, AND SLOVENES (later Yugoslavia). In 1945 it became an autonomous province of the Serbian republic, but in 1989 SLOBODAN MILOŠEVIĆ rescinded this status. In 1999, after receiving tens of thousands of Serbian refugees from KOSOVO, it demanded restoration of its autonomy. Although denied full autonomy, it was granted some powers in 2002 by the Serbian parliament.

volcanic glass Any glassy rock formed from LAVA or MAGMA that has a chemical composition close to that of GRANITE. Such molten material may reach very low temperatures without crystallizing, but its viscosity may become very high. Because high viscosity inhibits crystallization, the combination of sudden cooling and loss of volatiles, as when lava extrudes from a volcanic vent, tends to chill the material to a glass rather than crystallize it.

volcanism \'väl-kə-ˌni-zəm\ *or* **vulcanism** Any of various processes and phenomena associated with the surface discharge of molten rock or hot water and steam, including VOLCANOES, GEYSERS, and FUMAROLES. Most active volcanoes occur where two plates converge and one overrides the other (see PLATE TECTONICS). Volcanism can also occur along the axis of an OCEANIC RIDGE, where the plates move apart and magma wells up from the mantle. A few volcanoes occur within plates, far from margins. Some of these are thought to occur as a plate moves over a "hot spot" from which magma can penetrate to the surface; others appear to result from an extremely slow form of plate spreading.

volcano Vent in the crust of the Earth from which molten rock, hot rock fragments, ash, gas, and steam issue. Most volcanoes are found on the boundaries of the enormous plates that make up the Earth's surface. Some of the most violent eruptions take place along convergent boundaries where one plate margin is forced beneath another. The most famous such boundary is the circum-Pacific belt bordering the Pacific Ocean; the island arcs and mountain ranges of this "Ring of Fire" have seen gigantic explosions, among them the eruptions of Mount PINATUBO in the Philippines in 1991, Mount SAINT HELENS in the U.S. state of Washington in 1980, and KRAKATOA (Krakatau) in Indonesia in 1883. Volcanic activity is also common at divergent boundaries, where two plates slowly pull apart and allow molten rock to escape to the surface; the most prominent example is the MID-ATLANTIC RIDGE, site of volcanic islands such as ICELAND, the AZORES, Ascension, SAINT HELENA, and Tristan da Cunha. Yet another type of volcanic activity is found on the island of HAWAII, located on a "hot spot" near the middle of the Pacific Plate where plumes of partially melted rock rise from below the Earth's crust; there the volcanoes KILAUEA and MAUNA LOA frequently eject streams and fountains of LAVA. Some of the best-known volcanism takes place around the Mediterranean Sea, where the eruptions of Mount ETNA, VESUVIUS, the islands of STROMBOLI and VULCANO, and other volcanoes have been observed for millennia. Some volcanoes have cultural or religious significance for the peoples around them; these include MISTI VOLCANO in Peru, Mount FUJI in Japan, and Ol Doinyo Lengai in Tanzania.

A volcano forms when magma beneath the Earth's crust forces its way to the surface. Alternating layers of solidified lava and pyroclastic materials (ash and cinders) build up the typical cone shape of a stratovolcano as they are ejected through the central vent during eruptions.

Volcano Islands *Japanese* **Kazan-rettō** *or* **Iō-rettō** Group of three small volcanic islands, western Pacific Ocean. Administratively part of Japan, they lie south of the BONIN ISLANDS. After they were visited by Japanese fishermen and sulfur miners in 1887, the three islands of Kita Iō, Iō (IWO JIMA; the largest), and Minami Iō were claimed by Japan in 1891. Iō was the scene of heavy fighting during World War II. After the war Japan retained residual sovereignty over the islands, but the U.S. administered them from 1951 until they were returned to Japan in 1968.

volcanology *or* **vulcanology** Scientific discipline concerned with all aspects of volcanic phenomena. Volcanology deals with the formation, distribution, and classification of VOLCANOES, as well as their structure and the kinds of materials ejected during an eruption (e.g., lava, dust, ash, and gas). It also involves research on the relationships between volcanic eruptions and other large-scale geologic processes, such as mountain building and earthquakes. One of its chief aims is to determine the nature and causes of volcanic eruptions in order to predict them. Another practical concern is obtaining data that may aid in locating commercially valuable deposits of ores, particularly those of certain metallic sulfides.

Volcker, Paul A(dolph) (b. Sept. 5, 1927, Cape May, N.J., U.S.) U.S. economist. He worked as an economist for the Chase Manhattan Bank (1957–61; 1965–68). As an undersecretary at the U.S. Treasury Department (1969–74), Volcker was the chief architect of the U.S.'s abandon-

© 2006 Encyclopædia Britannica, Inc.

ment of the gold-exchange standard and the devaluations of the U.S. dollar (1971, 1973). After serving as president of the Federal Reserve Bank (1975–79), he was appointed head of the Federal Reserve System in 1979 by Pres. Jimmy Carter and served until 1987. To end a period of very high inflation, he slowed the growth of the money supply and allowed interest rates to rise, causing a recession (1982–83) but dramatically reducing inflation.

vole Any burrowing rodent (family Cricetidae) with a blunt snout, small ears, and short limbs. Most species are herbivorous and are found throughout North America and Eurasia. The approximately 45 species of the genus *Microtus*, also called meadow mice, are 4–10 in. (10–26 cm) long, including the tail. Their long, shaggy fur is grayish brown. About 10 species of pine voles inhabit swamps, fields, and hardwood forests. Red-backed voles inhabit forests in cold regions. Water voles are found only in Eurasia and usually live near a stream, ditch, or lake.

Meadow vole (*Microtus pennsylvanicus*).
JUDITH MYERS

Volga River River, western Russia. Europe's longest river and the principal waterway of western Russia, it rises in the Valdai Hills northwest of Moscow and flows 2,193 mi (3,530 km) southeastward to empty into the Caspian Sea. It is used for power production, irrigation, flood control, and transportation. The river has played an important part in the life of the Russian people, and in Russian folklore it is characteristically named "Mother Volga."

Volga-Baltic Waterway Series of rivers and canals, western Russia. The navigable system links the Volga River with the Baltic Sea and includes the Neva River, a canal along the southern shore of Lake Ladoga, and the Sheksna River past Cherepovets through the Rybinsk Reservoir. Its total length is some 685 mi (1,100 km). The system was completed in 1964, replacing the antiquated Mariinsk Canal system using the same route that had been constructed originally in the 18th century and later several times enlarged and improved. The system includes seven automatic locks.

Volga Tatar language See Tatar language

Volgograd *formerly (until 1925)* **Tsaritsyn** *(1925–61)* **Stalingrad** City (pop., 2001 est.: 982,900), southwestern Russia. Located on the Volga River, it was founded as the fortress of Tsaritsyn in 1589. During the Russian Civil War (1918–20), Joseph Stalin organized the city's defense against the White Russian armies, and it was later renamed in his honour. During World War II it was reduced to rubble in the Battle of Stalingrad; it was rebuilt in the postwar era. Its manufactures include steel and aluminum, engineering products, timber goods, building materials, and foodstuffs. A major railroad junction and river port, it is the eastern terminus of the Volga-Don Ship Canal.

Volhynia \väl-'hi-nē-ə\ Historical region, northwestern Ukraine. Located around the headstreams of the Pripyat and Bug rivers, it originally was a Russian principality (10th–14th century), west of Kiev. In the 14th century it became part of the Grand Duchy of Lithuania but was ruled largely by its own aristocracy. It passed to Poland in 1569. In 1793 it was transferred to Russia under the second partition of Poland. The Treaty of Riga (1921) divided it between Poland and the U.S.S.R. The U.S.S.R. took the Polish section in 1939 and made it part of the Ukrainian S.S.R. after World War II.

Volkswagen AG (VW) Major German automobile manufacturer. It was founded in 1937 to mass-produce a low-priced "people's car" (*Volkswagen*). After World War II the company was rebuilt with Allied help, and within a decade it was producing half of West Germany's motor vehicles. U.S. sales of the small, rounded car were initially low, but a humorous advertising campaign promoting the car as "the Beetle" lifted sales in the 1960s, making it the leading auto import in the U.S. Competition from other foreign compact cars brought VW near bankruptcy by 1974, but the firm rebounded by introducing sportier models such as the Rabbit. In 1998 it launched a fully redesigned version of the Beetle. With its affiliates, VW operates plants worldwide; it also owns other auto brands, including Audi and Bentley.

volleyball Game played by two teams of six players each, in which an inflated ball is volleyed over a high net. Each team tries to make the ball touch the court within the opposing side's playing areas before it can be returned. A team is allowed to touch the ball three times before returning it. The team that first scores 15 points wins the game. Volleyball was invented in 1895 by William G. Morgan in Holyoke, Mass. It soon proved to have wide appeal for both sexes in schools, playgrounds, the armed forces, and other settings. International competition began in 1913, and volleyball became an Olympic sport in 1964. Beach volleyball, a variation with two players on a side, has grown increasingly popular and became an Olympic sport in 1996.

Volsci \'vōl-skē, 'väl-ˌsī\ Ancient Italic people prominent in the history of Roman expansion in the 5th century BC. They belonged to the Osco-Sabellian group of tribes and lived (c. 600 BC) in the valley of the upper Liris River (then in southern Latium). They fought the Romans and the Latins intermittently for about 200 years. The Romans established several colonies to stem the Volsci advance. In 340 they joined the Latin revolt against Rome but were defeated. After submitting to Rome by 304, they quickly became fully Romanized.

Volstead Act See Prohibition

Vǫlsunga saga \'vœl-sùŋ-ə, 'vōl-sùŋ-ə\ ("Saga of the Volsungs") Best of the Icelandic sagas known as *fornaldar sǫgur* ("sagas of antiquity"). Dating from roughly 1270, it is the first of the *fornaldar sǫgur* to have been written down. It contains the Northern version of the story told in the *Nibelungenlied*. The saga was based on the heroic poems in the Poetic *Edda* and is especially valuable because it preserves in prose form some of the poems from the Edda that were lost. It became one of the sources of Richard Wagner's operatic *Ring* tetralogy.

Volta \'vōl-tə**, Alessandro (Giuseppe Antonio Anastasio)** (b. Feb. 18, 1745, Como, Lombardy—d. March 5, 1827, Como) Italian scientist. In 1775 he invented the electrophorus, a device used to generate static electricity. He taught physics at the University of Pavia (1779–1804). After Luigi Galvani in 1780 produced an electric current by connecting two different metals with the muscle of a frog, Volta began experimenting in 1794 with metals alone and found that animal tissue was not needed to produce current. He demonstrated the first electric battery in 1800. In 1801 he demonstrated the battery's generation of current before Napoleon, who made him a count and senator of the kingdom of Lombardy. In 1815 he was appointed director of the philosophical faculty at the University of Padua. The volt was named in his honour in 1881.

Volta, Lake Lake, Ghana. One of the world's largest artificial lakes, it was formed in 1965 when the Akosombo Dam dammed the Volta River and created a reservoir that extends about 250 mi (400 km) upstream to beyond the former confluence of the Black Volta and White Volta rivers. It covers 3,283 sq mi (8,502 sq km), or 3.6% of Ghana's area. It is a major fishing ground and provides irrigation water for farmland in the Accra plains. The dam generates enough hydroelectric power to supply most of Ghana's electricity needs.

Volta \'väl-tə, 'vōl-tə\ **River** River, Ghana, western Africa. The nation's chief river, it flows from Lake Volta and receives the Black Volta and the White Volta rivers. It flows southward through Ghana to the Bight of Benin in the Gulf of Guinea. The river system is 1,000 mi (1,600 km) long.

Voltaic languages See Gur languages

Voltaire \vōl-'ter\ *orig.* **François-Marie Arouet** (b. Nov. 21, 1694, Paris, France—d. May 30, 1778, Paris) French writer. Voltaire studied law but abandoned it to become a writer. He became acclaimed for his tragedies and continued to write for the theatre all his life. He was twice imprisoned in the Bastille for his remarks and in 1726 was exiled to England, where his philosophical interests deepened; he returned to France in 1728 or 1729. His epic poem *La Henriade* (1728) was well received, but his lampoons of the Regency and his liberal religious opinions caused offense. *Lettres philosophiques* (1734), in which he spoke out against established religious and political systems, created an uproar. He fled Paris and settled at Cirey in Champagne with Mme du Châtelet, who became his patroness and mistress, and there he turned to scientific research and the systematic study of religions and culture. After her death he spent periods in Berlin and Geneva; in 1754 he settled in Switzerland. In addition to his many works on philosophical and moral problems, he wrote *contes* ("tales") including *Zadig* (1747), *Micromégas* (1752), and his best-known work, *Candide* (1759), a satire on philosophical optimism.

© 2006 Encyclopædia Britannica, Inc.

He kept up an immense correspondence and took an interest in any cases of injustice, especially those resulting from religious prejudice. Voltaire is remembered as a crusader against tyranny and bigotry and is noted for his wit, satire, and critical capacity.

Volturno River \väl-'tůr-nō\ River, southern central Italy. It flows southeast from the Abruzzese Apennines, then turns west to empty into the Gulf of Gaeta. It is 109 mi (175 km) long and has a dam for flood control and irrigation. During the wars for Italian unity, the Italian nationalist leader Giuseppe de Garibaldi defeated a Neapolitan army there in 1860. During World War II, German forces in southern Italy used it as their line of defense after the fall of Naples; after severe fighting, the Allies crossed the river in October 1943.

volume See length, area, and volume

voluntarism \'vä-lən-tə-ˌri-zəm\ Metaphysical or psychological system that assigns a more predominant role to the will (Latin, *voluntas*) than to the intellect. Christian philosophers who have been described as voluntarist include St. Augustine, John Duns Scotus, and Blaise Pascal. A metaphysical voluntarism was propounded in the 19th century by Arthur Schopenhauer, who took will to be the single, unconscious force behind all of reality and all ideas of reality. An existentialist voluntarism was present in Friedrich Nietzsche's doctrine of the overriding "will to power" whereby man would eventually recreate himself as "superman." And a pragmatic voluntarism is evident in William James's conception of knowledge and truth in terms of purpose and practical ends.

vomiting Forcible ejection of the stomach contents from the mouth, usually following nausea. Causes include illness, motion sickness, certain drugs, inner ear disorders, and head injury. Vomiting may occur without nausea (e.g., after extreme exertion). Two centres in the brain's medulla oblongata are believed to control it; the vomiting centre initiates and controls a series of muscle contractions beginning at the small intestine and moving through the stomach and esophagus. This reaction may be set off by the chemoreceptor trigger zone, stimulated by many toxins and drugs, to rid the body of them, or by stimuli from various parts of the body that may be stressed or diseased. Severe vomiting may cause dehydration, malnutrition, or esophageal wall rupture. Vomiting of blood may be a sign of bleeding ulcer or other upper digestive tract disorders. See also bulimia.

von Neumann \vän-'nȯi-män**, John** *orig.* **János Neumann** (b. Dec. 28, 1903, Budapest, Hung.—d. Feb. 8, 1957, Washington, D.C., U.S.) Hungarian-born U.S. mathematician. After receiving his Ph.D. from the University of Budapest, he emigrated to the U.S. to teach at Princeton University (1930) and was among the original faculty of the Institute for Advanced Study (from 1933). He solved one of David Hilbert's 23 theoretical problems and collaborated on developing an algebraic ring with profound applications in quantum physics. During World War II he participated in the development of the atomic bomb. After the war he made major contributions to the development of high-speed computers; one of his computers was essential to the creation of the hydrogen bomb. As coauthor of *Theory of Games and Economic Behavior* (1944), he was one of the founders of game theory.

Vondel \'vȯn-dəl**, Joost van den** (b. Nov. 17, 1587, Cologne—d. Feb. 5, 1679, Amsterdam) Dutch poet and dramatist. Of Mennonite parents, Vondel early showed a preference for using Christian mythology as the subject matter of his plays. He also wrote lampoons and satirical poems against the Dutch church and government. His dramatic tragedies, with their lyrical language and grandeur of conception, are his most important achievement. *The Passover* (1612) is his most notable early work. He first modeled his plays on ancient Latin drama but later turned to the Greek model; plays of the latter type include his masterpiece, the trilogy comprising *Lucifer* (1654), *Adam in Exile* (1664), and *Noah* (1667), which influenced John Milton's *Paradise Lost*.

Vonnegut \'vä-nə-ˌgət**, Kurt, Jr.** (b. Nov. 11, 1922, Indianapolis, Ind., U.S.) U.S. novelist. He attended Cornell University and the University of Chicago. Captured by the Germans during World War II, he also survived the Allied firebombing of Dresden, an experience he made part of his novel *Slaughterhouse-Five* (1969; film, 1972). His pessimistic and satirical novels use fantasy and science fiction to highlight the horrors and ironies of 20th-century civilization. They include *Player Piano* (1952), *Cat's Cradle* (1963), *Breakfast of Champions* (1973), *Galápagos* (1985), and *Timequake* (1997). He also wrote plays and collections of short stories.

voodoo See vodou

Voronezh \və-'rô-nish\ City (pop., 2001 est.: 901,800), western Russia. It lies along the Voronezh River above its confluence with the Don. It was founded in 1586 as a fortress. Peter I (the Great) built a naval flotilla in Voronezh for use in his campaigns against the Turks. With the agricultural development of the region, it became a centre for the grain trade. Occupied by the Germans and largely destroyed in World War II, it was rebuilt in the postwar era. It has a range of engineering, chemical, and food-processing industries. Its university was established in 1918.

Vorontsov \və-rənt-'sȯf**, Mikhail (Illarionovich)** (b. July 23, 1714—d. Feb. 26, 1767, St. Petersburg, Russia) Russian statesman. A member of a family that became prominent in Russian court circles in the 18th century, he was appointed a page in the court of Yelizaveta Petrovna (later Elizabeth) at the age of 14. In 1742 he helped her overthrow Tsar Ivan VI and become empress. As Elizabeth's vice chancellor (1744–58) and chancellor (1758–62), he played a major role during her reign, especially in his pro-French foreign policy. When Peter III succeeded Elizabeth and abandoned her alliances with France and Austria, Vorontsov made no effort to dissuade the new emperor and even continued to support him when he was deposed by his wife, Catherine II (1762). Vorontsov was consequently placed under house arrest; only after Peter died did he swear allegiance to Catherine and resume his office as chancellor, which he held until he retired in 1763.

Voroshilov \ˌvȯr-ə-'shē-ˌlȯf**, Kliment (Yefremovich)** (b. Feb. 4, 1881, Verkhneye, Russia—d. Dec. 2, 1969, Moscow, Russia, U.S.S.R.) Soviet military and political leader. A notable military commander in World War I and later in the Russian Civil War, he led the defense of Tsaritsyn (now Volgograd). A close associate of Joseph Stalin, he was appointed people's commissar for defense (1925) and a member of the Politburo (1926). Named a marshal of the Soviet Union (1935), he reorganized the Soviet general staff, mechanized the army, and developed the air force. After the initial Soviet defeats in World War II, he was removed as defense commissar but appointed to the committee for state defense (1941–44). He later chaired the Presidium of the Supreme Soviet (1953–57).

Vorster \'fôr-stər**, John** *orig.* **Balthazar Johannes Vorster** (b. Dec. 13, 1915, Jamestown, Cape Province, S.Af.—d. Sept. 10, 1983, Cape Town) South African prime minister (1966–78). Vorster was arrested in 1942 for supporting Germany in World War II. In the 1948 elections he was rejected by the National Party as too extreme, but his support grew in the 1950s. As minister of justice (1961–66) under Hendrik Verwoerd, he rigidly enforced apartheid. When Verwoerd was assassinated, Vorster was chosen to replace him. In the 1970s he sent troops into Angola against its Soviet- and Cuban-supported government. He resigned in 1978 and took the ceremonial post of president, but a scandal forced his resignation.

Vorticism \'vȯr-ti-ˌsi-zəm\ Literary and artistic movement that flourished in England 1912–15. Founded by Wyndham Lewis, it attempted to relate art to industrialization. It opposed 19th-century sentimentality and extolled the energy of the machine and machine-made products, and it promoted something of a cult of sheer violence. In the visual arts, Vorticist compositions were abstract and sharp-planed, showing the influence of Cubism and Futurism. Artists involved in the movement included the poet Ezra Pound and the sculptor Jacob Epstein.

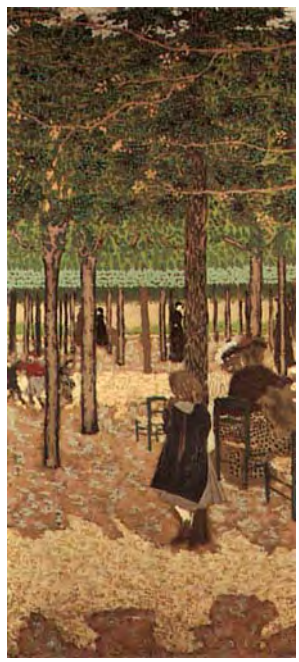
Võrtsjärv \'vərts-ˌyarv\ *or* **Võrts Järv** Lake, south-central Estonia. With an area of 110 sq mi (280 sq km), it is the largest lake in Estonia. It forms part of the 124-mi (200-km) course of the Ema River, which enters the lake from the south and drains it north and east into Lake Peipsi.

Vostok \vů-'stȯk,\ *English* \'väs-ˌtäk\ Any of a series of six manned Soviet spacecraft launched from 1961 to 1963. Vostok 1 (1961) carried the first human (Yury A. Gagarin) into space. Vostok 3 set a new time record in space of 94 hours. Vostoks 5 and 6 were launched two days apart and traveled very close together, at times only 3 mi (5 km) apart, setting the stage for future dockings between orbiting vehicles. The first woman in space, Valentina Tereshkova, flew aboard Vostok 6.

Voting Rights Act Act passed by the U.S. Congress in 1965 to ensure the voting rights of African Americans. Though the Constitution's 15th Amendment (passed 1870) had guaranteed the right to vote regardless of "race, color, or previous condition of servitude," African Americans in the South faced efforts to disenfranchise them, including poll taxes and literacy tests, as late as the 1960s, when the civil rights movement focused national attention on infringements of their voting rights; Congress responded with the Voting Rights Act, which prohibited Southern states

© 2006 Encyclopædia Britannica, Inc.

from using literacy tests to determine eligibility to vote. Later laws prohibited literacy tests in all states and made poll taxes illegal in state and local elections.



Voto, Bernard De See Bernard De Voto

Vouet \'vwe,\ *English* \vü-'ā**, Simon** (b. Jan. 9, 1590, Paris, France—d. June 30, 1649, Paris) French painter. He formed his style in Italy, where he lived from 1614 to 1627. His early work was influenced by Caravaggio, but works done after 1620 display more idealized figures and use more evenly diffused white light. He returned to Paris in 1627 to become first painter to Louis XIII. Thereafter he won almost all the important commissions and dominated the city artistically for the next 15 years. He introduced the Italian Baroque style in France with such paintings as *St. Charles Borromeo* (c. 1640). His late works display the soft, idealized modeling, sensuous forms, and bright colours for which he is best known.

vowel Speech sound in which air from the lungs passes through the mouth with minimal obstruction and without audible friction, like the *i* in *fit*. The word also refers to a letter representing such a sound (*a*, *e*, *i*, *o*, *u*, and sometimes *y*). In articulatory phonetics (see articulation), vowels are classified by tongue and lip position; for example, high vowels like the *i* in *machine* and the *u* in *flute* are both pronounced with the tongue arched high in the mouth, but in *u* the lips are also rounded. Single vowel sounds are monophthongs; two vowel sounds pronounced as one syllable, like the *ou* in *round*, are diphthongs.

Voyager Either of two unmanned U.S. interplanetary probes launched in 1977 to gather information about the Sun's outer planets. Voyager 1 flew by Jupiter in 1979 and reached Saturn in 1980. Voyager 2 traveled more slowly, flying by Jupiter, Saturn, and Uranus to reach Neptune in 1989. Data and photographs from both probes revealed new details about these giant planets, their moons, and their rings. In 1998 Voyager 1 became the most distant human-made object in space (overtaking Pioneer 10). Both Voyagers were expected to remain operable through the first or second decade of the 21st century, periodically transmitting data on the heliopause.

Voyageurs \ˌvwä-yä-'zhər\ **National Park** National park, northern Minnesota, U.S. Located along the Canadian border, the park was established in 1975 and was named for the mostly French-Canadian fur-trading frontiersmen (voyageurs) of the 18th–19th centuries. It occupies an area of 217,892 ac (88,178 ha) and consists of a network of streams and lakes, the largest of which is Rainy Lake.

"Under the Trees," tempera on canvas panel from "Jardin de Paris," by Édouard Vuillard, c. 1894; in the Cleveland Museum of Art, Cleveland.
COURTESY OF THE CLEVELAND MUSEUM OF ART, OHIO, GIFT OF HANNA FUND

Voznesensky \vəz-nʸi-'sʸen-skē**, Andrey (Andreyevich)** (b. May 12, 1933, Moscow, Russian S.F.S.R., U.S.S.R.) Russian poet. His childhood experience of World War II was later vividly reflected in poems such as "Goya" (1960), one of his best-known works. He became a protégé of Boris Pasternak and a star attraction at poetry readings until a 1963 Soviet crackdown on "excessively experimental" artists and writers. He later returned to partial favour. His most characteristic poems are apolitical celebrations of art, freedom, and the unrestrained human spirit. His works were collected in the bilingual *An Arrow in the Wall* (1987) and in *On the Edge* (1991).

Vuillard \vwē-'yär**, (Jean-) Édouard** (b. Nov. 11, 1868, Cuiseaux, France—d. June 21, 1940, La Baule) French painter, printmaker, and decorator. With Pierre Bonnard he developed the Intimist style, characterized by small paintings of daily home life, such as *Woman Sweeping* (c. 1892). He was an original member of the Nabis; his *Public Gardens* (1894), a series of decorative panels that use pale light and neutral colours to create a mood of restful calm, are typical of his mature work as a Nabi. He received numerous commissions to decorate public buildings, including murals in the Palais de Chaillot (1937) and in the League of Nations building in Geneva (1939), and also designed for the Ballets Russes.

Vulcan Ancient Roman god of fire. He was the counterpart of the Greek Hephaestus. Vulcan was especially associated with the destructive aspects of fire, such as volcanoes or conflagrations, and for this reason his temples were usually located outside the city. His chief festival, the Volcanalia, was marked by a rite in which the heads of Roman families threw fish into the fire. Often invoked to avert fire, he was addressed with epithets such as Mulciber ("Fire Allayer").

Vulcan Hypothetical planet within the orbit of Mercury. It was predicted in 1859 by Urbain-Jean-Joseph Le Verrier (1811–77) to account for an unexplained component of the precession of Mercury's orbit. Sightings were reported between 1859 and 1878, but these were not confirmed subsequently by observations made either during solar eclipses or when the planet was predicted to cross the Sun. The anomalies of Mercury's orbit were later explained by Albert Einstein's general theory of relativity.

vulcanism See volcanism

vulcanization Chemical process, discovered by Charles Goodyear (1839), by which the physical properties of natural or synthetic rubber are improved. It consists principally of heating rubber with sulfur; other substances (accelerators, carbon black, antioxidants, etc.) are also added. The sulfur does not simply dissolve or disperse in the rubber, but rather combines chemically, mostly in the form of cross-links (bridges) between the long-chain molecules; however, the reactions are not fully understood. Vulcanized rubber has higher tensile strength and resistance to swelling and abrasion, and is elastic over a greater range of temperatures.

Vulcano \vül-'kä-nō\ Island of the Eolie Islands, off northeastern Sicily, Italy. There are three volcanoes on the island, whose area is 8 sq mi (21 sq km). Although the last major eruptions were in 1888–90, one volcano is still active.

vulcanology See volcanology

Vulci \'vəl-ˌsī\ Ancient Etruscan city, northwest of Rome. It grew out of a number of Villanovan villages and flourished chiefly in the 6th–4th centuries BC, largely as a result of trade and the manufacture of bronze objects, including jugs and tripods. The important centre of a large city-state, after the 6th century BC it gradually came under Roman rule. The site, excavated in the 1950s, is noted for its bronze and pottery, much of which has been found in a huge necropolis. There also are Roman ruins.

vulture A bare-headed, keen-sighted bird of prey in any of 22 species found mainly in warm regions. New World vultures (family Cathartidae, related to storks) are 24–31 in. (60–80 cm) long. Old World vultures (family Accipitridae, related to eagles) include the smallest (20 in. [50 cm] long) and the largest vulture species. The cinereous, or black, vulture (*Aegypius monachus*), one of the largest flying birds, grows to about 40 in. (100 cm) long, weighs almost 30 lb (13 kg), and has a 9-ft (2.7-m) wingspan. Most species eat carrion, garbage, and excrement, but some will occasionally eat a live animal. See also condor; marabou; turkey vulture.

vulvitis \vəl-'vī-təs\ Inflammation of the vulva (female external genitalia), with red, swollen, itchy skin that may turn white, crack, or blister. The vulva provides a moist, warm breeding ground for microorganisms, particularly for yeast (see candida) but also for other fungi, bacteria, or viruses, especially if underwear is tight, nonporous, and nonabsorbent and if hygiene is poor. Pantyhose, synthetic underwear, detergents, vaginal sprays, and deodorants may cause allergy or irritation. Drying and thinning of tissues after menopause makes them more susceptible to irritation and infection. Treatment ranges from wearing loose, absorbent cotton underwear to creams that kill the infective microorganisms.

Vychegda \'vi-chəg-də\ **River** River, northwestern Russia. It rises on the slopes of the Timan Ridge and joins the Northern Dvina River near Kotlas. Its 702-mi (1,130-km) course is frequently marked by marshes, lakes, and sandbanks, but it is navigable for 596 mi (960 km).

Vygotsky \vi-'gȯt-skē**, L(ev) S(emyonovich)** (b. Nov. 5, 1896, Orsha, Russia—d. June 11, 1934, Moscow) Soviet psychologist. He stud-

© 2006 Encyclopædia Britannica, Inc.

ied linguistics and philosophy at the University of Moscow before becoming involved in psychological research. While working at Moscow's Institute of Psychology (1924–34), he became a major figure in post-revolutionary Soviet psychology. He studied the role of social and cultural factors in the making of human consciousness; his theory of signs and their relationship to the development of speech influenced psychologists such as A.R. Luria and Jean Piaget. His best-known work, *Thought and Language* (1934), was briefly suppressed as a threat to Stalinism.

Vyshinsky \və-'shin-skē**, Andrey (Yanuaryevich)** (b. Dec. 10, 1883, Odessa, Russia—d. Nov. 22, 1954, New York, N.Y., U.S.) Soviet politician and diplomat. A public prosecutor, he taught at Moscow State University. Appointed chief prosecutor of the Soviet Union (1935), he gained worldwide notoriety for his zeal in prosecuting the purge trials. As deputy commissar of foreign affairs, he supervised the annexation of Latvia (1940) and established a communist regime in Romania (1945). He later served as Soviet foreign minister (1949–53) and representative to the UN (1949–54), where he frequently launched bitter attacks on the U.S.

Vytautas \vē-'taù-täs\ **the Great** *Lithuanian* **Vytautus Didysis** (b. 1350, Lithuania—d. Oct. 27, 1430, Trakai, Lith.) Lithuanian national leader. Continuing a family struggle for control of Lithuania, he fought his cousin Władysław II Jagiełło but made peace in 1384. His popularity grew until Władysław was obliged to make him vice regent (1392), an office that allowed him to become effective ruler of Lithuania. He subdued rebellious nobles but was defeated by Mongols in the east (1399). He and Władysław united Lithuania and Poland (1401) and waged war on the Teutonic Order, defeating them at the Battle of Tannenberg (1410). Vytautas was named king of Lithuania in 1429 but died before he could be crowned.

W particle Electrically charged SUBATOMIC PARTICLE that transmits the WEAK FORCE, which governs radioactive decay (see RADIOACTIVITY) in some atomic nuclei. The discovery of the W particle in 1983 by teams led by Carlo Rubbia and Simon van der Meer confirmed the ELECTROWEAK THEORY, which explains that the ELECTROMAGNETIC FORCE and the weak force are manifestations of the same interaction. The weak force is exchanged via three types of particles, two charged and one neutral. The charged particles are designated W^+ and W^- according to the sign of their charge, and the neutral particle is the Z PARTICLE. The W particle has a mass about 80 times that of the proton, which gives the weak force a very short range.

Waals, Johannes Diederik van der See Johannes D. VAN DER WAALS

Wabash \'wȯ-ˌbash\ **River** River, flowing westward across Indiana, U.S. After crossing Indiana, the Wabash forms the 200-mi (320-km) southern section of the Indiana-Illinois boundary below Terre Haute, Ind. It empties into the OHIO RIVER in southwestern Indiana after a course of 475 mi (764 km). During the 18th century the French used it as a transportation link between Louisiana and Quebec. After the WAR OF 1812, its basin was rapidly developed by settlers. After the coming of the railroads in the 1850s, navigation almost disappeared except for barge traffic on its lower course.

WAC See WOMEN'S ARMY CORPS

Wace \'wās, 'wäs\ (b. c. 1100, Jersey, Channel Islands—d. after 1174) Anglo-Norman poet. He is known for his two verse chronicles, the *Roman de Brut* (1155) and the *Roman de Rou* (1160–74), named respectively after the reputed founders of the Britons and Normans. The *Brut* is a romanticized account of GEOFFREY OF MONMOUTH's *Historia regum Britanniae*, tracing the history of Britain from its founding by the legendary Brutus the Trojan. Its many fanciful additions (including the story of Arthur's Round Table) were important in the development of the ARTHURIAN LEGEND, and its literary style influenced later verse romances. The *Rou*, commissioned by Henry II of England, is a history of the Norman dukes (c. 911–1106).

Waco \'wā-kō\ City (pop., 2000: 113,726), north-central Texas, U.S. Located on the BRAZOS RIVER, it was founded in 1849 on the site of an Indian village. After 1865 it became a river-bridge crossing on cattle trails; later its economy was based on cotton. Its diversified economy now includes manufacturing and tourism. A tornado devastated Waco in 1953, killing 114 persons. On April 19, 1993, after a 51-day standoff with U.S. federal agents, some 80 members of the BRANCH DAVIDIANS religious sect perished in a fire at their compound nearby.

Wadai \wä-'dī\ Historical African kingdom, central Africa. Located east of Lake CHAD and west of DARFUR, it was founded in the 16th century. A Muslim dynasty was established there c. 1630, and, though long subordinate to Darfur, it became independent by the 1790s and began a period of rapid expansion. It came under French influence in 1899 and French control (1912–14). The area is now largely in eastern Chad.

Wade, Benjamin F(ranklin) (b. Oct. 27, 1800, Springfield, Mass., U.S.—d. March 2, 1878, Jefferson, Ohio) U.S. politician. He practiced law in Ohio before serving in the U.S. Senate (1851–69), where he opposed the extension of slavery and the KANSAS-NEBRASKA ACT. In the American Civil War he joined the RADICAL REPUBLICANS in demanding vigorous prosecution of the war and headed a joint congressional committee to investigate the Union military effort. He cosponsored the WADE-DAVIS BILL, which brought him into conflict with ABRAHAM LINCOLN. Opposed to Pres. ANDREW JOHNSON's RECONSTRUCTION policies, he voted for his removal from office at his Senate trial and, as Senate president pro tem, prepared to succeed Johnson. Disappointed by the trial's outcome, he was later defeated for reelection.

Wade-Davis Bill (1864) Measure passed by the U.S. Congress to set RECONSTRUCTION policy. It was cosponsored by Sen. BENJAMIN WADE and Rep. Henry W. Davis (1817–65) to counter Pres. ABRAHAM LINCOLN's lenient plans for readmitting Southern states after the American Civil War. Supported by the RADICAL REPUBLICANS, the bill called for provisional military government of the seceded states, an oath of allegiance from a majority of the state's whites, and new state constitutions that would abolish slavery and disqualify Confederate officials from holding office. Lincoln considered the bill too harsh and allowed it to expire by using a pocket veto.

wage-price control Setting of government guidelines to limit increases in wages and PRICES. It is one of the most extreme approaches to INCOMES POLICY. By controlling wages and prices, governments hope to control INFLATION and prevent extremes in the BUSINESS CYCLE. Countries with highly centralized methods of setting wages tend to have the greatest degree of public or collective regulation of wage and price levels. For example, wage settlements in The Netherlands must be approved by the government, and price increases are investigated by the Ministry of Economic Affairs. Other countries, including the U.S., have also made efforts at restraining wage and price increases, usually seeking the voluntary cooperation of management and labour. In the U.S., wage-price controls were instituted by Pres. FRANKLIN D. ROOSEVELT during World War II and by Pres. RICHARD M. NIXON in the early 1970s, when high inflation combined with rising unemployment to create instability.

Wagner \'wag-nər**, Honus** *orig.* **John Peter Wagner** (b. Feb. 24, 1874, Mansfield, Pa., U.S.—d. Dec. 6, 1955, Carnegie) U.S. baseball player. Wagner played principally for the Pittsburgh Pirates (1900–17) and coached the team from 1933 to 1951. The right-handed hitter led the National League in batting average in eight seasons (1900, 1903–04, 1906–09, 1911) and in stolen bases five seasons. His total of 252 three-base hits remains a National League record. Nicknamed the "Flying Dutchman" for his speed, Wagner is considered one of the greatest shortstops and all-around players in baseball history.

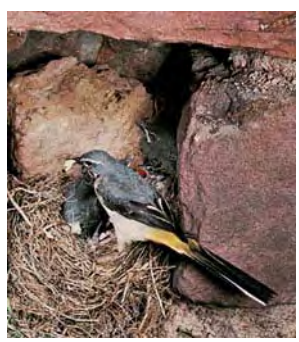
Wagner \'väg-nər**, Otto** (b. July 13, 1841, Penzing, near Vienna, Austrian Empire—d. April 11, 1918, Vienna) Austrian architect and teacher. In 1893 his general plan (not executed) for Vienna won a major competition, and in 1894 he was appointed professor at the Akademie der Bildenden Künste. As a teacher, Wagner soon broke with tradition by insisting on function, material, and structure as the bases of architectural design. Among his notable buildings, all in the ART NOUVEAU style, are a number of stations for the City Railway of Vienna (1894–97) and the Postal Savings Bank (1904–06). The latter, which had little decoration, is recognized as a milestone in the history of modern architecture, particularly for the curving glass roof of its central hall. Wagner's lectures were published in 1895 as *Moderne Architektur*.

Wagner \'väg-nər**, (Wilhelm) Richard** (b. May 22, 1813, Leipzig, Ger.—d. Feb. 13, 1883, Venice, Italy) German composer. His childhood was divided between Dresden and Leipzig, where he had his first composition lessons; his teacher refused payment because of his talent. His first opera, *The Fairies* (1834), was followed by *The Ban on Love* (1836); the premiere performance was so unprepared that the event was a fiasco, and he henceforth determined not to settle for modest productions. The success of *Rienzi* (1840) led him to be more adventurous in *The Flying Dutchman* (1843) and even more so in *Tannhäuser* (1845). Caught up in the political turmoil of 1848, he was forced to flee Dresden for Zürich. During this enforced vacation, he wrote influential essays, asserting (following G.W.F. HEGEL) that music had reached a limit after LUDWIG VAN BEETHOVEN and that the "artwork of the future" would unite music and theatre in a *Gesamtkunstwerk* ("total artwork"). In 1850 he saw *Lohengrin* produced. He had begun his most ambitious work, *The Ring of the Nibelung*, a four-opera cycle. The need for large-scale unity brought him to the concept of the LEITMOTIV. He ceased work on the *Ring*'s third opera, *Siegfried*, in the throes of an adulterous love with Mathilde Wesendonk and wrote an opera of forbidden love, *Tristan und Isolde* (1859), which also seemed to break the bonds of tonality. He published the *Ring* librettos in 1863, with a plea for financial support, and LOUIS II of Bavaria responded, inviting Wagner to complete the work in Munich. From the late 1860s to the early 1880s, Wagner completed work on *Die Meistersinger*, *Siegfried*, *Götterdämmerung*, and the long-deferred *Parsifal*, as he also oversaw the building of the great festival theatre at BAYREUTH (1872–76) that would be dedicated to his operas. His astonishing works made Wagner one of the most influential and consequential figures in the history of Western music and, indeed, of Western culture. In the late 20th

© 2006 Encyclopædia Britannica, Inc.

century his undoubted musical stature was challenged somewhat by the strongly racist and anti-Semitic views expressed in his writings, and evidence of anti-Semitism in his operas was increasingly documented.

Wagner \'wag-nər**, Robert F(erdinand)** (b. June 8, 1877, Nastätten, Hesse-Nassau, Ger.—d. May 4, 1953, New York, N.Y., U.S.) U.S. politician. He immigrated with his family to New York City in 1885. He became active in Democratic Party politics, serving in the state legislature (1904–19) and as a justice of the state court of appeals (1919–26). In the U.S. Senate (1927–49), he became an ally of Pres. Franklin D. Roosevelt and introduced New Deal labour and social-reform legislation, including the National Industrial Recovery Act (1933), the National Labor Relations Act (known as the Wagner Act), and the Social Security Act. He cosponsored the Wagner-Steagall Act (1937), which created the U.S. Housing Authority. His son, Robert F. Wagner, Jr. (1910–91), served as mayor of New York (1954–65).



Wagner Act *or* **National Labor Relations Act** (1935) Labour legislation passed by the U.S. Congress. Sponsored by Sen. Robert F. Wagner, the act protected workers' rights to form unions and to bargain collectively. A three-member National Labor Relations Board was established to protect against unfair labour practices; it could order elections to allow workers to choose which union they wanted to represent them. The act also prohibited employers from engaging in unfair labour practices such as setting up a company union and firing or otherwise discriminating against workers who organized or joined unions. The act, considered the most important piece of labour legislation in the 20th century, helped ensure union support for Pres. Franklin D. Roosevelt in the 1936 election.

Wagner-Jauregg \'väg-nər-'yaù-rek**, Julius** *orig.* **Julius Wagner, knight von Jauregg** (b. March 7, 1857, Wels, Austria—d. Sept. 27, 1940, Vienna) Austrian psychiatrist and neurologist. Knowing that malaria could be controlled with quinine and having observed that patients with some nervous disorders improved after infections with fever, he induced malaria to treat syphilis patients who had central nervous system disorders. For thus controlling an incurable fatal disease, he was awarded a 1927 Nobel Prize. Though antibiotics replaced this treatment for syphilis, it led to the development of fever therapy.

wagon Four-wheeled vehicle designed to be drawn by draft animals. Wagons have been used from the 1st century BC; early examples used spoked wheels with metal rims, pivoted front axles, and linchpins to secure the wheels. Ninth-century improvements in suspension made the wagon preferable to the two-wheeled cart, especially for carrying freight and agricultural produce.

Wagram \'vä-ˌgräm**, Battle of** (July 5–6, 1809) Victory by French forces under Napoleon against Austria. In an attempt to break French control of Germany, Austria's 158,000 troops under Archduke Charles (1771–1847) were deployed along a 14-mi (23-km) front on either side of the village of Wagram, near Vienna. The attack by Napoleon and his 154,000 French troops split the centre of the Austrian line. By the time reinforcements arrived, Charles's army was in retreat, and four days later he asked for an armistice. Heavy use of artillery (the heaviest in any war to that time) caused more than 40,000 Austrian casualties and about 34,000 French.

wagtail Any of 7–10 passerine species in the genus *Motacilla* and the forest wagtail (*Dendronanthus indicus*) of Asia. Wagtails continually pump their long tail up and down; the forest wagtail wags its entire body from side to side. They inhabit beaches, meadows, and streamsides, nesting on the ground and roosting in trees. Males of the white, or pied, wagtail (*M. alba*), common across Eurasia, are white and gray or white and black. The only New World species, the yellow wagtail (*M. flava*), breeds in Alaska and migrates to Asia.

Gray wagtail (*Motacilla cinerea*).
H. REINHARD-BRUCE COLEMAN INC.

Wahhāb \wȧ-'hȧb**, Muḥammad ibn ʿAbd al-** (b. 1703, ʿUyaynah, Arabia—d. 1792, Al-Dirʿīyah) Islamic theologian and founder of the Wahhābī movement. Educated in Medina, he spent several years teaching in Iraq and Iran. He reacted against what he perceived as the extremism of various sects of Sufism, setting out his ideas in the *Book of Unity* (1736). He stressed a conservative observation of Islam, rejecting polytheism and condemning reverence of saints and the decoration of mosques. His views were controversial; eventually he settled in Nejd, where, in alliance with Ibn Saʿūd, his teachings found favour and grew dominant.

Wahhābī \wȧ-'hȧb-ē\ Member of a Muslim puritan movement founded in the 18th century by Muḥammad ibn ʿAbd al-Wahhāb. Members call themselves al-Muwaḥḥidūn, a name derived from their emphasis on the absolute oneness of God. They reject all acts implying polytheism, including the veneration of saints, and advocate a return to the original teachings of Islam as found in the Qurʾān and the Ḥadīth. They supported the establishment of a Muslim state based on Islamic canon law. Adopted by the ruling Saudi family in 1744, the movement controlled all of Nejd by the end of the 18th century. It was assured of dominance on the Arabian Peninsula with the creation of the kingdom of Saudi Arabia in 1932, and in the 20th century—supported by Saudi wealth—it engaged in widespread missionary work throughout the Islamic world.

wahoo \'wä-ˌhü\ Species (*Acanthocybium solanderi*) of swift-moving, powerful, predaceous food and game fish found worldwide, especially in the tropics. A slim, streamlined fish, it has sharp-toothed, beaklike jaws and a tapered body ending in a crescent-shaped tail. Gray-blue above and paler below, it is marked with a series of vertical bars and, like the related tunas, has a row of small finlets behind the dorsal and anal fins. It may grow to 6 ft (1.8 m) long and weigh more than 120 lb (55 kg).

Waigeo \wī-'gā-ō\ Island, northeastern Moluccas, Indonesia. Located off northwestern New Guinea, it is part of Papua (Irian Jaya) province. Waigeo is 80 mi (130 km) long and 30 mi (48 km) wide. Its rocky and generally steep coastline is almost bisected by a narrow inlet of the Dampier Strait; its central areas are mountainous, rising to 3,300 ft (1,000 m), and are heavily forested. Islanders raise cattle and export tortoiseshell and fish.

Waikato River \wī-'kä-tō\ River, North Island, New Zealand. Rising on the slopes of Mount Ruapehu as the Tongariro River, it flows north through Lake Taupo, then northwest to enter the Tasman Sea. The nation's longest river, it is 264 mi (425 km) long and is a major source of hydroelectric power. It was the scene of several skirmishes between the British and the Waikato tribes in 1863–65.

Waikiki \ˌwī-kə-'kē\ Resort area, southern coast of Oahu island, Hawaii, U.S. Located in the southeastern section of Honolulu, near Diamond Head, its famous beach is lined with luxury hotels; it has water-sports facilities as well as an aquarium, a zoo, gardens, and the International Market Place. Waikiki is also the site of Fort DeRussy, a military recreation area.

Wailing Wall See Western Wall

Wailuku Valley See Iao Valley

Waimakariri \wī-ˌmä-kə-'rir-ē\ **River** River, east-central South Island, New Zealand. It rises in the Southern Alps and flows 100 mi (160 km) southeast to Pegasus Bay of the Pacific Ocean. The river's delta constitutes a major portion of the Banks Peninsula and part of the Canterbury Plains.

Wairau River \'wī-ˌraù\ River, northern South Island, New Zealand. It rises in the Spenser Mountains and flows for 105 mi (169 km) to enter Cloudy Bay of Cook Strait. In 1843 it was the site of the Wairau Affray, a battle between the New Zealand Co. and local Maori chiefs.

Waite, Morrison (Remick) (b. Nov. 29, 1816, Lyme, Conn., U.S.—d. March 23, 1888, Washington, D.C.) U.S. jurist. The son of a justice of the Connecticut Supreme Court, he practiced law in Toledo, Ohio; in his most notable case, he prosecuted the Alabama claims. In 1874 he was appointed chief justice of the Supreme Court of the United States by Pres. Ulysses S. Grant; he served on the court until his death. In *U.S.* v. *Cruikshank*, Waite stated that, despite its apparently plain language, the Fifteenth Amendment had not conferred a federal right of suffrage on African Americans, because "the right to vote comes from the states." In his most famous opinion, *Munn* v. *Illinois* (1877), he upheld legislation fixing maximum rates chargeable by grain elevators and railroads, declar-

© 2006 Encyclopædia Britannica, Inc.

ing that a business or private property "affected with a public interest" was subject to governmental regulation.

Waitemata \ˌwī-tə-'mä-tə\ **Harbour** Harbour, northern North Island, New Zealand. The harbour for Auckland, the Waitemata opens into Hauraki Gulf through Stanley Bay. Its shore has many lesser embayments; several tidal rivers empty into the western part.

waiting-line theory See queuing theory

Waitz, Grete *orig.* **Grete Andersen** (b. Oct. 1, 1953, Oslo, Nor.) Norwegian marathon runner. She set world records in the 3,000-m event (1975, 1976) and became the world women's marathon champion in 1983. She won the women's silver medal in the marathon at the 1984 Olympic Games. She won the New York marathon nine times in the years 1978–88 and was the first woman to finish that race in under 2.5 hours.

wakan \wä-'kän\ Among some American Indian tribes, a spiritual power of supernatural origin belonging to some natural objects, people, horses, and celestial and terrestrial phenomena. Wakan can be conceived of as weak or strong powers; the weak can be ignored but the strong must be placated. Wakan beings are the immortal supernatural powers who bestow wakan; they too may be weak or strong, but are all believed to enjoy music and smoke from pipes. Poisonous plants and reptiles can contain wakan, as can intoxicating drinks. The concept of wakan is similar to that of mana.

Wakatipu \ˌwä-kə-'tē-pü\ **Lake** Lake, south-central South Island, New Zealand. The S-shaped lake measures 48 mi (77 km) by 3 mi (5 km) and has an area of 113 sq mi (293 sq km) and a maximum depth of 1,240 ft (378 m). It receives the Dart, Rees, Greenstone, and Von rivers and empties by the Kawarau River, a tributary of the Clutha River.

Wake Island Atoll, central Pacific Ocean. An unincorporated territory of the U.S., Wake Island comprises three low-lying coral islets (Wilkes, Peale, and Wake) that surround a lagoon and occupy a total land area of 2.5 sq mi (6.5 sq km). The atoll was claimed by the U.S. in 1899. In 1935 it became a stopover for transpacific commercial flights. The U.S. Navy began construction of an air and submarine base in 1939, which was half-completed when Wake was attacked and occupied by Japanese forces in December 1941. After the Japanese surrendered (1945), Wake was administered by the U.S. Air Force. Commercial flights resumed, but by 1974 Wake was being used as an emergency stopover. It is also the site of weather research stations. There is no indigenous population on the island, but there is a small contingent of civilian workers.

Wakefield City and metropolitan borough (pop., 2001: 315,173), southeastern portion of the metropolitan county of West Yorkshire, historic county of Yorkshire, England. Originally part of a royal manor, it became a baronial holding after 1086. It was the scene of the Wars of the Roses at which Richard, duke of York, was captured and beheaded by Lancastrians. In the 15th century the Wakefield Plays, one of the collections of English miracle plays, were presented there. The town was attacked and taken by the Parliamentarian general Baron Fairfax in 1643 during the English Civil Wars. Known as a textile centre since the 16th century, Wakefield specializes in wool and synthetic knitting yarns.

Wakefield, Edward Gibbon (b. March 20, 1796, London, Eng.—d. May 16, 1862, Wellington, N.Z.) British colonizer of South Australia and New Zealand. After viewing the problems of the penal system, including the forcible removal of convicts to British colonies, he wrote *A Letter from Sydney* (1829) and proposed colonization by the sale of small landholdings to ordinary citizens. He influenced the founding of South Australia as a nonconvict settlement. As organizer and manager of the New Zealand Company (1838–58), he sent colonists to settle New Zealand and forced the British government to recognize the colony. As an adviser to the earl of Durham, he influenced the report that led to the union of Upper and Lower Canada. He founded a Church of England settlement at Canterbury, N.Z. (1847).

Waksman, Selman (Abraham) (b. July 22, 1888, Priluka, Ukraine, Russian Empire—d. Aug. 16, 1973, Hyannis, Mass., U.S.) Ukrainian-born U.S. biochemist. He became a U.S. citizen in 1916 and spent most of his career at Rutgers University. After the discovery of penicillin, he played a major role in initiating a calculated, systematic search for antibiotics (a term he coined in 1941) among microorganisms. His 1943 discovery of streptomycin, the first specific agent effective in the treatment of tuberculosis, brought him a 1952 Nobel Prize. Waksman also isolated and developed several other antibiotics, including neomycin, that have been used in treating many infectious diseases of humans, domestic animals, and plants.

Walachia \wä-'lā-kē-ə\ Former principality, south-central Europe. It lay between the Danube River and the Transylvanian Alps in what is now Romania. It was founded in 1290 by Radu Negru, a vassal of Hungary, and achieved independence from Hungary in 1330. The capital from the 14th to the 17th century was Targoviste. Walachia was ruled by the Turks in the 15th century, though some princes resisted, notably Vlad II Dracul (1436–47) and Vlad III Ţepeş, who are often cited as the historical bases for the Dracula vampire tales. Walachia briefly annexed Moldavia and Transylvania in the late 16th century. Russian influence grew in the 18th century, and in 1774 Walachia came under Russia's protection, though it continued to recognize Turkish suzerainty. Russia's protectorate ended after the Crimean War, and in 1859 Walachia united with Moldavia to form Romania.

Walcott \'wȯl-ˌkät**, Derek (Alton)** (b. Jan. 23, 1930, Castries, Saint Lucia) West Indian poet and playwright. Of mixed black, Dutch, and English descent, Walcott was educated in Saint Lucia and Jamaica. After 1958 he lived in Trinidad and the U.S. Most of his works explore the Caribbean cultural experience. He is best known for his poetry; in volumes such as *In a Green Night* (1962), *The Gulf* (1969), *Another Life* (1973), *The Star-Apple Kingdom* (1979), *The Fortunate Traveller* (1981), and *The Bounty* (1997), Walcott's erudition is submerged in sweeping rhythmic and sensuous sonorities. His epic poem *Omeros* (1990) is a retelling of Homer's *Odyssey* in a 20th-century Caribbean setting. Of his approximately 30 plays, the best known are *Dream on Monkey Mountain* (produced 1967), *Ti-Jean and His Brothers* (1958), and *Pantomime* (1978). In 1992 he was awarded the Nobel Prize for Literature.

Wald, George (b. Nov. 18, 1906, New York, N.Y., U.S.—d. April 12, 1997, Cambridge, Mass.) U.S. biochemist. He taught at Harvard University from 1934–77. His outstanding contributions were on the importance of vitamin A, the mechanisms of the photochemical reactions in the rod cells that enable night vision, and the identification of the colour-sensitive pigments in the cone cells (see photoreception; retina). He shared the Nobel Prize in 1967 with Haldan Keffer Hartline and Ragnar Arthur Granit. He was a prominent opponent of the Vietnam War.

Waldeck \'väl-ˌdek\ Former state, Germany. It is now a part of Hesse. The capital was Arolsen. A county in the Middle Ages, Waldeck became a principality in 1712 and part of Prussia in 1867. A republic and constituent state of the Weimar Republic (1918–29), it later formed part of the Prussian Hesse-Nassau province (until 1945).

Waldeck-Rousseau \väl-dek-rü-'sō**, (Pierre-Marie-) René** (b. Dec. 2, 1846, Nantes, France—d. Aug. 10, 1904, Corbeil) French politician. A conservative lawyer, he served in the Chamber of Deputies (1879–89) and as minister of the interior (1881–82, 1883–85). In 1884 he sponsored the law that legalized French trade unions. After returning to his prosperous law practice, he became a senator in 1894. In the upheaval over the Alfred Dreyfus affair, he was appointed premier (1899–1902) and formed a coalition cabinet that persuaded the president to pardon Dreyfus.

Waldenses \wȯl-'den-ˌsēz\ *French* **Vaudois** \vō-'dwä\ *Italian* **Valdesi** \val-'dā-zē\ Members of a Christian movement that originated in 12th-century France. Devotees sought to follow the example of Jesus and the Apostles by adopting lives of preaching and poverty. The movement's founder, Valdes, was condemned by the archbishop of Lyon for continuing to preach without church permission. Although placed under a ban in 1184 by Pope Lucius III (1181–85), Valdes remained orthodox and hoped for eventual acceptance by the church. His followers, however, gradually departed from Roman Catholicism by rejecting the clergy's right to administer the sacraments, the notion of purgatory, and the veneration of saints. Rome responded by actively persecuting the Waldenses, and their numbers diminished by the end of the 15th century. In the 16th century they adopted some aspects of Protestant doctrine and the church organization of Genevan Protestantism. Intermittently persecuted in later centuries, they have remained a small movement within Christianity. They survive today in Argentina, Uruguay, and the U.S.

Waldheim \'vält-ˌhīm**, Kurt** (b. Dec. 21, 1918, Sankt Andrä-Wördern, Austria) Fourth secretary-general of the United Nations (1972–81). After military service in the German army before and during World War II, he

© 2006 Encyclopædia Britannica, Inc.

entered the Austrian foreign service and served successively as ambassador to Canada (1958–60) and the UN (1964–68, 1970–71) and as foreign minister (1968–70). Elected to succeed U Thant as UN secretary-general, he served two terms, during which he oversaw disaster relief in Bangladesh, Nicaragua, and Guatemala and peacekeeping missions in Cyprus, the Middle East, Angola, and Guinea. Denied a third term, he returned to Austria and ran for president in 1986. His candidacy became controversial when it was learned that he had been a member of the Nazi Party and had served in a German army unit that had deported most of the Jewish population of the Greek town of Salonika to Nazi death camps in 1943. Elected nonetheless, he was diplomatically isolated throughout his term (1986–92).

Waldheim, 1971
UPI

Wales *Welsh* **Cymru** \ˈkəm-rē\ Principality, constituting an integral part of the United Kingdom. It occupies a peninsula on the western side of the island of Great Britain. Area: 8,015 sq mi (20,758 sq km). Population (2001): 2,903,085. Capital: Cardiff. The population is of Celtic, Anglo-Saxon, and Anglo-Norman ancestry. Languages: English, Welsh. Religion: Methodism. Wales is almost entirely an upland area the core of which is the Cambrian Mountains. The highest peak in England and Wales, Mount Snowdon, is found in Snowdonia National Park. The Severn, Wye, and Dee are the longest rivers. Economic activities include mining coal (though coal mining suffered a sharp decline in the late 20th century), slate, and lead; importing and refining petroleum; and manufacturing consumer electronics. Tourism is an important industry. In prehistoric times, tribal divisions of the British Celtic speakers who dominated all of Britain south of the Firth of Forth and the Firth of Clyde inhabited the region. The Romans ruled from the 1st century AD until the 4th–5th century. Welsh Celts fought off incursions from the Anglo-Saxons. A number of kingdoms arose there, but none was successful in uniting the area. The Norman conquerors of England brought all of southern Wales under their rule in 1093. English King Edward I conquered northern Wales and made it a principality in 1284. Since 1301 the heir to the English throne has carried the title Prince of Wales. Wales was incorporated with England in the reign of Henry VIII. It became a leading international coal-mining centre during the 19th century. The Plaid Cymru, or Welsh Nationalist Party, was founded in 1925, but its influence did not gather force until the 1960s, when Welsh nationalist aspirations rose. In 1997 a referendum approved the devolution of power to an elected assembly, which first convened in 1999.

Wales, Prince of Title of the heir apparent to the British throne. In 1301 Edward I of England granted it to his son Edward after conquering Wales and executing the last native Welsh prince (1283). Since that time most of the eldest sons of English sovereigns have been given the title. The title ceases to exist when a Prince of Wales becomes king, until a monarch bestows it on a son.

Wałęsa \vä-ˈlen-sə,\ *Polish* \vä-ˈweⁿ-sə**, Lech** (b. Sept. 29, 1943, Popowo, near Włocławek, Pol.) Polish labour leader and president of Poland (1990–95). An electrician, he worked in the Lenin Shipyard at Gdańsk, Pol. (1967–76), but he was fired for his antigovernment activities. In 1980 he joined workers in a strike and soon became leader of the Solidarity trade union. The union was banned in 1981, and he was detained into 1982. In 1983 he was awarded the Nobel Prize for Peace; fearing involuntary exile, he remained in Poland while his wife, Danuta, traveled to Norway to accept the prize on his behalf. He continued to direct the outlawed union until it received legal recognition in 1988. Solidarity won an overwhelming victory in free elections in June 1989, and after Wałęsa refused to form a coalition government with the communists, the Parliament was forced to accept a Solidarity-led government, though Wałęsa himself refused to serve as premier. In 1990 he won Poland's first direct presidential election by a landslide, and he helped guide Poland into a free-market economy. His confrontational style eroded his popularity, and he was narrowly defeated in his bid for reelection in 1995.

Walī Allāh \wä-ˈlē-ä-ˈlä**, Shāh** (b. 1702/03, Delhi—d. 1762, Delhi) Indian Islamic theologian. He received a traditional Islamic education, and after a pilgrimage to Mecca in 1732 he remained in the Hejaz to study theology. Living in a time of disillusionment following the death of Aurangzeb, he believed that Muslim polity could be restored only through religious reform that would harmonize Islam with India's changing social and economic conditions. He was steadfastly monotheistic but otherwise much more liberal than most Islamic theologians that had preceded him. His best-known work is *The Secrets of Belief*. His synthesis of theology, philosophy, and mysticism so reinvigorated Islam that it became prevalent among Islamic scholars in India until the 20th century.

Walker, Alice (Malsenior) (b. Feb. 9, 1944, Eatonton, Ga., U.S.) U.S. writer. After attending Spelman College and Sarah Lawrence College, Walker moved to Mississippi and became involved with the civil rights movement. She also began teaching and publishing short stories and essays. Her works are noted for their insightful treatment of African American culture. Her third and most popular novel, *The Color Purple* (1982, Pulitzer Prize; film, 1985), depicts a black woman's struggle for racial and sexual equality. Her later novels include *The Temple of My Familiar* (1989) and *Possessing the Secret of Joy* (1992). She also wrote essays, some collected in *In Search of Our Mothers' Gardens* (1983); several books of poetry; short stories; and children's books.

Walker, David (b. Sept. 28, 1785, Wilmington, N.C., U.S.—d. June 28, 1830, Boston, Mass.) U.S. abolitionist. The son of a slave father and a free mother, he was educated and traveled widely before settling in Boston, where he became an abolitionist lecturer and wrote for the anti-slavery *Freedom's Journal*. In his pamphlet *Appeal to the Colored Citizens of the World* (1829), he called for armed revolt. He smuggled the pamphlet into the South by hiding copies in clothing that he sold to sailors from his used-clothes store in Boston. Warned to flee for his life to Canada, he refused, and his body was found soon after; many believed he was poisoned. His son, Edwin G. Walker, was elected to the Massachusetts legislature in 1866.

Walker, James J(ohn) *known as* **Jimmy Walker** (b. June 19, 1881, New York, N.Y., U.S.—d. Nov. 18, 1946, New York City) U.S. politician. He entered politics after graduating from New York Law School, becoming a member of the Assembly (1909) and then of the State Senate (1914). Backed by Gov. Alfred E. Smith and Tammany Hall, he was elected mayor (1925–32). A popular figure known for his charm and wit but particularly for his enthusiastic participation in the high life typical of the era, he made improvements in sanitation, hospitals, and subways. In 1931 the state legislature, investigating the city's affairs, charged Walker with corruption; he resigned in 1932.

Walker, Sarah Breedlove *orig.* **Sarah Breedlove** (b. Dec. 23, 1867, near Delta, La., U.S.—d. May 25, 1919, Irvington, N.Y.) U.S. businesswoman and philanthropist, the first African American female millionaire. She was a widowed washerwoman with a daughter to support in 1905 when she developed a method for straightening curly hair. She founded the Madame C.J. Walker Manufacturing Co. to sell her treatment, and her door-to-door saleswomen became familiar figures in the black communities of the U.S. and the Caribbean. In 1910 she moved her company to Indianapolis, Ind. She augmented her earnings with shrewd real-estate investments, and she donated two-thirds of her fortune to charitable and educational institutions. Her daughter, A'Lelia Walker Kennedy, hosted salons where artists and cultural figures mingled during the Harlem Renaissance.

Walker, William (b. May 8, 1824, Nashville, Tenn., U.S.—d. Sept. 12, 1860, Trujillo, Hond.) U.S. military adventurer. He moved to California (1850), where his interest in colonizing Baja California developed into a filibustering (insurrection) scheme. He landed at La Paz (1853) and proclaimed Lower California and Sonora an independent republic, but Mexican resistance forced him back to the U.S. In 1855 he sailed to Nicaragua, where he effectively established himself as leader. There officers of Cornelius Vanderbilt's Accessory Transit Co. promised him financial assistance in a plot to take the company away from Vanderbilt. Walker seized the company and turned it over to them, then made himself president of Nicaragua (1856). In 1857 Vanderbilt induced five Central American republics to drive Walker out. In 1860 Walker attempted a filibuster in Honduras, where he was captured and executed.

Walker Cup Trophy awarded to the winner of a golf competition between amateur men's teams from the U.S. and Britain. It has been held biennially since 1922 on sites alternating between the two countries. The

© 2006 Encyclopædia Britannica, Inc.

cup is named for the event's organizer, George H. Walker, a president of the U.S. Golf Association. Contests consist of four 18-hole foursome matches and eight 18-hole singles matches on each of two days, with one point awarded to the winning side in each match.

walking In TRACK AND FIELD, a form of racing in which the competitor's advancing foot must touch the ground before the rear foot leaves it. Walking as a sport dates from the later 19th century. Walking races of 10 mi and 3,500 m were added to the men's Olympic program in 1908, but since 1956 the Olympic distances have been 20 km and 50 km. A women's 10-km walk was introduced in 1992.

walking catfish Species (*Clarias batrachus*) of Asian and African CATFISH that can progress remarkable distances over dry land. It uses its pectoral-fin spines as anchors to prevent jackknifing as its body musculature produces snakelike movements. Treelike respiratory structures extending above the gill chambers enable it to breathe. It has been introduced into southern Florida, where it now poses a serious threat to native fauna.

walking leaf See LEAF INSECT

wall Any of various upright constructions used to divide or enclose a room or building. In traditional masonry construction, BEARING WALLS supported the weight of floors and roofs, but modern steel and reinforced-concrete frames, as well as heavy timber and other skeletal structures, require exterior walls only for shelter. Some urban buildings dispense with walls on the ground floor, extending outdoor plazas under the building and permitting easier access to elevators, escalators, and stairs. In masonry construction, all types of floors and roofs except domes are most easily supported on straight, parallel walls. Nonbearing walls, used when loads are carried by girders, beams, or other members, can be either CURTAIN WALLS or infill of brick, block, or other material. See also CAVITY WALL, RETAINING WALL, SHEAR WALL.

Wall Street Street in New York City where many major U.S. financial institutions are located. The street, in southern Manhattan, is narrow and short and extends only about seven blocks from Broadway to the East River. It was named for an earthen wall built by Dutch settlers in 1653 to repel an expected English invasion. Even before the Civil War it was recognized as the nation's financial capital, and it remains a worldwide symbol of high finance. The Wall Street, or financial, district contains the NEW YORK STOCK EXCHANGE, the AMERICAN STOCK EXCHANGE, and the Federal Reserve Bank of New York. The district is also the headquarters for many INVESTMENT BANKS, securities dealers, utilities and insurance companies, and brokerage firms.

Wall Street Journal, The U.S. daily national newspaper, the most influential American business-oriented paper and one of the most respected dailies in the world. Founded in 1889 by Charles H. Dow, founder of Dow Jones & Co., it quickly won success. Beginning in the GREAT DEPRESSION, *The Wall Street Journal* began to feature more articles, reviews, and opinion on other subjects. Published in New York City and with regional editions printed across the country, it has one of the highest daily circulations of any U.S. newspaper. It is also published in Asian, European, and other special editions.

wallaby \'wä-lə-bē\ Any of about 25 species of medium-sized KANGAROOS, found chiefly in Australia. Brush wallabies (11 species) are built like the big kangaroos but differ in dentition. Rock wallabies live among rocks, usually near water. Nail-tailed wallabies, named for a horny growth on the tail tip, rotate their forelimbs while hopping. The small hare wallabies resemble HARES in movement and some habits. The small, stocky scrub wallabies, hunted for meat and fur, have short hind limbs and pointy noses. The similar short-tailed scrub wallaby occurs only on two offshore islands of western Australia. Several wallaby species have been exterminated, and several others are endangered. See photograph opposite.

Wallace, Alfred Russel (b. Jan. 8, 1823, Usk, Monmouthshire, Wales—d. Nov. 7, 1913, Broadstone, Dorset, Eng.) British naturalist. Though trained as a surveyor and architect, he became interested in botany and traveled to the Amazon in 1848 to collect specimens. In 1854–62 he toured the Malay Archipelago, augmenting his collection. His observations of the islands led to his developing a theory of the origin of species through natural selection independently of, and simultaneously with, CHARLES DARWIN, though Darwin developed his own theory in much greater detail, provided far more evidence for it, and was mainly responsible for its acceptance. Unlike Darwin, Wallace insisted that the higher mental capacities of humans could not have arisen by natural selection but that some nonbiological agency must have been responsible. He hypothesized a boundary (Wallace's line) running between the islands of the Malay Archipelago, between the Oriental and Australasian faunal regions, many animals abundant on one side being absent on the other. In the realm of public policy he supported socialism, pacifism, land nationalization, and women's suffrage. His works include *Contributions to the Theory of Natural Selection* (1870), *Geographical Distribution of Animals* (2 vol., 1876), and *Darwinism* (1889).

Wallace, (William Roy) DeWitt and Lila Acheson *Lila Acheson Wallace orig.* **Lila Bell Acheson** (respectively b. Nov. 12, 1889, St. Paul, Minn., U.S.—d. March 30, 1981, Mount Kisco, N.Y.; b. Dec. 25, 1889, Virden, Man., Can.—d. May 8, 1984, Mount Kisco) U.S. publishers and founders of *Reader's Digest* magazine. DeWitt Wallace began an index of favourite magazine articles while he was a college student, and he developed the idea of a pocket-sized digest of popular articles while recuperating from wounds suffered in World War I. Lila Acheson, a minister's daughter, worked in social services during the war. The two were married in 1921. After various publishers rejected the digest idea, they began publishing *READER'S DIGEST* themselves on a low budget and had rapid success. DeWitt Wallace served as editor until 1965. They had no heirs but supported numerous philanthropic causes; the Lila Wallace-Reader's Digest Fund has been a major benefactor of the arts and culture.

Wallace, (Richard Horatio) Edgar (b. April 1, 1875, Greenwich, London, Eng.—d. Feb. 10, 1932, Hollywood, Calif., U.S.) British novelist, playwright, and journalist. He held odd jobs, served in the army, and was a reporter before producing his first success, *The Four Just Men* (1905). With works such as *Sanders of the River* (1911), *The Crimson Circle* (1922), *The Flying Squad* (1928), and *The Terror* (1930), he virtually invented the modern "thriller"; the plots of his detective and suspense stories are complex but clearly developed, and they are known for their exciting climaxes. His output (including 175 books) was prodigious and his rate of production so great as to be the subject of humour. His literary reputation has suffered since his death.

Wallace, George C(orley) (b. Aug. 25, 1919, Clio, Ala., U.S.—d. Sept. 13, 1998, Montgomery, Ala.) U.S. politician. He served in the Alabama state legislature (1947–53). As a circuit court judge (1953–59), he was known for his resistance to federal investigations of racial discrimination. Campaigning as a segregationist, he was elected governor in 1963 and kept his pledge "to stand in the schoolhouse door" to prevent enrollment of African American students at the University of Alabama. He yielded only in the face of the federalized National Guard. Further confrontations made him a nationwide symbol of Southern opposition to racial integration. He formed the American Independent Party and was its presidential candidate in 1968, winning 13% of the popular vote. He again served as governor (1971–79). While campaigning for the 1972 Democratic presidential nomination, he was shot in an assassination attempt and left partly paralyzed. In the 1980s he renounced his segregationist views, and he won his last term as governor (1983–87) with support from African American voters.

Wallace, Henry A(gard) (b. Oct. 7, 1888, Adair county, Iowa, U.S.—d. Nov. 18, 1965, Danbury, Conn.) U.S. politician. An agricultural expert, he succeeded his father as editor of *Wallace's Farmer* (1924–33). In 1932 he helped Franklin D. Roosevelt win Iowa. As U.S. secretary of agriculture (1933–40), he shaped the administration's farm policy, including the Agricultural Adjustment Administration. He served as vice president during Roosevelt's third term but was replaced in 1944 by Harry S. Truman. He was later secretary of commerce (1945–46). Very liberal in his views, he helped form the Progressive Party in 1948 and was its candidate against Truman in the presidential election, receiving more than one million votes. He wrote several books, including *Sixty Million Jobs* (1945).

Wallace, Lew(is) (b. April 10, 1827, Brookville, Ind., U.S.—d. Feb. 15, 1905, Crawfordsville, Ind.) U.S. writer. The son of Indiana's governor, he served in the Mexican War and in the American Civil War, in which he rose to the rank of major general. Later he returned to law practice, interrupted by two diplomatic postings. His literary reputation rests on three historical novels: *The Fair God* (1873), on the Spanish conquest of Mexico; *The Prince of India* (1893), on the Byzantine Empire; and, above all, the enormously popular *Ben-Hur* (1880; films, 1925, 1959), a romantic tale set in the Roman Empire during the time of Christ.

Lew Wallace

Wallace, Mike *orig.* **Myron Leon Wallace** (b. May 9, 1918, Brookline, Mass., U.S.) U.S. television interviewer and reporter. After graduating from the University of Michigan (1939), he worked as an announcer and newscaster on radio, delving into various programs, including talk shows, quiz shows, serials, and the news. He served as a naval communications officer during World War II and was subsequently hired as a radio reporter in Chicago. He began to work on television in the 1950s, hosting several television quiz shows. He joined CBS as a reporter in 1963 and was coeditor of the long-running *60 Minutes* from its first program in 1968. Noted for his aggressive, bruising style (which led some of his guests to experience "Mike fright"), he traveled the world interviewing some of the most famous and powerful figures, and he won numerous Emmy Awards.

Wallace, Sir William (b. 1279, probably near Paisley, Renfrew, Scot.—d. Aug. 23, 1305, London, Eng.) Scottish national hero. Son of a small landowner, he began his attacks on English settlements and garrisons in 1297, after Edward I declared himself ruler of Scotland. His army defeated a much larger English force at Stirling Bridge, captured Stirling Castle, and then ravaged northern England, for which Wallace was knighted and proclaimed guardian of the Scottish kingdom. In 1298 Edward I invaded Scotland and defeated Wallace at the Battle of Falkirk. Disgraced, Wallace resigned his guardianship and was replaced by the future Robert I but apparently continued to fight a guerrilla war. In 1305 he was arrested by the English and hanged, then disemboweled, beheaded, and quartered. The next year Robert raised the rebellion that eventually won independence for Scotland.

Wallack, James William (b. Aug. 24, 1795, London, Eng.—d. Dec. 25, 1864, New York, N.Y., U.S.) British-U.S. actor-manager. Born into a London stage family, he acted in Shakespearean roles from age 12 and made his U.S. debut as Macbeth in 1818. He performed in London and New York City until 1852, crossing the Atlantic 35 times. In 1837–39 he comanaged New York's National Theatre with his brother Henry John Wallack (1790–1870), the company's leading player. In 1852–62 he comanaged the Lyceum Theatre (renamed Wallack's Lyceum) with his son Lester (1820–88) as stage manager. Succeeding his father as general manager, Lester staged polished productions of English plays and trained most of the major 19th-century U.S. stage performers.

wallaroo \ˌwä-lə-ˈrü\ *or* **euro** \ˈyůr-ˌō\ One of the four largest species of kangaroo. The wallaroo (*Macropus robustus*) is smaller and stockier than the other three species (also in the genus *Macropus*); its colour varies from dark gray to pinkish brown. It lives in rocky country throughout Australia except in Victoria.

Wallenberg \ˈwä-lən-ˌbərg,\ *Swedish* \ˈwä-lən-ˌber-ē**, Raoul** (b. Aug. 4, 1912, Stockholm, Swed.—d. July 17, 1947?, Moscow, Russia, U.S.S.R.) Swedish businessman and humanitarian. The scion of a family of bankers, industrialists, and diplomats, in 1936 he became the foreign representative of a Hungarian trading company whose president was Jewish. When the Nazis sent troops to round up Jews in Hungary (1944), Wallenberg asked to be sent to Budapest as a diplomat. There he rescued thousands of Hungarian Jews by sheltering them in "protected houses" under the Swedish flag or securing their passage out of Hungary through bribes or counterfeit documents. Soon after Soviet troops occupied Budapest (1945), he was arrested on suspicion of espionage. He was sent to Moscow, where he allegedly died of a heart attack in prison in 1947. Unconfirmed reports from freed Soviet prisoners reported him alive in 1951, 1959, and 1975.

Wallenda \vä-ˈlen-dä,\ *English* \wȯ-ˈlen-də**, Karl** (b. 1905, Magdeburg, Ger.—d. March 22, 1978, San Juan, P.R.) German-born U.S. circus acrobat. He founded the Great Wallendas acrobatic troupe, which achieved fame in Europe for its four-man pyramid and cycling on the high wire without a safety net. His wife, Helen Kreis (1910–96), joined the troupe in 1926 and later was balanced at the peak of the seven-person pyramid, the most famous of the Wallendas' acts. The troupe traveled with the U.S. Ringling Brothers and Barnum & Bailey Circus (1928–46), then performed as freelancers. Karl's nephew Gunther (1927–96) trained on the wire from age five; when a pyramid collapsed in 1962, Gunther was the only member left standing and rescued three who were clinging to the wire; two others were killed and one was paralyzed. Two troupe members died in accidents in 1963 and 1972. Karl died in a fall from a wind-whipped wire 123 ft (37 m) above a street in San Juan.

Wallenstein \ˈvä-lən-ˌshtīn,\ *English* \ˈwä-lən-ˌstīn**, Albrecht Wenzel Eusebius von, duke von Friedland** *later* **Duke von Mecklenburg** (b. Sept. 24, 1583, Heřmanice, Bohemia—d. Feb. 25, 1634, Eger) Austrian general. A noble of Bohemia, he served with the future Habsburg emperor Ferdinand II in the campaign against Venice in 1617. He remained loyal to Ferdinand when other Bohemian nobles revolted (1618–23) and was made governor of Bohemia and allowed to acquire vast holdings in confiscated estates. Created duke of Friedland (1625), he commanded the imperial armies in the Thirty Years' War. After successes in the war against Denmark (1625–29), he was awarded the principality of Sagan (1627) and the duchy of Mecklenburg (1629). Under pressure from the German princes, Ferdinand was forced to dismiss Wallenstein. Recalled to imperial command in 1631, he drove the Swedish army from Bavaria and Franconia but was defeated at the Battle of Lützen (1632). Believing he had the support of his generals, he mounted a revolt against the emperor (1634) and was assassinated.

Waller, Edmund (b. March 3, 1606, Coleshill, Hertfordshire, Eng.—d. Oct. 21, 1687, Beaconsfield, Buckinghamshire) English poet. As a member of Parliament during the political turmoil of the 1640s, he was arrested for his part in a plot to establish London as a stronghold of the king; by betraying his colleagues and by lavish bribes, he avoided death. He later wrote poetic tributes to both Oliver Cromwell (1655) and Charles II (1660). Rejecting the dense intellectual verse of Metaphysical poetry, he adopted generalizing statement, easy associative development, and urbane social comment. With his emphasis on definitive phrasing through inversion and balance, he prepared the way for the emergence of the heroic couplet. By the end of the 17th century the heroic couplet was the dominant form of English poetry. Waller's lyrics include the well-known "Go, lovely Rose!"

Waller, Fats *orig.* **Thomas Wright Waller** (b. May 21, 1904, New York, N.Y., U.S.—d. Dec. 15, 1943, Kansas City, Mo.) U.S. jazz pianist, singer, and composer. Waller was influenced early by stride pianist James P. Johnson. He became an important exponent of stride piano by the late 1920s, recording solo piano pieces such as "Handful of Keys." From 1934 he recorded with a small ensemble, Fats Waller and His Rhythm, integrating his vocals and unique comic timing with instrumental finesse. His rhythmically contagious performances of his own songs, such as "Ain't Misbehavin'" and "Honeysuckle Rose," are timeless classics of jazz.

walleye *or* **walleyed pike** Species (*Stizostedion vitreum*) of pike-perch (family Percidae), carnivorous food and game fishes found in clear, cool lakes and rivers of eastern North America. Walleyes are slender and

© 2006 Encyclopædia Britannica, Inc.

darkly mottled. They have two dorsal fins and generally weigh less than 10 lbs (4.5 kg), though some may weigh up to 24 lbs (11 kg). They are at most 35 in. (90 cm) long. Walleyes are not true PIKES.

Wallis, Sir Barnes (Neville) (b. Sept. 26, 1887, Ripley, Derbyshire, Eng.—d. Oct. 30, 1979, Leatherhead, Surrey) British aeronautical designer and military engineer. He invented the innovative "dambuster" bombs used in World War II by the Royal Air Force to destroy the Möhne and Eder dams in Germany's industrial Ruhr area, producing heavy floods that slowed industrial production. He also invented the 12,000-lb (5,400 kg) "Tallboy" and the 22,000-lb (10,000 kg) "Grand Slam" bombs and was responsible for the bombs that destroyed the German warship *Tirpitz*, V-rocket sites, and much of Germany's railway system. In 1971 he designed an aircraft that could fly five times the speed of sound.

Wallis and Futuna Island group, west-central South PACIFIC OCEAN. It is a self-governing overseas territory (pop., 2003 prelim.: 14,944) of France, which includes Uvea (WALLIS ISLAND), the HORNE (Futuna) Islands (Futuna and Alofi), and a number of islets. The administrative seat is the village of Matâ'utu on Uvea. Until 1961 Wallis and Futuna was a protectorate under French authority attached to NEW CALEDONIA.

Wallis Islands Island group (pop., 2003 prelim.: 10,071), forming the northeastern part of the French overseas territory of WALLIS AND FUTUNA, west-central South Pacific Ocean. It comprises the main island of Uvea (Wallis) and a number of islets, all enclosed in one coral reef, with a total land area of 23 sq mi (60 sq km). Visited in 1767 by the British navigator Capt. Samuel Wallis, the islands were occupied by the French in 1842. They became a French protectorate in 1887 and part of the overseas territory in 1961.

Hand-printed wallpaper by Jean-Baptiste Réveillon, c. 1780–90; in the Victoria and Albert Museum, London.
COURTESY OF THE VICTORIA AND ALBERT MUSEUM, LONDON; PHOTOGRAPH, THE COOPER-BRIDGEMAN LIBRARY, LONDON

wallpaper Ornamental and utilitarian covering for walls made from long sheets of paper that have been stenciled, painted, or printed with abstract or narrative designs. Wallpaper developed soon after the introduction of papermaking to Europe in the late 15th century, originally as a substitute for tapestry, painted cloth, and wood paneling, and the first wallpapers were esteemed for the cleverness with which they mimicked the more costly wall coverings. In the 18th century, designs such as chintz patterns and stripes began to express the medium's decorative possibilities. In the mid-19th century, the wallpapers of WILLIAM MORRIS, featuring stylized, naturalistic patterns, created a revolution in wallpaper design. Plastic coating now improves wallpaper's durability and maintenance.

walnut Any of about 20 species of DECIDUOUS TREES in the genus *Juglans*, family Juglandaceae. Black walnut (*J. nigra*) of eastern North America and English, or Persian, walnut (*J. regia*), native to Iran, are valuable timber trees that produce edible NUTS. The butternut (*J. cinerea*) of eastern North America also produces an edible nut. The walnut family contains an additional seven genera of flowering plants, found mainly in the northern temperate zone in a variety of habitats. PECAN and HICKORY are among the many family members that are prized for both their edible nuts and their strong, attractive woods, especially noted for their grain patterns and lustre. Leaves of the walnut family are feather-like; tiny, resinous scales that look like yellow dots on the undersurface of the leaflets give *Juglans* species a pungent aroma.

Walnut Canyon National Monument National monument, north-central Arizona, U.S. Established in 1915 and covering an area of 3 sq mi (8 sq km), it preserves more than 300 pre-Columbian dwellings built by the PUEBLO INDIANS in shallow caves on the canyon walls. Main occupancy was from AD 1000 to 1200.

Walpole, Horace, 4th earl of Orford *orig.* **Horatio Walpole** (b. Sept. 24, 1717, London, Eng.—d. March 2, 1797, London) English writer, connoisseur, and collector. The son of prime minister ROBERT WALPOLE, he had an undistinguished career in Parliament. In 1747 he acquired a small villa at Twickenham that he transformed into a pseudo-Gothic showplace called Strawberry Hill; it was the stimulus for the GOTHIC REVIVAL in English domestic architecture. His literary output was extremely varied. He became famous for his medieval horror tale *The Castle of Otranto* (1765), the first GOTHIC NOVEL in English. He is especially remembered for his private correspondence of more than 3,000 letters, most addressed to Horace Mann, a British diplomat. Intended for posthumous publication, they constitute a survey of the history, manners, and taste of his age.

Walpole, Sir Hugh (Seymour) (b. March 13, 1884, Auckland, N.Z.—d. June 1, 1941, near Keswick, Cumberland, Eng.) British novelist, critic, and dramatist. A natural storyteller, Walpole turned to writing and reviewing books after unsuccessful attempts at teaching and lay reading in the Anglican church. Among his important novels is the semiautobiographical series that includes *Jeremy* (1919), *Jeremy and Hamlet* (1923), and *Jeremy at Crale* (1927). The Herries Chronicle, about an English country family, comprises *Rogue Herries* (1930), *Judith Paris* (1931), *The Fortress* (1932), and *Vanessa* (1933). He also wrote critical works on ANTHONY TROLLOPE, WALTER SCOTT, and JOSEPH CONRAD.

Walpole, Robert, 1st earl of Orford (b. Aug. 26, 1676, Houghton Hall, Norfolk, Eng.—d. March 18, 1745, London) English statesman generally regarded as the first British PRIME MINISTER. Elected to the House of Commons in 1701, he became an active Whig parliamentarian. He served as secretary at war (1708–10) and as treasurer of the navy (1710–11). He was also a member of the KIT-CAT CLUB. The Tory government sought to remove his influence by impeaching him for corruption, and he was expelled from the Commons in 1712. With the accession of GEORGE I (1714), he regained his position and rose rapidly to become first lord of the treasury and chancellor of the Exchequer (1715–17, 1721–42). Although associated with the SOUTH SEA BUBBLE scandal, he restored confidence in the government and maintained the Whigs in office. He cultivated the support of GEORGE II from 1727 and used royal patronage for political ends, skillfully managing the House of Commons to win support for his trade and fiscal programs, including the SINKING FUND. With his consolidation of power, he effectively became the first British prime min-

ister. He avoided foreign entanglements and kept England neutral until 1739 but was forced into the War of Jenkins' Ear. He resigned under pressure in 1742 and was created an earl. His acclaimed art collection, sold to Russia in 1779, became part of the Hermitage Museum collection.

Walpurgis Night Night before May 1. The name comes from the 8th-century St. Walburga (or Walpurgis), an English missionary who ran an important early convent in Germany, May 1 being one of her feast days. In Sweden it is celebrated with bonfires as the beginning of spring. In Germany, as Walpurgisnacht, it was the night witches were supposed to meet in the Harz Mountains (see Brocken), though the association of witches with St. Walburga is only coincidental. See also Beltane.

Walras \vål-'rå**, (Marie-Esprit-) Léon** (b. Dec. 16, 1834, Évreux, France—d. Jan. 5, 1910, Clarens, near Montreux, Switz.) French-Swiss economist. An advocate of cooperatives as an alternative to revolution, he ran a bank for producers' cooperatives with Léon Say (grandson of Jean-Baptiste Say) from 1865 to 1868. At the Academy of Lausanne, Switz. (1870–92), he began the school of economics later known (under Vilfredo Pareto) as the Lausanne school. Walras's *Elements of Pure Economics* (1874–77) was one of the first comprehensive mathematical analyses of general economic equilibrium. Assuming an environment of free competition, he constructed a mathematical model in which productive factors, products, and prices automatically adjust in equilibrium. He thus tied together the theories of production, exchange, money, and capital.

walrus Only living species (*Odobenus rosmarus*) of the pinniped family Odobenidae. Larger than the related seals, walrus males grow up to 12 ft (3.7 m) long and weigh up to 2,800 lbs (1,270 kg). Both sexes have long, downward-pointing tusks that may grow to 3 ft (1 m) long and weigh 12 lbs (5.4 kg) each. They have no external ears. The grayish skin is deeply folded over the shoulders. They live on ice floes, in groups of up to 100, on relatively shallow water in arctic seas of Eurasia and North America. They may dive to great depths in search of food, mostly shellfish. On land and ice, they move on all four limbs. They generally follow the ice line south in winter and north in summer. Traditionally important to native humans as sources of food and clothing, they have also been hunted commercially for centuries, which has resulted in serious depletion of their numbers. Commercial hunting is now generally banned.

Walrus (*Odobenus rosmarus*).

Walsh, Raoul (b. March 11, 1887, New York, N.Y., U.S.—d. Dec. 31, 1980, Simi Valley, near Los Angeles, Calif.) U.S. film director. Walsh began acting for the stage in 1910 and on film in 1912, the same year that he began directing. He was an assistant to D.W. Griffith and appeared in *The Birth of a Nation* (1915). In his 50-year career, he directed over 200 films, usually characterized by their simplicity and quick action. His *White Heat* (1949) is a classic study of a pathological criminal, and *The Naked and the Dead* (1958) is an effective translation of Norman Mailer's novel into film. His other films include *What Price Glory?* (1926), *The Roaring Twenties* (1939), *They Drive by Night* (1940), *They Died with Their Boots On* (1941), *High Sierra* (1941), and *A Distant Trumpet* (1964).

Walsingham, Sir Francis (b. c. 1532, probably Footscray, Kent, Eng.—d. April 6, 1590, London) English statesman and adviser to Queen Elizabeth I (1573–90). A member of Parliament from 1563, he became ambassador to the French court (1570–73) and established friendly relations between France and England. He was admitted to the Privy Council in 1573 and became secretary of state to Elizabeth I. Although not allowed to pursue an independent policy, he faithfully executed Elizabeth's foreign policy. He proved invaluable in uncovering conspiracies by Catholics against Elizabeth's life, including the plots by Francis Throckmorton (1583) and Anthony Babington (1586) to free Mary, Queen of Scots.

Walter, Bruno *orig.* **Bruno Walter Schlesinger** (b. Sept. 15, 1876, Berlin, Ger.—d. Feb. 17, 1962, Beverly Hills, Calif., U.S.) German-born U.S. conductor. An associate of Gustav Mahler, he was long a faithful proponent and interpreter of Mahler's music, giving the world premieres of *Das Lied von der Erde* (1911) and the *Symphony No. 9* (1912). He held positions in Munich (1913–22) and at Covent Garden (1924–31), but thereafter he served more often as a guest conductor than a music director. After moving to the U.S. in 1939, he often conducted the New York Philharmonic (recording as the Columbia or CBS Symphony), the Metropolitan Opera, the Philadelphia Orchestra, and the Los Angeles Philharmonic, and he was admired for the warmth of his interpretations, primarily of the Viennese school.

Walter, John (b. 1739, probably in London, Eng.—d. Nov. 16, 1812, Teddington, Middlesex) English newspaper publisher. Initially a coal dealer and marine-insurance underwriter, Walter acquired the patent for a printing system in 1783 and in 1785 in London began to publish the *Daily Universal Register*. He renamed it *The Times* in 1788. Though neither outstanding nor honest as a journalist, he turned from scandal to more serious topics and organized (while in prison for libeling members of the royal family) a news service from the European continent, thereby launching *The Times* toward its later preeminence in foreign news reporting. Walter's family owned *The Times* for almost 125 years.

Walters, Barbara (b. Sept. 25, 1931, Boston, Mass., U.S.) U.S. television journalist. After brief employment in an advertising agency, she became assistant to the publicity director for New York City's NBC-affiliated television station. She worked in television as a writer-producer (1952–58), interviewer (1964–74), and cohost (1974–76) of NBC's *Today* show, for which she won an Emmy Award in 1975. In 1976–78, for an unprecedented $1 million a year, she was coanchor of the *ABC Evening News*, the first woman to anchor a network newscast in the U.S. From 1976 she hosted the series of *Barbara Walters Specials*, interviewing celebrities and world leaders Her disarmingly direct questioning drew many subjects into frequently interesting and occasionally provocative moments of self-revelation. In 1982 and 1983 she received Emmy Awards for best interviewer. From 1984 she also cohosted ABC's *20/20* news magazine program.

Walther von der Vogelweide \'väl-tər-fòn-der-'fō-gəl-ˌvī-də\ (b. c. 1170—d. c. 1230, Würzburg?) Greatest German lyric poet of the Middle Ages. Of knightly birth, Walther was educated at a monastery school and served masters in several courts. His poetry goes far beyond the artificial conventions followed by other minnesingers by introducing an element of realism. He emphasizes the virtues of the balanced life, in both the social and the personal spheres. More than half of his approximately 200 extant poems are political, moral, or religious; the rest are love poems, among them the popular "Unter der Linden."

Walton, Izaak (b. Aug. 9, 1593, Stafford, Staffordshire, Eng.—d. Dec. 15, 1683, Winchester, Hampshire) English biographer and author. A prosperous ironmonger with only a few years of schooling, he read widely, developed scholarly tastes, and associated with men of learning. A friend and fishing companion of John Donne, he contributed "An Elegie" to the posthumous publication of Donne's poetry (1633) and wrote biographies of Donne (1640), George Herbert (1670), and others. His classic *The Compleat Angler* (1653), a pastoral discourse on the joys and stratagems of fishing, is one of the most frequently reprinted works in English literature, most often in a revision (1676) with additions by Charles Cotton (1630–87).

Walton, Sam(uel Moore) (b. March 29, 1918, Kingfisher, Okla., U.S.—d. April 5, 1992, Little Rock, Ark.) U.S. retail magnate, founder of Wal-Mart Stores, Inc. He attended the University of Missouri and then trained with the J.C. Penney Co. In 1945 he started a chain of variety stores in Arkansas, and in 1962 he opened his first Wal-Mart store in Rogers, Ark., offering a wide selection of discount merchandise. Whereas other discount-store chains were usually situated in or near large cities, Walton based his stores in small towns where there was little competition from established chains. Using this strategy his company expanded to 800 stores by 1985. In 1983 he opened the first Sam's Wholesale Club. Walton stepped down as chief executive officer of Wal-Mart Stores in 1988 but remained chairman until his death, by which time there were over 1,700 stores and Walton's family was the wealthiest in the U.S. In the 1990s Wal-Mart became controversial for depleting downtown districts of their commercial life by siting stores nearby. By the end of the 20th century it had become the world's largest retailer.

Walton, Sir William (Turner) (b. March 29, 1902, Oldham, Lancashire, Eng.—d. March 8, 1983, Ischia, Italy) British composer. His parents were musicians, and he learned to sing and play piano and violin

© 2006 Encyclopædia Britannica, Inc.

early. He established his reputation at age 19 by setting to jazzy music the whimsical poetry of Edith Sitwell (see SITWELL FAMILY); *Façade* (1923) premiered with the poet reading her poetry through a megaphone. Walton's later works include *Belshazzar's Feast* (1931), two symphonies (1935, 1960), and concertos for viola, violin, and cello (1929, 1939, 1956). His scores for LAURENCE OLIVIER's films of *Henry V* (1944), *Hamlet* (1947), and *Richard III* (1955) became well known; he also wrote coronation marches for GEORGE VI and ELIZABETH II.

waltz Ballroom turning dance evolved from the LÄNDLER in the 18th century. It is characterized by a step, slide, and step in 3/4 time. It was highly popular in the 19th and early 20th century. Variations include the rapid, whirling Viennese waltz and the slower, dipping Boston waltz, modified by VERNON AND IRENE CASTLE as the hesitation waltz. Many 19th-century composers wrote waltz music, most notably FRANZ PETER SCHUBERT, FRÉDÉRIC CHOPIN, JOHANNES BRAHMS, and JOHANN STRAUSS.

Walvis Bay Town (pop., 2001 prelim.: 40,849), west-central Namibia, on the Atlantic Ocean. A mid-19th-century rush to exploit GUANO deposits on nearby islands was followed by British annexation of the bay and the adjacent land in 1878. It was incorporated into Britain's Cape Colony in 1884. In 1910 it was included in the newly united South Africa. Administered as part of South West Africa (1922–77), it was then governed directly by South Africa, which retained the enclave after Namibia reached independence in 1990. The two countries administered the enclave jointly from 1992 to 1994; then South Africa transferred it to Namibia. Its harbour serves as Namibia's chief port.

wampum Tubular shell beads assembled into strings or woven into belts or embroidered ornaments. The ALGONQUIAN word (short for *wampumpeag*) translates as "string of white (shell beads)." Before contact with white settlers, Indians used wampum primarily ceremonially or in GIFT EXCHANGES. In the early 17th century it came to be used as money in trade with whites, because of a shortage of European currency.

Wanaka \'wä-nə-kə**, Lake** Lake, west-central SOUTH ISLAND, New Zealand. It covers an area of 75 sq mi (193 sq km) and is some 1,000 ft (300 m) deep. Fed by the Makarora and Matukituki rivers, the lake is the source of the CLUTHA RIVER. Its outlet is harnessed for hydroelectric power.

Wang Anshi *or* **Wang An-shih** \'wäŋ-'än-'shir\ (b. 1021, Linchuan, Jiangsu province, China—d. 1086, Jiangning, Jiangsu) Chinese poet and government reformer of the SONG DYNASTY. His "New Policies" of 1069–76 sparked academic controversy that continued for centuries. He created a fund for agricultural loans to farmers to spare them the exorbitant demands of moneylenders; he also replaced corvée labour with a hired-service system financed by a graduated tax levied on all families. He enabled officials to purchase supplies at the cheapest price in the most convenient market. He established a village militia system (see BAOJIA), reorganized the HANLIN ACADEMY, and restructured the civil service examinations. Wang's reforms were unpopular, and he was forced to resign in 1074. He returned to government in 1075, but with less political power. After the emperor's death an antireform clique came to power and dismantled Wang's reforms by the time of his death shortly afterward. See also FAN ZHONGYEN.

Wang Chong *or* **Wang Ch'ung** \'wäŋ-'chůŋ\ (b. AD 27, Kuiji, China—d. 100?, Kuiji) Chinese philosopher of the HAN DYNASTY. A rationalistic naturalist, he paved the way for the critical spirit of the next philosophical period and prepared China for the advent of Neo-Daoism. He opposed the superstitious element of CONFUCIANISM, declaring that natural events occur spontaneously and are not influenced by the actions of humans, who have no exceptional position in the universe. He also insisted that theories be supported by concrete evidence and experimental proof. Though never greatly popular in China, he attracted new interest in the 20th century for his foreshadowing of RATIONALISM and the SCIENTIFIC METHOD.

Wang Hui (b. 1632, Jiangsu province, China—d. 1717) Chinese artist who was the paramount member of the group of Chinese painters known as the Four Wangs (including Wang Shimin, Wang Jian, and Wang Yuanqi). Wang Hui, much like the other Wangs, primarily painted landscapes. In his best works he built up an intense web of rhythmic brushwork, while at the same time maintaining a composition's sense of unity and clarity. His fame reached the court in Beijing, and in 1691–98 he was commissioned to supervise the production of a series of hand scrolls commemorating the Kangxi emperor's tour of the South.

Wang Jingwei *or* **Wang Ching-wei** \'wäŋ-'jiŋ-'wā\ (b. May 4, 1883, Sanshui, Guangdong province, China—d. Nov. 10, 1944, Nagoya, Japan) Chinese leader, head of the regime established by the Japanese in 1940 to govern their conquests in China. A leading polemicist for SUN YAT-SEN's revolutionary party, in 1910 he tried to assassinate the imperial regent and was caught; his courage in the face of execution resulted in his sentence being reduced. He was released the following year, after the republican revolution. In the 1920s he served as a major official in the NATIONALIST PARTY. After Sun's death, he chaired the party while CHIANG KAI-SHEK led the NORTHERN EXPEDITION against China's WARLORDS. Chiang and Wang vied for party control; in a compromise in 1932, Wang became president and Chiang headed the military. After war erupted with Japan, Wang flew to Hanoi, Viet., and issued a statement calling on the Chinese to work out a peaceful settlement. In 1940, in cooperation with the Japanese, he became head of a regime that governed the Japanese-occupied areas centred on Nanjing. Though Wang had hoped to be granted virtual autonomy, the Japanese continued to exercise military and economic dominance. He died while undergoing medical treatment in Japan.

Wang Mang \'wäŋ-'mäŋ\ (b. 45 BC, China—d. Oct. 6, AD 23, Chang'an) Founder of the short-lived Xin dynasty (AD 9–25), an interlude between the two halves of the HAN DYNASTY in China. Wang's family was well connected to the Han imperial family, and in 8 BC Wang was appointed regent, only to lose the position when the emperor died. When the new emperor died in 1 BC, Wang was reappointed regent and married his daughter to the subsequent emperor, Ping, who died in AD 6. Wang picked the youngest of more than 50 eligible heirs to follow Ping and was named acting emperor. In AD 9 he ascended the throne and proclaimed the Xin dynasty. His dynasty might have endured had the Huang He (Yellow River) not changed course twice before AD 11, causing massive devastation and attendant famines, epidemics, and social unrest. Peasants banded together in ever larger units. In AD 23 rebel forces set the capital, Chang'an (modern Xi'an), on fire, forced their way into the palace, and killed him.

Wang Xiaotong (fl. early 7th century) Chinese mathematician who made important advances in the solution of problems involving cubic equations. In 626 he took part in the revision of the Wuying calendar (618), which had erroneously predicted eclipses in 620. About 630 he finished his *Jigu suanjing* ("Continuation of Ancient Mathematics"). All 20 problems in this book, except for the first one dealing with astronomy, involve cubic or biquadratic equations. Thirteen of the problems involve solving for the volume or the dimensions of a polyhedron. In solving some of these problems, Wang first used the formula for the volume of a dike of varying cross section. Other problems involve right-angled triangles.

Wang Yangming *or* **Wang Yang-ming** \'wäŋ-'yäŋ-'miŋ\ (b. 1472, Yuyao, Zhejiang province, China—d. 1529, Nanen, Jiangxi) Chinese scholar and official whose idealistic interpretation of NEO-CONFUCIANISM influenced philosophical thinking in East Asia for centuries. The son of a high government official, he was both a secretary to the Ministry of War and a lecturer on Confucianism by 1505. The next year, he was banished to a post in remote Guizhou, where hardship and solitude led him to focus on philosophy. He concluded that investigation of the principles of things should occur within the mind rather than through actual objects and that knowledge and action are codependent. Named governor of southern Jiangxi in 1516, he suppressed several rebellions and implemented governmental, social, and educational reform. By the time he was appointed war minister (1521), his followers numbered in the hundreds. His philosophy spread across China for 150 years and greatly influenced Japanese thought during that time. From 1584 he was offered sacrifice in the Confucian temple under the title Wencheng ("Completion of Culture").

Wankel \'väŋ-kəl**, Felix** (b. Aug. 13, 1902, Lahr, Ger.—d. Oct. 9, 1988, Lindau, W.Ger.) German engineer and inventor. In 1954 he completed the design of his distinctive engine, with an orbiting rotor in the shape of a curved equilateral triangle, which does the work done by the pistons in traditional reciprocating internal-combustion engines. Its advantages include light weight, few moving parts, compactness, low initial cost, fewer repairs, and relatively smooth performance. The first unit was tested in 1957, and from 1967 Japanese automobile company Mazda produced and developed the engine for a series of sports cars.

Wannsee \'vän-,zā\ **Conference** (Jan. 20, 1942) Meeting of Nazi officials in the Berlin suburb of Wannsee to plan the "final solution" to the "Jewish question." It was attended by 15 Nazi senior bureaucrats led

© 2006 Encyclopædia Britannica, Inc.

by Reinhard Heydrich, head of the SS and Gestapo, and included Adolf Eichmann, chief of Jewish affairs for the Reich Central Security Office. It marked a turning point in Nazi policy toward the Jews. An earlier idea, to deport all of Europe's Jews to Madagascar, was abandoned as impractical in wartime. Instead, the newly planned final solution would entail rounding up all Jews throughout Europe, transporting them eastward, and organizing them into labour gangs. The final protocol of the Wannsee Conference never explicitly mentioned extermination, but, within a few months after the meeting, the first gas chambers were installed at Auschwitz and Treblinka. See also Holocaust.

wapiti \ˈwä-pə-tē\ Species (*Cervus canadensis*) of North American deer, often considered the same species as the red deer. Once common, the wapiti is now confined to the Rocky Mountains and southern Canada. It is the second-largest living deer species (the moose is first). Males may stand taller than 5 ft (1.5 m) at the shoulder and weigh up to 1,100 lbs (500 kg). The coat is brown, pale on the rump, and long and shaggy on the shoulders and neck. The male's five-tined antlers tower almost 4 ft (1.2 m) above his head. Wapiti live in large bands in winter and in small groups in summer. See also elk.

Male wapiti (*Cervus canadensis*). ALAN CAREY

war State of conflict, generally armed, between two or more entities. It is characterized by intentional violence on the part of large bodies of individuals organized and trained for that purpose. On the national level, some wars are fought internally between rival political factions (civil war); others are fought against an external enemy. Wars have been fought in the name of religion, in self-defense, to acquire territory or resources, and to further the political aims of the aggressor state's leadership.

War Communism (1918–21) Soviet economic policy applied by the Bolsheviks during the Russian Civil War. Its chief features were the expropriation of private business and the nationalization of industry, as well as the forced requisition of surplus grain and other food products from the peasantry. These measures caused a rapid decline in agricultural production, labour productivity, and industrial output. Real wages declined by two-thirds, and uncontrolled inflation made paper currency worthless. By 1921 public discontent resulted in strikes and protests, culminating in the Kronshtadt Rebellion. In response, the Bolsheviks adopted the less-radical New Economic Policy.

war crime Any violation of the laws of war, as laid down by international customary law and certain international treaties. At the end of World War II, the part of the London Agreement signed by the U.S., Britain, the Soviet Union, and France established three categories of war crime: conventional war crimes (including murder, ill treatment, or deportation of the civilian population of occupied territories), crimes against peace, and crimes against humanity (political, racial, or religious persecution against any civilian population). The charter also provided for an international military tribunal to try major Axis war criminals. It further stated that a defendant's position as head of state would not free him from accountability, nor would having acted on orders or out of military necessity. German and Japanese war criminals were tried before Allied tribunals in Nürnberg and Tokyo in 1945–46 and 1946–48, respectively, and in the 1990s tribunals were created for the prosecution of war crimes committed in Rwanda and the territory of the former Yugoslavia. See also Geneva Convention; genocide; Hague Convention; Nürnberg trial.

War Hawk Member of the U.S. Congress who advocated war with Britain (1811). The term was applied by opponents to newly elected Southern and Western congressmen who strongly promoted U.S. expansion into the Northwest and Canada and vigorously protested British aid to Indians. The anti-British fervour of the War Hawks, who included Henry Clay and John C. Calhoun, helped cause the War of 1812.

War of 1812 U.S.-British conflict arising from U.S. grievances over oppressive British maritime practices in the Napoleonic Wars. To enforce its blockade of French ports, the British boarded U.S. and other neutral ships to check cargo they suspected was being sent to France and to impress seamen alleged to be British navy deserters. The U.S. reacted by passing legislation such as the Embargo Act (1807); Congress's War Hawks called for expulsion of the British from Canada to ensure frontier security. When the U.S. demanded an end to the interference, Britain refused, and the U.S. declared war on June 18, 1812. Despite early U.S. naval victories, notably the duel between the *Constitution* and the *Guerrière*, Britain maintained its blockade of eastern U.S. ports. A British force burned public buildings in Washington, D.C., including the White House, in retaliation for similar U.S. acts in York (Toronto), Can. The war became increasingly unpopular, especially in New England, where a separatist movement originated at the Hartford Convention. On Dec. 24, 1814, both sides signed the Treaty of Ghent, which essentially restored territories captured by each side. Before news of the treaty reached the U.S., its victory in the Battle of New Orleans led it to later proclaim the war a U.S. victory. See also Battle of Châteauguay; Chippewa; Thames; Isaac Hull; Francis Scott Key; Oliver Perry.

War of Independence, U.S. See American Revolution

War of the Three Henrys See War of the Three Henrys

War Powers Act (Nov. 7, 1973) Law passed by the U.S. Congress over the veto of Pres. Richard Nixon. The act restrained the president's ability to commit U.S. forces overseas by requiring the executive branch to consult with and report to Congress before involving U.S. forces in foreign hostilities. Widely considered a measure for preventing "future Vietnams," it was nonetheless resisted or ignored by subsequent presidents, most of whom regarded it as an unconstitutional usurpation of their executive authority.

Warbeck, Perkin (b. 1474?, Tournai, Flanders—d. Nov. 23, 1499, London, Eng.) Flemish impostor, pretender to the throne of Henry VII. The son of a local official in Flanders, while working as a servant in Ireland in 1491, he was misidentified as royalty while dressed in his master's rich silks and was soon persuaded to impersonate Richard, duke of York, who was presumed to have been murdered with his brother in the Tower of London in 1483. Encouraged by several monarchs and other Yorkist enemies in both England and Europe, he gathered forces and supporters on the continent for an invasion. After abortive attempts in 1495 and 1496, he landed in Cornwall in 1497 but was captured and hanged when he tried to escape.

warble fly Any of several dipteran species (botfly family Oestridae or the family Hypodermatidae), widespread in Europe and North America. The warble flies *Hypoderma lineatum* and *H. bovis*, also called cattle grubs or heel flies, are large, heavy, and beelike. They deposit their eggs on the legs of cattle. The larvae penetrate the skin, migrate through the body, and produce a lump, or warble, on the animal's back. Mature grubs emerge and drop to the ground to pupate. Warbles contain breathing holes, which reduce the hide's commercial value. One species (*Oedemagena tarandi*) is a reindeer pest that also causes economic losses.

warbler Any songbird of almost 350 Old World species (family Sylviidae) or about 120 New World species (family Parulidae, see wood warbler). Old World warblers, found in gardens, woodlands, and marshes, have a slender bill adapted for gleaning insects from foliage. They occur mainly from Europe and Asia to Africa and Australia, but a few (e.g., the gnatcatcher) live in the Americas. They are drab greenish, brownish, or black and 3.5–10 in. (9–26 cm) long. See also blackcap, blackpoll warbler, gnatcatcher, wood warbler.

Warburg \ˈvär-ˌbůrk,\ *English* \ˈwôr-ˌbərg**, Otto (Heinrich)** (b. Oct. 8, 1883, Freiburg im Breisgau, Ger.—d. Aug. 1, 1970, West Berlin, W.Ger.) German biochemist. In the 1920s, after earning doctorates in chemistry and medicine, he investigated the process by which oxygen is consumed in the cells of living organisms, introducing the technique of measuring changes in gas pressure for studying the rates at which slices of living tissue take up oxygen. His search for the cell components involved in oxygen consumption led to identification of the role of the cytochromes. He was awarded a 1931 Nobel Prize for his research. He was the first to observe that the growth of cancer cells requires much less oxygen than that of normal cells.

Warburg family *orig.* **Del Banco family** Family of eminent bankers, philanthropists, and scholars. A Jewish family apparently of Italian origin, they settled in the German town of Warburgum in 1559, and branches subsequently settled in Scandinavia, the U.S., and Britain.

© 2006 Encyclopædia Britannica, Inc.

Simon Elias Warburg (1760–1828) founded the first Jewish community in Sweden. Among the family's bankers were Moses Marcus Warburg (d. 1830) and his brother Gerson (d. 1825), who founded the Hamburg bank of M.M. Warburg & Co. (1798), and James Paul Warburg (1896–1969), a member of Pres. Franklin D. Roosevelt's Brain Trust. The family's scholars included Nobel Prize-winning biochemist Otto Warburg. Among the U.S. philanthropists were Frieda Schiff Warburg (1876–1958) and her sons, patrons of art and music.

Ward, Barbara (Mary), Baroness Jackson (of Lodsworth) (b. May 23, 1914, York, Eng.—d. May 31, 1981, Lodsworth) British economist and writer. After studying economics at the University of Oxford, she became a writer and editor at *The Economist* (from 1939). She married Robert Jackson in 1950. She was an influential adviser to the Vatican, the UN, and the World Bank, and she wrote numerous articles and books on the worldwide threat from poverty among less-developed countries (she advocated the transfer of wealth from rich to poor countries) and the importance of conservation; her books, which reached a wide audience, included *The Rich Nations and the Poor Nations* (1962), *Spaceship Earth* (1966), *Only One Earth* (with René Dubos, 1972), and *Progress for a Small Planet* (1980).

warfarin \'wȯr-fə-rən\ Anticoagulant drug, marketed as Coumadin. Originally developed to treat thromboembolism (see thrombosis), it interferes with the liver's metabolism of vitamin K, leading to production of defective coagulation factors. Warfarin therapy risks uncontrollable hemorrhage, either spontaneously or from any cut or bruise; it requires frequent checks to maintain the proper level in the blood. In high concentrations, warfarin is used as a rodent poison, causing death by internal bleeding.

Warfield, Paul (b. Nov. 28, 1942, Warren, Ohio, U.S.) U.S. football player. He compiled an outstanding record at Ohio State University. As a wide receiver for the Cleveland Browns (1964–69, 1976–77), he helped lead them to four league championship games. With the Miami Dolphins (1970–74) he played in three Super Bowl games (1972–74). In his 13-year career he caught 427 passes for 8,565 yd, averaging a near-record 20.1 yd per catch.

Warhol, Andy *orig.* **Andrew Warhola** (b. Aug. 6, 1928?, Pittsburgh?, Pa., U.S.—d. Feb. 22, 1987, New York, N.Y.) U.S. artist and filmmaker. The son of Czech immigrants, Warhol graduated from the Carnegie Institute of Technology, Pittsburgh, in 1949. He then went to New York City, where he worked as a commercial illustrator. Warhol began painting in the late 1950s and received sudden notoriety in 1962, when he exhibited paintings of Campbell's soup cans, Coca-Cola bottles, and wooden replicas of Brillo soap-pad boxes. By 1963 he was mass-producing these purposely banal images of consumer goods by means of photographic silk screen prints; he then began printing endless variations of portraits of celebrities in garish colours. The silk screen technique was ideally suited to Warhol, for the repeated image was reduced to a dehumanized cultural icon that reflected both the supposed emptiness of American material culture and the artist's emotional distance from the practice of his art. Warhol's work placed him in the forefront of the emerging Pop art movement in the United States. As the 1960s progressed, Warhol devoted more of his energy to filmmaking. His "underground" films are known for their inventive eroticism, plotless boredom, and inordinate length (up to 25 hours). Throughout the 1970s and until his death he continued to produce prints depicting political and Hollywood celebrities, and he involved himself in a wide range of advertising illustrations and other commercial art projects. He was one of the most famous and important American cultural figures of the late 20th century, and the effects of his conceptions of art and celebrity continue to be felt.

warlord In China, an independent military commander in the early 20th century. Warlords, supported by provincial military interests or foreign powers, ruled various parts of China following the death of Yuan Shikai, first president of the Republic of China. In southeastern China Sun Yat-sen and the Nationalist Party gained the backing of a warlord based in Guangzhou (Canton). In northern China three leading warlords emerged: Zhang Zuolin, a Japanese-backed bandit in Manchuria; Wu Peifu, a traditionally educated officer in central China; and Feng Yuxiang, who seized Beijing in 1924. The Nationalist Party consolidated its control in the south and, under Chiang Kai-shek, swept northward, reuniting the country in 1928. Numerous local warlords continued to exert de facto power over their own domains until the Japanese invasion during what became World War II. See also Northern Expedition.

Warner, Pop *orig.* **Glenn Scobey Warner** (b. April 5, 1871, Springfield, N.Y., U.S.—d. Sept. 7, 1954, Palo Alto, Calif.) U.S. college football coach. At the Carlisle (Pa.) Indian School (1898–1904, 1906–15), he coached Jim Thorpe, one of football's greatest players. He also coached at the University of Pittsburgh (1915–23) and Stanford University (1924–32). Warner perfected the single- and double-wing formations (now rarely used); these and other innovations helped refine the modern game. In 46 seasons (1895–1940) his teams won 312 games, lost 104, and tied 32.

Warner, W(illiam) Lloyd (b. Oct. 26, 1898, Redlands, Calif., U.S.—d. May 23, 1970, Chicago, Ill.) U.S. sociologist and anthropologist. He studied with Alfred L. Kroeber and A.R. Radcliffe-Brown and later taught at the universities of Chicago and Michigan. His studies of the American class system have been widely influential. In the late 1930s he produced a five-volume study of Newburyport, Mass.; his other books include *A Black Civilization* (1937), *The Social Life of a Modern Community* (1941), and *The Living and the Dead* (1959).

Warner Bros. Inc. U.S. film studio. Beginning in Pennsylvania as movie distributors and theatre owners in 1903, the four Warner brothers started producing their own films in 1913 and moved to Hollywood in 1917. They founded Warner Brothers Pictures Inc. in 1923, with Harry Warner (b. 1881—d. 1958) as president in New York, Albert Warner (b. 1884—d. 1967) as treasurer, and Sam Warner (b. 1888—d. 1927) and Jack Warner (b. 1892—d. 1978) as studio managers in Hollywood. In the mid 1920s they helped develop the important Vitaphone sound process. With the release of *The Jazz Singer* (1927), the first feature film with synchronized music and dialogue, the studio's success was assured. Warner Brothers went on to produce gangster films starring James Cagney and Edward G. Robinson, adventure movies with Errol Flynn, and mystery dramas with Humphrey Bogart. After his brothers retired, Jack became president (1956–72). See also AOL Time Warner Inc.

warrant In law, authorization in writing empowering a person to perform an act or execute an office. Arrest warrants are necessary (except in certain circumstances) for an arrest to be considered legal. Search warrants entitle the holder to enter and search a property. Both are classes of judicial warrants. To obtain them, a complainant must provide an affidavit setting forth facts sufficient to satisfy the belief that a crime has been committed and that the accused is the guilty party (or, in the case of the search warrant, that the place to be searched will yield the expected evidence). Nonjudicial warrants include tax warrants (which provide the authority to collect taxes) and land warrants (which entitle the holder to a specific tract of public land).

Warrau \wə-'raù\ *or* **Guarauno** Group of nomadic South American Indians who in modern times inhabit the swampy Orinoco River delta in Venezuela and areas eastward into Guyana. Some live in Suriname. They subsist mainly by fishing, hunting, and gathering, though they practice some agriculture in the drier regions. The Mauritia palm is a staple: they make a fermented drink from its sap and bread from its pith, eat its fruit, and fashion its fibre into clothing and hammocks. Their priestly ceremonies and complex social classes are unusual among hunters and gatherers.

Warren Town (pop., 2000: 11,360), eastern Rhode Island, U.S. Located near Providence, it was settled in 1632 and was originally part of Massachusetts. In 1747 Rhode Island annexed it. It was pillaged and burned by the British during the American Revolution. It is now a summer resort.

Warren, Earl (b. March 19, 1891, Los Angeles, Calif., U.S.—d. July 9, 1974, Washington, D.C.) U.S. jurist and politician. He graduated from law school at the University of California, then served as a county district attorney (1925–39), state

attorney general (1939–43), and governor of the state for three terms (1943–53). He was criticized for interning Japanese citizens in camps during World War II. His only electoral defeat came in 1948, when he ran for vice president on the Republican ticket with Thomas Dewey. In 1953 Pres. Dwight D. Eisenhower appointed Warren chief justice of the Supreme Court of the United States, a post he held until 1969. This was a period of sweeping changes in U.S. constitutional law. Under his leadership the court proved to be strongly liberal. Among Warren's notable opinions are those in *Brown v. Board of Education* (1954), which held that segration in public education was unconstitutional; *Reynolds* v. *Sims* (1964), which declared the "one man, one vote" principle requiring state legislative reapportionment (1964); and *Miranda v. Arizona* (1966), which held that police must inform an arrestee of his right to remain silent and to have counsel present (appointed for him if he is indigent) and that a confession obtained in defiance of these requirements is inadmissible in court. After the assassination of Pres. John F. Kennedy, he chaired the Warren Commission.

Warren, Harry *orig.* **Salvatore Guaragna** (b. Dec. 24, 1893, Brooklyn, N.Y., U.S.—d. Sept. 22, 1981, Los Angeles, Calif.) U.S. songwriter. The youngest of 12 children, Warren was self-taught musically. He toured with brass bands and carnivals from age 15. After a few years as a song plugger in Tin Pan Alley, he began contributing tunes to Broadway musicals, including "You're My Everything" and "I Found a Million Dollar Baby in a Five-and-Ten-Cent Store." In 1932 he moved to Hollywood, where he collaborated on films such as *Gold Diggers of 1933* (1933), *42nd Street* (1933), *Down Argentine Way* (1940), and *Sun Valley Serenade* (1941; with "Chattanooga Choo-Choo"), and he received Academy Awards for the songs "Lullaby of Broadway," "You'll Never Know," and "On the Atchison, Topeka and the Santa Fe." Between 1935 and 1950 he wrote more top-10 hit songs than any other songwriter.

Warren, Joseph (b. June 11, 1741, Roxbury, Mass.—d. June 17, 1775, Bunker Hill, Mass.) American Revolutionary leader. He was a physician in Boston. He was active in patriot causes after passage of the Stamp Act (1765) and helped draft the Massachusetts colonial grievances called the Suffolk Resolves (1774). As a member of the Massachusetts Committee of Public Safety, he sent Paul Revere on his ride to Lexington. He was made a major general in the Revolutionary army and died in the Battle of Bunker Hill.

Warren, Mercy Otis *orig.* **Mercy Otis** (b. Sept. 25, 1728, Barnstable, Mass.—d. Oct. 19, 1814, Plymouth, Mass., U.S.) U.S. poet, dramatist, and historian. The sister of James Otis, she received no formal education but nevertheless became a woman of letters and a friend and correspondent of leading political figures. She commented on the issues of the day in political satires, plays, and pamphlets. Though a defender of the American Revolution, she opposed the Constitution, arguing that power should rest with the states. Her most significant work, *History of the Rise, Progress, and Termination of the American Revolution* (3 vol., 1805), covered the period from 1765 to 1800.

Warren, Robert Penn (b. April 24, 1905, Guthrie, Ky., U.S.—d. Sept. 15, 1989, Stratton, Vt.) U.S. novelist, poet, and critic. Warren attended Vanderbilt University, where he joined the Fugitives, a group of poets who advocated the agrarian way of life in the South. Later he taught at several colleges and universities and helped found and edit *The Southern Review* (1935–42), possibly the most influential American literary magazine of the time. His writings often treat moral dilemmas in a South beset by the erosion of its traditional rural values. His best-known novel is *All the King's Men* (1946, Pulitzer Prize; film, 1949). The short-story volume *The Circus in the Attic* (1948) contains the notable "Blackberry Winter." He won Pulitzer prizes for poetry in 1958 and 1979 and became the first U.S. poet laureate in 1986.

Warren Commission *officially* **President's Commission on the Assassination of President John F. Kennedy** (1963–64) Group appointed by Pres. Lyndon B. Johnson to investigate the circumstances surrounding John F. Kennedy's slaying and the shooting of his assassin, Lee Harvey Oswald. It was chaired by Earl Warren and included two U.S. senators, two U.S. congressmen, and two former public officials. After months of investigation, it reported that Kennedy was killed by Oswald's rifle shots from the Texas School Book Depository and that Oswald's murder by Jack Ruby two days later was not part of a conspiracy to assassinate Kennedy. Its findings were later questioned in a number of books and articles and in a special congressional committee report in 1979, though no conclusive contradictory evidence was found.

Warring States period *Chinese* **Zhangou** (475–221 BC) In Chinese history, a period in which small feuding kingdoms or fiefdoms struggled for supremacy. The period was dominated by seven or more small feuding Chinese kingdoms. It was the age of Confucian thinkers Mencius and Xunzi, the time when many of the government institutions and cultural patterns that would characterize China for the next 2,000 years were established. The term Warring States (Sengoku) is also used in Japan for a period (1482–1558) during the Muromachi period that was marked by almost constant warfare among rival daimyo seeking to consolidate and increase their landholdings.

Wars of the Roses See Wars of the Roses

Warsaw City (pop., 2001 est.: 1,610,471), capital of Poland, on the Vistula River. Founded c. 1300, it flourished as a trade centre, came under Polish control in 1526, and became the capital in 1596. During the late 18th century it expanded rapidly, but it was destroyed in 1794 by the Russians. In 1807 it was made the capital of the Duchy of Warsaw by Napoleon. Taken by the Russians in 1813, it was the centre of Polish insurrections in 1830–31 and 1860. It was occupied by the Germans in World War I and again in World War II, when its large Jewish population revolted in the Warsaw Ghetto Uprising (1943). The Warsaw Uprising in 1944 was unsuccessful, and the Germans virtually destroyed the city. Modern Warsaw, rebuilt after the war, now houses government bodies, including the Sejm (parliament); it is also an industrial and educational centre. Among its historic buildings are a 14th-century Gothic cathedral and a medieval castle.

Warsaw, Duchy of *or* **Grand Duchy of Warsaw** Independent Polish state (1807–15), created by Napoleon. Established by the Treaties of Tilsit in 1807 after the Poles had helped Napoleon defeat Prussia, it consisted originally of the major portion of the central Polish provinces that Prussia had taken in the 1790s. For Napoleon's second war against Russia (1812), the Duchy of Warsaw supplied nearly 98,000 men, but Napoleon's defeat in Russia also sealed the fortunes of the duchy. In 1813 the Russians assumed control of it. Later the Congress of Vienna divided it into three parts: the Grand Duchy of Poznań; the free Republic of Kraków; and the Congress Kingdom of Poland, which was joined to Russia by making the Russian emperor its king.

Warsaw Ghetto Uprising (April 19–May 16, 1943) Revolt by Polish Jews under Nazi occupation against deportation to the Treblinka extermination camp. By July 1942 the Nazis had herded 500,000 Jews from surrounding areas into the ghetto in Warsaw. Though starvation killed thousands each month, the Nazis began transferring more than 5,000 Jews a day to rural "labour camps." When word reached the ghetto in early 1943 that the destination was actually the gas chambers at Treblinka, the newly formed Jewish Fighting Organization (ŻOB) attacked the Nazis, killing 50 in four days of street fighting and causing the deportations to halt. On April 19 Heinrich Himmler sent 2,000 SS men and army troops to clear the ghetto of its remaining Jews. For four weeks the ŻOB and guerrillas fought with pistols and homemade bombs, destroying tanks and killing several hundred Nazis, until their ammunition ran out. Not until May 8 did the Nazis manage to take the ŻOB headquarters bunker. Many of the surviving ŻOB fighters took their own lives to avoid being captured. The battle raged until May 16, when the SS chief declared "The Warsaw Ghetto is no more." During the 28 days of the uprising, more than 40,000 Jews were either killed or deported.

Warsaw Pact *or* **Warsaw Treaty Organization** Military alliance of the Soviet Union, Albania (until 1968), Bulgaria, Czechoslovakia, East Germany, Hungary, Poland, and Romania, formed in 1955 in response to West Germany's entry into NATO. Its terms included a unified military command and the stationing of Soviet troops in the other member states. Warsaw Pact troops were called into action to suppress uprisings in Poland (1956), Hungary (1956), and Czechoslovakia (1968). The alliance was dissolved in 1991 after the collapse of the Soviet bloc, and Soviet troops departed. Several Warsaw Pact members later joined NATO.

Warsaw Uprising (August–October 1944) Insurrection in Warsaw in World War II that failed to prevent the pro-Soviet Polish administration from gaining control of Poland. In July 1944, as Soviet troops approached Warsaw, the Polish underground was encouraged to stage an uprising against the Germans. Though wary of Soviet promises of self-government, the Polish home army of 50,000 troops attacked the weakened German force and gained control of most of Warsaw in four days.

© 2006 Encyclopædia Britannica, Inc.

German reinforcements then bombarded the city with air and artillery attacks for 63 days. The approaching Red Army halted, and the Soviets refused to allow aid from the Allies to the beleaguered Poles, who were forced to surrender when their supplies ran out in October; the Germans then deported the rest of the city's population and destroyed most of the city itself. During the fighting, some 300,000 Poles died. By allowing the Polish home army to be eliminated, the Soviets diminished potential resistance to their establishing political domination of Poland in 1945.

wart *or* **verruca** \və-'rü-kə\ Well-defined growth on the skin, usually caused by a PAPILLOMAVIRUS, which triggers overproduction of epidermal cells. This may lead to a single long-standing wart, profuse local spread (especially in moist areas), or warts in various parts of the body. The most common type is a round bump with a dry, rough surface. Warts are usually painless except in pressure areas, such as the sole of the foot (plantar wart). Genital warts are merely a nuisance unless they become large or numerous enough to interfere with urination, defecation, or childbirth, but some viral strains are associated with cervical cancer. Warts are considered contagious. They may be removed by applying acids, cryotherapy, electrocautery, or surgery; they sometimes disappear spontaneously.

Warta \'vär-tä\ **River** River, west-central Poland. It rises northwest of KRAKÓW and flows northwest 502 mi (808 km) before joining the ODER RIVER. The Warta is the second longest river lying entirely in Poland; about half of its length is navigable. Its lower course, formerly in Germany, is in a region assigned to Poland by the POTSDAM CONFERENCE in 1945.

Wartenburg, Johann Yorck von See Johan, Graf YORCK VON WARTENBURG

warthog Large-headed species (*Phacochoerus aethiopicus*) of PIG (UNGULATE family Suidae), inhabiting open and lightly forested areas of Africa. Warthogs, about 30 in. (76 cm) high, are blackish or brown, with a coarse mane from the neck to the midback. The male has two pairs of bumps (warts) on the face. Both sexes have tusks. The tusks on the lower jaw are weapons; those on the upper jaw curve upward and inward in a semicircle, growing to more than 24 in. (60 cm) in some males. The long tufted tail is held high when the animal runs. Warthogs live in groups, feeding on grass and other vegetation.

Warthog (*Phacochoerus aethiopicus*)
KARL H. MASLOWSKI

Warwick \'wär-ik\ Town and district (pop., 2001: 125,962), administrative and historic county of WARWICKSHIRE, central England. Known for its historic castle, it grew up at a crossing place on the River AVON and was fortified c. 915. By 1086 it was a royal borough, and WILLIAM I ordered the castle to be enlarged. The present-day castle dates mainly from the 14th and 15th centuries. With its virtually intact structure and its fine collections of paintings and armour, the castle has become a major tourist attraction. The town, which grew around the castle, is a market centre and has light industry.

Warwick \'wär-ik**, Earl of** *orig.* **Richard Neville** (b. Nov. 22, 1428—d. April 14, 1471, Barnet, Hertfordshire, Eng.) English nobleman influential in the Wars of the ROSES. Son of the earl of Salisbury, he became through marriage (1449) the earl of Warwick and acquired vast estates. With his father, he helped the Yorkists win the Battle of St. Albans (1455). Appointed captain of Calais, in 1460 he crossed to England to defeat and capture HENRY VI at Northampton. In 1461 he was routed by the Lancastrians, but he recovered to march on London with York's son Edward, soon crowned EDWARD IV. Warwick was the virtual ruler during Edward's early reign (1461–64), but tensions between the two mounted, and in 1469 Warwick engineered a revolt in northern England that forced Edward to flee to Flanders in 1470. Warwick joined the Lancastrians and restored Henry VI to the throne, earning his later nickname "the Kingmaker." He was killed by Edward's forces at the Battle of Barnet.

Warwickshire \'wär-ik-ˌshir\ Administrative (pop., 2001: 505,885) and historic county, central England. As an administrative and geographic unit, the county dates from the 10th century, with the historic county town of WARWICK lying roughly at its centre. In Saxon times Warwickshire formed a border zone between the kingdoms of WESSEX and MERCIA. During the Middle Ages two major centres grew up in the county, at Warwick and Kenilworth. Historical structures surviving in the area include Norman and early English churches, along with buildings at STRATFORD-UPON-AVON associated with WILLIAM SHAKESPEARE. The Battle of Edgehill (1642), the first serious clash of the ENGLISH CIVIL WARS, was fought in Warwickshire near the OXFORDSHIRE border. Farming, dairy farming, fruit growing, market gardening, and coal mining are important economic activities.

Wasatch \'wȯ-ˌsach\ **Mountains** Range of the south-central ROCKY MOUNTAINS. They extend about 250 mi (400 km) from southeastern Idaho to central Utah, U.S. The highest peak is Mount Timpanogos (12,008 ft [3,660 m]). The TIMPANOGOS CAVE NATIONAL MONUMENT is within the range.

Washington State (pop., 2000: 5,894,121), northwestern U.S. Washington is bounded by the Canadian province of British Columbia to the north, Idaho to the east, Oregon to the south, and the Pacific Ocean to the west. It covers an area of 68,139 sq mi (176,479 sq km); its capital is OLYMPIA. The state contains the CASCADE RANGE, which includes Mount RAINIER and Mount SAINT HELENS, and the OLYMPIC MOUNTAINS. The Strait of JUAN DE FUCA and PUGET SOUND extend inland into the state from the Pacific Ocean. Cape Alva, the most westerly point of the coterminous U.S., is in Washington, as is the COLUMBIA RIVER. The area was inhabited by Pacific Coast Indians, including the CHINOOK and NEZ PERCÉ, when the region was visited by Spanish, Russian, British, and French explorers (1543–1792). Claimed by the Spanish and British, it was crossed by the LEWIS AND CLARK EXPEDITION in 1805. Spain surrendered to the U.S. its territories north of California in 1819. Until the 1840s, international agreement permitted citizens of both the U.S. and Britain to settle in what was known as Oregon Country. An 1846 treaty with Great Britain set the present Washington-Canada boundary; the Oregon Country was added to the U.S. and renamed the Territory of Oregon in 1848. Washington received territorial status in 1853 and was reduced to its present size in 1863. It was admitted to the Union as the 42nd state in 1889. In the late 1890s it was the main staging point for gold miners going to the Alaskan and Yukon strikes. The greatest stimulus to its 20th-century progress came with the development of hydroelectric power and the work on the Bonneville and Grand Coulee dams. Its important manufactures include aircraft building and shipbuilding. Expanding trade with Pacific Rim countries, high technology, and tourism add to the economy.

Washington, Booker T(aliaferro) (b. April 5, 1856, Franklin county, Va., U.S.—d. Nov. 14, 1915, Tuskegee, Ala.) U.S. educator and reformer. Born into slavery, he moved with his family to West Virginia after emancipation. He worked from age nine, then attended (1872–75) and joined the staff of the Hampton (Va.) Normal and Agricultural Institute. In 1881 he was selected to head the Tuskegee Normal and Industrial Institute, a new teacher-training school for African Americans, and he successfully transformed it into a thriving institution (later TUSKEGEE UNIVERSITY). He became perhaps the most prominent African American leader of his time. His controversial conviction that African Americans could best gain equality in the U.S. by improving their economic situation through education rather than by demanding equal rights was termed the ATLANTA COMPROMISE. His books include *Up from Slavery* (1901).

Washington, D.C. City (pop., 2000: 572,059), capital of the U.S. It is coextensive with the DISTRICT OF COLUMBIA. Situated at the navigational head of the POTOMAC RIVER, between Maryland and Virginia, it has an area of 69 sq mi (179 sq km). The site was chosen by GEORGE WASHINGTON in 1790 as a political compromise that satisfied both Northern and Southern states. Designed by Pierre-Charles L'ENFANT, it is one of the few cities in the world planned expressly as a national capital. The federal government occupied it in 1800. British troops burned the city (1814) during the WAR OF 1812. With the annexation of Georgetown in 1878, the city became coterminous with the District of Columbia. Significant buildings include the Capitol, WHITE HOUSE, and LIBRARY OF CONGRESS. The WASHINGTON MONUMENT, Lincoln Memorial, Jefferson Memorial, and VIETNAM VETERANS MEMORIAL are among the most famous of the city's more than 300 memorials and statues. The SMITHSONIAN INSTITUTION is in Washington, as are numerous other cultural and educational institutions and foreign embassies. The economy is based on national and international political activities, scientific research, and tourism.

Washington, Denzel (b. Dec. 28, 1954, Mount Vernon, N.Y., U.S.) U.S. film actor. A graduate of Fordham University, he began his career as a stage actor. Featured in the television series *St. Elsewhere* (1982–88),

© 2006 Encyclopædia Britannica, Inc.

he also appeared in movies from 1981 and won acclaim for his roles in *Cry Freedom* (1987), *Glory* (1989, Academy Award), and *Mississippi Masala* (1991). Praised for his portrayal of the title character in Spike Lee's *Malcolm X* (1992), he became one of the most popular leading men of the 1990s in films such as *Philadelphia* (1993), *Devil in a Blue Dress* (1995), and *He Got Game* (1998). For his performance in *Training Day* (2001), Washington became only the second African American to win an Oscar for best actor. In 2002 he made his directorial debut with *Antwone Fisher*.

Washington, Dinah *orig.* **Ruth Lee Jones** (b. Aug. 29, 1924, Tuscaloosa, Ala., U.S.—d. Dec. 14, 1963, Detroit, Mich.) U.S. singer. Washington sang in church choirs as a child. She joined Lionel Hampton's band in 1943, embarking on a solo career in 1946. Her recordings encompassed a wide variety of idioms including rhythm and blues, jazz, and country music; her "What a Difference a Day Makes" (1959) was a pop hit. Known as "Queen of the Blues," she combined precise diction and intonation with an alternately gentle and brassy vocal timbre, and her voice was remarkable for its clarity and projection. She had remarkable vocal control. Even after she crossed over to the popular (pop) music market, in which she had her greatest commercial success, Washington retained many of her earlier fans because of her passionate, supple style.

Washington, George (b. Feb. 22, 1732, Westmoreland county, Va.—d. Dec. 14, 1799, Mount Vernon, Va., U.S.) American Revolutionary commander-in-chief (1775–83) and first president of the U.S. (1789–97). Born into a wealthy family, he was educated privately. In 1752 he inherited his brother's estate at Mount Vernon, including 18 slaves; their ranks grew to 49 by 1760, though he disapproved of slavery. In the French and Indian War he was commissioned a colonel and sent to the Ohio Territory. After Edward Braddock was killed, Washington became commander of all Virginia forces, entrusted with defending the western frontier (1755–58). He resigned to manage his estate and in 1759 married Martha Dandridge Custis (1731–1802), a widow. He served in the House of Burgesses (1759–74), where he supported the colonists' cause, and later in the Continental Congress (1774–75). In 1775 he was elected to command the Continental Army. In the ensuing American Revolution, he proved a brilliant commander and a stalwart leader, despite several defeats. With the war effectively ended by the capture of Yorktown (1781), he resigned his commission and returned to Mount Vernon (1783). He was a delegate to and presiding officer of the Constitutional Convention (1787) and helped secure ratification of the Constitution in Virginia. When the state electors met to select the first president (1789), Washington was the unanimous choice. He formed a cabinet to balance sectional and political differences but was committed to a strong central government. Elected to a second term, he followed a middle course between the political factions that later became the Federalist Party and the Democratic Party. He proclaimed a policy of neutrality in the war between Britain and France (1793) and sent troops to suppress the Whiskey Rebellion (1794). He declined to serve a third term (thereby setting a 144-year precedent) and retired in 1797 after delivering his "Farewell Address." Known as the "father of his country," he is universally regarded as one of the greatest figures in U.S. history.

Washington, Harold (b. April 15, 1922, Chicago, Ill., U.S.—d. Nov. 25, 1987, Chicago) U.S. politician and mayor of Chicago (1983–87). He practiced law and served as a city attorney (1954–58). He was elected successively to the Illinois legislature (1965–76), the state senate (1976–80), and the U.S. House of Representatives (1980–83). In 1983 he campaigned for mayor of Chicago on a platform of reform and an end to city patronage; with his election, he become the first African American to hold that post. He was reelected to a second term in 1987 but died soon after.

Washington, Mount Peak in the Presidential Range of the White Mountains, northern New Hampshire. Reaching an elevation of 6,288 ft (1,917 m), it is the highest point in the northeastern U.S. and is noted for its extreme weather conditions; the world's highest wind velocity (231 mph [372 kph]) was recorded there in 1934. It is the site of Mount Washington Observatory. The area is included in the White Mountain National Forest.

Washington and Lee University Private university in Lexington, Virginia, U.S. Founded as an academy in 1749, it is one of the oldest institutions of higher learning in the U.S. It is named for George Washington, who presented the academy with a gift of $50,000 in 1796, and Robert E. Lee, who served as its president from 1865 to 1870. It became coeducational in 1984. It has an undergraduate college, a law school, and a school of commerce, economics, and politics. Among its offerings are programs in engineering, environmental studies, and journalism.

Washington Birthplace National Monument, George See George Washington Birthplace National Monument

Washington Conference *officially* **International Conference on Naval Limitation** Conference held in Washington, D.C. (1921–22), to limit the naval arms race and negotiate Pacific security agreements. Several major and minor treaty agreements were drafted and signed: the Four-Power Pact (signed by Britain, Japan, France, and the U.S.) stipulated mutual consultation regarding any issue in the Pacific and affirmed respect for the Pacific territories of signatory nations. The Five-Power Naval Limitation Treaty (which Italy also signed) imposed proportional limits on the number of warships each signatory nation could maintain and mandated some actual disarmament; it lapsed in 1936 when Japan was refused equality with the U.S. and Britain. Another agreement regulated the use of submarines and outlawed poison gas in warfare. A Nine-Power Pact (with The Netherlands, Portugal, Belgium, and China) affirmed China's sovereignty.

Washington Monument Obelisk in Washington, D.C., U.S., honouring George Washington, the first president of the United States. Based on a design by Robert Mills (b. 1781—d. 1855), it was built between 1848 and 1884. It is constructed of granite faced with Maryland marble and is some 555.5 ft (169.3 m) high, the world's tallest masonry structure. Inserted in the interior walls are more than 190 carved stones presented by various individuals, cities, states, and foreign countries. It is located on grounds that are a westward extension of the Mall. The top can be reached by elevator or by an interior iron stairway. It underwent a major restoration in the 1990s and reopened in 2001.

Washington Post, The Morning daily newspaper published in Washington, D.C., the dominant paper in the U.S. capital and one of the nation's leading newspapers. Established in 1877 as a Democratic Party organ, it changed orientation and ownership several times and faced constant economic problems until financier Eugene Meyer (1875–1959) purchased it in 1933. Under the leadership of Meyer, his son-in-law Philip L. Graham (publisher from 1946 until his death in 1963), and his daughter, Katharine Graham (publisher from 1969–79), it acquired domestic and international prestige, especially in its coverage of the Watergate scandal. Donald E. Graham was named publisher in 1979. The newspaper is known for its sound and independent editorial stance and thorough, accurate reporting.

Washington University Private university in St. Louis, Mo. It was founded as a seminary in 1853 and became a university in 1857. It is a comprehensive research and teaching institution, with one of the leading medical schools in the U.S. It has a college of arts and sciences, a graduate school, and schools of architecture, business (the Olin School), engineering and applied science, fine arts, law, and social work. Research facilities include a space science centre, a centre for the study of Islamic culture and society, and an institute for the deaf.

Washita \'wä-shi-ˌtȯ\ **River** River, west- and south-central Oklahoma, U.S. It rises in northwestern Texas and flows east across the Oklahoma boundary, then southeast to south-central Oklahoma, and south into the Red River. It is 626 mi (1,007 km) long. The Battle of the Washita (November 1868), in which Gen. George Custer attacked a Cheyenne Indian encampment, took place near Cheyenne.

Washita River See Ouachita River

wasp Any of more than 20,000, usually winged, insect species in the order Hymenoptera. The abdomen is attached to the thorax by a slender petiole, or "waist," and the female's abdomen has a formidable stinger. Most species are solitary; about 1,000 species are highly social; and some may be either social or solitary. Adults feed primarily on nectar. Most solitary wasps nest in tunnels in the ground and feed larvae with paralyzed insects or spiders. The paperlike nest of social wasps (family Vespidae) consists of chewed plant material mixed with saliva and arranged in adjacent hexagonal cells. The female lays one egg in each cell and provisions it with a macerated caterpillar. Successive generations may enlarge the nest and care for the young.

Wassermann \'vä-sər-ˌmän,\ *English* \'wä-sər-mən**, August von** (b. Feb. 21, 1866, Bamberg, Bavaria—d. March 16, 1925, Berlin, Ger.) German bacteriologist. With Albert Neisser (1855–1916) he developed a

© 2006 Encyclopædia Britannica, Inc.

test for the antibody to the spirochete that causes syphilis in 1906. That test, along with other procedures, is still used to diagnose syphilis. He is also noted for developing tests for tuberculosis. With Wilhelm Kolle he wrote *Handbook of Pathogenic Microorganisms* (6 vol., 1903–09).

Wassermann \'vä-sər-ˌmän,\ *English* \'wä-sər-mən**, Jakob** (b. March 10, 1873, Fürth, Bavaria—d. Jan. 1, 1934, Altaussee, Austria) German novelist. After an unsettled youth he achieved success with such works as *Die Juden von Zirndorf* (1897), *Caspar Hauser* (1908), and *Christian Wahnschaffe* (1919). His popularity was greatest in the 1920s and '30s, when he wrote *The Maurizius Case* (1928), treating the theme of justice with the carefully plotted suspense of a detective story, and extended the tale of a post-World War I youth into a trilogy with *Etzel Andergast* (1931) and *Kerkhoven's Third Existence* (1934). He is frequently compared to FYODOR DOSTOYEVSKY in both his moral fervour and his sensationalizing tendency.

Wasserstein \'wä-sər-ˌstīn**, Wendy** (b. Oct. 18, 1950, Brooklyn, N.Y., U.S.—d. Jan. 30, 2006, New York, N.Y.) U.S. playwright. Wasserstein earned a graduate degree at the Yale School of Drama. She won favourable notice for *Uncommon Women and Others* (1977), which was followed by *Isn't It Romantic* (1981) and *The Heidi Chronicles* (1988, Tony Award, Pulitzer Prize). She became noted for her comic gift and her portrayals of single women. Her later plays include *The Sisters Rosensweig* (1992), *An American Daughter* (1997), and *Third* (2005).

Wat Tyler's Rebellion See PEASANTS' REVOLT

watch Portable timepiece designed to be worn on the wrist or carried in the pocket. The first watches appeared shortly after 1500, when the mainspring (see SPRING) was invented as a replacement for weights in driving CLOCKS. The progressive miniaturization of electronic components in recent decades has made possible the development of all-electronic watches, in which the necessary transistors, resistors, capacitors, and other elements are all on one or several miniature INTEGRATED CIRCUITS, or chips. Such circuitry enables them to perform several timekeeping functions and also makes possible digital readouts of the time.

water Inorganic compound composed of HYDROGEN and OXYGEN (H_2O), existing in LIQUID, GAS (STEAM, water vapour), and SOLID (ICE) states. At room temperature, water is a colourless, odourless, tasteless liquid. One of the most abundant compounds, water covers about 75% of Earth's surface. Life depends on water for virtually every process, its ability to dissolve many other substances being perhaps its most essential quality. Life is believed to have originated in water (the world's oceans or smaller bodies), and living organisms use aqueous solutions (including blood and digestive juices) as mediums for carrying out biological processes. Because water molecules are asymmetric and therefore ELECTRIC DIPOLES, HYDROGEN BONDING between molecules in liquid water and in ice is important in holding them together. Many of water's complex and anomalous physical and chemical properties (high melting and boiling points, VISCOSITY, SURFACE TENSION, greater density in liquid than in solid form) arise from this extensive hydrogen bonding. Water undergoes DISSOCIATION to the IONS H^+ (or H_3O^+) and OH^-, particularly in the presence of SALTS and other solutes; it may act as an ACID or as a BASE. Water occurs bound (as water of hydration) in many salts and MINERALS. It has myriad industrial uses, including as a suspending agent (papermaking, coal slurrying), SOLVENT, diluting agent, coolant, and source of hydrogen; it is used in filtration, washing, steam generation, hydration of lime and cement, textile processing, sulfur mining, HYDROLYSIS, and HYDRAULICS, as well as in beverages and foods. See also HARD WATER; HEAVY WATER.

water bloom Dense aquatic accumulation of microscopic organisms produced by an abundance of nutrients in surface water coupled with adequate sunlight for PHOTOSYNTHESIS. The microorganisms or the toxic substances they release may discolour the water, exhaust its oxygen content, poison aquatic animals and waterfowl, and irritate the skin and respiratory tract of humans. Single species of ALGAE, DIATOMS, or DINOFLAGELLATES, reproducing every few hours, may dominate a bloom's population; the number of individuals per quart (litre) of water, normally about 1,000, can increase to 60 million. Blooms of the dinoflagellate genus *Gymnodinium* cause RED TIDES. The Red Sea is named for the occasional blooms of the alga *Trichodesmium erythraeum*. See also WATER POLLUTION.

water buffalo *or* **Indian buffalo** Any of three subspecies of oxlike BOVID (species *Bubalus bubalis*). Two have been domesticated in Asia since the earliest recorded history. The animal is named for its ability to work on waterlogged land and in humid climates. The largest breeds stand 5–6 ft (1.5–1.8 m), is up to 9 ft (2.8 m) long, and may weigh over 2,000 lb (900 kg). The dull black or dark gray body has little hair. The horns spread outward and upward, measuring up to 7 ft (2 m) across. One subspecies, the swamp buffalo, is the principal draft animal of southern China and South and Southeast Asia. Another, the river buffalo, is used for dairy and meat production and draft work in southern and South Asia and Egypt. The third subspecies is the wild water buffalo, of which only a few dozen herds remain. It is larger than domestic buffaloes and is sometimes referred to as a separate species (*B. arnee*).

water chestnut Any of several perennial water plants of the genus *Trapa* (family Trapaceae), native to Europe, Asia, and Africa, or their edible, nutlike fruit. The water caltrop (*T. natans*) has two sets of leaves—long, feathery, rootlike, submerged leaves and a loose rosette of floating leaves attached to leafstalks 2–4 in (5–10 cm) long. The small fruit usually has four spiny angles. The Chinese water chestnut (*Eleocharis tuberosus* or *E. dulcis*) is a member of the SEDGE FAMILY.

water clock *or* **clepsydra** \'klep-sə-drə\ Ancient device for measuring time by the gradual flow of water. One form, used by North American Indians and some African peoples, consisted of a small boat or floating vessel that shipped water through a hole until it sank. In another form, water escaped through a hole in a vessel marked with graduated lines; specimens from Egypt date from the 14th century BC. The Romans invented a clepsydra consisting of a cylinder into which water dripped from a reservoir; a float provided readings against a scale on the cylinder wall. GALILEO used a mercury clepsydra to time his experimental falling bodies. See also CLOCK.

water flea Any of about 450 species (order Anomopoda) of microscopic, mostly freshwater CRUSTACEANS distributed worldwide. Species in the genus *Daphnia* are ubiquitous in Europe and North America. Water fleas have a discrete head that bears antennae. The carapace (shell) encloses all or most of the body, except on the predatory giant *Leptodora* (up to 0.7 in. [18 mm] long), whose carapace is just a small brood sac. Most species swim by powerful strokes of the antennae, sometimes producing a hopping-and-sinking motion. All but a few predatory species use specialized thoracic limbs to filter organic matter from the water. See also COPEPOD.

Water flea of the genus *Daphnia* (magnified about 30×)
ERIC V. GRAVE—PHOTO RESEARCHERS

water frame In textile manufacture, a spinning machine powered by water that produced a cotton YARN suitable for warp (lengthwise threads). Patented in 1769 by R. ARKWRIGHT, it represented an improvement on JAMES HARGREAVES'S SPINNING JENNY, which produced weaker thread suitable only for weft (filling yarn).

water hyacinth Any of about five species of aquatic plants that make up the genus *Eichhornia* of the pickerelweed family (Pontederiaceae). They are native mainly to the New World tropics. Some species float in shallow water; others are rooted in muddy streambanks and lakeshores. All have slender rootstocks, feathery roots, rosettes of stalked leaves, and flowers arranged in spikes or clusters. The common water hyacinth (*E. crassipes*) is the most widespread. The leafstalk is spongy and inflated, and the upper lobes of its purple flowers have blue and yellow markings. It reproduces quickly, often clogging slow-flowing streams. It is used as an ornamental in outdoor pools and aquariums.

Common water hyacinth (*Eichhornia crassipes*)
W.H. HODGE

water lily Any of the freshwater plants in eight genera that make up the family Nymphaeaceae, native to temperate and tropical regions. All are perennial except those in the genus *Euryale*. Most have rounded, floating, waxy-coated leaves growing atop long stalks that contain many

© 2006 Encyclopædia Britannica, Inc.

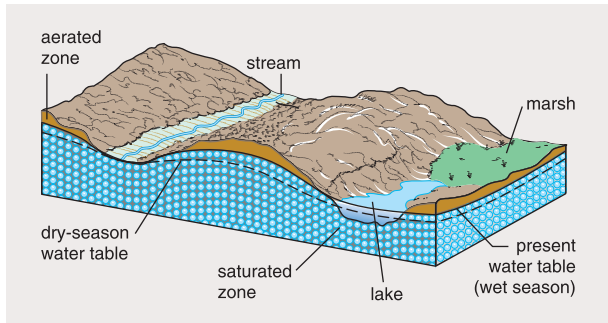
air spaces. Thick, fleshy, creeping underwater stems are buried in the mud. In some species the leaves are also submerged. Showy, solitary, cuplike flowers with numerous spirally arranged petals are borne at or above the water surface on the long stalks. The genus *Nymphaea* includes the water lilies proper (or water nymphs). The common North American white water lily, pond lily, or toad lily is *N. odorata*. The LOTUS of ancient Egyptian art was usually the blue lotus (*N. caerulea*). The largest water lilies are two species that make up the tropical South American genus *Victoria*; the Santa Cruz water lily (*V. cruziana*) has leaves 2–6 ft (60–180 cm) in diameter. Water lilies provide food for fish and wildlife but sometimes cause drainage problems because of their rapid growth. Many varieties have been developed for ornamental use in garden pools and conservatories.

Santa Cruz water lily (*Victoria cruziana*).
GOTTLIEB HAMPFLER

water moccasin *or* **cottonmouth** Either of two species of PIT VIPER that inhabits marshy lowlands of the southeastern U.S. and Mexico. The U.S. species (*Agkistrodon piscivorus*) is called a cottonmouth because it threatens with the mouth open, showing the white interior. It is up to 5 ft (1.5 m) long and is completely black or brown with darker crossbands. A dangerous snake with a potentially lethal bite, it tends to stand its ground or move slowly away when alarmed. It will eat almost any small animal, including turtles, fishes, and birds. See also COPPERHEAD.

water ouzel See DIPPER

water pollution State resulting when substances are released into a body of water, where they become dissolved or suspended in the water or deposited on the bottom, accumulating to the extent that they overwhelm its capacity to absorb, break down, or recycle them, and thus interfering with the functioning of aquatic ecosystems. Contributions to water pollution include substances drawn from the air (see ACID RAIN), silt from soil erosion, chemical FERTILIZERS and PESTICIDES, runoff from septic tanks, outflow from livestock feedlots, chemical wastes (some toxic) from industries, and sewage and other urban wastes from cities and towns. A community far upstream in a watershed may thus receive relatively clean water, whereas one farther downstream receives a partly diluted mixture of urban, industrial, and rural wastes. When organic matter exceeds the capacity of microorganisms in the water to break it down and recycle it, the excess of nutrients in such matter encourages algal WATER BLOOMS. When these algae die, their remains add further to the organic wastes already in the water, and eventually the water becomes deficient in oxygen. Organisms that do not require oxygen then attack the organic wastes, releasing gases such as methane and hydrogen sulfide, which are harmful to the oxygen-requiring forms of life. The result is a foul-smelling, waste-filled body of water. See also EUTROPHICATION.



water polo Sport played in a swimming pool by teams of seven with a buoyant ball resembling a football (soccer ball). The ball may be carried or thrown, and a point is scored when the ball is placed in the opposing team's goal. The name derives from a mid-19th-century version of the sport in which players rode barrels and struck the ball with sticks. A rough and demanding game, it is played by both men and women. Modern water polo was introduced as an Olympic sport in 1900.

water resource Any of the entire range of natural waters (vapour, liquid, or solid) that occur on the Earth and that are of potential use to humans. These resources include the waters of the oceans, rivers, and lakes; groundwater and deep subsurface waters; and glaciers and permanent snowfields. Continuing increase in water use has led to growing concern over the availability and quality of water supplies.

water snake Any of 65–80 SNAKE species of the genera *Natrix* and *Nerodia*, as well as similar snakes of the family Colubridae, found worldwide except in South America. Most species have a stout body with dark blotches or streaks and ridged scales. Some are simliar in appearance to venomous species. They kill fishes and amphibians with a nonvenomous bite. The New World species live in or near water and bear live young; European species are less water-dependent and lay eggs. In defense they inflate the head, strike, and release a foul secretion. Average length is about 3 ft (1 m); some Old World species reach 6 ft (1.8 m).

water-supply system Facilities for the collection, treatment, storage, and distribution of water. Ancient systems included wells, storage reservoirs, CANALS and AQUEDUCTS, and water-distribution systems. Highly advanced systems appeared c. 2500 BC and reached their peak in the Roman aqueduct system. In the Middle Ages, water supplies were largely neglected and epidemics caused by waterborne organisms were common. In the 17th–18th century, distribution systems utilizing cast-iron pipes, aqueducts, and pumps began to be installed. The link between polluted water and disease came to be understood in the 19th century, and treatment methods such as slow sand filtration and disinfection with chlorine were introduced. Modern reservoirs are formed usually by constructing DAMS near the collection point of mountain-water runoff or across rivers. After the water reaches collection points, it is treated to improve its quality; it is then pumped either directly into a city or town's distribution system or to an elevated storage location, such as a water tank. See also PLUMBING.

water table *or* **groundwater table** Surface of a body of underground water below which the soil or rocks are permanently saturated with water. The water table separates the groundwater zone (zone of saturation) that lies below it from the zone of aeration that lies above it. The water table fluctuates both with the seasons and from year to year because it is affected by climatic variations and by the amount of precipitation used by vegetation. It also is affected by withdrawing excessive amounts of water from wells or by recharging them artificially. See also AQUIFER.

Seasonal variations in groundwater levels.
© MERRIAM-WEBSTER INC.

waterbuck Species of ANTELOPE (*Kobus ellipsiprymnus*) that lives in herds, usually near water, on plains and floodplains and in woodlands and swamps of sub-Saharan Africa. Waterbucks are almost 5 ft (1.5 m) high at the shoulder. Males have long, heavily ridged horns that curve backward and then upward. The coarse, shaggy coat is grayish, and the rump has a white ring.

Waterbury City (pop., 2000: 107,271), western Connecticut, U.S. Located on the Naugatuck River, Mattatuck Plantation was settled in 1674 as part of Farmington, Conn., and was later incorporated (1686) as the town of Waterbury. The city of Waterbury, incorporated in 1853, was consolidated with the town in 1902. In the 19th century it became the nation's largest producer of brass products. Other manufactures include clocks, watches, and chemicals. It is the financial and commercial centre of western Connecticut.

watercolour Painting made with a pigment ground in gum, usually gum arabic, and applied with brush and water to a surface, usually paper. The pigment is ordinarily transparent but can be made opaque by mixing with a whiting to produce GOUACHE. Transparent watercolour allows for freshness and luminosity. Whereas oil paintings achieve their effects by a building up of colour, watercolours rely on what is left out, with empty, unpainted spaces being an integral part of the work.

watercress Perennial plant (*Nasturtium officinale*) of the MUSTARD FAMILY, native to Eurasia and naturalized throughout North America. It grows submerged, floating on the water, or spread over mud surfaces in cool, flowing streams. White flowers are followed by small, beanlike seedpods. Watercress is often cultivated in tanks for its young shoots, which are used

© 2006 Encyclopædia Britannica, Inc.

in salads. The delicate, light green, peppery-flavoured leaves are rich in vitamin C. Since watercress grown near cattle and sheep feedlots can become contaminated by feces containing cysts of the liver fluke, agent of the illness fascioliasis (liver rot), regulations specify that commercial watercress beds be protected from such pollution.

Wateree River River, central South Carolina, U.S. It enters the state from North Carolina as the Catawba River but is known as the Wateree in South Carolina. It joins the Congaree River to form the Santee River. The Wateree-Catawba River is 395 mi (636 km) long. The Wateree flows through a series of lakes and reservoirs, the largest of which is Wateree Lake, 15 mi (24 km) long.

waterfall Area where flowing river water drops abruptly and nearly vertically. A waterfall may also be termed a falls, or, when large volumes of water are involved, a cataract. Waterfalls of small height and less steepness or a series of small falls are called cascades. Still gentler stretches of river that exhibit turbulent flow and white water are called rapids.

Waterford glass Heavy cut glassware, produced in Waterford, Ire., from the 1720s to the present, characterized by thick walls, deeply incised geometric cutting, and brilliant polish. Characteristic Waterford products include Rococo chandeliers, wall lamps, sconces, bowls, and vases. After c. 1770 Waterford glassmakers gradually abandoned the Rococo style in favour of the more restrained Neoclassical style popular in England.

waterfowl Any member of the family Anatidae, web-footed birds with a broad bill containing fine plates, or lamellae; usually stocky and often long-necked, including ducks, geese (see goose), and swans. Waterfowl feed by dabbling, diving, or grazing. Most species are social and have an array of formal displays and group cohesion signals. Almost all breed in water. The female usually selects the nest site, builds the nest from any vegetation within reach, and incubates the 3–12 eggs. Shortly after hatching, the young imprint on their mother (see imprinting). Many species are migratory.

Watergate scandal (1972–74) Political scandal involving illegal activities by Pres. Richard Nixon's administration. In June 1972 five burglars were arrested after breaking into the Democratic Party's national headquarters at the Watergate Hotel complex in Washington, D.C. Within a few days of their arrest at the Watergate, charges of burglary and wiretapping were brought against the five and two others, including a former White House aide and G. Gordon Liddy, general counsel for the Committee to Reelect the President. Nixon and his aides steadfastly denied that anyone in the administration had been involved, despite persistent press reports to the contrary, and in November 1972 Nixon was easily reelected. In January 1973 the trial of the burglars was held before Judge John Sirica; five pleaded guilty and two were convicted by a jury. Sirica's direct questioning of witnesses revealed details of a cover-up by H.R. Haldeman, John D. Ehrlichman, and John W. Dean. They and Attorney General Richard G. Kleindienst resigned in April. The new attorney general, Elliot L. Richardson (1920–98), appointed Archibald Cox (b. 1912) as special prosecutor. A Senate committee under Samuel Ervin held televised hearings in which the existence of tapes of conversations in the president's office was disclosed. Cox and Ervin subpoenaed the tapes, but Nixon refused to relinquish them and ordered Cox fired (Oct. 20, 1973). Richardson resigned in protest, and the public outcry eventually forced Nixon to surrender the tapes (December 8), which revealed clear signs of his involvement in the cover-up. In July 1974 the Judiciary Committee of the House of Representatives passed three articles of impeachment against Nixon. On August 5 Nixon supplied three tapes that clearly implicated him in the cover-up. Though Nixon continued to insist that he had not committed any offenses, he resigned on Aug. 8, 1974. He was pardoned a month later by his successor, Gerald Ford.

Waterloo, Battle of (June 18, 1815) Final defeat of Napoleon and French forces in the Napoleonic Wars. The battle was fought near Waterloo village, south of Brussels, during the Hundred Days of Napoleon's restoration, by Napoleon's 72,000 troops against the duke of Wellington's combined Allied army of 68,000 aided by 45,000 Prussians under Gebhard von Blücher. After the French defeated the Prussians at Ligny and held Wellington at Quatre-Bras in secondary battles on June 16, Napoleon's marshals, including Michel Ney, failed to eliminate either enemy while they were separated. Napoleon delayed his attack at Waterloo until midday, to allow the ground to dry, which enabled Blücher's main force to escape the pursuing French and join Wellington. Four French attacks on the Allied centre failed to break through, and Napoleon had to move troops to meet the Prussian flanking attack. When Ney succeeded in capturing a farmhouse at the centre of the Allied line, his call to Napoleon for reinforcements was refused. Wellington and his forces, though vulnerable after heavy losses, repulsed the final French assault and turned to advance against the French, forcing them into a disorganized retreat. The French suffered 25,000 killed and wounded, and 9,000 were captured; Wellington's casualties were 15,000, and Blücher's were about 8,000. Four days later, Napoleon abdicated for the last time.

Waterloo, University of Public university in Waterloo, Ont., Can., founded in 1957. It has faculties of applied health sciences, arts, engineering, environmental studies, mathematics, and science, as well as schools of accounting, architecture, optometry, and urban and regional planning. Special facilities include museums of optometry and of games.

watermelon Succulent fruit of *Citrullus lanatus* (formerly *C. vulgaris*), in the gourd family, native to tropical Africa and cultivated on every continent except Antarctica. The vines spread across the ground with branched tendrils, deeply cut leaves, and light-yellow flowers. Each vine bears 2–15 large, reddish, white, or yellow, sweet, very juicy fruits with flat black seeds. Varieties differ in flesh color, shape, and rind thickness. The rind may be preserved as a pickle.

waterpower Power produced by a stream of water as it turns a wheel or similar device. The waterwheel, probably invented in the 1st century BC, was widely used throughout the Middle Ages and into modern times for grinding grain, operating bellows for furnaces, and other purposes. The more compact water turbine, which passes water through a series of fixed and rotating blades, was introduced in 1827. Water turbines, used originally for direct mechanical drive for irrigation, now are used almost exclusively to generate hydroelectric power.

Waters, Ethel (b. Oct. 31, 1896/1900, Chester, Pa., U.S.—d. Sept. 1, 1977, Chatsworth, Calif.) U.S. blues and jazz singer and actress. She was a professional singer by age 17, and she recorded with jazzmen such as Duke Ellington and Benny Goodman in the 1930s. She made her Broadway debut in the *Africana* revue (1927) and later had a lead role in *Blackbirds* (1930). In 1933 she appeared in Irving Berlin's musical *As Thousands Cheer*, in which she sang "Heat Wave" and "Suppertime." Her later stage successes included *Cabin in the Sky* (1940; film, 1943) and *The Member of the Wedding* (1950; film, 1952). She also acted in films such as *Pinky* (1949) and *The Sound and the Fury* (1959).

Waters, Muddy *orig.* **McKinley Morganfield** (b. April 4, 1915, Rolling Fork, Miss., U.S.—d. April 30, 1983, Westmont, Ill.) U.S. blues guitarist and singer. He grew up in the cotton country of Mississippi and taught himself harmonica as a child. He later took up guitar, eagerly absorbing the classic delta blues styles of Robert Johnson and Son House. He was first recorded in 1941 by archivist Alan Lomax (see John Lomax). In 1943 he moved to Chicago; there he broke with the country blues style by playing over a heavy dance rhythm, adopting the electric guitar and adding piano and drums while retaining a moan-and-shout vocal style and lyrics that were by turns mournful, boastful, and risqué. The result came to be known as urban blues, from which sprang in large part later forms such as rock music and soul music. A surge in interest in the roots of popular music in the early 1960s brought Waters widespread fame, and he performed internationally into the 1970s.

waterskiing Sport of planing and jumping on water skis, broad skilike runners that a rider wears while being towed by a motorboat. The sport originated in the U.S. in the 1920s. International competitions have been held since 1946. Single-ski slalom competition is held on a course consisting of a specified number of buoys around which the skier must negotiate. Jumping competitions employ a ramp; skiers are judged for distance and style. Barefoot and trick skiing are also part of some competitions. A later development in waterskiing, wakeboarding began in the U.S. in the 1980s when surfers began riding their boards as they were pulled behind boats. Since the mid 1990s wakeboarding has been an event at both the Gravity Games and the X Games (see extreme sports) and has become the fastest-growing water sport worldwide.

Waterton Lakes National Park Mountain recreational area, western Canada. Located in southwestern Alberta, it became a national park in 1895. It covers 203 sq mi (525 sq km). It adjoins the U.S. border and Glacier National Park in the U.S.; the two parks together compose the Waterton-Glacier International Peace Park, dedicated in 1932.

© 2006 Encyclopædia Britannica, Inc.

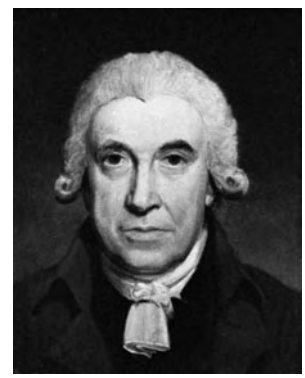
waterwheel Machine for tapping the energy of running or falling water (hence a prime mover) by means of a set of paddles or buckets mounted around a wheel. The force of the moving water against the paddles, or the weight of water poured into the buckets, rotates the wheel. The resulting power is transmitted to machinery via the shaft of the wheel. The waterwheel was perhaps the earliest source of mechanical energy to replace that of humans and animals, and it was first used for such tasks as raising water and grinding grain. See also WATERPOWER.

Watie \'wä-tē**, Stand** *orig.* **De Gata Ga** (b. Dec. 12, 1806, Rome, Ga., U.S.—d. Sept. 9, 1871) American Indian leader. He learned English at a mission school and helped publish the *Cherokee Phoenix*, a tribal newspaper. In 1835 he joined three other CHEROKEE chiefs to sign the Treaty of New Echota, which surrendered Cherokee lands in Georgia and forced the tribe to move to Indian Territory in present-day Oklahoma. In the American Civil War he raised a mounted Cherokee rifle regiment and joined the Confederate army. He directed cavalry raids on the fields and other property of Indians who backed the Union. Promoted to brigadier general (1864), he remained loyal to the Confederacy even after the tribe ended its alliance. After the war, he went to Washington, D.C., as a representative of the southern Cherokee.

Watling Street Ancient Roman road in Britain. Extending from LONDON to Wroxeter, it was one of the great arterial roads of Roman Britain. In the 9th century it divided MERCIA. Later the name was applied to other main roads, including the London-Dover road that ran through CANTERBURY.

Watson, Doc *orig.* **Arthel Lane Watson** (b. March 2, 1923, Stony Fork, near Deep Gap, N.C., U.S.) U.S. COUNTRY MUSIC singer, banjoist, and guitarist. Blind from birth, Watson grew up on a farm and learned to play guitar, banjo, and harmonica as a child. Though he did not record professionally until he was in his late 30s, he quickly rose to prominence with his renditions of traditional and popular tunes backed by his virtuoso flatpicking guitar style. He appeared at the 1963 Newport Folk Festival to great acclaim. He performed for many years with his son Merle (1949–85).

Watson, James D(ewey) (b. April 6, 1928, Chicago, Ill., U.S.) U.S. geneticist and biophysicist. He earned his Ph.D. at Indiana University in 1950. Using X-ray diffraction techniques, he began work in Britain with FRANCIS CRICK on the problem of DNA structure. In 1952 he determined the structure of the protein coat surrounding the tobacco mosaic virus. In early 1953 he determined that the essential DNA components, four organic bases, must be linked in definite pairs, a discovery that enabled Watson and Crick to formulate a double-helix molecular model for DNA. In 1962 the two scientists and MAURICE WILKINS shared the Nobel Prize. Watson's *The Double Helix* (1968), a best-selling personal account of the DNA discovery, aroused controversy. He taught at Harvard University (1955–76) and served as director of the Carnegie Institute's laboratory at Cold Spring Harbor (1968–94). See also ROSALIND FRANKLIN.



Watson, John B(roadus) (b. Jan. 9, 1878, Travelers Rest, near Greenville, S.C., U.S.—d. Sept. 25, 1958, New York, N.Y.) U.S. psychologist. Trained at the University of Chicago, Watson taught psychology at Johns Hopkins University (1908–20). He is remembered for codifying and publicizing behaviourism. In his epoch-making article, "Psychology as a Behaviorist Views It" (1913), he asserted that psychology should restrict itself to the objective, experimental study of the relations between environmental events and human behaviour. In *Behavior* (1914) he argued for the use of animal subjects in studying reflexes and conditioned responses, and in *Psychology from the Standpoint of a Behaviorist* (1919) he extended the principles and methods he employed in animal experiments. In 1920 he left academia to enter the advertising business.

Watson, Thomas J(ohn), Sr. (b. Feb. 17, 1874, Campbell, N.Y., U.S.—d. June 19, 1956, New York, N.Y.) U.S. industrialist. He went to work for the National Cash Register Co. in 1899. In 1914 he became president of the company that in 1924 became International Business Machines Corporation (IBM), which he built into the world's largest manufacturer of electric typewriters and data-processing equipment. Backing an aggressive research-and-development program, he assembled a highly motivated, well-trained, and well-paid staff, gave pep talks, enforced a strict dress code, and posted the now-famous "Think" sign in company offices. In the 1930s and '40s he pursued international trade, extending IBM's influence worldwide. Active in civic affairs, he was noted for his efforts on behalf of the arts and world peace. His son Thomas John Watson, Jr. (1914–93), succeeded him as president (1952), chairman (1961), and CEO (1972).

Watson, Tom *in full* **Thomas Sturges Watson** (b. Sept. 4, 1949, Kansas City, Mo., U.S.) U.S. golfer. Watson attended Stanford University before becoming a professional golfer in 1971. He became one of the sport's dominant figures in the 1970s and early '80s, winning the British Open (1975, 1977, 1980, 1982, 1983), the Masters (1977, 1981), and the U.S. Open (1982).

Watson-Watt, Sir Robert Alexander (b. April 13, 1892, Brechin, Scot.—d. Dec. 5, 1973, Inverness) Scottish physicist. He began as a meteorologist working on devices for locating thunderstorms. As head of the radio department of Britain's National Physical Laboratory (1935), he worked on aircraft radio location and could locate planes at a distance of about 80 mi (110 km) by beaming radio waves at them, receiving reflections of the waves, and calculating distance by elapsed time. This led to the design of the world's first practical RADAR system, a vital element in the defense of Britain against German air raids during World War II. His other contributions include a cathode-ray direction finder used to study atmospheric phenomena, research in electromagnetic radiation, and inventions used for flight safety.

Watt, James (b. Jan. 19, 1736, Greenock, Renfrewshire, Scot.—d. Aug. 25, 1819, Heathfield Hall, near Birmingham, Warwick, Eng.) Scottish engineer and inventor. Though largely self-taught, he began work early as an instrument maker and later as an engineer on the Forth and Clyde Canal. Watt's major improvement to THOMAS NEWCOMEN'S STEAM ENGINE was the use of a separate CONDENSER (1769), which reduced the loss of LATENT HEAT and greatly increased its efficiency. With MATTHEW BOULTON he began manufacture of his new engine in 1775. In 1781 he added rotary motion (a so-called sun-and-planet gear) to replace the up-and-down action of the original engine. In 1782 he patented the double-acting engine, in which the piston pushed as well as pulled. This engine required a new method of rigidly connecting the piston to the beam, a problem he solved in 1784 with an arrangement of connected rods that guided the piston rod in a perpendicular motion. His application of the centrifugal governor for automatic control of the speed of the engine (1788) and his invention of a PRESSURE GAUGE (1790) virtually completed the Watt engine, which had immense consequences for the INDUSTRIAL REVOLUTION. He introduced the concept of HORSEPOWER; the watt, a unit of power, is named for him.

James Watt, oil painting by H. Howard; in the National Portrait Gallery, London.
COURTESY OF THE NATIONAL PORTRAIT GALLERY, LONDON

Watteau \vä-'tō,\ *English* \wä-'tō**, (Jean-) Antoine** (b. Oct. 10, 1684, Valenciennes, France—d. July 18, 1721, Nogent-sur-Marne) French painter. Son of a roof tiler in Valenciennes, he was apprenticed to a local artist. At 18 he moved to Paris, where he worked for a series of painters; one of them was a theatrical scenery painter, and much of Watteau's work consequently embraced the artifice of the theatre, particularly the COMMEDIA DELL'ARTE and the ballet. His works typified the lyrically charming and graceful ROCOCO STYLE. The greatest, his *Pilgrimage to the Island of Cythera*, depicts pilgrims setting out for (or departing from) the mythic island of love and was his presentation piece when he was inducted into the academy in 1717. The academicians, unable to fit him into any of the recognized categories, welcomed him as a painter of *fêtes galantes* ("elegant festivities"), an important new genre to which countless later Rococo pictures belong.

Watts, André (b. June 20, 1946, Nürnberg, Ger.) German-born U.S. pianist. Son of an African American soldier and a Hungarian mother, he made his debut at age nine at a Philadelphia Orchestra children's concert. He attracted wide attention when at age 16 he performed on television

© 2006 Encyclopædia Britannica, Inc.

under conductor Leonard Bernstein. Though already a mature musician, he chose to continue study with Leon Fleischer (b. 1928). In 1976 he gave a concert that was the first live television broadcast of a solo recital in history. His surpassing technique and understated manner made him a favoured concert performer, and his popularity continued into the 21st century.

Watts, Isaac (b. July 17, 1674, Southampton, Hampshire, Eng.—d. Nov. 25, 1748, Stoke Newington, London) English Nonconformist minister, regarded as the father of English hymnody. Watts studied at the Dissenting Academy at Stoke Newington, London, and he later became pastor of Mark Lane Independent (i.e., Congregational) Chapel. His collections of sacred lyrics include *Horae Lyricae* (1706), *Hymns and Spiritual Songs* (1707), and *The Psalms of David Imitated in the Language of the New Testament* (1719). His hymns, numbering more than 600, became known throughout Protestant Christendom; they include "When I Survey the Wondrous Cross," "O God, Our Help in Ages Past," "Joy to the World," and "Jesus Shall Reign." A man of great erudition, he published books on a range of subjects.

Watusi See Tutsi

Waugh \'wȯ**, Evelyn (Arthur St. John)** (b. Oct. 28, 1903, London, Eng.—d. April 10, 1966, Combe Florey, near Taunton, Somerset) English novelist. After an Oxford education, he devoted himself to solitary, observant travel and the writing of novels, soon earning a wide reputation for sardonic wit and technical brilliance. His finest satirical novels are *Decline and Fall* (1928), *Vile Bodies* (1930), *Black Mischief* (1932), *A Handful of Dust* (1934), *Scoop* (1938), and *The Loved One* (1948). He converted to Roman Catholicism in 1930, and his Catholicism is insistently reflected in his novels from then on. After service in World War II he led a retired life, growing increasingly conservative and misanthropic. His later works, more serious and ambitious but written with less élan, include *Brideshead Revisited* (1945) and the *Sword of Honour* trilogy—*Men at Arms* (1952), *Officers and Gentlemen* (1955), and *Unconditional Surrender* (1961).

wave Propagation of disturbances from place to place in a regular and organized way. Most familiar are surface waves that travel on water, but sound, light, and the motion of subatomic particles all exhibit wavelike properties. In the simplest waves, the disturbance oscillates periodically (see periodic motion) with a fixed frequency and wavelength. Mechanical waves, such as sound, require a medium through which to travel, while electromagnetic waves (see electromagnetic radiation) do not require a medium and can be propagated through a vacuum. Propagation of a wave through a medium depends on the medium's properties. See also seismic wave.

wave In oceanography, a ridge or swell on the surface of a body of water, normally having a forward motion distinct from the motions of the particles that compose it. Ocean waves are fairly regular, with an identifiable wavelength between adjacent crests and with a definite frequency of oscillation. Waves result when a generating force (usually the wind) displaces surface water and a restoring force returns it to its undisturbed position. Surface tension alone is the restoring force for small waves. For large waves, gravity is more important.

wave-cut platform *or* **abrasion platform** Gently sloping rock ledge that extends from the high-tide level at a steep cliff base to below the low-tide level. It develops as a result of wave abrasion; beaches protect the shore from abrasion and therefore prevent the formation of platforms. A platform is broadened as waves erode a notch at the base of the sea cliff, causing overhanging rock to fall. As the sea cliffs are attacked, weak rocks are quickly eroded, leaving the more resistant rocks as protrusions.

wave front Imaginary surface that represents corresponding points of waves vibrating in unison. As identical waves from the same source travel through a homogeneous medium, corresponding crests and troughs are in phase at any instant; that is, they have completed the same fraction of their periodic motion. Any surface drawn through all points of the same phase constitutes a wave front.

wave function Variable quantity that mathematically describes the wave characteristics of a particle. It is related to the likelihood of the particle being at a given point in space at a given time, and may be thought of as an expression for the amplitude of the particle wave, though this is strictly not physically meaningful. The square of the wave function is the significant quantity, as it gives the probability for finding the particle at a given point in space and time. See also wave-particle duality.

wave-particle duality Principle that subatomic particles possess some wavelike characteristics, and that electromagnetic waves, such as light, possess some particlelike characteristics. In 1905, by demonstrating the photoelectric effect, Albert Einstein showed that light, which until then had been thought of as a form of electromagnetic wave (see electromagnetic radiation), must also be thought of as localized in packets of discrete energy (see photon). In 1924 Louis-Victor Broglie proposed that electrons have wave properties such as wavelength and frequency; their wavelike nature was experimentally established in 1927 by the demonstration of their diffraction. The theory of quantum electrodynamics combines the wave theory and the particle theory of electromagnetic radiation.

waveguide Device that constrains the path of electromagnetic waves (see electromagnetic radiation). It can be used to transmit power or signals in the form of waves while minimizing power loss. Common examples are metallic tubes, coaxial cables, and optical fibres (see fibre optics). Waveguides transmit energy by propagating transmitted electromagnetic waves through the inside of a tube to a receiver at the other end. Metal waveguides are used in such technologies as microwave ovens, radar systems, radio relay systems, and radio telescopes.

wavelength Distance between corresponding points of two consecutive waves. "Corresponding points" refers to two points or particles that have completed identical fractions of their periodic motion. In transverse waves, wavelength is measured from crest to crest or from trough to trough. In longitudinal waves, it is measured from compression to compression or from rarefaction to rarefaction. Wavelength, λ, is equal to the speed v of a wave in a medium divided by its frequency f, or $\lambda = v/f$.

Wavell \'wā-vəl\ **(of Eritrea and of Winchester), Archibald Percival Wavell, 1st Earl** (b. May 5, 1883, Colchester, Essex, Eng.—d. May 24, 1950, London) British army officer. Recognized as an excellent trainer of troops, he became British commander in chief for the Middle East in 1939. In World War II he was noted for his defeat of the numerically superior Italian armies in North Africa (1940–41) but was unable to stop the German force under Erwin Rommel in the North Africa Campaign. As commander in chief of Southeast Asia (1941–43), he failed to stop the Japanese conquests of Malaya, Singapore, and Burma (1942). Promoted to field marshal, he served as viceroy of India (1943–47).

wax Any of a class of pliable substances, organic compounds of animal, plant, mineral, or synthetic origin, less greasy, harder, and more brittle than fats. Waxes contain mostly compounds of high molecular weight (fatty acids, alcohols, and saturated hydrocarbons). Many melt at moderate temperatures and form hard films that can take a high polish. Animal and plant waxes are esters of fatty acids and either a sterol (see steroid) or a straight-chain higher alcohol (e.g., cetyl alcohol). Animal waxes include beeswax; wool wax (lanolin), used in pharmaceuticals and cosmetics; and sperm oil and spermaceti (from sperm whales), used as lubricants. Plant waxes include carnauba wax, candelilla wax, and sugarcane wax, used in polishes. About 90% of the waxes in commerce are recovered by dewaxing petroleum. There are three main types: paraffin (used in candles, crayons, paper coating, and industrial polishes and as a protective sealant, lubricant, insulating agent, and antifrothing agent), microcrystalline wax (used in paper coating), and petrolatum (used in ointments and cosmetics). Synthetic waxes (carbowaxes), derived from ethylene glycol, are commonly blended with petroleum waxes.

wax sculpture Figures modeled or molded in beeswax, either as finished pieces or for use as forms for casting metal (see lost-wax casting) or creating preliminary models. At ordinary temperatures, beeswax can be cut and molded easily, it melts at a low temperature, it mixes with any

© 2006 Encyclopædia Britannica, Inc.

colouring matter and takes surface tints well, and its texture can be modified by a variety of additives. The ancient Egyptians used wax figures of deities in their funeral rites, and the Romans used wax images as presents in the Saturnalia. MICHELANGELO used wax models in making preliminary sketches for his statues. Wax medallion portraits, popular in the 16th century, enjoyed renewed popularity in the 18th century. JOHN FLAXMAN made many wax portraits and relief figures which JOSIAH WEDGWOOD translated into pottery. Exhibitions of wax figures are still popular, the most famous being those of Madame TUSSAUD's museums in London and other international cities.

waxwing Any of three species (family Bombycillidae) of elegant-looking songbirds named for shiny red beads on the tips of the secondary wing feathers. All species are gray-brown and have a tapering crest. The common, or Bohemian, waxwing (*Bombycilla garrulus*) is 8 in. (20 cm) long and has yellow, white, and red wing markings. It breeds in northern forests of Eurasia and America. The cedar waxwing (*B. cedrorum*), smaller and less colourful, breeds in Canada and the northern U.S. Flocks of waxwings may invade city parks and gardens in winter, searching for berries. The Japanese waxwing (*B. japonica*) is restricted to northeastern Asia.

Wayne, Anthony (b. Jan. 1, 1745, near Paoli, Pa.—d. Dec. 15, 1796, Presque Isle, Pa., U.S.) American Revolutionary officer. He owned a tannery before he was commissioned a colonel in the Continental Army (1776). He aided the American retreat from Canada and was given command of Fort Ticonderoga (1776). Promoted to brigadier general (1777), he led troops in the battles of the Brandywine, Paoli, and Germantown. He led the successful storming of the British fort at Stony Point, N.Y. (1779), earning the nickname "Mad Anthony" for his boldness. He served in the Siege of YORKTOWN and later defeated the Indians allied with the British in Georgia. In 1792 Pres. GEORGE WASHINGTON sent Wayne to fight the Indians in the Ohio Territory, and he decisively ended Indian resistance at the Battle of FALLEN TIMBERS (1794).

Wayne, John *orig.* **Marion Michael Morrison** (b. May 26, 1907, Winterset, Iowa, U.S.—d. June 11, 1979, Los Angeles, Calif.) U.S. film actor. While a member of the University of Southern California football team, he worked summers at the Fox Film Corporation as a propman and developed a friendship with director JOHN FORD, who cast him in small parts from 1928. After his leading role in *The Big Trail* (1930), he played in more than 80 low-budget movies before winning acclaim for his starring role as the Ringo Kid in Ford's *Stagecoach* (1939). Noted for his image as the strong, silent man, Wayne, nicknamed "Duke," became one of the top box-office attractions in movie history. He starred in other westerns (many directed by Ford) such as *Red River* (1948), *She Wore a Yellow Ribbon* (1949), *Rio Grande* (1950), *The Searchers* (1956), *Rio Bravo* (1959), and *True Grit* (1969, Academy Award), as well as in *The Quiet Man* (1952), *The Alamo* (1960), which he also directed, *Hatari!* (1962), and *The Green Berets* (1968), which he codirected.

wazīr See VIZIER

WCTU See WOMAN'S CHRISTIAN TEMPERANCE UNION

weak force *or* **weak nuclear force** Fundamental interaction that underlies some forms of RADIOACTIVITY and certain interactions between SUBATOMIC PARTICLES. It acts on all elementary particles that have a SPIN of ½. The particles interact weakly by exchanging particles that have integer spins. These particles have masses about 100 times that of a PROTON, and it is this relative massiveness that makes the weak force appear weak at low energies. For example, in radioactive decay, the weak force has a strength about 1/100,000 that of the ELECTROMAGNETIC FORCE. However, it is now known that the weak force has intrinsically the same strength as the electromagnetic force, and the two are believed to be only different manifestations of a single electroweak force (see ELECTROWEAK THEORY).

weakfish *or* **sea trout** Any of several species (genus *Cynoscion*) in the DRUM family (Sciaenidae), carnivorous bottom-dwelling fishes along warm and tropical seashores. The name weakfish refers to their delicate mouth, which is easily torn by fishhooks. About six species inhabit North American coasts. The weakfish, or sea trout (*Cynoscion regalis*), is a sport fish but is usually less than 2 ft (60 cm) long. Weakfish are caught commercially along the Middle Atlantic coastal states and are considered the most economically important species in the family. The spotted sea trout (*C. nebulosus*) is found along Florida's Atlantic and Gulf coasts. Sea trouts resemble but are not related to true TROUTS.

weapon of mass destruction (WMD) Weapon with the capacity to inflict death and destruction indiscriminately and on a massive scale. The term has been in currency since at least 1937, when it was used to describe massed formations of bomber aircraft. Today WMDs are nuclear, biological, or chemical weapons—frequently referred to collectively as NBC weapons. Efforts to control the spread of WMDs are enshrined in international agreements such as the NUCLEAR NON-PROLIFERATION TREATY of 1968, the Biological Weapons Convention of 1972, and the Chemical Weapons Convention of 1993. See NUCLEAR WEAPON; CHEMICAL WARFARE; BIOLOGICAL WARFARE.

weapons system Any integrated system for the control and operation of a specific type of weaponry. Weapons are usually divided into two categories, strategic and tactical. Strategic weapons strike at the seat of an enemy's military, economic, and political power, targeting cities, factories, military bases, transportation and communications networks, and seats of government. Most NUCLEAR WEAPONS are part of strategic weapons systems. Tactical weapons are designed instead for offensive or defensive use at relatively short range—for example, GUIDED MISSILES intended as antiaircraft and antitank weapons, or other weapons used in aerial and naval combat.

weasel Any of several genera (CARNIVORE family Mustelidae) of voracious nocturnal predators found throughout the Americas, Africa, and Eurasia. Weasels have slender bodies and necks, small flat heads, short legs, clawed toes, dense short fur, and slim pointed tails. The size and relative length of the tail vary among species. Their total length is 7–20 in. (17–50 cm), and they may weigh 1–12 oz (30–350 g). The approximately 10 New World and Eurasian species of *Mustela* are reddish brown; in cold regions, their winter coat turns white, and the pelt, especially of the stoat (*M. erminea*), is called ERMINE. Weasels generally hunt alone, feeding on rodents, fish, frogs, and birds' eggs.

Long-tailed weasel (*Mustela longicauda*)
JOHN H. GERARD

weather State of the atmosphere at a particular place during a short period of time. It involves day-to-day changes in such atmospheric phenomena as temperature, humidity, precipitation (type and amount), air pressure, wind, and cloud cover. Most weather occurs in the TROPOSPHERE, but phenomena of the higher regions of the atmosphere, such as JET STREAMS, and geographic features, most notably mountains and large bodies of water, also affect it. See also CLIMATE.

weather forecasting Prediction of the weather through application of the principles of physics and METEOROLOGY. Weather forecasting predicts atmospheric phenomena and changes on the Earth's surface caused by atmospheric conditions (snow and ice cover, storm tides, floods, etc.). Scientific weather forecasting relies on empirical and statistical techniques, such as measurements of temperature, humidity, atmospheric pressure, wind speed and direction, and precipitation, and computer-controlled mathematical models.

weather modification Deliberate or inadvertent alteration of atmospheric conditions by human activity, sufficient to modify the weather on a local or regional scale. Deliberate alterations include covering plants to keep them warm at night, seeding clouds to induce or augment precipitation, and firing silver-iodide particles into clouds to suppress or mitigate hail and to reduce fog at airports. Inadvertent alterations are the result of industrialization and urbanization, which have added billions of tons of carbon dioxide and other gases to the atmosphere (see ACID RAIN, GLOBAL WARMING, GREENHOUSE EFFECT).

weathering Physical disintegration and chemical decomposition of rocks, minerals, and immature soils at or near the Earth's surface. Physical, chemical, and biological processes induced or modified by wind, water, and climate cause the changes. Weathering is distinguished from EROSION in that no transportation of material is involved. A broader application of erosion, however, includes weathering as a component. Weathering is also distinguished from METAMORPHISM, which usually takes place deep in the crust at much higher temperatures and elevated pressures.

© 2006 Encyclopædia Britannica, Inc.

Weaver, James B(aird) (b. June 12, 1833, Dayton, Ohio, U.S.—d. Feb. 6, 1912, Des Moines, Iowa) U.S. politician. An advocate of the GREENBACK MOVEMENT, he was elected to the U.S. House of Representatives from Iowa (1879–81, 1885–89). He helped form the People's Party (see POPULIST MOVEMENT) and was its candidate for president in 1892, receiving more than 1 million popular votes and 22 electoral votes. After helping effect the party's merger with the Democratic Party, he retired to Iowa.

Weaver, John (b. July 21, 1673, Shrewsbury, Shropshire, Eng.—d. Sept. 24, 1760, Shrewsbury) English dancer and teacher, known as "the father of English pantomime." From 1700 to 1736 he performed and produced his dance dramas at the Drury Lane and Lincoln's Inn Fields theatres. His libretto for *The Loves of Mars and Venus* (1717) was the first published dance drama and displayed the integration of plot and dance that was later developed by JEAN-GEORGES NOVERRE and GASPARO ANGIOLINI as the *ballet d'action*.

Weaver, Warren (b. 1894, Reedsburg, Wisc., U.S.—d. 1978) U.S. mathematician. He studied at the University of Wisconsin, taught there (1920–32), and directed the Rockefeller Foundation's Natural Science Division (1932–55). He is considered the first person to propose using electronic computers for the translation of natural languages. In a 1949 memo, he proposed that statistical techniques from the field of information theory could be used to enable computers to translate text from one natural language to another automatically. His proposal was based on the assumption that a document in a human language can be viewed as having been written in code, which can be broken like other codes.

weaving Production of fabric by interlacing two sets of YARNS so that they cross each other, normally at right angles, usually accomplished with a hand- or power-operated LOOM. In weaving, lengthwise yarns are called warp and crosswise yarns are called weft, or filling. Most woven fabrics are made with their outer edges finished in a manner that avoids raveling (because the weft yarn turns around instead of ending in a cut end). These edges, called selvages, run lengthwise, parallel to the warp yarns. The three basic weaves are plain or tabby (weft threads go over one warp thread, then under one), TWILL, and SATIN. Fancy weaves, such as pile, Jacquard, dobby, and leno, require more complicated looms or special loom attachments. See also NAVAJO WEAVING.

Web See WORLD WIDE WEB

Web site Collection of files and related resources accessible through the WORLD WIDE WEB and organized under a particular DOMAIN NAME. Typical files found at a Web site are HTML documents with their associated graphic image files (GIF, JPEG, etc.), scripted programs (in PERL, CGI, JAVA, etc.), and similar resources. The site's files are usually accessed through HYPERTEXT or hyperlinks embedded in other files. A Web site may consist of a single HTML file, or it may comprise hundreds or thousands of related files. A Web site's usual starting point or opening page, called a home page, usually functions as a table of contents or index, with links to other sections of the site. Web sites are hosted on one or more Web SERVERS, which transfer files to client computers or other servers that request them using the HTTP protocol. Although the term "site" implies a single physical location, the files and resources of a Web site may actually be spread among several servers in different geographic locations. The particular file desired by a client is specified by a URL that is either typed into a BROWSER or accessed by selecting a hyperlink.

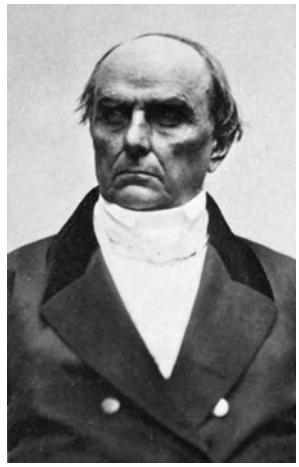
Webb, Sidney (James) and Beatrice *Beatrice Webb orig.* **Martha Beatrice Potter** (respectively b. July 13, 1859, London, Eng.—d. Oct. 13, 1947, Liphook, Hampshire; b. Jan. 22, 1858, Gloucester, Gloucestershire, Eng.—d. April 30, 1943, Liphook, Hampshire) English socialist economists. Sidney was a civil service clerk when GEORGE BERNARD SHAW induced him to join the FABIAN SOCIETY in 1885. He wrote the first Fabian tract, *Facts for Socialists* (1887), and took to lecturing on socialism. In 1891 he met Beatrice, author of *The Cooperative Movement in Great Britain* (1891), and they were married in 1892. Together they wrote the influential *The History of Trade Unionism* (1894) and *Industrial Democracy* (1897). As a member of the London County Council (1892–1910), Sidney effected extensive reforms in public education. The Webbs cofounded the London School of Economics and helped reorganize the University of London. As a member of the Poor Laws commission (1905–09), Beatrice wrote a report that anticipated the WELFARE STATE. In 1914 they joined the Labour Party, and Sidney wrote its influential policy statement, *Labour and the New Social Order* (1918). Sidney served in Parliament (1922–29) and as colonial secretary (1929–31), having been created Baron Passfield of Passfield Corner in 1929. Impressed by the Soviet Union after their trip in 1932, the Webbs wrote *Soviet Communism: A New Civilisation?* (1935), in which they seemed to abandon their belief in gradual social and political evolution.

Webber, Andrew Lloyd See Andrew LLOYD WEBBER

Weber \'vā-bər**, Carl Maria (Friedrich Ernst) von** (b. Nov. 18, 1786, Eutin, Holstein—d. June 5, 1826, London, Eng.) German composer. Son of a musician and a theatre manager, and first cousin to WOLFGANG AMADEUS MOZART's wife, he was born with a deformed hip and was never strong. He took composition lessons with Michael Haydn (1737–1806) and with Abbé Vogler (1749–1814), who recommended him for a post in Breslau (1804–06). His operas began to have success, and he took over direction of the Prague Opera (1813–16), which he saved from ruin, but finding little time for composition, he resigned. Showing signs of the tuberculosis that would kill him, he began to compose more prolifically. Appointed kapellmeister for life in Dresden, he began work on his masterpiece, the opera *The Freeshooter* (1821), the premiere of which made him an international star. The libretto for his next opera, *Euryanthe* (1823), was so clumsy that its admirable music never succeeded, and his final opera, *Oberon* (1826), composed for London, was a success there but not elsewhere.

Weber \'vā-bər**, Max** (b. April 21, 1864, Erfurt, Prussia—d. June 14, 1920, Munich, Ger.) German sociologist and political economist. Son of a wealthy liberal politician and a Calvinist mother, Weber was a compulsively diligent scholar who suffered occasional nervous collapses. Insights derived from his own experience inform his most famous and controversial work, *The Protestant Ethic and the Spirit of Capitalism* (1904–05), which examines the relationship between Calvinist (or Puritan) morality, compulsive labour, BUREAUCRACY, and economic success under CAPITALISM (see PROTESTANT ETHIC). Weber also wrote penetratingly on social phenomena such as charisma and mysticism, which he saw as antithetical to the modern world and its underlying process of rationalization. His efforts helped establish sociology as an academic discipline in Germany, and his work continues to stimulate scholarship. Through his insistence on the need for objectivity and his analysis of human action in terms of motivation, he profoundly influenced sociological theory. His voluminous writings, mostly published posthumously, include *Economy and Society* (2 vol., 1922–25) and *General Economic History* (1923).

Weber-Fechner law See WEBER'S LAW



Webern \'vā-bərn**, Anton (Friedrich Wilhelm von)** (b. Dec. 3, 1883, Vienna—d. Sept. 15, 1945, Mittersill, near Salzburg, Austria) Austrian composer. He learned piano and cello as a child and earned a doctorate in musicology at the University of Vienna, specializing in the music of the 15th-century Flemish composer HEINRICH ISAAC. In 1904 he and his friend ALBAN BERG began composition lessons with ARNOLD SCHOENBERG, and Webern was soon combining ATONALITY with complex COUNTERPOINT in the manner of Isaac, producing works distinctive for their extreme brevity and delicacy. While Schoenberg was developing the 12-tone method (see SERIALISM) of composition into the 1920s, Webern was independently moving in a similar direction. After Schoenberg presented the system in 1924, Webern adopted it, composing relatively extended pieces such as the *Symphony* (1928), *Concerto* (1934), and *Variations for Piano* (1936). He earned a living most of his life as a conductor. During Austria's occupation at the end of World War II, he was accidentally shot and killed by an American soldier. Though he was little appreciated during his lifetime, his works became highly influential internationally in the postwar decades.

Weber's law \'vā-bərz\ *or* **Weber-Fechner law** \'fe̲k-nər\ In PSYCHOPHYSICS, a historically important law quantifying the perception of change in a given stimulus. Originated by the German physiologist Ernst Heinrich Weber (1795–1878) in 1834 and elaborated by his student GUSTAV THEODOR FECHNER, the law states that the change in a stimulus that will be just noticeable is a constant ratio of the original stimulus. It was later shown not to hold for extremes of stimulation.

Webster, Ben(jamin Francis) (b. March 27, 1909, Kansas City, Mo., U.S.—d. Sept. 20, 1973, Amsterdam, Neth.) U.S. tenor saxophonist. Influenced by COLEMAN HAWKINS and JOHNNY HODGES, he played in several important SWING bands before joining that of DUKE ELLINGTON in 1940. After 1943 he worked mostly as the leader of small ensembles. He moved to Copenhagen, Den., in 1964. His sensual, breathy tone and wide vibrato were his trademarks, and he became one of the master interpreters of JAZZ ballads.

Webster, Daniel (b. Jan. 18, 1782, Salisbury, N.H., U.S.—d. Oct. 24, 1852, Marshfield, Mass.) U.S. lawyer and politician. He served in the U.S. House of Representatives (1813–17). After moving to Boston (1816), he built a prosperous law practice and represented Massachusetts in the House (1823–27). He argued several precedent-setting cases before the U.S. Supreme Court, including the Dartmouth College case, *McCulloch v. Maryland*, and *Gibbons v. Ogden*. Elected to the U.S. Senate (1827–41, 1845–50), he became famous as an orator for his speeches supporting the Union and opposing the nullification movement and its advocates, John C. Calhoun and Robert Y. Hayne. As U.S. secretary of state (1841–43, 1850–52) he negotiated the Webster-Ashburton Treaty to settle the Canada-Maine border dispute.

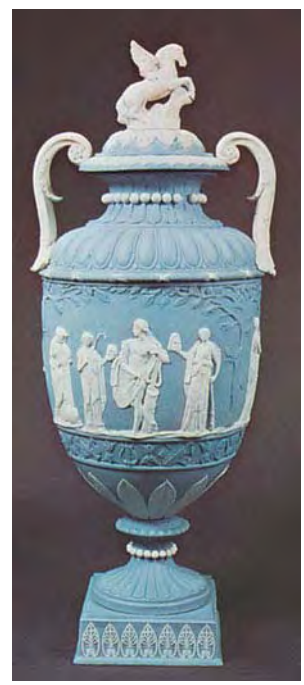
Webster, John (b. c. 1580, London, Eng.—d. c. 1632) British playwright. Little is known of his life, but he may have been an actor who began writing plays later in his career. He collaborated with several leading dramatists, including Thomas Dekker. Webster is best remembered for the revenge tragedies *The White Devil* (1612) and *The Duchess of Malfi* (published 1623), both of which concern the murders and bloody deeds that arise out of family quarrels among the Italian nobility. They are often considered the greatest 17th-century English tragedies apart from those of William Shakespeare.

Webster, Lake See Lake Chargoggagoggmanchauggauggagoggchaubunagungamaugg

Webster, Noah (b. Oct. 16, 1758, West Hartford, Conn., U.S.—d. May 28, 1843, New Haven, Conn.) U.S. lexicographer and writer. He attended Yale University and then studied law. While working as a teacher in New York, he began his lifelong efforts to promote a distinctively American education. His first step was publishing *A Grammatical Institute of the English Language*, including *The American Spelling Book* (1783), the famed "Blue-Backed Speller" that went on to sell some 100 million copies. An ardent Federalist, he founded two pro-Federalist newspapers (1793) and wrote articles on politics and many other subjects. He produced his first dictionary in 1806; in 1807 he began work on his landmark *American Dictionary of the English Language* (1828; 2nd ed. 1840). Reflecting his principle that spelling, grammar, and usage should be based on the living, spoken language, it was instrumental in establishing the dignity and vitality of American English. In 1821 Webster cofounded Amherst College. The rights to the dictionary were purchased from his estate by George and Charles Merriam, whose firm developed the Merriam-Webster dictionary series.

Webster-Ashburton Treaty (1842) Treaty between the U.S. and Britain establishing the northeastern boundary of the U.S. Negotiated by U.S. secretary of state Daniel Webster and Britain's ambassador Lord Ashburton, it also provided for Anglo-U.S. cooperation in the suppression of the slave trade. It fixed the present boundary between Maine and New Brunswick, granted the U.S. navigation rights on the St. John River, provided for extradition in nonpolitical criminal cases, and established a joint naval system for suppressing the slave trade off the African coast.



Wedekind \'vā-də-ˌkint\, **Frank** *orig.* **Benjamin Franklin Wedekind** (b. July 24, 1864, Hannover, Hanover—d. March 9, 1918, Munich, Ger.) German actor and playwright. He lived in Switzerland (1872–84) and then in Munich, where he worked at various jobs, including journalist and cabaret performer. He wrote plays from 1891, when his tragedy *The Awakening of Spring* created a scandal with its theme of awakening adolescent sexuality. In his "Lulu" cycle, *Earth Spirit* (1895) and *Pandora's Box* (1904), he extended the theme of sex to the underworld of society and introduced the amoral Lulu. His plays used episodic scenes, fragmented dialogue, distortion, and caricature, prefiguring the Theatre of the Absurd and forming a transition from realism to Expressionism.

Wedemeyer \'we-də-ˌmī-ər\, **Albert C(oady)** (b. July 9, 1897, Omaha, Neb., U.S.—d. Dec. 17, 1989, Ft. Belvoir, Va.) U.S. army officer. He graduated from West Point and served in China, the Philippines, and Europe until World War II. As a staff officer in the war-plans division of the U.S. War Department (1941–43), he was the principal author of the 1941 Victory Program for U.S. entry into the war and helped plan strategies such as the Normandy Campaign. He became chief of staff to Gen. Chiang Kai-shek and commander of U.S. forces in China (1944–46). He retired in 1951 and was promoted to general in 1954.

wedge In mechanics, a device that tapers to a thin edge, usually made of metal or wood, and used for splitting, lifting, or tightening, such as to secure a hammer head onto its handle. The wedge is considered one of the five simple machines. Wedges have been used since prehistoric times to split logs and rocks; for rocks, wooden wedges, caused to swell by wetting, have been used. In terms of its mechanical function, the screw may be thought of as a wedge wrapped around a cylinder.

Wedgwood, Josiah (baptized July 12, 1730, Burslem, Staffordshire, Eng.—d. Jan. 3, 1795, Etruria, Staffordshire) British pottery designer and manufacturer. His family had been potters since the 17th century. After an apprenticeship with his elder brother, he formed a partnership with another potter and finally went into business for himself. He took a scientific approach to pottery-making and was so successful that the makers of even Meissen and Sèvres porcelain found their trade affected. His many innovations include development of a green glaze still popular today, the perfection of creamware, and the invention of the pyrometer. His daughter Susannah was the mother of Charles Darwin. See also Wedgwood ware; Wood family.

Wedgwood ware English stoneware made by Staffordshire factories originally established by Josiah Wedgwood. Creamware appealed to the middle class because of its high quality, durability, and affordability. Black basaltes (from 1768), unglazed stoneware of fine texture that was ideal for imitating antique and Renaissance objects, appealed to antiquarians. Also in the Neoclassical tradition was jasperware (from 1775), a white, matte, unglazed stoneware that could be stained. White ornaments were applied to the coloured body, achieving the look of an antique cameo. With the help of such artists as John Flaxman, Wedgwood copied many antique designs. Production of fine Wedgwood ware continues to the present day.

weed Any plant growing where it is not wanted. On land under cultivation, weeds compete with crops for water, light, and nutrients. On rangelands and in pastures, weeds are those plants that grazing animals dislike or that are poisonous. Many weeds are hosts of plant disease organisms or of insect pests. Some originally unwanted plants later were found to have virtues and came under cultivation, while some cultivated plants, when transplanted to new climates, escaped cultivation and became weeds in the new habitat.

Weed, Thurlow (b. Nov. 15, 1797, Cairo, N.Y., U.S.—d. Nov. 22, 1882, New York, N.Y.) U.S. journalist and politician. He worked on various newspapers in upstate New York and was a leader in the Anti-Masonic movement. He was the founding editor of the *Albany Evening Journal* (1830–63). He helped form the Whig Party in New York and was instru-

mental in William Seward's election as governor (1838) and in the presidential election of William H. Harrison (1840). He later became active in the Republican Party and was a staunch supporter of Pres. Abraham Lincoln. In 1861 he was sent to England to seek support for the Union.

Weelkes \'wēlks**, Thomas** (baptized Oct. 25, 1576, Elsted, Sussex?, Eng.—d. Nov. 30, 1623, London) British composer and organist. He published his first book of madrigals in 1597 and was appointed organist at Winchester College the following year. His next two books of madrigals, his greatest, were soon published (1598, 1600), and a final volume was published in 1608. Weelkes is noted for his word painting, lively rhythms, and highly developed sense of form and structure.

weevil *or* **snout beetle** Any of about 40,000 beetle species in the largest family of beetles, Curculionidae, which is also the largest family in the animal kingdom. Most weevils have long, elbowed antennae that may fold into special grooves on the prominent snout. Many species are wingless. Most species are less than 0.25 in. (6 mm) long, are plainly coloured and marked, and feed exclusively on plants. Some species are more than 3 in. (80 mm) long. The larvae may feed on only a certain part of a plant or a single plant species; adults are less specialized. The family includes many destructive pests, including the boll weevil.

Wegener \'vā-gə-nər**, Alfred (Lothar)** (b. Nov. 1, 1880, Berlin, Ger.—d. Nov. 1930, Greenland) German meteorologist and geophysicist. After earning a Ph.D. in astronomy (1905), he became interested in paleoclimatology and traveled to Greenland to research polar air circulation. He formulated the first complete statement of the continental drift hypothesis, which he presented in *The Origin of Continents and Oceans* (1915). His theory won some adherents, but by 1930 most geologists had rejected it because of the implausibility of his postulations for the driving force behind the continents' movement. It was resurrected in the 1960s as part of the theory of plate tectonics. Wegener died during his fourth expedition to Greenland.

Wei Chung-hsien See Wei Zhongxian

Wei \'wā\ **River** River, north-central China. It rises in the mountains of southeastern Gansu province and flows east through Shaanxi province to join the Huang He (Yellow River). It is 537 mi (864 km) long. Its valley was the earliest centre of Chinese civilization and until the 10th century AD was the site of a succession of capital cities. In the 3rd century BC the area around the junction of the Ching and Wei rivers was the site of the first ambitious irrigation works in China.

Wei Zhongxian *or* **Wei Chung-hsien** \'wā-'jůŋ-shē-'ən\ (b. 1568, Suning, Heibei province, China—d. 1627, Anhui province) Eunuch who dominated the Chinese government in 1624–27. As a close companion to the nurse of the future Tianqi emperor (r. 1620–27), Wei captured the young prince's trust. Once on the throne, the weak and indecisive emperor let Wei become the actual ruler. Wei levied crushing taxes on the provinces, ruthlessly exploited the population, hounded his enemies, terrorized the official class, and filled the government with sycophants and opportunists. He fell from power when the emperor died and hanged himself to avoid trial. He is considered the most powerful eunuch in Chinese history.

Weidman \'wīd-mən**, Charles** *orig.* **Charles Edward Weidman, Jr.** (b. July 22, 1901, Lincoln, Neb., U.S.—d. July 15, 1975, New York, N.Y.) U.S. modern dancer, teacher, and choreographer. He studied at the Denishawn school and was a member of its company in the 1920s. In 1928 he cofounded with Doris Humphrey the Humphrey-Weidman school and dance company, for which he choreographed many works. His dances, often comic and satiric, employed an abstract, rhythmic pantomime. In 1945 he established his own school, and in 1948 he founded the Theatre Dance Company, for which he choreographed his major work, *Fables for Our Time*. He continued to teach, choreograph, and dance into the 1970s.

Weierstrass \'vī-ər-ˌshträs**, Karl (Theodor Wilhelm)** (b. Oct. 31, 1815, Ostenfelde, Bavaria—d. Feb. 19, 1897, Berlin) German mathematician. He taught principally at the University of Berlin (from 1856). After many years of working in isolation, an article in 1854 initiated a string of important contributions, which he disseminated mainly through lectures. He is known for his work on the theory of functions, and he is called the father of modern analysis. His greatest influence was felt through his students, many of whom went on to make important contributions to mathematics.

weight Gravitational force of attraction on an object, caused by the presence of a massive second object, such as the Earth or Moon. It is a consequence of Isaac Newton's universal law of gravitation, which states that the force of attraction between two objects is proportional to the product of their masses and inversely proportional to the square of the distance between them. For this reason, objects of greater mass weigh more on the surface of the Earth. On the other hand, an object's weight on the Moon is about one-sixth of its weight on Earth, even though its mass remains the same, because the Moon has less mass and a smaller radius than the Earth and therefore exerts less gravitational force. Weight W is the product of an object's mass m and the acceleration of gravity g at the location of the object, or $W = mg$. Since weight is a measure of force rather than mass, the units of weight in the International System of Units are newtons (N). In common usage, weight is measured by the gram in the metric system and by the ounce and pound in the U.S. and British systems.

weight lifting Sport in which barbells are lifted competitively or as an exercise. The two main events are (1) the snatch, in which the barbell is lifted from the floor to arm's length overhead in a single, continuous motion; and (2) the clean and jerk, in which it is lifted first to the shoulders and then, after a pause, to arm's length overhead. Contestants are divided into 10 body-weight categories ranging from flyweight to superheavyweight. Lifts may range to over 1,000 lbs (455 kg) in the heavyweight divisions. The origins of modern competition are to be found in 18th- and 19th-century strongman contests. The first three Olympic Games (1896, 1900, 1904) included weight lifting, as have all games after 1920.

weight training System of conditioning involving lifting weights, especially for strength and endurance. It may include the use of barbells and dumbbells, a Nautilus or similar machines, or a combination of these. Athletes use it to improve their performance, nonathletes use it for general conditioning or bodybuilding, and those recovering from an injury may use it as part of an overall rehabilitation program.

weights and measures Standard quantities by which comparisons are made between an object to be measured and a known quantity of the same kind (see measurement). Weights and measures are fundamental to the sciences, to engineering, building, and other technical matters, and to much everyday activity. See also foot; gram; International System of Units; metre; metric system; pound. See table on following page.

Weil \'vey**, Simone** (b. Feb. 3, 1909, Paris, France—d. Aug. 24, 1943, Ashford, Kent, Eng.) French mystic and social philosopher. After graduating from the École Normale Supérieure, she taught philosophy in several girls' schools from 1931 to 1938. To learn the psychological effects of heavy industrial labour, she took a job in 1934–35 in an auto factory, where she observed the spiritually deadening effect of machines on her fellow workers. She assisted the anti-Franco forces in the Spanish Civil War and aided the French Resistance from London from 1942. Born Jewish, she converted to Roman Catholicism in the 1940s. She died at age 34 of tuberculosis complicated by self-imposed starvation undertaken out of sympathy for those suffering in occupied France. Her posthumously published works, including *Gravity and Grace* (1947), *The Need for Roots* (1949), *Waiting for God* (1950), and *Notebooks* (3 vol., 1951–56) explore her own religious life and analyze the individual's relation to the state and to God, the spiritual shortcomings of modern industrial society, and the horrors of totalitarianism.

Weill \'vīl**, Kurt (Julian)** (b. March 2, 1900, Dessau, Ger.—d. April 3, 1950, New York, N.Y., U.S.) German-born U.S. composer. Son of a cantor, by age 15 he was working as a theatre accompanist. He studied composition briefly with Engelbert Humperdinck, and a conductor's post gave him wide experience. For a master class with Ferruccio Busoni (1920), he wrote his first symphony. He gained attention with his one-act opera *Der Protagonist* (1925); its sparse and spiky style prefigured that of his greatest works. In 1927 he teamed with Bertolt Brecht to write *The Threepenny Opera* (1928) in a new "cabaret" style; the musical had enormous success in Berlin and elsewhere. In 1930 the two produced *The Rise and Fall of the City of Mahagonny*. When the Nazis took power in 1933, he fled to Paris with his wife, Lotte Lenya, where he wrote *The Seven Deadly Sins* (1933). In 1935 the couple immigrated to the U.S.; there he collaborated on musicals such as *Knickerbocker Holiday* (1938) and *Lost in the Stars* (1949). Two of his songs, the "Moritat" ("Mack the Knife") from *Threepenny Opera* and "September Song" from *Knickerbocker Holiday*, have remained especially popular.

Weimar Republic \'vī-ˌmär\ Government of Germany 1919–33, so named because the assembly that adopted its constitution met at Weimar in 1919. In its early years, the Weimar Republic was troubled by postwar economic and financial problems and political instability, but it had recovered considerably by the late 1920s. Its major political leaders included presidents Friedrich Ebert (1919–25) and Paul von Hindenburg (1925–34), as well as Gustav Stresemann, who was chancellor (1923) and foreign minister (1923–29). With the Great Depression, its political and economic collapse enabled Adolf Hitler to rise to power and become chancellor (1933), after which he suspended the Weimar constitution.

weimaraner \ˌvī-mə-'rä-nər, 'wī-mə-ˌrä-nər\ Dog breed developed in the early 19th century by German nobles of the court of Weimar. First used to hunt big game, the breed was later used as a bird dog and retriever. A graceful dog, it has hanging ears; blue, gray, or amber eyes; and a short, sleek, mouse- or silver-gray coat. It stands 23–27 in. (58–69 cm) and weighs 70–85 lbs (32–39 kg). It is characterized by an alert, well-balanced stance and is valued as an aggressive hunter and a good companion and watchdog.

Weingartner \'vīn-gärt-nər**, (Paul) Felix, lord von Münzberg** (b. June 2, 1863, Zara, Dalmatia, Austrian Empire—d. May 7, 1942, Winterthur, Switz.) Austrian conductor and composer. After studies in Leipzig, he came to the attention of Franz Liszt, who arranged the premiere of Weingartner's first opera at Weimar (1884). He held conducting posts at Danzig, Hamburg, and Mannheim, and he became conductor of the Berlin Opera in 1891. He succeeded Gustav Mahler as conductor of the Vienna Opera (1908–11) and stayed on with the Vienna Philharmonic until 1927. He also directed the Basel Conservatory (1927–33) and was a distinguished writer on music.

Weiser \'vī-zər**, Johann Conrad** (b. Nov. 2, 1696, near Herrenberg, Württemberg—d. July 13, 1760, Womelsdorf, Pa.) North American colonial Indian agent. He immigrated to New York in 1710 and lived briefly among the Iroquois before becoming a farmer and an Indian interpreter. In 1729 he moved to Pennsylvania, where he worked with the colony's Indian agent. He arranged agreements between Iroquois tribes and colonial governments that helped form a British-Indian alliance against the French.

Weisgall, Hugo (David) (b. Oct. 13, 1912, Eibenschutz, Moravia—d. March 11, 1997, Manhasset, N.Y., U.S.) Czech-born U.S. composer. Born into a musical family that had produced several generations of composers and cantors, he was raised in Baltimore, Md., U.S., from 1920. He studied composition with Roger Sessions and conducting with Fritz Reiner, also earning a doctorate in German literature from Johns Hopkins University. He is considered one of the most important U.S. opera composers for the literary quality of his chosen texts and the individuality and effectiveness of his music; his works include the operas *The Tenor* (1950), *The Stronger* (1952), and *Six Characters in Search of an Author* (1956); his last completed opera, *Esther* (1993), won wide acclaim.

Weiss \'vīs**, Peter (Ulrich)** (b. Nov. 8, 1916, Nowawes, near Potsdam, Ger.—d. May 10, 1982, Stockholm, Swed.) German playwright. After fleeing Germany in 1934, his family settled in Sweden. Weiss painted and made avant-garde films in the 1950s, then turned to fiction and drama, establishing a reputation in Germany with his novel *Exile* (1962). He won international acclaim for his play *The Persecution and Assassination of Jean-Paul Marat as Performed by the Inmates of the Asylum of Charenton Under the Direction of the Marquis de Sade* (1964; usually referred to as *Marat/Sade*), which addressed themes of individualism, revolution, and violence. Associated with the Theatre of Fact movement, he also wrote the documentary dramas *The Investigation* (1965), *The Song of the Lusitanian Bogey* (1967), and *Discourse on Vietnam* (1968).

Weissmuller \'wīs-ˌməl-ər**, Johnny** *in full* **Peter John Weissmuller** (b. June 2, 1904, Freidorf, near Timişoara, Rom.—d. Jan. 20, 1984, Acapulco, Mex.) U.S. freestyle swimmer and actor. He was reared in Chicago, where he attended the University of Chicago and developed into a champion swimmer. He won five Olympic gold medals (three in 1924, two in 1928) and set 67 world records. He later became even more famous as an actor, starring as Tarzan of the Apes in 12 films (1932–48) and later creating the role of the comic-book character Jungle Jim for film and television.

Weizmann \'vīts-män**, Chaim (Azriel)** (b. Nov. 27, 1874, Motol, Pol., Russian Empire—d. Nov. 9, 1952, Reḥovot, Israel) Russian-born Israeli chemist and first president of Israel (1949–52). After studying in Germany and Switzerland, he earned a doctorate in chemistry and patented several dyestuffs before moving to England to teach in 1904. His 1912 discovery of a bacterium that could convert carbohydrate to acetone proved of great value to the British armaments industry in World War I (1914–18), and in return the government aided his negotiations for the Balfour Declaration (1917). In 1919 he obtained an agreement on Jewish-Arab coexistence in Palestine from Fayṣal I, and in 1920 he became president of the World Zionist Organization, a post from which he was ousted in 1931. He settled in Reḥovot, Palestine, in 1937. Despite conflicts with more extreme Zionists, he was sent to the U.S. to secure support for Israel in 1948, and in 1949 he was elected president.

Welch, William Henry (b. April 8, 1850, Norfolk, Conn., U.S.—d. April 30, 1934, Baltimore, Md.) U.S. pathologist. He studied pathology in Germany before returning to the U.S. to open the nation's first pathology laboratory, at Bellevue Hospital Medical College in New York City (1879). From 1893 he directed the rise of Johns Hopkins University, where he developed the country's first true university department of pathology. He recruited William Osler and William S. Halsted for the faculty and was the medical school's first dean (1893–98). His curriculum revolutionized U.S. medicine by demanding that students study physical sciences and be actively involved in clinical duties and laboratory work. Welch also demonstrated the effects of diphtheria toxin and discovered bacteria involved in wound fever and gas gangrene.

Weld, Theodore Dwight (b. Nov. 23, 1803, Hampton, Conn., U.S.—d. Feb. 3, 1895, Hyde Park, Mass.) U.S. reformer. He left divinity studies to become an agent for the American Anti-Slavery Society (1834). His pamphlets *The Bible Against Slavery* (1837) and *Slavery as It Is* (1839) helped convert figures such as James Birney, Henry Ward Beecher, and Harriet Beecher Stowe to the antislavery cause. He married his coworker Angelina Grimké (1838), and they directed schools and taught in New Jersey and Massachusetts. In 1841–43 Weld organized an antislavery reference bureau in Washington, D.C., to assist congressmen seeking to repeal the gag rule restricting the consideration of antislavery petitions in Congress.

welding Technique for joining metallic parts, usually through the application of heat. Discovered in the 1st millennium AD during attempts to manipulate iron into useful shapes, the technique produced a strong, tough blade. Welding traditionally involved interlayering relatively soft and tough iron with high-carbon material, followed by hammer forging. Modern welding processes include gas welding, arc welding, and resistance welding. More recently, electron-beam welding, laser welding, and several solid-phase processes such as diffusion bonding, friction welding, and ultrasonic joining have been developed. See also brazing, soldering.

Welensky, Sir Roy (b. Jan. 20, 1907, Salisbury, Southern Rhodesia—d. Dec. 5, 1991, Blandford Forum, Dorset, Eng.) Rhodesian politician. He worked on the railways as a youth, later becoming head of the Railway Workers Union. He held the heavyweight boxing title for Rhodesia, 1925–27. He began his political career with election to Northern Rhodesia's legislature in 1938. A strong supporter of the Federation of Rhodesia and Nyasaland (now Zambia, Zimbabwe, and Malawi), he was elected to its first parliament, became prime minister in 1956, and served until the federation broke up in 1963.

Welf dynasty \'welf\ Dynasty of German nobles and rulers. They descended from Count Welf of Bavaria (early 9th century), whose daughters married Louis I the Pious and Louis the German. The Welfs were linked to the House of Este in the 11th century. They supported the papal party against Emperor Henry IV and were rivals of the Hohenstaufens in central Europe and in Italy (where their name was Guelpho; see Guelphs and Ghibellines). As part of the House of Hanover, they became rulers of Britain.

welfare *or* **social welfare** Any of a variety of governmental programs that provide assistance to those in need. Programs include pensions, disability and unemployment insurance, family allowances, survivor benefits, and national health insurance. The earliest modern welfare laws were enacted in Germany in the 1880s (see social insurance), and by the 1920s and '30s most Western countries had adopted similar programs. Most industrialized countries require firms to insure workers for disability (see workers' compensation) so that they have income if they are injured, whether temporarily or permanently. For disability from illness unrelated to occupational injury, most industrial states pay a short-term benefit followed by a long-term pension. Many countries pay a family allowance to reduce the poverty of large families or to increase the birth rate. Survivor

© 2006 Encyclopædia Britannica, Inc.

benefits, provided for widows below pension age who are left with a dependent child, vary considerably among nations and generally cease if the woman remarries. Among the world's wealthy countries, only the U.S. fails to provide national health insurance other than for the aged and the poor (see MEDICARE AND MEDICAID).

welfare economics Branch of economics established in the 20th century that seeks to evaluate economic policies in terms of their effects on the community's well-being. Early theorists defined WELFARE as the sum of the satisfactions accruing to an individual through an economic system. Believing it was possible to compare the well-being of two or more individuals, they argued that a poor person would derive more satisfaction from an increase in income than would a rich person. Later writers argued that making such comparisons with any precision was impossible. A new and more limited criterion was later developed: one economic situation was deemed superior to another if at least one person had been made better off without anyone else being made worse off. See also CONSUMER'S SURPLUS; VILFREDO PARETO.

Welfare Island See ROOSEVELT ISLAND

Welfare Party See REFAH PARTY

welfare state Concept of government in which the state plays a key role in protecting and promoting the economic and social well-being of its citizens. It is based on the principles of equality of opportunity, equitable distribution of wealth, and public responsibility for those who lack the minimal provisions for a good life. The term may be applied to a variety of forms of economic and social organization. A basic feature of the welfare state is SOCIAL INSURANCE, intended to provide benefits during periods of greatest need (e.g., old age, illness, UNEMPLOYMENT). The welfare state also usually includes public provision of education, health services, and housing. Such provisions are less extensive in the U.S. than in many European countries, where comprehensive health coverage and state-subsidized university-level education have been common. In countries with centrally planned economies, the welfare state also covers employment and administration of consumer prices. Most nations have instituted at least some of the measures associated with the welfare state; Britain adopted comprehensive social insurance in 1948, and in the U.S., social-legislation programs such as the NEW DEAL and the Fair Deal were based on welfare-state principles. Scandinavian countries provide state aid for the individual in almost all phases of life.

Welk, Lawrence (b. March 11, 1903, Strasburg, N.D., U.S.—d. May 17, 1992, Santa Monica, Calif.) U.S. bandleader and television performer. Born in a German-speaking village in North Dakota, he did not learn English until he was 21. He played the accordion and formed two musical groups that opened for bands and orchestras in the Midwest. Welk moved to Los Angeles, where his television program *The Lawrence Welk Show* (1955–71), which featured band music with vocalists, dancers, and instrumental soloists, became a huge success. The show was dropped by the network, but Welk continued it as *Memories with Lawrence Welk* (1971–82) after he was able to sign contracts with more than 250 independent television stations in the U.S. and Canada. Known for his unpretentious warmth and his trademark phrase "Wunnerful, wunnerful," he played light, nostalgic "champagne music" and featured smiling performers such as the Lennon Sisters.

well-field system Communal land organization supposedly in effect early in the ZHOU DYNASTY (1046–256 BC). It is mentioned in the writings of MENCIUS, who advocated it. In the well-field system, one unit of land was divided among eight peasant families. A shared field was surrounded by eight fields, each worked by an individual family. The field in the centre was worked jointly by the families for their lord. Later reformers referred to the concept to justify their land-redistribution systems or to criticize government land practices.

well-made play *French* **pièce bien faite** Play constructed according to strict technical principles that produce neatness of plot and theatrical effectiveness. The form was developed c. 1825 by EUGÈNE SCRIBE and became dominant on 19th-century European and U.S. stages. It called for complex, artificial plotting, a buildup of suspense, a climactic scene in which all problems are resolved, and a happy ending. Scribe's hundreds of successful plays were imitated all over Europe; other practitioners of the form included playwrights VICTORIEN SARDOU, GEORGES FEYDEAU, and ARTHUR WING PINERO, who brought the form to the level of art with *The Second Mrs. Tanqueray* (1893).

Weller, Thomas H(uckle) (b. June 15, 1915, Ann Arbor, Mich., U.S.) U.S. physician and virologist. He studied at Harvard Medical School. For culturing poliomyelitis virus, which led to the development of polio vaccines, he shared a 1954 Nobel Prize with John Enders (1879–1985) and Frederick Robbins (b. 1916). He was the first (with Franklin Neva) to culture rubella virus and to isolate chickenpox virus from human cell cultures. He served as director of Harvard University's Center for the Prevention of Infectious Diseases (1966–81).

Welles \'welz**, Gideon** (b. July 1, 1802, Glastonbury, Conn., U.S.—d. Feb. 11, 1878, Hartford, Conn.) U.S. politician. Cofounder and editor the *Hartford Times* (1826–36), he founded one of the first Republican Party newspapers in New England, the *Hartford Evening Press* (1856). In 1861 he was appointed secretary of the navy by Pres. ABRAHAM LINCOLN, and in the American Civil War he built a large Union navy from a few ships, supported development of the IRONCLADS, and helped form the strategic naval blockade. His *Diary of Gideon Welles* (published 1911) contains valuable insights into the Civil War.

Welles, (George) Orson (b. May 6, 1915, Kenosha, Wis., U.S.—d. Oct. 10, 1985, Los Angeles, Calif.) U.S. film director, actor, and producer. He began acting on stage at 16 and made his Broadway debut in 1934. He directed an all-African American cast in *Macbeth* for the Federal Theatre Project. In 1937 he and JOHN HOUSEMAN formed the Mercury Theatre, creating a series of radio dramas, attempting to mount MARC BLITZSTEIN's *The Cradle Will Rock* in the face of determined opposition, and winning notoriety with their panic-producing broadcast of *War of the Worlds* (1938). Welles then moved to Hollywood, where he cowrote, directed, produced, and acted in the classic *Citizen Kane* (1941), noted for its innovative narrative technique and atmospheric cinematography and considered among the most influential movies in film history. His other films include *The Magnificent Ambersons* (1942), *The Stranger* (1946), *The Lady from Shanghai* (1948), *Touch of Evil* (1958), and *Chimes at Midnight* (1966). His problems with Hollywood studios curtailed future productions, and he moved to Europe. He was also notable as an actor in *Jane Eyre* (1944), *The Third Man* (1949), and *Compulsion* (1959).

Wellesley (of Norragh), Richard Colley Wellesley, Marquess (b. June 20, 1760, Dangan, County Meath, Ire.—d. Sept. 26, 1842, London, Eng.) British statesman. He inherited his father's Irish title as earl of Mornington and sat in the Irish House of Lords from 1781. He served in the British House of Commons (1784–97). As governor of Madras and governor general of Bengal (1797–1805), he used military force and annexation to greatly enlarge the British Empire in India, but he was recalled by the East India Co. for his vast expenditures. In 1809 he went to Spain to make diplomatic preparations for the Peninsular War; he served as foreign secretary (1809–12). As lord lieutenant of Ireland (1821–28, 1833–34) he tried to reconcile Protestants and Catholics. Despite his own achievements, he became increasingly jealous of his younger brother, the duke of WELLINGTON.

Wellesley College Private women's college in Wellesley, Mass., chartered in 1870. Long one of the most eminent women's colleges in the U.S., it was the first to provide scientific laboratories. It grants bachelor's degrees in humanities, including Chinese, Japanese, and Russian languages; in social science, including African studies, religion, and economics; and in science and mathematics, including computer science. Among its facilities are an advanced science centre and an observatory.

Wellington City (pop., 2001 prelim.: 165,945), port, and capital of New Zealand. It is located at the southern shore of the NORTH ISLAND, on Port Nicholson. Founded in 1840, it became a municipality in 1853. In 1865 the capital was transferred there from AUCKLAND. It is the financial, commercial, and transportation centre of New Zealand. Wellington produces transportation equipment, machinery, metal products, textiles, and printed materials. It is the site of the major government buildings and the headquarters of many cultural, scientific, and agricultural organizations.

Wellington, Arthur Wellesley, 1st duke of (b. May 1, 1769, Dublin, Ire.—d. Sept. 14, 1852, Walmer Castle, Kent, Eng.) British general. Son of the Irish earl of Mornington, he entered the army in 1787 and served in the Irish Parliament (1790–97). Sent to India in 1796, he commanded troops to victories in the Maratha War (1803). Back in England, he served in the British House of Commons and as chief secretary in Ireland (1807–09). Commanding British troops in the PENINSULAR WAR, he won battles against the French in Portugal and Spain and invaded France to win the war in 1814, for which he was promoted to field marshal and

© 2006 Encyclopædia Britannica, Inc.

created a duke. After Napoleon renewed the war against the European powers, the "Iron Duke" commanded the Allied armies to victory at the Battle of Waterloo (1815). Richly rewarded by English and foreign sovereigns, he became one of the most honoured men in Europe. After commanding the army of occupation in France (1815–18) and serving in the Tory cabinet as master general of ordnance (1818–27), he served as prime minister (1828–30), but he was forced to resign after opposing any parliamentary reform. He was honoured on his death by a monumental funeral and burial in St. Paul's Cathedral alongside Horatio Nelson.

Wellman, William (Augustus) (b. Feb. 29, 1896, Brookline, Mass, U.S.—d. Dec. 9, 1975, Los Angeles, Calif.) U.S. film director. He was a flying ace in World War I and later a barnstorming stunt pilot. He acted in *Knickerbocker Buckeroo* (1919) with Douglas Fairbanks before turning to directing. Known as "Wild Bill," he made the aerial dogfight classic *Wings* (1929, Academy Award), setting standards for documentary realism, and he launched a gangster movie trend with *Public Enemy* (1931), starring James Cagney. *The Ox-Bow Incident* (1942), considered one of his best films, examined frontier justice in the American West. In *Track of the Cat* (1954), Wellman experimented with the minimal use of colour. His other films include *A Star Is Born* (1937), *Nothing Sacred* (1937), *Beau Geste* (1939), *The Story of GI Joe* (1945), and *The High and the Mighty* (1954).

Wells, H(erbert) G(eorge) (b. Sept. 21, 1866, Bromley, Kent, Eng.—d. Aug. 13, 1946, London) English novelist, journalist, sociologist, and historian. While studying science under T.H. Huxley in London, Wells formulated a romantic conception of the subject that would inspire the inventive and influential science-fiction and fantasy novels for which he is best known, including the epochal *The Time Machine* (1895), *The Invisible Man* (1897), and *The War of the Worlds* (1898). He simultaneously took on a public role as an agitator for progressive causes, including the League of Nations. He later abandoned science fiction and drew on memories of his lower-middle-class early life in works including the novel *Tono-Bungay* (1908) and the comic *The History of Mr. Polly* (1910). He had a 10-year affair with the young Rebecca West. World War I shook his faith in human progress, prompting him to promote popular education through nonfiction works including *The Outline of History* (1920). *The Shape of Things to Come* (1933) was an antifascist warning. Though a sense of humour reappears in *Experiment in Autobiography* (1934), most of his late works reveal a pessimistic, even bitter outlook.

Wells, Ida B(ell) *or* **Ida Bell Wells-Barnett** (b. July 16, 1862, Holly Springs, Miss., U.S.—d. March 25, 1931, Chicago, Ill.) U.S. journalist and antilynching crusader. The daughter of slaves, she was educated at a freedmen's school in Holly Springs and later at Fisk University in Nashville, Tenn. She was a teacher until the late 1880s, when she turned to journalism, writing articles for African American-owned newspapers on issues such as the limited education available to African American children. In 1892, after three of her friends were lynched by a mob, Wells began an editorial campaign against lynching that quickly led to the destruction of her newspaper's office by whites. She continued her antilynching campaign as a lecturer and founder of antilynching societies and African American women's clubs throughout the U.S. In 1895 she married Ferdinand Barnett and began writing for his newspaper, the *Chicago Conservator*. In 1910 she founded the Chicago Negro Fellowship League. She also founded Chicago's Alpha Suffrage Club, perhaps the first African American woman-suffrage group.

Wells, Kitty *orig.* **Muriel Ellen Deason** (b. Aug. 30, 1919, Nashville, Tenn., U.S.) U.S. country music singer and songwriter. She sang gospel music in church as a child. In the 1930s she made her radio debut and took her name from a Carter family song. She married Johnny Wright in 1937, and they performed together off and on since. Her first major hit was the classic "It Wasn't God Who Made Honky Tonk Angels" (1952). Her extensive repertory made her the top-ranking female country artist for some 15 years, paving the way for later stars such as Patsy Cline and Loretta Lynn.

Wells Fargo & Co. Leading U.S. banking and financial services company formerly involved in express transport. Founded in 1852, Wells, Fargo transported gold between the west and east coasts in the wake of the California gold rush. By 1866 it had gained control of almost all stagecoach business in the West. In 1905 its banking operations were separated from its express operations. The express carrier disappeared by the mid 1920s, its domestic business taken over by the firm later known as the Railway Express Agency and its foreign express business by American Express Co. Its security services still exist under the name Wells Fargo Armored Service Corp., a subsidiary of Baker Industries. The Wells Fargo Bank's holding company, Wells Fargo & Co., was established in 1968. Headquartered in San Francisco, the bank has subsidiaries and affiliates worldwide. In 1998 Wells Fargo & Co. merged with Norwest Corp.

Welsh corgi \'kȯr-gē\ Either of two breeds of cattle dogs. The Cardigan Welsh corgi was developed from relatives of the dachshund that Celts brought to Wales c. 1200 BC. The Pembroke Welsh corgi is descended from sled-dog stock brought to Wales about 1100 by Flemish weavers. Both have short legs, a foxlike head, and erect ears, and both stand 10–12 in. (25–30 cm) tall and weigh 25–38 lb (11–17 kg). The Cardigan has a long tail and rounded ears; the Pembroke has a short tail and pointed ears. The Cardigan's coarser coat can be solid-coloured, tricoloured, or mottled; the Pembroke is solid- or bicoloured.

Welsh language Celtic language of Wales. Besieged for centuries by the English language, Welsh continues to be spoken by 18–20% of the population of Wales, or more than half a million people, though estimates of the actual number of first-language speakers vary widely. Welsh is traditionally divided into three periods: Old Welsh (c. 800–1150), attested mainly in glosses and short textual passages; Middle Welsh (c. 1150–1500), with a rich medieval literature including poetic texts originally composed much earlier; and Modern Welsh (from c. 1500). Modern literary Welsh was largely fixed by William Salesbury's Bible translation. Vernacular Welsh, split along dialectal lines, has long been diverging from literary Welsh; many modern speakers cannot write or easily understand the traditional written language. The issue of an acceptable modern standard remains unresolved.

Welsh literary renaissance Literary activity in Wales and England in the mid-18th century that attempted to stimulate interest in the Welsh language and in the classical bardic verse forms of Wales. It was centred on the Morris family of Welsh scholars, who preserved ancient texts and encouraged contemporary poets to use the strict metres of the ancient Welsh bards. The movement gave rise to many publications and helped reestablish local eisteddfods and, in the early 19th century, the National Eisteddfod. A second revival began with the establishment of the University of Wales at the end of the 19th century.

Welty, Eudora (b. April 13, 1909, Jackson, Miss., U.S.—d. July 23, 2001, Jackson) U.S. short-story writer and novelist. Welty focused her work on a small town that resembled her birthplace and the Delta country. Her main subject is the intricacies of human relationships. She first gained attention for the story collection *A Curtain of Green* (1941), containing the widely admired "Petrified Man" and "Why I Live at the P.O." Other stories appear in *The Wide Net* (1943), *The Golden Apples* (1949), and *The Bride of the Innisfallen* (1955). Her novels include *Delta Wedding* (1946), *The Ponder Heart* (1954), and *The Optimist's Daughter* (1972, Pulitzer Prize). Her works combine humour and psychological acuity with a sharp ear for regional speech patterns. She also published books of her photographs, including those she took while working for the Works Progress Administration during the Great Depression.

Wen Jiabao (b. Sept. 1942, Tianjin, China) Premier of China (from 2003). While studying at the Beijing Institute of Geology, Wen joined the Chinese Communist Party (CCP). In 1985 he was named deputy director of the General Office of the CCP Central Committee and the following year became director. While at the General Office, Wen also served as chief of staff to several general secretaries of the CCP, including Zhao Ziyang. The two men faced criticism after visiting Beijing's Tiananmen Square during a series of pro-democracy demonstrations and being photographed talking with protestors. Although Zhao was placed under house arrest, Wen escaped any lasting political damage. In 1993 he became a full member of the Secretariat of the CCP Central Committee and four years later a member of the Political Bureau. In 1998 he was appointed one of China's four vice-premiers. Aided by his experience in shaping agricultural policy, Wen succeeded Zhu Rongji as premier in 2003.

Wen Zhengming *or* **Wen Cheng-ming** (b. 1470, Suzhou, Jiangsu province, China—d. 1559) Chinese painter, calligrapher, and scholarly figure. Born to an established family, Wen Zhengming was by nature sensitive and withdrawn, and it was not until age 53 that he emerged from his scholarly isolation, receiving the recognition of the court with his appointment to the Hanlin Academy. He stayed there for only three years and then retired to produce his best-known works. He was expert at the

© 2006 Encyclopædia Britannica, Inc.

four major styles of calligraphy: seal, official, regular, and "running." In all his paintings there is a spirit of studied antiquarianism and cautious consideration. In technique, Wen Zhengming's paintings range from the highly detailed to the more freely washed. Along with his teacher, Shen Zhou, he was a leading figure of the Wu school of scholar-artists.

Wenceslas (b. Feb. 26, 1361, Nürnberg—d. Aug. 16, 1419, Prague) King of Bohemia (as Wenceslas IV, 1363–96) and German king and Holy Roman emperor (1378–1400). The son of the emperor Charles IV, he was a weak ruler whose reign was plagued by wars and princely rivalries. He spent most of his time in Prague to the detriment of Germany, which suffered a decade of anarchy until peace was established by the Diet at Eger (1389). He was deposed by rebellious princes in 1400.

Wenceslas \'wen-sə-ˌslȯs\ **I** (b. 1205—d. Sept. 23, 1253) King of Bohemia (1230–53). He prevented Mongol armies from attacking Bohemia in 1241 but could not defend Moravia. He gained control of Austria and forced the Austrian estates to accept his son Přemysl Otakar II as their duke in 1251. Bohemia prospered under his reign, and an influx of German colonists and craftsmen enriched the country.

Wenceslas II (b. Sept. 17, 1271—d. June 21, 1305) King of Bohemia (1278–1305). He inherited the throne from his father at age seven, but his cousin Otto IV of Brandenburg served as his regent until 1283. Wenceslas gained full control of the country only after suppressing a dissident faction and executing his ambitious stepfather in 1290. A capable ruler who extended the boundaries of his kingdom, he annexed most of Upper Silesia and occupied Kraków (1291). He became king of Poland in 1300 but declined to become king of Hungary in 1301, instead placing his son Wenceslas on the Hungarian throne (1301–04).

Wend Any member of a group of Slavic tribes that by the 5th century AD had settled in the area between the Oder and Elbe rivers in what is now eastern Germany. They occupied the eastern borders of the domain of the Franks and other Germanic peoples. From the 6th century the Franks warred sporadically against the Wends; under Charlemagne in the early 9th century they began a campaign to subjugate the Wends and forcibly convert them to Christianity. German annexation of Wendish territories began in 929 but collapsed during a Wendish rebellion in 983. A German Crusade against the Wends in 1147, authorized by the church and led by Henry the Lion, inflicted great loss of life. The Wends thereafter offered little opposition to German colonization of the Elbe-Oder region; themselves enserfed, they were gradually assimilated by the Germans, except for a minority in the traditional region of Lusatia (in eastern Germany) who are now known as Sorbs.

Wenders \'ven-dərs**, Wim** *orig.* **Ernst Wilhelm Wenders** (b. Aug. 14, 1945, Düsseldorf, Ger.) German film director. He directed short films from 1967 and made features from 1973, including *Alice in the Cities* (1974) and *Kings of the Road* (1976), which explored themes of alienation and anxiety that are typical of Wenders's work. He won acclaim in the U.S. for *Paris, Texas* (1984) and *Wings of Desire* (1987). He later directed *Far Away, So Close* (1993), *Lisbon Story* (1994), *The End of Violence* (1997), and the documentary *Buena Vista Social Club* (1999).

Wendi *or* **Wen Ti** \'wən-'dē\ Chinese god of literature. His chief heavenly task is to keep a register of men of letters so that he can mete out rewards and punishments to each according to merit. He had 17 reincarnations, during the ninth of which he appeared on earth as Zhang Ya. His writing earned him canonization during the Tang dynasty.

Wendi *or* **Wen-ti** \'wən-'dē\ *orig.* **Liu Heng** (b. 203 BC, China—d. 157 BC, China) Fourth emperor of the Chinese Han dynasty. His long reign (180–157 BC) was one of good government and peaceful consolidation of power. Under his rule, China's economy prospered and its population expanded. To later ages Wendi epitomized the virtues of frugality and benevolence in a Chinese ruler.

Wendi *or* **Wen-ti** *orig.* **Yang Jian** (b. 541, China—d. 604, China) Founder of the Chinese Sui dynasty, which reunified China after centuries of instability. He was born into a powerful family in northern China, an area controlled by the non-Chinese Northern Zhou dynasty (557–81). When the Zhou emperor died unexpectedly, Wendi seized the throne, overcame his rivals, and in 581 proclaimed the Sui dynasty. Intending to build a strong, centralized state, he designed a huge new capital at Chang'an and attacked entrenched local interests. Families with hereditary local power were replaced with officials selected by examination, who were forbidden to serve in the areas from which they came and were rotated frequently. Wendi conquered the dynasties of southern China and broke the power of the Turkish empires in Turkistan and Mongolia. He put the equal-field system into practice and produced a new legal code. His government brought in tax revenues and maintained price-regulating granaries. In old age he became deeply involved with Buddhism, building shrines and dicating relics. See also Yang Di.

Wentworth, Thomas See Thomas Wentworth, 1st earl of Strafford

Wenwang *or* **Wen-wang** \'wən-'wäŋ\ *or* **Xibo** (fl. 12th century BC, China) Father of Wuwang (founder of the Zhou dynasty) and one of the sage rulers regarded by Confucian historians as a model king. He is traditionally credited as author of the divination formulas of the *Yijing* (*I Ching*), which he is supposed to have written during his imprisonment by the last ruler of the Shang dynasty. See also Confucianism; Five Classics.

Wenzel Anton, prince von Kaunitz \'kaù-nits\ **-Rietberg** (b. Feb. 2, 1711, Vienna, Austria—d. June 27, 1794, Vienna) Austrian state chancellor (1753–92). He entered the Austrian foreign service in 1740 and was responsible for the foreign policy of the Habsburg monarchy, serving Maria Theresa and her successors. He represented Austria at the 1748 Aix-la-Chapelle peace conference and was ambassador to Paris (1750–52). A lifelong enemy of Prussia, he managed to reverse Austria's alliances during the Seven Years' War, bringing France and Russia into the Habsburg orbit and isolating Prussia. The French Revolution terminated the system of alliances he had created, and he resigned in 1792.

werewolf In European folklore, a man who changes into a wolf at night and devours animals, people, or corpses, returning to human form by day. Some werewolves are thought to change shape at will; others, who inherited the condition or acquired it by being bitten by a werewolf, are transformed involuntarily under the influence of a full moon. Belief in werewolves is found throughout the world and was especially common in 16th-century France. Humans who believe they are wolves suffer from a mental disorder called lycanthropy.

Lon Chaney, Jr., as a werewolf in *The Wolf Man* (1941).

Werner \'ver-nər**, Abraham Gottlob** (b. Sept. 25, 1750, Wehrau, Saxony—d. June 30, 1817, Freiberg) German geologist. In opposition to the Plutonists, or Vulcanists, who argued that granite and many other rocks were of igneous origin, he founded the Neptunist school, which proclaimed that all rocks resulted from precipitation from oceans that had, he theorized, once completely covered the Earth. He rejected uniformitarianism. His brilliant lecturing and personal charm won him many students, who, though many eventually discarded his theories, would not renounce them while Werner lived.

Wertheimer \'vert-ˌhī-mər**, Max** (b. April 15, 1880, Prague, Czech.—d. Oct. 12, 1943, New Rochelle, N.Y., U.S.) German psychologist. He taught at the Universities of Frankfurt and Berlin (1916–29) before immigrating to the U.S. to teach at the New School for Social Research (1933–43). With Wolfgang Köhler and Kurt Koffka (1886–1941), he was instrumental in establishing Gestalt psychology. Much of his work dealt with perception, though he also explored thinking and problem solving. His *Productive Thinking* was published posthumously in 1945.

Wertmüller \'vert-ˌmü-lər**, Lina** *orig.* **Arcangela Wertmüller von Elgg** (b. Aug. 14, 1928, Rome, Italy) Italian film director. After working as a puppeteer and stage actress and director, she became an assistant to Federico Fellini and began writing and directing her own films in 1963. She achieved international fame with *The Seduction of Mimi* (1972), a satire on sexual hypocrisy, and *Love and Anarchy* (1972). Her most controversial works were the witty *Swept Away* (1974) and the morally ambiguous *Seven Beauties* (1976), about a man scrabbling to survive in a Nazi concentration camp. Her later movies, including *Ciao, Professore* (1994), were less successful.

Weser River \'vā-zər\ River, western Germany. Formed by the union of the Fulda and Werra rivers at Münden, it flows northward into the North Sea through a large estuary. It is 273 mi (440 km) long. There are several hydroelectric dams on the Weser, and it is linked with numerous canals.

© 2006 Encyclopædia Britannica, Inc.

Wesley, John (1703–1791) Anglican clergyman, evangelist, and cofounder of Methodism. The 15th child of a former Nonconformist minister, he graduated from Oxford University and became a priest in the Church of England in 1728. From 1729 he participated in a religious study group in Oxford organized by his brother Charles (1707–1788), its members being dubbed the "Methodists" for their emphasis on methodical study and devotion. Its numbers grew, and it began to undertake social and charitable activities. After a largely unsuccessful mission to the North American colony of Georgia (1735–37), they returned to London, where they came under the influence of the Moravian Church. In 1738, inspired by the theology of Martin Luther, both men had a religious experience that convinced them that salvation was possible through faith alone. Zealous evangelists, they had great success in preaching to the masses in the succeeding decades. In 1784 John began ordaining ministers himself when the bishop of London refused to do so (despite Charles's disapproval) and declared his independence from the Church of England. The two wrote several thousand hymns, including "Hark, the Herald Angels Sing" and "Christ the Lord Is Ris'n Today."

Wesleyan University Private university in Middletown, Conn. It was founded in 1831 by Methodists, who named the institution for John Wesley. Its formal ties to the Methodist church ended in 1937. Wesleyan offers 50 major fields of undergraduate and graduate study, including roughly one dozen master's and doctoral programs in music and sciences. Campus facilities include centres for African American and East Asian studies, an astronomical observatory, and the Center for Humanities and Arts.

Wessex Ancient Anglo-Saxon kingdom, southern England. Its area approximated that of the counties of Hampshire, Dorset, Wiltshire, Somerset, Berkshire, and Avon. Its capital was Winchester. The kingdom is traditionally thought to have been founded by Saxon invaders of Britain c. 494. Wessex conquered Kent and Sussex, and in the 9th century, under King Alfred the Great, it prevented the Danes from conquering England south of the Danelaw. By 927 Wessex had reconquered the Danelaw, and Alfred's grandson, Athelstan, had become king of all England; thereafter all kings of Wessex were kings of England. The region figures prominently in legends of King Arthur (see Arthurian legend), and the designation "Wessex" was used by Thomas Hardy to represent the region of southwestern England in which he set his works of fiction.

West, Benjamin (b. Oct. 10, 1738, near Springfield, Pa.—d. March 11, 1820, London, Eng.) U.S.-British painter. After studying painting in his native Philadelphia, he established himself as a portraitist in New York City. He sailed to Italy in 1760 and visited most of its art centres before settling in London in 1763. The patronage of George III freed him of the need to paint portraits for a living, and he became known for historical, religious, and mythological subjects. His *Death of General Wolfe* (1771) aroused controversy for its depiction of modern dress rather than the flowing robes expected in a history painting, but it was one of his most popular works. He never returned to the U.S., but through such pupils and followers as Washington Allston, Gilbert Stuart, Charles Willson Peale, and John Singleton Copley he exerted considerable influence on the development of U.S. art in the 19th century.

West, Jerry *in full* **Jerome Alan West** (b. May 28, 1938, Cheylan, W.Va., U.S.) U.S. basketball player, coach, and manager. As a sharpshooting guard for the Los Angeles Lakers (1960–74), he compiled a career scoring average of 27 points and earned the nickname "Mr. Clutch." As the Lakers' head coach (1976–79), he led them to 145 wins and 101 losses. He later became the team's general manager and executive vice president and contributed to the team's eight NBA titles between 1980 and 2002. In 2002 he joined the front office of the Memphis Grizzlies.

West, Mae (b. Aug. 17, 1892/93, Brooklyn, N.Y., U.S.—d. Nov. 22, 1980, Los Angeles, Calif.) U.S. film actress. She performed with a Brooklyn stock company around 1901, and by 1907 she had become a performer on the national vaudeville circuit. She made her Broadway debut as a singer and dancer in 1911. In 1926 she began to write, produce, and star in her own Broadway plays, including the sensation-creating *Sex* (1926), *Diamond Lil* (1928), and *The Constant Sinner* (1931), productions that mired her in legal battles. Her frank sensuality, regal postures, and suggestive wisecracks became her trademarks in popular movies such as *She Done Him Wrong* (1933), *Belle of the Nineties* (1934), *I'm No Angel* (1933), and *My Little Chickadee* (1940). In World War II Allied soldiers called their inflatable life jackets "Mae Wests" in honour of her hourglass figure. Her films were revived in the 1960s, and she appeared in *Myra Breckenridge* (1970) and *Sextette* (1979).

West, Nathanael *orig.* **Nathan Weinstein** (b. Oct. 17, 1903, New York, N.Y., U.S.—d. Dec. 22, 1940, near El Centro, Calif.) U.S. writer. He attended Brown University and was supporting himself as a hotel manager, giving free or low-rent rooms to struggling fellow writers, when he wrote the novella *Miss Lonelyhearts* (1933), about an advice columnist whose attempts to solace his correspondents end in ironic defeat. *A Cool Million* (1934) mocks the American dream as popularized by Horatio Alger. His last novel, *The Day of the Locust* (1939), depicts the savagery lurking beneath the Hollywood dream. Though not widely read until after his death in an auto accident at age 37, West is now considered a major American novelist.

West, Dame Rebecca *orig.* **Cicily Isabel Fairfield** (b. Dec. 21, 1892, London, Eng.—d. March 15, 1983, London) British journalist, novelist, and critic. Trained as an actress, from 1911 West contributed to the left-wing press and made a name as a fighter for woman suffrage. She had a 10-year love affair (1913–23) with the novelist H.G. Wells. Her novels, including *The Judge* (1922), *The Thinking Reed* (1936), and *The Birds Fall Down* (1966), attracted less attention than her social and cultural writings. Her admired reports on the Nürnberg trials were collected in *A Train of Powder* (1955). Her history of Yugoslavia, *Black Lamb and Grey Falcon* (1942), is regarded as one of the century's finest nonfiction works. In 1946 she reported on the trial for treason of William Joyce, articles that were later published as *The Meaning of Treason* (1949).

West Bank Area (pop., 2002 est.: 2,414,000), Palestine, west of the Jordan River and east of Jerusalem. Covering an area of about 2,270 sq mi (5,900 sq km), excluding east Jerusalem, the territory is also known within Israel by its biblical names, Judaea and Samaria. It is a region with deep history, forming the heart of historic Palestine. Populated areas include Nabulus, Hebron, Bethlehem, and Jericho. Under a 1947 UN agreement, most of what is now the West Bank was to become part of a Palestinian state. When the State of Israel was formed, the Arabs attacked Israel (see Arab-Israeli wars), and the partition plan was never adopted. Following a truce, Jordan remained in control of the area and annexed it in 1950. Israel subsequently occupied it during the Six-Day War of 1967. During the 1970s and '80s Israel established settlements there, provoking resentment among the Arab population and protest from the international community. Arab uprisings began in 1987 in the Gaza Strip and spread to the West Bank (see *intifādah*). Jordan relinquished its claims in 1988, ceding them to the Palestine Liberation Organization (PLO). Secret meetings between the PLO and Israel in 1993 led to an end of violence and an agreement granting Palestinian self-rule in parts of the West Bank and Gaza Strip. Further negotiations to resolve outstanding issues proceeded intermittently in the 1990s but broke down amid renewed violence in late 2000.

West Bengal State (pop., 2001 prelim.: 80,221,171), northeastern India. It is bordered by Nepal and Bangladesh and the states of Orissa, Jharkhand, Bihar, Sikkim, Assam, and Meghalaya and has an area of 34,267 sq mi (88,752 sq km); the capital is Kolkata (Calcutta). It encompasses two broad natural regions, the Gangetic Plain in the south and the Himalayas in the north. From the 3rd century BC it formed part of Ashoka's empire. In the 4th century AD it was absorbed into the Gupta empire. From the 13th century it was under Muslim rule, until it came under the British in 1757. At Indian independence in 1947, it was partitioned, with the eastern sector becoming East Pakistan (later Bangladesh) and the western sector becoming India's West Bengal. The state is important for its mineral output, but agriculture is its main economic activity. It is noted for its artistic endeavours, including filmmaking.

West Florida Controversy Dispute over status of American territory in a region on the Gulf of Mexico between the Apalachicola and Mississippi rivers. First claimed by Spain in 1492, it was occupied by France as part of Louisiana after 1695, then passed under various treaties to Britain (1763) and Spain (1783). The U.S. claimed it as part of the Louisiana Purchase (1803), and American frontiersmen rebelled against Spanish control in 1810. Under the Transcontinental Treaty of 1819, Spain ceded all claim to West Florida, and it became part of the U.S. in 1821.

West Indies Islands, enclosing the Caribbean Sea. Lying between southeastern North America and northern South America, they may be divided into the following groups: the Greater Antilles, including Cuba,

© 2006 Encyclopædia Britannica, Inc.

Jamaica, Hispaniola (Haiti and the Dominican Republic), and Puerto Rico; the Lesser Antilles, including the Virgin Islands, Windward Islands, Leeward Islands, Barbados, and the islands in the southern Caribbean Sea north of Venezuela (generally considered to include Trinidad and Tobago); and the Bahamas. Although physiographically not a part of the West Indies, Bermuda is often included.

West Midlands Metropolitan county (pop., 2001: 2,555,596), west-central England. Its main centre is Birmingham. From 1974 to 1986 West Midlands was an administrative metropolitan county; in 1986 its administrative functions were dispersed, and it is now a geographic and ceremonial county without administrative authority. Early settlement was sparse until Saxon colonists arrived; Coventry was the region's only significant town by the late 14th century. Small metalworking industries began in Birmingham in the 16th century, and by the 18th century the area's coalfields were important for ironworking. Many of the West Midlands' traditional metallurgical and manufacturing industries persisted into the 21st century, alongside the growth of electrical engineering and the manufacture of motor vehicles, aircraft, and synthetic fibres. The West Midlands name is also applied to the western portions of the Midlands region comprising Staffordshire, Warwickshire, Shropshire, Herefordshire, and Worcestershire; this combined area constitutes one of England's so-called standard regions.

West Nile virus Virus, belonging to the family Flaviviridae, that can cause encephalitis (inflammation of the brain). West Nile is predominantly a fatal infection of birds but can be transmitted to humans by mosquitoes. Most human infections are inapparent or mild, causing a flu-like illness that lasts only a few days. A minority develop encephalitis, characterized by headache, fever, neck stiffness, and muscle weakness, that has proved fatal in some cases. There is no cure. In severe cases, intensive medical care, involving intravenous fluids and respiratory support, is necessary. The virus was originally confined to Africa, the Middle East, and Southeast Asia but has spread to Europe and North America.

West River See Xi River

West Sussex Administrative county (pop., 2001: 753,612), southeastern England. It borders the English Channel, and its administrative centre is Chichester. There is evidence of settlements dating from prehistoric times in the region. A dynasty of British chieftains was in the area just before the Roman invasion. After the Romans left, Saxon invaders conquered Sussex in the late 5th century. They were overcome by the peoples of neighbouring Wessex and later by the Normans, who built castles and monasteries. Since the beginning of the 14th century, the growth of seaside resorts has been important in the development of the area's coast; inland, much of it remains rural.

West Virginia State (pop., 2000: 1,808,344), east-central U.S. It covers an area of 24,232 sq mi (62,760 sq km); its capital is Charleston. West Virginia is bordered by Pennsylvania to the north, Maryland and Virginia to the east, Kentucky to the southwest, and Ohio to the northwest. The Ohio River forms a large section of the upper western boundary, while the Potomac River forms a section of the northern boundary. The Great Kanawha, Little Kanawha, Monongahela, and Shenandoah rivers cross the state. West Virginia is crossed by the Appalachian Mountains and is generally rugged land. The highest elevation is Spruce Knob (4,861 ft [1,482 m]). Long occupied by Indian hunters, it was home to the Adena, or Mound Builders, who left archaeological traces. They were succeeded by the Iroquois and the Cherokee. The first permanent white settlement was in the 1730s. The English controlled the region during the 1750s and 1760s. Though eastern Virginia was rapidly settled, the western area's rugged terrain restricted settlement there. After the American Revolution, largely nonslaving settlers moved west; they grew dissatisfied with the Virginia government. With the outbreak of the American Civil War, residents from western Virginia voted against the ordinance of secession in 1861. In 1863 West Virginia was admitted to the Union as the 35th state. Its industrial emergence, encouraged by railroad expansion, began in the 1870s when its natural resources, including coal and gas, contributed to the growth of the U.S. In the 20th century, recreation and tourism became an increasingly important part of the state's economy.

West Yorkshire Metropolitan county (pop., 2001: 2,079,217), northern England. Its main cities are Wakefield and Leeds. From 1974 to 1986 West Yorkshire was an administrative unit; in 1986 the metropolitan county lost its administrative powers, and its constituent boroughs became autonomous unitary authorities. Anglo-Saxons and Scandinavians from the east established the first settlements. While baronial power was strong in the medieval period, anarchic conditions often prevailed, and the area was the site of several 15th-century battles. In the same period, the wool textile industry developed. In the 18th and 19th centuries, abundant waterpower, and later steam power based on locally mined coal, stimulated factory-based industry. Worsted and woolen industries remain important, while an engineering industry has developed. Leeds, the area's largest city, is a major commercial and cultural centre.

western Genre of novels and short stories, motion pictures, and television and radio shows set in the American West, usually during 1850–1900, when the area was opened to white settlement. Though basically an American creation, it has counterparts in the gaucho literature of Argentina and in tales of the settlement of the Australian Outback. Conflicts between white pioneers and Native Americans and between cattle ranchers and fence-building farmers form two basic themes. Cowboys, the town sheriff, and the U.S. marshal are staple figures, and lawlessness and gun violence are standard. Owen Wister's *The Virginian* (1902) is regarded as the seminal western novel; the popularity of the genre peaked in the early and middle decades of the 20th century and declined somewhat thereafter.

Western Australia State (pop., 2001: 1,906,114), western Australia. Covering 976,790 sq mi (2,529,880 sq km), it constitutes one-third of the continent's area but has less than one-tenth of Australia's population; its capital is Perth. The extensive interior region has three deserts: Great Sandy, Gibson, and Great Victoria. The coast along the Timor Sea and Indian Ocean has only a few good harbours; notable inlets are Joseph Bonaparte and Exmouth gulfs. Australian Aboriginal peoples have occupied Western Australia for about 40,000 years. The western coast was first visited in 1616 by the Dutch; it was later explored by Englishman William Dampier in 1688 and 1699. In 1829 Capt. James Stirling led the first group of settlers there to establish Australia's first nonconvict colony. The discovery of gold in 1886 prompted a movement for constitutional autonomy, which was granted in 1890. In 1900 it was the last state to ratify the newly constituted Commonwealth of Australia. Initially it suffered from slow growth, but since 1960 its economy, fueled by agriculture and mining (notably of hydrocarbons), has been expanding.

Western Dvina River *Russian* **Zapadnaya** \'zä-pəd-nə-yə\ **Dvina** *Latvian* **Daugava** \'daù-gə-və\ River, north-central Europe. It rises in Russia's Valdai Hills and flows 632 mi (1,020 km) in a great arc south through Russia and into Belarus and then northwest across Latvia. It discharges into the Gulf of Riga on the Baltic Sea. An important water route since early times, connected in its upper reaches by easy portages to the Dnieper, Volga, and Lovat-Volkhov river systems, it constituted part of the great trade route from the Baltic region to Byzantium and to the Arabic east. Rapids and the presence of dams have restricted navigation on it.

Western Electric Co. Inc. Former U.S. telecommunications company. Founded in 1869 by Elisha Gray and Enos N. Barton, the firm was incorporated in Chicago, Ill., in 1872 as the Western Electric Manufacturing Co. It manufactured a series of new products, including the world's first commercial typewriters and incandescent lamps. Bell Telephone bought a controlling interest in the company in 1881; the next year it was reincorporated as Western Electric Co., becoming part of the Bell System (see AT&T Inc.). It became a major manufacturer of telephone equipment and communications satellites, in addition to producing radar and missile systems. In 1983, with the breakup of AT&T, the company was dissolved as a separate subsidiary and became part of AT&T Technologies (renamed Lucent Technologies).

Western European Union (WEU) Association of 10 European countries to coordinate matters of European security and defense. The WEU was formed in 1955 as an outgrowth of the Brussels Treaty of 1948. Composed of Belgium, France, Germany, Greece, Italy, Luxembourg, The Netherlands, Portugal, Spain, and Britain, it works in cooperation with NATO and the European Union and is administered by a council of the foreign affairs and defense ministers of the member countries. There are also several associate members, observers, and associate partners. It is headquartered in Brussels.

Western Hemisphere Part of Earth comprising North and South America and the surrounding waters. Longitudes 20° W and 160° E are often considered its boundaries.

Western Indian bronze Style of metal sculpture that flourished in India from the 6th to the 12th century and later, mainly in the area of modern Gujarat and Rajasthan states. Most of the bronzes are associated with JAINISM; they include representations of saviour figures and ritual objects such as incense burners and lamp bearers. Most are small, as they were intended for private worship. They were made by LOST-WAX CASTING, and the eyes and ornaments are frequently inlaid with silver and gold.

Rsabhanatha, Western Indian bronze from Chahardi, western Khandesh, Maharashtra state, 9th century AD; in a private collection.

Western Isles See HEBRIDES ISLANDS

Western Ontario, University of Public university in London, Ontario, Canada, founded in 1878. It has faculties of applied health sciences, arts, business administration, dentistry, education, engineering, graduate studies, journalism, law, library science, medicine, music, nursing, science, and social science as well as a graduate school of journalism.

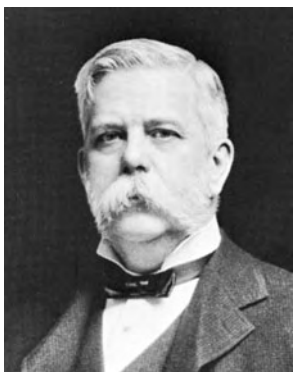
Western Reserve Tract of land, northeastern Ohio, U.S. Located on the southern shore of Lake ERIE, it formed part of the western lands of Connecticut not surrendered to Congress in 1786. It covered about 3,500,000 ac (1,417,500 ha) and was sold in part to immigrants from Connecticut (1786–1800). Ceded in 1800 to Ohio, it was later divided into several counties.

Western Sahara *formerly* **Spanish Sahara** Territory, North Africa. Area: 97,344 sq mi (252,120 sq km). Population (2002 est.): 256,000. Capital: LAAYOUNE. Little is known of the area's prehistory, though rock engravings in southern locations suggest a succession of nomadic groups. In the 4th century BC there was trade across the Mediterranean Sea between the region and Europe; this did not last, and there was little European contact until the 19th century. In 1884 Spain claimed a protectorate over the RÍO DE ORO region. Boundary agreements with France were concluded in 1900 and 1912. Spain formally united the area's northern and southern parts into the overseas province of the Spanish Sahara in 1958. In 1976 Spain relinquished its claim. The region then was divided between Mauritania, which relinquished its claim in 1979, and Morocco, which later occupied the whole territory. Separatists of the POLISARIO movement, based in Algeria, declared a government-in-exile called the Saharan Arab Democratic Republic in 1976; the issue of Western Sahara's status remained unresolved. remained unresolved.Western Sahara has vast phosphate deposits and some potash and iron ore.

Western Samoa See SAMOA

Western Scheldt *or* **Westerschelde** \'ves-tər-ˌskel-də\ Estuary, southwestern Netherlands. An inlet of the North Sea at the mouth of the SCHELDE RIVER, it flows west for about 30 mi (50 km) through the Delta Islands to the North Sea. It has been an important transportation route since the 16th century, when Holy Roman Emperor CHARLES V designated VLISSINGEN as his port of embarkation from the Netherlands. It continues to operate as an important shipping route to many destinations, including ANTWERP.

Western Schism See Western SCHISM



Western Union Former U.S. telegraph company and contemporary provider of electronic financial transactions. From its foundation in 1851 as a company formed to build a telegraph line from Buffalo, N.Y., to St. Louis, Mo., in 1856 the expanding business was reorganized as the Western Union Telegraph Co. By the end of 1861 Western Union had built the first transcontinental TELEGRAPH line. The company introduced singing telegrams in 1933. Western Union continued to grow, absorbing competitors such as Postal Telegraph Inc. in 1943. As telegraphy was superseded by other methods of telecommunication, Western Union diversified into teletypewriter services, money orders, and mailgrams. It launched the telecommunications satellite Westar 1 in 1974 and was operating five satellites by 1982. In 1988 the company was reorganized as Western Union Corp. to handle money transfers and related services. After declaring bankruptcy in 1993, it sold its financial services arm in 1994 to First Financial Management Corp., and in 1995 that company merged with First Data Corp. The renamed Western Union Financial Services, Inc., became a world leader in electronic (including Internet) transactions.

Western Wall *or* **Wailing Wall** Place of prayer in the Old City of JERUSALEM sacred to the Jewish people. It is the only remnant of the Second Temple of JERUSALEM. Because it now forms part of a larger area—known as the Temple Mount by Jews and as al-Ḥaram al-Sharīf by Muslims—surrounding the Muslim DOME OF THE ROCK and al-Aqṣā Mosque, the two groups have often vied for control of it. When Israel captured the Old City in the SIX-DAY WAR (1967), the Jews once more gained authority over the site.

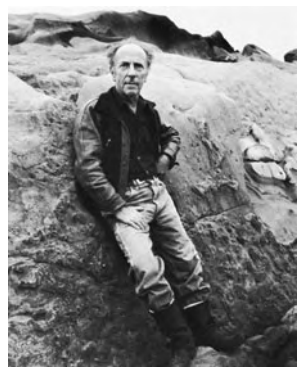
Westerschelde See WESTERN SCHELDT

Westinghouse, George (b. Oct. 6, 1846, Central Bridge, N.Y., U.S.—d. March 12, 1914, New York, N.Y.) U.S. inventor and industrialist. He served in the American Civil War. His first major invention was an air brake (patented 1869), which was eventually made compulsory on all American trains. He developed a railway signaling system and later introduced many innovations in piping natural gas. His major achievement was the adoption by the U.S. of ALTERNATING CURRENT (AC) for electric power transmission. The electrical system being developed in the U.S. in the 1880s used DIRECT CURRENT (DC), though AC systems were being developed in Europe. Westinghouse purchased the patents for NIKOLA TESLA's AC motor and hired Tesla to improve and modify the motor for use in his power system. In 1886 he incorporated the predecessor of WESTINGHOUSE ELECTRIC CORP. He eventually prevailed over powerful opposition from advocates of DC power, and in 1893 his company was hired to light the World's Columbian Exposition at Chicago. He also obtained the rights to develop the great falls of the Niagara River with AC generators. See also ELECTRIC CURRENT.

Westinghouse
COURTESY OF WESTINGHOUSE ELECTRIC CORPORATION

Westinghouse Electric Corp. U.S. television and radio broadcasting company, formerly an electrical equipment manufacturer. It was founded in 1886 as the Westinghouse Electric Co. by GEORGE WESTINGHOUSE to make and sell alternating-current electrical systems. The company became a major supplier to the electric-utility industry, producing machinery used to generate and distribute electricity. It adopted the name Westinghouse Electric Corp. in 1945. After World War II Westinghouse also manufactured nuclear reactors and defense electronics. In the 1990s it bought television and radio stations throughout the U.S., including the television network CBS Inc. in 1995 and Infinity Broadcasting Corp. in 1996. After selling its defense electronics unit to Northrop Grumman Corp. in 1996, the company changed its name to CBS Corp. in 1997 and sold its nuclear operations to British Nuclear Fuels PLC in 1998. CBS was purchased by media conglomerate Viacom Inc. in 1999 and renamed CBS TELEVISION NETWORK.

Westminster, Statute of (1931) Parliamentary statute that effected the equality of Britain and the then-dominions of Canada, Australia, New Zealand, South Africa, Ireland, and Newfoundland. It confirmed declarations made at British imperial conferences in 1926 and 1930 that the self-governing dominions were to be regarded as "autonomous communities within the BRITISH EMPIRE." United in their allegiance to the crown, the countries individually controlled their own domestic and foreign affairs as equal members of the British COMMONWEALTH of Nations.



Westminster Abbey Church in London. It was originally a Benedictine monastery. EDWARD THE CONFESSOR built a Norman-style church (consecrated 1065) on the site of an older church there; this was pulled

down in 1245 by Henry III (except for the nave) and replaced with the present Gothic-style abbey church. The rebuilding of the nave was begun by 1376 and continued intermittently until Tudor times. The chapel of Henry VII (begun c. 1503) is noted for its exquisite fan vaulting. Elizabeth I refounded the church as the Collegiate Church of St. Peter in Westminster (1560). The western towers (1745), by Nicholas Hawksmoor and John James, were the last addition. Every British sovereign since William the Conqueror has been crowned in the abbey except Edward V and Edward VIII. Many are also buried there, and it is crowded with the tombs and memorials to other famous Britons. Part of the southern transept is known as the Poets' Corner, while the northern transept has memorials to statesmen.

Westminster Confession Confession of faith of English-speaking Presbyterians, representing a theological consensus of international Calvinism. Produced by the Westminster Assembly, it was completed in 1646 and approved by Parliament in 1648. When the monarchy was restored in 1660, the episcopal form of church government was reinstated and the Confession lost official status in England, but it had already been adopted by the Church of Scotland (1647) and various other churches. Consisting of 33 chapters, it states that the sole doctrinal authority is scripture, restates the doctrines of the Holy Trinity and Jesus, and gives reformed views of the sacraments, the ministry, and grace. See also Presbyterianism.

Weston, Edward (b. March 24, 1886, Highland Park, Ill., U.S.—d. Jan. 1, 1958, Carmel, Calif.) U.S. photographer. A camera enthusiast from boyhood, Weston began his professional career by opening a portrait studio in Glendale, Calif. His early work was in the style of the Pictorialists, photographers who imitated Impressionist paintings. In 1915 Weston saw an exhibition of modern art that inspired him to renounce his former work: he began to create sharp and realistic pictures that convey the beauty of natural objects through skillful composition and subtleties of tone, light, and texture. After traveling and meeting luminaries such as Alfred Stieglitz and Diego Rivera, in 1927 Weston made a series of monumental close-ups of seashells, peppers, and halved cabbages, bringing out the rich textures of their sculpturelike forms. Two years later he made the first of many photographs of the rocks and trees on Point Lobos, Calif. In 1936 Weston began a series of photographs of nudes and sand dunes at Oceano, Calif., which are often considered his finest work. After being stricken by Parkinson disease, Weston realized he would soon be unable to work. He made his last photographs on Point Lobos in 1948. He is considered one of the most influential photographers of the 20th century.

Edward Weston at Point Lobos, Carmel Bay, Calif., 1945
IMOGEN CUNNINGHAM

Westphalia Former province of Prussia, now part of Germany. It comprises (with the former state of Lippe) the present German state of North Rhine–Westphalia and parts of the states of Lower Saxony and Hesse. Settled by Saxons called Westphalians c. AD 700, Westphalia was created a duchy (1180), which for several centuries was administered for the archbishop of Cologne. The Peace of Westphalia (1648) was signed at Münster. In 1807 Napoleon created for his brother, Jérôme Bonaparte, the kingdom of Westphalia; its capital was Kassel. Reorganized by the Congress of Vienna in 1815, it became a province of Prussia in 1816, with its capital at Münster. Its cities suffered severe bombings in World War II.

Westphalia, Peace of (1648) European settlements that ended the Thirty Years' War, negotiated in the Westphalian towns of Münster and Osnabrück. The deliberations began in 1644 and ended in 1648 with two assemblies that produced the treaty between Spain and the Dutch (signed January 30) and another between Emperor Ferdinand III, the other German princes, France, and Sweden (signed October 24). Territorial changes gave Sweden control of the Baltic Sea, ensured France a firm frontier west of the Rhine River, and provided their allies with additional lands. Independence was confirmed for the United Provinces of the Netherlands and for the Swiss Confederation. The treaties also confirmed the Peace of Augsburg and extended the religious toleration of Lutherans to include toleration of the Reformed (Calvinist) Church. The Holy Roman Empire was forced to recognize its German princes as absolute sovereigns in their own dominions, which greatly weakened its central authority.

Wetar \'we-ˌtär\ Island, Indonesia. Lying 35 mi (56 km) north of East Timor, it is 80 mi (130 km) long, 28 mi (45 km) wide, and has an area of 1,400 sq mi (3,600 sq km). In its interior, rugged mountains covered with tropical rain forests rise to 4,632 ft (1,412 m). Subsistence farming and fishing are the main occupations of the few islanders.

Weyden \'vī-dᵊn, 'vā-dᵊn**, Rogier van der** (b. 1399/1400, Tournai, France—d. June 18, 1464, Brussels) Flemish painter. He seems to have begun his painting career at the rather advanced age of 27, when he entered the studio of Robert Campin. In early paintings he combined Campin's bold style with the elegance and subtle visual refinements he admired in the art of Jan van Eyck. By 1435 he moved to Brussels and the next year was appointed city painter. During that period (c. 1435–40) he executed the celebrated panel of the *Descent from the Cross* for the chapel of the Archers' Guild of Louvain. His international reputation grew, his work being particularly admired in Italy. Though most of his work was religious, he produced secular paintings (now lost) and some sensitive portraits. His art affected generations of Flemish artists and introduced the Flemish style throughout Europe.

Weyerhaeuser \'wī-ər-ˌhaù-zər**, Frederick** *orig.* **Friedrich Weyerhaeuser** (b. Nov. 21, 1834, Nieder Saulheim, Hesse—d. April 4, 1914, Pasadena, Calif., U.S.) German-born U.S. lumber magnate. He immigrated to the U.S. at age 18 and found work in an Illinois sawmill, which he and his brother-in-law bought in 1857. He traveled constantly to buy stands of timber and acquired an interest in many logging and milling operations. In 1872 he organized the Mississippi River Boom and Logging Co., a huge confederation that handled all the logs milled on the Mississippi. In 1900 he bought 900,000 acres of timberland in the Pacific Northwest and founded the Weyerhaeuser Timber Co. (now Weyerhaeuser Co.), centred in Tacoma, Wash. During his lifetime the company bought almost two million acres of land.

Weygand \vā-'gäⁿ**, Maxime** (b. Jan. 21, 1867, Brussels, Belg.—d. Jan. 28, 1965, Paris, France) Belgian-born French army officer. He was educated in France and taught at the French cavalry school. He served as chief of staff to Gen. Ferdinand Foch (1914–23), as high commissioner in Syria (1923–24), and as inspector general of the army (1931–35) before retiring in 1935. In May 1940 he was recalled to take command of the French armies; unable to prevent a German victory, he advised capitulation in June. After the Allied invasion of North Africa (1942) he sought to fly to Algiers but was caught by the Germans and imprisoned in an Austrian castle. Released by U.S. troops in 1945, he was arrested by the French under the orders of Charles de Gaulle. He was exonerated by de Gaulle in 1948.

whale Any of dozens of species of exclusively aquatic mammals found in oceans, seas, rivers, and estuaries worldwide but especially numerous in the Antarctic Ocean. Whales are commonly distinguished from the smaller porpoises and dolphins and sometimes from narwhals, but they are all cetaceans. See also baleen whale; toothed whale.

whale shark Species (*Rhincodon typus*) of gigantic but harmless shark found worldwide but mainly in the tropics. The largest of living fishes, it often grows to about 30 ft (9 m) long and may reach twice that size. It is gray or brown with a pale undersurface and is distinctively marked with small spots and narrow vertical lines of yellow or white. It has tiny teeth, and eats plankton and small fishes. A sluggish animal, it generally swims slowly near the surface and has been hit by ships.

Whales, Bay of Former inlet of the Ross Sea, Ross Ice Shelf, Antarctica. It was first seen by the British explorer James C. Ross in 1842. The bay was the continent's most southerly open harbour in summer and was the site of several important bases for Antarctic exploration. More than 10 mi (16 km) wide in 1911, it gradually narrowed as advancing ice sheets collided. It disappeared entirely in 1987 when an iceberg 99 mi (159 km) long broke off from the Ross Ice Shelf.

whaling Hunting of whales for food, oil, or both. Whaling dates to prehistoric times, when Arctic peoples used stone tools to hunt whales. They used the entire animal, a feat not accomplished by Western commercial whalers until the advent of floating factories in the 20th century. The Basque were the first Europeans to hunt whales commercially; when seaworthy oceangoing vessels began to be made, they took to the open seas

© 2006 Encyclopædia Britannica, Inc.

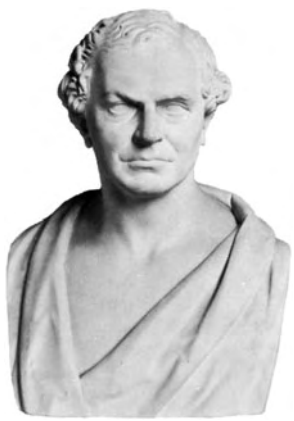
(14th–16th century). They were followed by the Dutch and the Germans in the 17th century and the British and their colonists in the 18th century. In 1712 the first SPERM WHALE was killed; its oil proved more valuable than that of the RIGHT WHALE, which had hitherto been the object of whaling ventures. Whaling expeditions in pursuit of the free-ranging sperm whale could last for four years. The discovery of petroleum (1859), overfishing, the use of vegetable oil, and the substitution of steel for whalebones in corsets led to a steep decline in whaling in the later 19th century, but Norwegian innovations made hunting the hitherto "wrong" whales (RORQUALS, including the BLUE WHALE and the SEI WHALE; so called because they sank when killed) commercially feasible, and the number of whales killed rose from under 2,000 to over 20,000 between 1900 and 1911. The Norwegians and the British dominated whaling into the mid 20th century, when overfishing again made it unprofitable for most nations, though not Japan and the Soviet Union, which became the chief whaling nations. Concern over the near extinction of many species led to the establishment in 1946 of the International Whaling Commission. Commercial whaling was prohibited altogether in 1986, but several nations refused to comply. At the beginning of the 21st century, Norway and Japan continued to hunt hundreds of nonendangered whales annually.

Wharton, Edith (Newbold) *orig.* **Edith Newbold Jones** (b. Jan. 24, 1862, New York, N.Y., U.S.—d. Aug. 11, 1937, Saint-Brice-sous-Forêt, near Paris, France) U.S. novelist and short-story writer. Born into upper-class society, she began writing a few years after her marriage in 1885. She lived in France after 1908 and was divorced in 1913. Her works examine the barriers of social convention, especially in the upper class, that stand in the way of individual happiness. Her close friendship with the older novelist HENRY JAMES did much to support and shape her work. The critical and popular success of her novel *The House of Mirth* (1905; film, 1918, 2000; for television, 1981) established her as a leading writer. She is perhaps best known for *Ethan Frome* (1911), which exploits the grimmer possibilities of New England farm life. Her other books include the novels *The Custom of the Country* (1913), *The Age of Innocence* (1920, Pulitzer Prize), and *The Buccaneers* (1938).

wheat Any of various CEREAL GRASSES in the genus *Triticum* of the Poaceae (or Gramineae) family, one of the oldest and most important of the cereal crops. More of the world's farmland is devoted to wheat than to any other food crop; China is the largest wheat producer. The plant has long, slender leaves, hollow stems in most varieties, and flowers grouped together in spikelets. Of the thousands of varieties known, the most important are *T. aestivum*, used to make bread; *T. durum*, used in making pasta; and *T. compactum* (club wheat), a softer type used for cake, crackers, cookies, pastries, and household flours. Winter wheat (sown in fall) and spring wheat (sown in spring or, where winters are mild, sometimes fall) are the two major types. The greatest portion of wheat flour is used for breadmaking. Small quantities are used in the production of starch, malt, gluten, alcohol, and other products. Inferior and surplus wheats and various milling by-products are used for livestock feeds.

Wheatley, Phillis (b. c. 1753, present-day Senegal or The Gambia?, West Africa—d. Dec. 5, 1784, Boston, Mass., U.S.) African American poet and the first African American to publish a book. She was kidnapped, transported to America, and sold from a slave ship in 1761 to John Wheatley, a Boston merchant. The Wheatleys taught her to read and write English and Latin. At about age 14 she began writing poetry modeled on ALEXANDER POPE and other Neoclassical writers. Her verse—exceptionally mature, if conventional, poetry that was largely concerned with morality and piety—attracted much attention. *Poems on Various Subjects, Religious and Moral* (1773), published in England, spread her fame to Europe. Freed in 1773, she married a free black man in 1778. She worked as a servant in her final years and died in poverty.

wheel Circular frame of hard material capable of turning on an axle. Wheels may be solid, partly solid, or spoked. The oldest known wheel was a wooden disk of planks held together by crosspieces. A pottery wheel or turntable was developed c. 3500 BC in Mesopotamia. The spoked wheel appeared c. 2000 BC on CHARIOTS in Asia Minor. Later developments included iron hubs that turned on greased axles. Perhaps the most important invention in human history, the wheel was essential to developing civilizations, and has remained essential to power generation, transportation, industrial manufacturing, and countless other applications.



wheel lock Device for igniting the powder in a firearm such as a MUSKET. Developed c. 1515, the wheel lock struck a spark to ignite powder in the pan of a musket by means of a holder that pressed a shard of flint or a piece of iron pyrite against an iron wheel with a milled edge; the wheel rotated and sparks flew. The principle was used in the design of the flint-and-wheel cigarette lighter. See also FLINTLOCK.

whelk Any marine SNAIL of the family Buccinidae, or a snail having a similar shell; found worldwide. Some whelks are called CONCHS. The sturdy shell of most species in the family is slender and has a wide opening in the first whorl. The animal feeds on other mollusks through its long proboscis; some species also kill fishes and crustaceans caught in commercial traps. Most are cold-water species; tropical species are smaller and more colourful. The common northern whelk (*Buccinum undatum*) has a stout pale shell about 3 in. (8 cm) long and is abundant in North Atlantic waters.

Northern whelk (*Buccinum undatum*)
INGMAR HOLMASEN

Whewell \'hyü-əl**, William** (b. May 24, 1794, Lancaster, Lancashire, Eng.—d. March 6, 1866, Cambridge, Cambridgeshire) British philosopher and historian. He spent most of his career at the University of Cambridge, where he taught mineralogy (1828–32) and moral philosophy (1838–55) and served as college master (1841–66). He is remembered primarily for his work on the theory of INDUCTION. He stressed the need to see scientific progress as a historical process, asserting that inductive reasoning could be employed properly only if its use throughout history was closely analyzed. His major works on induction are *History of the Inductive Sciences* (3 vol., 1837) and *Philosophy of the Inductive Sciences* (1840). See also problem of INDUCTION.

Whewell, plaster cast of bust by Edward Hodges Baily, 1851; in the National Portrait Gallery, London
COURTESY OF THE NATIONAL PORTRAIT GALLERY, LONDON

Whig Member of a political faction in England, particularly in the 18th century. Originally a term for Scottish Presbyterians, the name came to imply nonconformity and rebellion and was applied in 1679 to those who wanted to exclude James, the Catholic duke of York (later JAMES II), from succession to the throne of England. The Whigs were opposed by the TORY faction in that struggle but later represented the aristocratic, landowning families and financial interests of the wealthy middle classes. They maintained power through patronage and connections in PARLIAMENT, but there was no distinct party until 1784, when CHARLES JAMES FOX represented the interests of religious dissenters, industrialists, and others who sought parliamentary reform. After 1815 and following various party realignments, the political group became the LIBERAL PARTY.

Whig Party (1834–54) U.S. political party. Organized by opponents of Pres. ANDREW JACKSON, whom they called "King Andrew," the party took its name from the British antimonarchist party. The U.S. Whigs favoured a program of national development. Jackson's opposition to the Second BANK OF THE UNITED STATES (see BANK WAR) and NULLIFICATION in South Carolina allowed HENRY CLAY to bring fiscal conservatives and southern STATES' RIGHTS proponents together in a coalition with those who still believed in the National Republican program of a protective tariff and federally financed internal improvements. The party also included members of the former Anti-Masonic Party. The Whig's candidate, WILLIAM H. HARRISON, won the 1840 presidential election and the party captured Congress, but Harrison's premature death halted enactment of the Whig program (his vice president and successor, JOHN TYLER, vetoed much of the Whig's agenda). Clay was the party's unsuccessful candidate in the 1844 election. In 1848 it nominated ZACHARY TAYLOR, who won the presidency. The party began to split into the "conscience" (antislavery) and "cotton" (proslavery) Whigs and was further divided by the COMPROMISE OF 1850. Its

© 2006 Encyclopædia Britannica, Inc.

nominee in the 1852 election, Winfield Scott, failed to win wide support as most Southern Whigs joined the Democratic Party. In 1854 most Northern Whigs joined the new Republican Party, though some joined the Know-Nothing Party.

whip-tailed ray See stingray

whippet Breed of hound dog developed in 19th-century Britain to chase rabbits in an arena. It was developed from terriers and English and Italian greyhounds, which it resembles. It stands 18–22 in. (46–56 cm), weighs about 28 lbs (13 kg), and has a smooth coat of gray, tan, or white. Capable of speeds up to 35 mph (56 kph), it is used for racing and for hunting small game. It is typically quiet and even-tempered.

Whippet
SALLY ANNE THOMPSON/EB INC.

Whipple, George H(oyt) (b. Aug. 28, 1878, Ashland, N.H., U.S.—d. Feb. 1, 1976, Rochester, N.Y.) U.S. pathologist. He studied medicine at Johns Hopkins University. He and George Minot discovered that raw liver fed to chronically bled dogs reversed anemia; this led to introduction of raw liver in the diet to treat pernicious anemia, for which the two men shared a 1934 Nobel Prize with William Murphy (1894–1987). Whipple's study of bile pigments led to an interest in how the body makes hemoglobin (important in bile pigment production). His experiments in artificial anemia (1923–25) established iron as the most potent inorganic factor in red-blood-cell formation.

whippoorwill Species (*Caprimulgus vociferus*) of nocturnal North American bird, similar to the nightjar, named for its resonant "whip-poor-will" call (first and third syllables accented), which it may repeat 400 times without stopping. It lives in woods near open country, where it catches insects on the wing around dusk and dawn. By day it sleeps on the forest floor or perches lengthwise on a branch. About 10 in. (25 cm) long, it has mottled brownish plumage; the male has a white collar and white tail corners. It winters as far south as Costa Rica.

whiskey *or* **whisky** Any of several distilled liquors made from a fermented mash of cereal grains. Whiskeys are distinctive because of differences in raw materials and production methods. All are aged in wooden containers. The earliest direct account of whiskey making is found in Scottish records from 1494. Scotch whisky (this spelling is also used by Canadians) is usually somewhat light in body, with a distinctive smoky malt flavour; it is made primarily from malted barley that has been heated over a peat fire, fermented, distilled, and blended with similar whiskies made by different distillers. Irish whiskeys, lighter-bodied and lacking any smoky flavor, are not malt-fired and may be mixed with neutral grain spirits. Canadian whisky, light in colour and flavour, is a blend of highly flavoured and neutral grain whiskies. In the U.S., the largest producer and consumer of whiskey, both straight (at least 51% single-mash) and blended whiskeys are produced, derived from both sour and sweet mashes. (Sour mashes are fermented with both fresh and previously fermented yeast; sweet mashes employ only fresh yeast.) Bourbon, first produced in Bourbon Co., Ky., is a full-bodied unblended whiskey derived from a sour mash of corn grain. Whiskeys are consumed both unmixed and in cocktails, punches, and other beverages.

Whiskey Rebellion (1794) American uprising to protest a federal liquor tax. Farmers in western Pennsylvania rebelled against paying a tax on their locally distilled whiskey and attacked federal revenue collectors. After 500 armed men burned the home of the regional tax inspector, Pres. George Washington ordered 13,000 federal troops to the area. The rebellion quickly dissolved without further violence. The event established the authority of federal law within the states and strengthened support for the Federalists' advocacy of a strong central government.

Whiskey Ring (1875) Group of U.S. whiskey distillers who defrauded the government of taxes. The ring operated mainly in St. Louis, Milwaukee, and Chicago and kept liquor taxes after bribing Internal Revenue officials in Washington, D.C. A secret investigation by the U.S. Treasury Department resulted in 238 indictments and 110 convictions. While not involved, Pres. Ulysses S. Grant was tarnished by the scandal; his private secretary, Orville E. Babcock, was indicted but acquitted on Grant's testimony. The Republican Party allegedly received some of the illegally held tax money.

whist Card game. It belongs to a family that includes bridge whist and bridge, each of which developed in succession from the original game of whist. The essential features of card games in the whist family are: four people usually play, two against two as partners; a full 52-card deck is dealt out evenly so that each player holds 13 cards; the object of play is to win tricks, and win or loss is determined by the number of tricks taken (as distinct from games such as pinochle, in which it is determined by the value of card points taken in tricks). Whist originated in 17th-century England.

whistler See goldeneye

Whistler, James (Abbott) McNeill (b. July 14, 1834, Lowell, Mass., U.S.—d. July 17, 1903, London, Eng.) U.S.-born British painter, etcher, and lithographer. He attended West Point but soon abandoned the army for art. In 1855 he arrived in Paris to study painting and adopted a bohemian lifestyle. In 1863 he moved to London, where he had considerable success, becoming widely famous for his wit and large public presence. During the 1860s and '70s he began to use musical terms in the titles of his paintings, such as *Symphony* and *Harmony*, reflecting his belief in the "correspondences" between the arts. During this period he started to paint his "nocturnes"—scenes of London, especially of Chelsea, that have poetic intensity. For them he evolved a special technique by which paint, in a very liquid state he called a sauce, was stroked onto the canvas in fast sweeps of the brush, somewhat in the manner of Japanese calligraphy (he was an outspoken advocate of Japanese arts). From the 1870s onward he was preoccupied by the problems of portrait painting, creating a number of masterpieces, including *Arrangement in Grey and Black, No. 1: The Artist's Mother* (1871–72), known as *Whistler's Mother*. These paintings underline his aestheticism, his liking for simple forms and muted tones, and his dependence on the 17th-century Spanish painter Diego Velázquez. In 1877 he brought a libel suit against John Ruskin for attacking his *Nocturne in Black and Gold: The Falling Rocket* (1875); he won his case but received damages of only a farthing, and the costs of the suit temporarily bankrupted him. Considered one of the leading painters of his day, after his death his reputation declined. Only in the later 20th century did Whistler begin to receive serious acclaim once again.

whistling swan Species (*Cygnus columbianus*) of North American swan that calls with a soft, musical note. It has a black bill, usually with a small yellow spot near the eye. It breeds in the Arctic tundra and winters in shallow fresh or salt water, especially along eastern and western U.S. coasts.

Whitby, Synod of Meeting of the Christian church of the Anglo-Saxon kingdom of Northumbria in 664 or, possibly, 663, to decide whether to follow Celtic or Roman usages, which had been reintroduced to southern England by St. Augustine of Canterbury in 597. Though Northumbria had been mainly converted by Celtic missionaries, the king decided for Rome, believing that Rome followed the teaching of St. Peter, holder of the keys to heaven. The decision contributed to the unification of the English church and brought it into close contact with the rest of Europe.

White, Byron R(aymond) (b. June 8, 1917, Fort Collins, Colo., U.S.—d. April 15, 2002, Denver, Colo.) U.S. jurist. An accomplished athlete, he played football with the Pittsburgh Pirates (now Steelers) and the Detroit Lions. He attended the University of Oxford as a Rhodes scholar before studying law at Yale. White clerked for Fred M. Vinson and later practiced corporate law in Colorado. In 1961 he was named deputy U.S. attorney general by Pres. John F. Kennedy, and the following year he was appointed to the U.S. Supreme Court. His opinions and votes on the court were generally moderate to conservative. He retired in 1993.

White, E(lwyn) B(rooks) (b. July 11, 1899, Mount Vernon, N.Y., U.S.—d. Oct. 1, 1985, North Brooklin, Maine) U.S. essayist and literary stylist. White attended Cornell University and in 1927 joined *The New Yorker*; he would contribute to it and later to *Harper's* magazine over several decades. He collaborated with James Thurber on *Is Sex Necessary?* (1929). His novels *Stuart Little* (1945), *Charlotte's Web* (1952), and *The Trumpet of the Swan* (1970) are classics of children's literature. White's revision of *The Elements of Style* (1959) by his professor William Strunk became a standard style manual for writers. He received a Pulitzer Prize special citation in 1978.

© 2006 Encyclopædia Britannica, Inc.

White, James (Springer) and Ellen (Gould) *orig.* **Ellen Gould Harmon** (respectively b. April 8, 1821, Palmyra, Me., U.S.—d. June 8, 1881, Battle Creek, Mich.; b. Nov. 26, 1827, Gorham, Me.—d. July 16, 1915, St. Helena, Cal.) Cofounders of the Seventh-Day Adventists. James was a schoolteacher and then a minister who accepted the Adventist views of William Miller (1782–1849). He married Ellen Harmon in 1846; she had become a Millerite in 1840, at 13. A visionary, Ellen had more than 2,000 visions before she died; these helped guide the Seventh-Day Adventist Church, which was formed in 1863. They preached together until James's death. Ellen continued, speaking on many subjects, notably temperance, and was regarded by some as a prophet. Of her many books, the best known is *Steps to Christ*.

White, John (fl. 1585–93) British artist, explorer, and North American colonist. He sailed on an expedition to Greenland in 1577 and returned to England with sketches of the land and its people. His 1585 trip to colonize Roanoke was sponsored by Sir Walter Raleigh. White's paintings and sketches illustrated a report of the region after the colony was abandoned (1586). He was appointed governor of a second colony and arrived at Roanoke with 100 colonists (1587). He returned to England for supplies that year but was unable to send a relief expedition to Roanoke until 1590; the expedition found no trace of the colonists, including White's granddaughter, Virginia Dare.

White, Minor (b. July 9, 1908, Minneapolis, Minn., U.S—d. June 24, 1976, Cambridge, Mass.) U.S. photographer and editor. He began to photograph seriously in 1938 when he went to work for the Works Progress Administration. In 1946 he studied with Edward Weston and Alfred Stieglitz before moving to San Francisco, where he worked closely with Ansel Adams. He succeeded Adams as head of the photography department at the California School of Fine Arts and later taught at MIT. He founded and edited (1952–76) the photography magazine *Aperture* and also edited *Image* (1953–57). His efforts to extend photography's range of expression made him one of the century's most influential photographers.

White, Patrick (Victor Martindale) (b. May 28, 1912, London, Eng.—d. Sept. 30, 1990, Sydney, N.S.W., Austrl.) Australian writer. As a youth White moved between Australia and England, where he attended Cambridge University. After serving in the Royal Air Force during World War II, he returned to Australia, which he saw as a country in a volatile process of growth and self-definition. His somewhat misanthropic novels often explore the possibilities of savagery in that context; they include *The Tree of Man* (1955), *Voss* (1957), *Riders in the Chariot* (1961), and *The Twyborn Affair* (1979). His other works include plays and short stories, the latter collected in *The Burnt Ones* (1964) and *The Cockatoos* (1974). He was awarded the Nobel Prize for Literature in 1973.

White, Stanford (b. Nov. 9, 1853, New York, N.Y., U.S.—d. June 25, 1906, New York City) U.S. architect. He trained with Henry Hobson Richardson. In 1880 he formed an architectural firm with Charles F. McKim and William R. Mead that soon became the most famous in the country, known especially for its Shingle-style country and seaside mansions. The firm later led the U.S. trend toward Neoclassical architecture. White's design for the Casino (1881) at Newport, R.I., exhibited his characteristic use of gracefully proportioned structures and Italian Renaissance ornamentation. His New York commissions included Madison Square Garden (1891) and the Washington Arch (1891). A versatile artist, he also designed jewelry, furniture, and interiors. An extrovert noted for his lavish entertainments, he was shot to death at Madison Square Garden by Harry Thaw, the husband of the showgirl Evelyn Nesbit, with whom White had had a love affair.

White, T(erence) H(anbury) (b. May 29, 1906, Bombay, India—d. Jan. 17, 1964, Piraeus, Greece) English novelist, social historian, and satirist. Educated at Cambridge University, White was working as a teacher when he attained his first critical success with the autobiographical *England Have My Bones* (1936). He later devoted himself to writing, studying subjects such as Arthurian legend while living a largely reclusive life. He is best known for his adaptation of Sir Thomas Malory's *Le Morte Darthur* in the tetralogy *The Once and Future King* (1958), comprising *The Sword in the Stone* (1938), *The Queen of Air and Darkness* (originally *The Witch in the Wood*, 1939), *The Ill-Made Knight* (1940), and *The Candle in the Wind* (1958).

White, Theodore H(arold) (b. May 6, 1915, Boston, Mass., U.S.—d. May 15, 1986, New York, N.Y.) U.S. journalist, historian, and novelist. White became one of *Time* magazine's first foreign correspondents, serving in East Asia (1939–45) and later as a European correspondent. He is best known for his accounts of two presidential elections, *The Making of the President, 1960* (1961, Pulitzer Prize) and *The Making of the President, 1964* (1965), and for associating the short-lived presidency of John F. Kennedy with the legend of Camelot. His intimate style of journalism, centring on the personalities of his subjects, strongly influenced the course of political journalism and campaign coverage.

White, William Allen (b. Feb. 10, 1868, Emporia, Kan., U.S.—d. Jan. 29, 1944, Emporia) U.S. journalist. White purchased the *Emporia Daily and Weekly Gazette* in 1895. His editorial writing was a mixture of tolerance, optimism, liberal Republicanism, and provincialism. His widely circulated 1896 editorial "What's the Matter with Kansas?" was credited with helping elect William McKinley president. He also wrote fiction, biographies, and an autobiography. His son and successor, William Lindsay White (1900–73), wrote one of the best-selling books on World War II, *They Were Expendable* (1942).

white blood cell See leukocyte

white butterfly Any of several lepidopteran species of the family Pieridae that are found worldwide. Adults have a wingspan of 1.5–2.5 in. (38–63 mm); the wings are white, with black marginal markings. The pattern and colour of many species vary with sex and season. Many of the green, slender larvae, most of which are covered with a short down, or pile, are pests of garden crops. The pupae are attached to a twig by a posterior spine and a girdle of silk. See also cabbage white.

White butterfly (*Pieris brassicae*).
CHR LEDERER-BAVARIA-VERLAG

white cedar In the lumber trade, the American arborvitae, some species of false cypress (genus *Chamaecyparis*) and McNab cypress, incense cedar (*Calocedrus decurrens*), and California juniper, all in the cypress family. Nonconiferous trees that are called white cedar include the chinaberry (*Melia azedarach*, mahogany family) and some members of the plant families Bignoniaceae (trumpet creepers), Celastraceae (staff trees), Myristicaceae (nutmegs), Burseraceae, and Dipterocarpaceae. Botanically, white cedar is *Chamaecyparis thyoides*, a picturesque tree with purple cones, native to North America and East Asia. The wood is used for carpentry, pencils, storage chests, interiors, and fence posts.

white dwarf star Any of a class of small, faint stars representing the end point of the evolution of stars without enough mass to become neutron stars or black holes. Named for the white colour of the first ones discovered, they actually occur in a variety of colours depending on their temperature. They are extremely dense, typically containing the mass of the Sun within the volume of the Earth. White dwarfs have exhausted all their nuclear fuel and cannot produce heat by nuclear fusion to counteract their own gravity, which compresses the electrons and nuclei of their atoms until they prevent further gravitational contraction. When a white dwarf's reservoir of thermal energy is exhausted (after several billion years), it stops radiating and becomes a cold, inert stellar remnant, sometimes called a black dwarf. White dwarf stars are predicted to have an upper mass limit, known as the Chandrasekhar limit (see Subrahmanyan Chandrasekhar), of about 1.4 times the Sun's mass. Dying stars that are more massive undergo a supernova explosion. As members of binary stars, white dwarf stars play an essential role in the outbursts of novas.

white-footed mouse See deer mouse

White Horse, Vale of the Valley, Oxfordshire, England. It is named for the White Horse, a gigantic (374 ft [114 m] long) prehistoric figure of a horse formed by cutting away the turf on the side of a chalk hill. A number of other prehistoric remains are in the vicinity, including the megalith known as Wayland's Smithy. Wantage, an ancient market town in the valley, is said to be the birthplace of Alfred the Great.

White House Official residence of the U.S. president, in Washington, D.C. It has been the home of every president since John Adams. In 1791 James Hoban (1762–1831) won the commission to build the presidential residence with his plan for a Georgian mansion in the style of Andrea Palladio. The structure, to be built of gray sandstone, was to have more

© 2006 Encyclopædia Britannica, Inc.

than 100 rooms. The British burned it in 1814, but it was rebuilt and enlarged under Hoban's direction. In the 1820s, Hoban added eastern and western terraces as well as a semicircular southern portico and a colonnaded northern portico. The later addition of the West Wing (1902) and East Wing (1942) provided additional office space. Theodore Roosevelt adopted "White House" as the building's official name in 1902. Its public areas are toured by about 1.5 million people every year.

White Lotus Chinese Buddhist millenarian movement that was often persecuted because of its association with rebellion. The movement had roots in 4th-century worship of the Buddha Amitabha, whose devotional cult inspired Mao Ziyuan to form the White Lotus Society, a pious vegetarian group of monks and laity. By the 14th century it had developed into a millenarian sect that combined Maitreyan and Manichaean beliefs and was active in rebellions at the end of the Yuan dynasty. The society became most prominent through its role in the White Lotus Rebellion (1786–1804), a large-scale uprising in central China that contributed to the fall of the Qing dynasty. It was eventually put down by peasants organized into local militia defense corps. Later Chinese governments came to use the term White Lotus for all illegal millenarian groups. Some observers saw the Nian Rebellion of 1852 as well as the secret society behind the Boxer Rebellion as new manifestations of the White Lotus Society.

White Monk See Cistercian

White Mountain, Battle of (1620) Decisive battle near Prague at the beginning of the Thirty Years' War. The Catholic forces of Maximilian I, duke of Bavaria, commanded by count von Tilly, defeated the Protestant forces of Frederick V, king of Bohemia. By the defeat, Bohemia lost its independence, and Protestantism was exterminated until 1648.

White Mountains Segment of the Appalachian Mountains. It extends 87 mi (140 km) across north-central New Hampshire and into western Maine. Containing the highest elevations in the northeastern U.S., its loftiest peaks, mostly 5,000–6,000 ft (1,500–1,800 m) high, occur in a series of summits that are named for U.S. presidents and make up the Presidential Range. The highest point is Mount Washington. Most of the White Mountains lie within the White Mountain National Forest. It is a popular summer and winter resort area.

White Nile See Nile River

White River River, Arkansas, U.S. It rises in the Boston Mountains in northwestern Arkansas, flows north into southern Missouri, then bends southeast and reenters Arkansas. It continues south to join the Arkansas River near its confluence with the Mississippi River. It is 685 mi (1,102 km) long.

White Sands National Monument National monument, south-central New Mexico, U.S. Established in 1933, it covers 225 sq mi (583 sq km) and lies between the San Andres and the Sacramento mountains. Its white gypsum sand constantly drifts into dunes 10–60 ft (3–18 m) high. The San Andres National Wildlife Refuge, White Sands Missile Range, and Holloman Air Force Base are nearby.

White Sea Sea, extension of the Arctic Ocean, northwestern Russia. Almost landlocked, it is connected to the more northerly Barents Sea by a long, narrow strait known as the Gorlo. It covers an area of approximately 35,000 sq mi (90,000 sq km) and has a maximum depth of 1,115 ft (340 m). Rivers, including the Northern Dvina and Onega, flow into it. An important transportation route, it remains navigable year-round with the help of icebreakers in winter. Arkhangelsk is one of the principal ports.

white shark See great white shark

white-tailed deer *or* **Virginia deer** Common reddish brown deer (*Odocoileus virginianus*), an important game animal found alone or in small groups from southern Canada to South America. The tail, white on the underside, is held aloft when the deer is alarmed or running. The male has forwardly curved antlers with several unbranched tines. Northern white-tailed deer grow up to 3.5 ft (107 cm) tall and weigh up to 400 lbs (180 kg). The white-tailed deer lives in open woodlands (young and cutover forests) and on the fringes of urban areas and farmlands, and eats leaves, twigs, fruits, nuts, lichen, and fungi.

White-tailed deer buck (*Odocoileus virginianus*)
KARL H. MASLOWSKI

White Volta River River, Burkina Faso and Ghana, western Africa. It rises in Burkina Faso (where it is known as the Nakambé) and flows southwest for about 400 mi (640 km) to empty into Lake Volta in Ghana. It is a headstream of the Volta River.

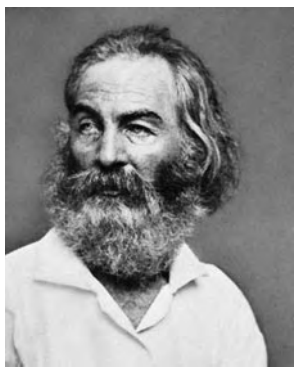
whitefish Any of several silvery food fishes (family Salmonidae, or Coregonidae), inhabiting cold northern lakes of Europe, Asia, and North America. Whitefish weigh about 2–5 lbs (1–2 kg); they eat insect larvae and other small animals. The Lake Superior whitefish (*Coregonus clupeaformis*), also called whiting or shad, is the largest of the lake whitefishes. Ciscoes, or lake herring (*Coregonus artedi*), are herringlike food and sport fishes. The best sport fishes of the family are the Rocky Mountain whitefish (*Prosopium williamsoni*) and other round whitefishes.

whitefly Any sap-sucking member of the insect family Aleyrodidae (order Homoptera). Nymphs are flat, oval, and usually covered with a cottony substance. Adults, 0.08–0.12 in. (2–3 mm) long, are covered with a white opaque powder and resemble moths. Whiteflies are abundant in warm climates, on houseplants, and in greenhouses. The greenhouse whitefly is one of the most abundant and destructive members of the family. The citrus whitefly and citrus blackfly damage fruit and other crops by sucking sap and producing honeydew, a by-product of digestion on which grows a sooty fungus that ruins fruit and reduces the host plant's ability to photosynthesize.

Whitehead, Alfred North (b. Feb. 15, 1861, Ramsgate, Isle of Thanet, Kent, Eng.—d. Dec. 30, 1947, Cambridge, Mass., U.S.) British mathematician and philosopher. He taught principally at the University of Cambridge (1885–1911) and Harvard University (1924–37). His *Treatise on Universal Algebra* (1898) extended Boolean symbolic logic. He collaborated with Bertrand Russell on the epochal *Principia Mathematica* (1910–13), which attempted to establish the thesis of logicism. In *Process and Reality* (1929), his major work in metaphysics, he proposed that the universe consists entirely of becomings, each a process of appropriating and integrating the infinity of items provided by the antecedent universe and by God. His other works include "On Mathematical Concepts of the Material World" (1905), *An Introduction to Mathematics* (1911), *Enquiry Concerning the Principles of Natural Knowledge* (1919), *The Concept of Nature* (1920), *Science and the Modern World* (1925), and *Religion in the Making* (1926). He received the Order of Merit in 1945.

Whitehorse City (pop., 2001: 19,058), capital of Yukon Territory, Canada. Located on the Yukon River, it was founded during the Klondike gold rush (1897–98) as a staging and distribution centre. Robert Service got much of his inspiration for his ballads while working there. The territorial capital since 1952, it is an important transportation centre on the Alaska Highway, as well as an outfitting base for anglers and hunters.

Whiteman, Paul (b. March 28, 1890, Denver, Colo., U.S.—d. Dec. 29, 1967, Doylestown, Pa.) U.S. musician and bandleader. Whiteman made his first records in 1920. His instrumental concept, known as "symphonic jazz," featured lush harmonies and simplified jazz rhythms but little improvisation; he nevertheless became known as "The King of Jazz." Whiteman commissioned George Gershwin's *Rhapsody in Blue* and conducted its premiere in 1924. The Whiteman band featured, among others, Bing Crosby, Bix Beiderbecke, and Jack Teagarden. His popularity waned in the late 1940s, but he was a television-series host in the 1950s and occasionally led bands up to the time of his death.



whiting Species (*Merlangius merlangus*) of common marine food fish of the cod family (Gadidae), found in European waters and especially abundant in the North Sea. It feeds on invertebrates and small fishes. It has three dorsal and two anal fins; a chin barbel (a slender, fleshy feeler), if present, is very small. Whitings grow to less than 30 in. (70 cm) long. They are silvery, with a distinctive black blotch near the base of each pectoral fin. Several species of the family Sciaenidae are also called whiting. See also whitefish.

Whitman, Marcus (b. Sept. 4, 1802, Rushville, N.Y., U.S.—d. Nov. 29, 1847, Waiilatpu, Oregon Territory) U.S. missionary and pioneer. A physician and Congregational missionary, he was sent to the Oregon region after offering his services to the American Board of Commissioners for Foreign Missions. In 1836 he and his wife founded a mission among the Cayuse Indians near present-day Walla Walla, Wash. He helped the Indians build houses and a corn-grinding mill, and his wife opened a

© 2006 Encyclopædia Britannica, Inc.

mission school. In 1842 he traveled east to encourage settlement of the Oregon country. On his return he joined a caravan of 1,000 immigrants to the Columbia River valley. He cared for Indian children in an 1847 measles epidemic, but he was accused of sorcery when many died while white children survived. The Indians attacked the whites and massacred 14, including the Whitmans. Their deaths led Congress to organize the Oregon Territory in 1848.

Whitman, Walt(er) (b. May 31, 1819, West Hills, Long Island, N.Y., U.S.—d. March 26, 1892, Camden, N.J.) U.S. poet, journalist, and essayist. Whitman lived in Brooklyn as a boy and left school at age 12. He went on to hold a great variety of jobs, including writing and editing for periodicals. His revolutionary poetry dealt with extremely private experiences (including sexuality) while celebrating the collective experience of an idealized democratic American life. His *Leaves of Grass* (1st ed., 1855), revised and much expanded in successive editions that incorporated his subsequent poetry, was too frank and unconventional to win wide acceptance in its day, but it was hailed by figures such as Ralph Waldo Emerson and exerted a strong influence on American and foreign literature. Written without rhyme or traditional metre, poems such as "I Sing the Body Electric" and "Song of Myself" assert the beauty of the human body, physical health, and sexuality; later editions included "Crossing Brooklyn Ferry," "Out of the Cradle Endlessly Rocking," and the elegies on Abraham Lincoln "O Captain! My Captain!" and "When Lilacs Last in the Dooryard Bloom'd." Whitman served as a volunteer in Washington hospitals during the Civil War. The prose *Democratic Vistas* (1871) and *Specimen Days & Collect* (1882–83) drew on his wartime experiences and subsequent reflections. His powerful influence in the 20th century can be seen in the work of poets as diverse as Pablo Neruda, Fernando Pessoa, and Allen Ginsberg.

Library of Congress, Washington, D.C.

Whitney, Amos (b. Oct. 8, 1832, Biddeford, Maine, U.S.—d. Aug. 5, 1928, Portland, Maine) U.S. manufacturer. He was apprenticed at age 13. In 1860, with Francis Pratt, he founded the firm of Pratt & Whitney, originally to manufacture thread spoolers. It later diversified into the manufacture of innovative designs of guns, cannons, sewing machines, and typesetting machines; instruments for measurement developed there proved of great value to science and industry. Today a separate company, formed from the toolworks in 1925, produces aircraft engines and space-propulsion systems as part of the United Technologies Corporation.

Whitney, Eli (b. Dec. 8, 1765, Westboro, Mass., U.S.—d. Jan. 8, 1825, New Haven, Conn.) U.S. inventor, engineer, and manufacturer. He is best remembered as the inventor of the cotton gin (1793), which led to greatly increased production of the short-staple cotton grown in much of the South, making the region prosperous. The most important innovation credited to Whitney may be the concept of mass production of interchangeable parts. His idea of manufacturing quantities of identical parts for assembly into muskets, after undertaking in 1797 to supply the U.S. government with 10,000 muskets in two years, helped inaugurate the vastly important American System of manufacture.

Whitney, Gertrude Vanderbilt *orig.* **Gertrude Vanderbilt** (b. Jan. 9, 1875, New York, N.Y., U.S.—d. April 18, 1942, New York City) U.S. sculptor and art patron. Great-granddaughter of Cornelius Vanderbilt, she was born to great wealth and studied sculpture in New York City and Paris. Among her major works were the *Titanic Memorial* (1914–31) in Washington, D.C., and *Victory Arch* (1918–19) in New York. All her works were simple, direct, and traditional. In 1929 she offered to donate her collection of about 500 works by modern American artists to the Metropolitan Museum of Art but was refused by the traditionalist director. The next year she founded the Whitney Museum of American Art, also in New York City, which opened in 1931; today it is the foremost museum of American art.

Whitney, John Hay (b. Aug. 17, 1904, Ellsworth, Maine, U.S.—d. Feb. 8, 1982, Manhasset, N.Y.) U.S. multimillionaire and sportsman. The son of Harry Payne Whitney and Gertrude Vanderbilt Whitney, "Jock" Whitney attended Yale University and later the University of Oxford, which he left to manage the family fortune on his father's death. He became an internationally ranked polo player, his stables produced notable racehorses, he invested in successful films and Broadway plays, and he boasted one of the finest art collections in the U.S. As a combat-intelligence captain in World War II, he was captured in France but escaped; he was later awarded the Legion of Merit. He served as ambassador to Britain (1956–61). As publisher and (from 1961) editor in chief of the *New York Herald Tribune*, he tried to revitalize the paper, but it folded in 1966. He founded the John Hay Whitney Foundation in 1946.

Whitney, Mount Peak in the Sierra Nevada, southeast-central California, U.S. Located in Sequoia National Park, it is 14,494 ft (4,418 m) high, the highest point in the continental U.S. outside of Alaska. It was first climbed in 1873.

Whitney, William C(ollins) (b. July 5, 1841, Conway, Mass., U.S.—d. Feb. 2, 1904, New York, N.Y.) U.S. politician. He practiced law in New York City, where he helped Samuel Tilden overthrow the corrupt political boss William Marcy Tweed; he also served as corporation counsel for the city (1875–82). As U.S. secretary of the navy (1885–89), he rebuilt the neglected fleet with a major shipbuilding program that included the battleship *Maine* (see destruction of the *Maine*). He returned to New York, where he became co-owner of the city's first rapid-transit system.

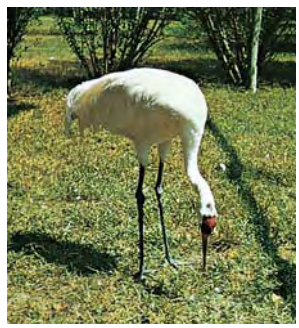
Whittier, John Greenleaf (b. Dec. 17, 1807, near Haverhill, Mass., U.S.—d. Sept. 7, 1892, Hampton Falls, Mass.) U.S. poet and reformer. A Quaker born on a farm, Whittier had limited education but was early acquainted with poetry. He became involved in journalism and published his first volume of poems in 1831. During 1833–42 he embraced the abolitionism of William Lloyd Garrison and became a prominent antislavery crusader. Thereafter he continued to support humanitarian causes while publishing further poetry volumes. After the Civil War he was noted for his vivid portrayals of rural New England life. His best-known poem is the nostalgic pastoral "Snow-Bound" (1866); others include "Maud Muller" (1854) and "Barbara Frietchie" (1863).

Whittington, Richard *known as* **Dick Whittington** (d. March 1423, London) Lord mayor of London (1397–99, 1406–07, 1419–20). The son of a knight, he earned a vast fortune as a merchant and made loans to Henry IV and Henry V, then entered city politics and served three terms as lord mayor. In legend he is portrayed as an orphan who ventures his only possession, a cat, as an item to be sold on one of his master's trading ships. Ill-treated by the cook, he runs away, but at the edge of the city he hears the bells say, "Turn again, Whittington, lord mayor of great London." He returns to find that his cat has been sold for a great sum to a Moorish ruler plagued by rats. He becomes a wealthy merchant and later lord mayor.

Whittle, Sir Frank (b. June 1, 1907, Coventry, Warwickshire, Eng.—d. Aug. 8, 1996, Columbia, Md., U.S.) British aviation engineer and pilot who invented the jet engine. He obtained his first patent for a turbojet engine in 1930, and in 1936 he cofounded Power Jets Ltd. The outbreak of World War II spurred the British government to support Whittle's work, and the first jet-powered aircraft took off in 1941. He was knighted in 1948 and awarded the Order of Merit in 1986.

Whitworth, Sir Joseph (b. Dec. 21, 1803, Stockport, Cheshire, Eng.—d. Jan. 22, 1887, Monte-Carlo, Monaco) British mechanical engineer. Working for Henry Maudslay, he devised a scraping technique for making a true plane surface. He followed this with a measuring machine and a system of accurate dimensional standards or master gauges to go with it, and screws with standardized threads (1841), among other innovations. His machine tools became internationally known for their accuracy and quality.

WHO See World Health Organization



wholesaling Selling of merchandise to anyone other than a retail customer. The term may include sales to a retailer, wholesaler, broker, distributor, or business enterprise. Wholesaling usually involves sales in quantity and at a cost significantly lower than the average retail price. It has become an important step in the supply chain since the introduction of mass production and mass marketing techniques in the 19th century. Without wholesalers, manufacturers would have to market their products directly to a huge number of customers at high unit costs, and buyers would have to deal with an inconveniently large number of suppliers.

© 2006 Encyclopædia Britannica, Inc.

There are three major categories of wholesalers. Merchant wholesalers, the most important category, are independent businesses that buy merchandise in great quantities from manufacturers and resell it to retailers. Manufacturers' sales branches are businesses founded by manufacturers to sell directly to retailers. Merchandise agents and brokers represent various manufacturers; they usually do not buy the merchandise they handle but instead arrange for shelf space and the display of merchandise. So-called warehouse stores sell large quantities of goods at near-wholesale prices. See also RETAILING.

whooping cough *or* **pertussis** Acute, very contagious childhood disease, typically with bouts of coughing followed by a long, loud inhalation (whoop) and ending with mucus expulsion and often vomiting. Caused by the bacterium *Bordetella pertussis*, it initially resembles a cold with a short dry cough. Within one or two weeks, coughing bouts begin; this phase usually lasts four to six weeks. Serious complications include bronchopneumonia (PNEUMONIA involving the bronchi), asphyxia, seizures, and signs of brain damage. Treatment is with antibiotics. The pertussis vaccine is usually combined with tetanus and diphtheria toxoids as part of routine childhood immunizations.

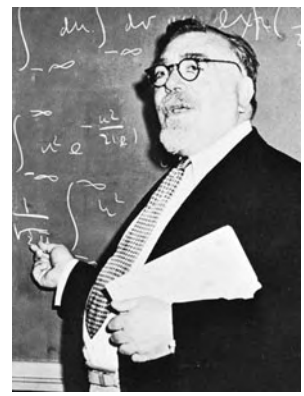
whooping crane Migratory North American bird (*Grus americana*) and one of the world's rarest birds, on the verge of extinction. The tallest North American bird, it is almost 5 ft (150 cm) tall and has a wingspread of about 7 ft (210 cm). It is white with black-tipped wings, black legs, and a bare red face and crown. Its shrill, whooping call can be heard for 2 miles (3 km). Almost exterminated in the early 20th century, it became the object of intensive conservation efforts; by century's end there were still fewer than 300 wild and captive individuals. See also SANDHILL CRANE.

Whooping crane (*Grus americana*).
H. WILLIAM BELKNAP

Whorf \'wȯrf**, Benjamin Lee** (b. April 24, 1897, Winthrop, Mass., U.S.—d. July 26, 1941, Wethersfield, Conn.) U.S. linguist. He worked professionally as a fire-prevention authority. The concept he developed (under EDWARD SAPIR's influence) of the equation of culture and language became known as the Whorf (or Sapir-Whorf) hypothesis. He maintained that a language's structure tends to condition the ways its speakers think—for example, that the way a people views time and punctuality may be influenced by the types of verb TENSES in its language. Whorf was also noted for his studies of UTO-AZTECAN LANGUAGES, especially Hopi, and MAYAN HIEROGLYPHIC WRITING.

Whymper \'hwim-pər**, Edward** (b. April 27, 1840, London, Eng.—d. Sept. 16, 1911, Chamonix, Fr.) British mountaineer and artist. He became a mountaineer after making sketches for a book on the Alps. In 1865 he made the first ascent of the MATTERHORN; an accident on the descent caused the death of four of his companions. His *Scrambles Amongst the Alps* (1871) and *Travels Amongst the Great Andes* (1892) describe his experiences and are illustrated with his own engravings.

Wicca Modern Western witchcraft movement. Some practitioners consider Wicca the religion of pre-Christian Europe, forced underground by the Christian church. That thesis is not accepted by historians, and modern Wicca is usually dated to the work of Gerald B. Gardner (1884–1964) and Doreen Valiente (1922–1999), who, after the repeal of the last Witchcraft Act in England (1951), went public with their cult of witchcraft, which centered on a horned god of fertility and a great earth goddess. Gardner is credited with introducing the term Wicca. So-called "Dianic" Wicca focuses on the Goddess as the supreme being and usually excludes men. Wiccans share a belief in the importance of the feminine principle, a deep respect for nature, and a pantheistic and polytheistic worldview. They practice some form of ritual magic, almost always considered good or constructive. Some are solitary practitioners; others belong to covens.



Wichita \'wi-chə-ˌtȯ\ City (pop., 2000: 344,284), south-central Kansas, U.S. On the ARKANSAS RIVER, the city was founded in 1864 as a trading post on the site of a Wichita Indian village; it developed with the Texas cattle trade along the CHISHOLM TRAIL and the rapid spread of agricultural settlement along the ATCHISON, TOPEKA AND SANTA FE Railroad Co. In the 1870s it was a major cattle-shipping centre. It developed as a centre of the aircraft industry in the 1920s. Aircraft construction continues; other economic activities include oil refining, grain processing and storage, and livestock marketing.

Wideman, John Edgar (b. June 14, 1941, Washington, D.C., U.S.) U.S. writer and educator. After graduating from the University of Pennsylvania he became the second African American to receive a Rhodes scholarship to Oxford University. He published his first novel, *A Glance Away*, in 1967. His first work of nonfiction was the acclaimed *Brothers and Keepers* (1984), in which he examines his relationship with his brother, who is serving a life sentence in prison. He won PEN/Faulkner Awards for *Sent for You Yesterday* (1983) and *Philadelphia Fire* (1990), a fictional account of the bombing of the militant black group MOVE combined with an examination of his relationship with his son, now in prison.

widgeon See WIGEON

Wieland \'vē-ˌlänt**, Heinrich Otto** (b. June 4, 1877, Pforzheim, Ger.—d. Aug. 5, 1957, W.Ger.) German chemist. He won a 1927 Nobel Prize for research on BILE acids which showed that the three acids then isolated had similar structures and were also structurally related to CHOLESTEROL. He also found that different forms of nitrogen in organic compounds can be detected and distinguished from each other, an important contribution to structural organic chemistry. Wieland's theory that oxidation in living tissues occurs through removal of hydrogen atoms, not addition of oxygen (see OXIDATION-REDUCTION), was of great importance to physiology, biochemistry, and medicine.

Wiener \'wē-nər**, Norbert** (b. Nov. 26, 1894, Columbia, Mo., U.S.—d. March 18, 1964, Stockholm, Swed.) U.S. mathematician. He earned a Ph.D. from Harvard at 18. He joined the faculty of MIT in 1919. His work on generalized harmonic analysis and Tauberian theorems (which deduce the convergence of an infinite series) won the American Mathematical Society's Bôcher Prize in 1933. The origin of CYBERNETICS as an independent science is generally dated from the 1948 publication of his *Cybernetics*. He made contributions to such areas as stochastic processes, quantum theory, and, during World War II, gunfire control. Crater Wiener on the Moon is named for him.

Norbert Wiener.
COURTESY OF THE LIBRARY OF CONGRESS, WASHINGTON, D.C.

Wiener Werkstätte \'vē-nər-'verk-ˌshtet-ə\ *English* **Vienna Workshops** Cooperative enterprise for crafts and design founded in Vienna in 1903. Inspired by WILLIAM MORRIS and the English ARTS AND CRAFTS MOVEMENT, it was founded by Koloman Moser and JOSEF HOFFMANN with the goal of restoring the values of handcraftsmanship to an industrial society in which such crafts were dying. Its members had close ties to the artists of the Vienna SEZESSION and the ART NOUVEAU movement. The Wiener Werkstätte's work in jewelry, furnishings, interior design, fashion, and other areas, which often celebrated the beauty of geometry, became widely known for elegance and innovation, and this "square style" influenced the work of the BAUHAUS craftsmen in the 1920s as well as the work of FRANK LLOYD WRIGHT.

Wiesbaden \'vēs-ˌbä-dən\ City (pop., 2002 est.: 271,276), capital of HESSE, southern Germany. It is situated on the RHINE RIVER. The Romans fortified it in the 1st century AD; it has been noted since then for its hot saline springs. Made an imperial city in 1241, it passed to the counts of Nassau in 1255. It was capital of the duchy of Nassau from 1806 to 1866, when it passed to PRUSSIA. After World War I it was the seat of the Rhineland Commission under French and British occupation (1918–29). In 1946 Wiesbaden became the capital of the newly created state of Hesse. It was particularly noted for its spa in the 18th and 19th centuries, when it was frequented by Johann W. von GOETHE, JOHANNES BRAHMS, and FYODOR DOSTOYEVSKY. It continues to be a popular resort. It has printing firms, publishing houses, and film studios, and it is noted for its *Sekt* (sparkling wine).

Wiesel \vē-'zel**, Elie** *orig.* **Eliezer Wiesel** (b. Sept. 30, 1928, Sighet, Rom.) Romanian-born U.S. novelist. Living in a small Hasidic community, Wiesel and his family were deported in 1944 to Auschwitz and then to Buchenwald; his parents and sister were killed. All his works reflect his experiences as a survivor of the Holocaust and his attempt to resolve the ethical torment of why it happened and what it reveals about human nature. They include *Night* (1958), *A Beggar in Jerusalem* (1968), *The Testament* (1980), and *The Forgotten* (1989). A noted lecturer, he was awarded the 1986 Nobel Prize for Peace for his universal condemnation of violence, hatred, and oppression.

Wiesel \'vē-səl**, Torsten (Nils)** (b. June 3, 1924, Uppsala, Swed.) Swedish neurobiologist. After earning his medical degree in Sweden, he moved to the U.S., where he joined DAVID HUBEL in investigating brain function. By analyzing the flow of nerve impulses from the eye in laboratory animals, they detected many structural and functional details of the visual cortex, in the occipital lobes of the cerebral cortex. Their studies of the effects of visual impairments in young animals lent strong support to the view that prompt surgery is crucial to correct certain eye defects in newborn children. The two shared a 1981 Nobel Prize with ROGER SPERRY.

wig Manufactured head covering of real or artificial hair worn in the theatre, as personal adornment, disguise, or symbol of office, or for religious reasons. Ancient Egyptians, Assyrians, Phoenicians, Greeks, and Romans used wigs, often as protection from the sun. In the West the wig first became an acceptable form of adornment or corrective for nature's defects in the 16th century, and men's perukes, or periwigs, came into widespread use in the 17th century. Men's wigs were common throughout the 18th century. Women wore wigs surreptitiously in the 18th–19th centuries; after the development of inexpensive synthetic wigs in the 20th century, women's wigs increased in popularity. In East Asia wigs have been used rarely except in the Chinese and Japanese theatre.

Wigan \'wi-gən\ Town and metropolitan borough (pop., 2001: 301,417), northwestern GREATER MANCHESTER, historic county of LANCASHIRE, England. It lies along the River Douglas and the Leeds and Liverpool Canal. Coal was mined from the 14th century, and textiles were produced in the area as early as the 16th century. Industrialization in the late 18th century was accelerated by the building of canals and railways. Textiles have declined in importance, and the last coal mine closed in 1993. New industries, including food processing, paper and packaging, and electrical engineering, have broadened the economy. Tourism was spurred by GEORGE ORWELL's treatise *The Road to Wigan Pier*.

wigeon *or* **widgeon** Any of four species of DABBLING DUCKS, popular game and food birds. The male European wigeon (*Anas penelope*) has a reddish head, cream forehead, and gray back. The male American wigeon, or baldpate (*A. americana*), has a white crown, green eye stripe, and brown back. Baldpates often graze on young grasses. The Cape wigeon (*A. capensis*) of Africa is a nocturnal feeder.

Wiggin, Kate Douglas *orig.* **Kate Douglas Smith** (b. Sept. 28, 1856, Philadelphia, Pa., U.S.—d. Aug. 24, 1923, Harrow, Middlesex, Eng.) U.S. novelist and a leader of the kindergarten movement in the U.S. After moving to San Francisco she headed the Silver Street Kindergarten (1878), the first free kindergarten on the U.S. West Coast, and helped establish the California Kindergarten Training School. To help support the school she began writing novels for both adults and children. She is best remembered for the children's classic *Rebecca of Sunnybrook Farm* (1903).

Wight, Isle of Island and unitary authority (pop., 2001: 132,719), part of the historic county of HAMPSHIRE, in the ENGLISH CHANNEL off the southern coast of England. Separated from mainland Hampshire by the SOLENT, the island has an area of 147 sq mi (381 sq km). Its main town is NEWPORT. The backbone of the Isle of Wight is a chalk ridge that extends across its entire breadth, the thickest bed of chalk in the British Isles. The Needles are three detached masses of chalk that lie off the island's westernmost point and rise to about 100 ft (30 m). Three rivers, the Eastern Yar, the Medina, and the Western Yar, flow northward into the Solent. A major British maximum security prison is located at Parkhurst. Boatbuilding, marine engineering, and the aerospace, plastics, and electronics industries are economically important. The island's warm, sunny climate has made it a popular vacation spot.

Wightman, Hazel Hotchkiss *orig.* **Hazel Virginia Hotchkiss** (b. Dec. 20, 1886, Healdsburg, Calif., U.S.—d. Dec. 5, 1974, Newton, Mass.) U.S. tennis player. She was a dominant competitor in the pre-World War I years, winning nine national tennis titles in the years 1909–11 alone. She won a lifetime total of 45 U.S. titles, the last at age 68. She was instrumental in establishing an annual match between British and U.S. women's teams; the Wightman Cup competition, first held in 1923, continued until 1989. She served as captain of the U.S. team from its inception until 1948.

Wigman, Mary *orig.* **Marie Wiegmann** (b. Nov. 13, 1886, Hanover, Ger.—d. Sept. 18, 1973, West Berlin, W.Ger.) Pioneering German dancer. Wigman studied with ÉMILE JAQUES-DALCROZE and RUDOLF LABAN and made her debut in 1914. Only a few years later she began a stellar career as an innovative choreographer. Her impact on dance throughout the West was immense. Her students included HANYA HOLM, who exerted a major influence on the development of American MODERN DANCE, and thousands of other original choreographers.

Wigner, Eugene (Paul) *orig.* **Jenó Pál Wigner** (b. Nov. 17, 1902, Budapest, Hung.—d. Jan. 1, 1995, Princeton, N.J., U.S.) Hungarian-born U.S. physicist. After studies at the University of Berlin, he immigrated to the U.S. in 1930 and joined the faculty of Princeton University. He was instrumental in getting the MANHATTAN PROJECT started and was present when ENRICO FERMI initiated the first chain reaction. He determined that the nuclear force is short-range and does not involve an ELECTRIC CHARGE, using GROUP THEORY to investigate atomic structure. His name was given to several formulations, including the Breit-Wigner formula, which describes resonant nuclear reactions. He won a 1963 Nobel Prize (shared with MARIA MAYER and Hans Jensen [1907–73], who won for unrelated work) for his insights into QUANTUM MECHANICS, especially principles governing interaction of protons and neutrons in the nucleus and his formulation of the law of conservation of PARITY (see CONSERVATION LAW). In addition to his many scientific awards, he received numerous awards for his work for peace.

wigwam American Indian dwelling, characteristic of the ALGONQUIAN-speaking nomadic tribes of what is now the northeastern U.S. It is constructed of saplings driven into the ground in a circle and tied together at the top, then covered with mats of woven rushes or sewn bark. See also IGLOO; LONGHOUSE; TEPEE.

Wilberforce, William (b. Aug. 24, 1759, Hull, Yorkshire, Eng.—d. July 29, 1833, London) British politician. Entering the House of Commons in 1780, he supported parliamentary reform and Catholic emancipation. Converted to evangelical Christianity (1785), he agitated against the slave trade and cofounded the Anti-Slavery Society. His sponsorship of antislavery legislation led to the passage of a bill abolishing the slave trade in the British West Indies (1807). From 1821 he agitated for emancipation of all slaves and was joined in Parliament by Thomas F. Buxton (1786–1845), who continued to sponsor legislation after Wilberforce retired in 1825. The Slavery Abolition Act was passed one month after Wilberforce's death in 1833.

Wilbur, Richard (Purdy) (b. March 1, 1921, New York, N.Y., U.S.) U.S. poet, critic, editor, and translator. He studied literature at Harvard University and established himself as an important young poet with the collections *The Beautiful Changes* (1947) and *Ceremony* (1950). His urbane, well-crafted verse later appeared in volumes such as *Things of This World* (1956, Pulitzer Prize), *Walking to Sleep* (1969), and *The Mind Reader* (1976). He also translated plays (notably those of MOLIÈRE) and wrote criticism and children's books. He served as U.S. poet laureate in 1987–88.

Wilbye \'wil-bē**, John** (b. March 7, 1574, Diss, Norfolk, Eng.—d. September 1638, Colchester, Essex) British composer. He spent his entire life in the employ of the Kytson family, as a domestic musician at Hengrave Hall, and then in Colchester (from 1628). One of the finest of the English madrigalists, he published only two collections (1598, 1609). His MADRIGALS are less chromatic than those of his contemporary THOMAS WEELKES, but he made subtle use of varying textures for expression.

wild rice Coarse annual GRASS (*Zizania aquatica*) of the family Poaceae (or Gramineae) whose grain, now often considered a delicacy, has long been an important food of American Indians. Despite its name, the plant is not related to RICE. Wild rice grows naturally in shallow water in marshes

© 2006 Encyclopædia Britannica, Inc.

and along the shores of streams and lakes in northern central North America. Cultivated varieties are now grown in Minnesota and California. The plant, about 3–10 ft (1–3 m) tall, is topped with a large, open flower cluster. The ripened grains, dark brown to purplish-black, are slender rods 0.4–0.8 in. (1–2 cm) long.

Wild West Show Theatrical extravaganza produced by William F. (Buffalo Bill) Cody. First performed in 1883, the show reached New York City's Madison Square Garden in 1887 with a cast of 100 Native Americans, the sharpshooter Annie Oakley, other trick riders and ropers, and wild animals such as buffalo, elk, bear, and deer. The four-hour spectacle, including Native American war dances and an attack on a stagecoach, toured Europe with great success in the 1890s and continued touring the U.S. until 1916.

wildcat Wild species (*Felis silvestris*) of cat (family Felidae) native to Eurasian forests. Very similar to the domestic yellowish tabby, it will interbreed with domestic cats (of which it is presumably an ancestor). It is 20–32 in. (50–80 cm) long, excluding the 10–14-in. (25–35-cm) tail. It stands 14–16 in. (35–40 cm) and weighs 6–20 lbs (3–10 kg). Solitary and nocturnal, it preys on birds and small animals. In North America the name is used for the bobcat and lynx; in Africa it refers to the Caffre cat.

wildcat bank In the U.S., an unsound bank chartered under state law during the period of state banking control (1816–63). Such banks distributed currency backed by questionable securities and were located in inaccessible areas to discourage note redemption. Note circulation by state banks ended with the passage of the National Bank Act of 1863, which provided for the incorporation of national banks and the issue of banknotes on the security of government bonds. The term wildcat bank was later applied to any unstable bank.

Wilde, Oscar (Fingal O'Flahertie Wills) (b. Oct. 16, 1854, Dublin, Ire.—d. Nov. 30, 1900, Paris, France) Irish poet and dramatist. Son of an eminent surgeon, Wilde attended Trinity College, Dublin, and later Oxford University, becoming widely known for his wit while still an undergraduate. A spokesman for Aestheticism, in the early 1880s he gave a lecture tour in the U.S. and established himself in London circles by his wit and flamboyance. His only novel, *The Picture of Dorian Gray* (1891), combines gothic elements with mockery of bourgeois morality. His macabre play *Salomé* (1893) was later adapted as the libretto of Richard Strauss's opera; his other plays, all successes, include *Lady Windermere's Fan* (1893), *A Woman of No Importance* (1893), and *An Ideal Husband* (1895). His greatest work was the comedy *The Importance of Being Earnest* (1899), a satire of Victorian social hypocrisy. Two critical dialogues, "The Decay of Lying" and "The Critic as Artist," are admired as equally brilliant. Though happily married, in 1891 he began an intimate relationship with the young Lord Alfred Douglas, son of the marquess of Queensberry. Accused by Queensberry of being a sodomite, Wilde sued for libel and lost, then was arrested for sodomy and convicted in a trial that became internationally notorious. Imprisoned at Reading Gaol (1895–97), he wrote a recriminatory letter to his lover that was edited and published as *De Profundis* (1905). After his release, he moved to Paris; his only later work was *The Ballad of Reading Gaol* (1898), on inhumane prison conditions. He died suddenly of acute meningitis.

Oscar Wilde, 1882.

Wilder, Billy *orig.* **Samuel Wilder** (b. June 22, 1906, Sucha, Austria—d. March 27, 2002, Beverly Hills, Calif., U.S.) Austrian-born U.S. film director and screenwriter. Working as a reporter in Vienna and Berlin, he wrote screenplays for German films. He fled Germany in 1933 and arrived in Hollywood a year later. He cowrote screenplays with Charles Brackett and established his reputation as a director with *Double Indemnity* (1944). Noted for his humorous treatment of controversial subjects and his biting indictments of hypocrisy, he also directed *The Lost Weekend* (1945, Academy Award), *Sunset Boulevard* (1950, Academy Award for best screenplay), *Stalag 17* (1953), and *The Apartment* (1960, Academy Award). His acclaimed comedies include *Sabrina* (1954), *The Seven Year Itch* (1955), *Some Like It Hot* (1959), and *Kiss Me, Stupid* (1964).

Wilder, Laura Ingalls *orig.* **Laura Ingalls** (b. Feb. 7, 1867, Lake Pepin, Wis., U.S.—d. Feb. 10, 1957, Mansfield, Mo.) U.S. children's author. She led the pioneer life with her family, living in Kansas, Minnesota, Iowa, and South Dakota, where she married. With her husband she finally settled in Missouri, where she edited the *Missouri Ruralist* for 12 years before being encouraged by her daughter to write down her childhood memories, and the internationally popular *Little House* books (1932–43) were the result. They were the basis for a popular television series (1974–84).

Wilder, Thornton (Niven) (b. April 17, 1897, Madison, Wis., U.S.—d. Dec. 7, 1975, Hamden, Conn.) U.S. playwright and novelist. After attending Yale University, Wilder studied archaeology in Rome. He earned wide acclaim for his second novel, *The Bridge of San Luis Rey* (1927, Pulitzer Prize). His play *Our Town* (1938, Pulitzer Prize), which became one of the most enduringly popular of all American plays, was followed by the successful *The Skin of Our Teeth* (1942, Pulitzer Prize). In them he rejected naturalism, often discarding props and scenery, using deliberate anachronisms, and having the characters address the audience directly. His farcical play *The Matchmaker* (1954) was adapted into the musical *Hello, Dolly!* (1964). Wilder's later novels include *The Eighth Day* (1967) and *Theophilus North* (1973).

Wilderness, Battle of the (May 5–7, 1864) Engagement in the American Civil War. When Ulysses S. Grant planned a Union campaign to capture Richmond, Va., and advanced with 115,000 troops, he was met by a Confederate army of 62,000 under Robert E. Lee in dense thickets called the Wilderness. After two days of intense and inconclusive fighting, Union casualties outnumbered those of the Confederacy (burning brush killed many of the wounded), and Grant saw the futility of further hostilities in the area. He moved on to do battle at Spotsylvania Courthouse, forcing Lee back toward Richmond.

wildflower Any flowering plant that grows without intentional human aid. Wildflowers are the source of all cultivated garden varieties of flowers. A wildflower growing where it is unwanted is considered a weed. Thousands of the approximately 250,000 species of flowering plants are wildflowers. Wildflowers can be divided into three categories by location: those found in the tropics and subtropics, those in temperate regions, and those that grow on the summits of mountain chains and in the Arctic and Antarctic.

wildlife conservation Regulation of wild animals and plants in such a way as to provide for their continuance. Efforts are aimed at preventing the depletion of present populations and ensuring the continued existence of the habitats targeted species need to survive. Techniques involve establishment of sanctuaries and controls on hunting, use of land, importation of exotic species, pollution, and use of pesticides. See also biodiversity, conservation, endangered species.

Wilfrid, Saint *or* **Wilfrid of York** (b. 634, Northumbria, Eng.—d. April 24, 709/710, monastery of Oundle, Mercia) English monk and bishop who established close relations between the Anglo-Saxon church and the papacy. As abbot of the monastery at Ripon, he introduced the Benedictine Rule to the kingdom. At the Synod of Whitby, he successfully advocated the adoption of Roman over Celtic traditions. As bishop of York, he built a monastery at Hexham and traveled twice to Rome to defend the see of York in jurisdictional controversies with the see of Canterbury (679, 704). A quarrel over the division of his diocese obliged Wilfrid to take refuge in Sussex, where he Christianized the people and founded a monastery at Selsey; he later served as bishop of Lichfield in Mercia. Following his second dispute with Canterbury, Wilfrid became bishop of Hexham and spent his last years there and at his monastery in Ripon.

Wilhelmina (Helena Pauline Maria) (b. Aug. 31, 1880, The Hague, Neth.—d. Nov. 28, 1962, Het Loo, near Apeldoorn) Queen of The Netherlands (1890–1948). Daughter of King William III, she became queen on his death, under her mother's regency until 1898, and soon gained wide popular approval. She helped maintain her country's neutrality in World War I. After Germany invaded The Netherlands in 1940, she left with her

© 2006 Encyclopædia Britannica, Inc.

family for London. Throughout World War II she made radio broadcasts to maintain the morale of the Dutch people, becoming a symbol of Dutch resistance to the German occupation. In 1948 she abdicated in favour of her daughter, JULIANA.

Wilkes, John (b. Oct. 17, 1725, London, Eng.—d. Dec. 26, 1797, London) English politician. The son of a successful malt distiller, he was educated at an academy at Hertford and afterward privately tutored. His marriage to Mary Meade (1747), heiress of the manor of Aylesbury, brought him a comfortable fortune and an assured status among the gentry of Buckinghamshire. A profligate by nature, he was a member of the so-called Hell-Fire Club, which indulged in debauchery and the performance of Black Masses, and he bribed voters to win election to the House of Commons (1757). For an attack on the government in his journal the *North Briton* (1763), he was prosecuted for libel and expelled from Parliament. Reelected, he continued to print his attacks on the government and was again tried for libel and expelled (1764). Regarded as a victim of persecution and a champion of liberty, he gained widespread popular support. He was again elected to Parliament and again expelled (1769). He become lord mayor of London in 1774. Back in the House of Commons (1774–90), he supported parliamentary reform and freedom of the press.

Wilkes, Maurice V(incent) (b. June 26, 1913, Dudley, Staffordshire, Eng.) British computer-science pioneer. He helped build the EDSAC computer (1949), invented MICROPROGRAMMING (1950), cowrote the first book on computer programming (1951), wrote the first paper on cache memories (1964), and pioneered CLIENT-SERVER ARCHITECTURE computing (1980). He won the Turing Award in 1967 and the Kyoto Prize in 1992. In 1995 he published *Memoirs of a Computer Pioneer*.

Wilkins, Maurice (Hugh Frederick) (b. Dec. 15, 1916, Pongaroa, N.Z.—d. Oct. 6, 2004, London, Eng.) New Zealand-born British biophysicist. Educated in Birmingham and Cambridge, he participated in the MANHATTAN PROJECT, working on the separation of uranium isotopes for use in the atomic bomb. On his return to Britain, he began a series of investigations that led ultimately to his studies of DNA. His X-ray diffraction studies of DNA proved crucial to the determination of DNA's molecular structure by JAMES D. WATSON and FRANCIS CRICK, for which the three were awarded a 1962 Nobel Prize. He later applied X-ray diffraction techniques to the study of RNA. See also ROSALIND FRANKLIN.

Wilkins, Roy (b. Aug. 30, 1901, St. Louis, Mo., U.S.—d. Sept. 8, 1981, New York, N.Y.) U.S. civil-rights leader. He was a reporter for the African American-owned *Kansas City Call* and later became its managing editor. He joined the staff of the NAACP (1931) and became editor (1934–49) of its official publication, *The Crisis*. In 1955 he began a 22-year tenure as executive director of the NAACP, which he set on a course of seeking equal rights through legal redress. He helped organize the 1963 March on Washington, and he served as chairman of the U.S. delegation to the International Conference on Human Rights in 1968.

Wilkinson, James (b. 1757, Calvert county, Md.—d. Dec. 28, 1825, Mexico City, Mex.) American army officer and double agent. He served in the AMERICAN REVOLUTION under HORATIO GATES and was involved in the THOMAS CONWAY cabal. He settled in Kentucky in 1784 and schemed to ally the Kentucky region with Spain, though he was in fact working against Spain. He served as governor of part of the Louisiana territory (1805–06). He allegedly planned to conquer the Mexican provinces of Spain and conspired with AARON BURR to establish an independent government; when he betrayed Burr's plan, he was investigated but cleared. In the War of 1812 he commanded U.S. forces on the Canadian border, but his campaign against Montreal failed.

Wilkinson, John (b. 1728, Clifton, Cumberland, Eng.—d. July 14, 1808, Bradley, Staffordshire) British industrialist. Known as "the great Staffordshire ironmaster," he found many new applications for iron, developed a BORING MACHINE whose precision enabled JAMES WATT to perfect his STEAM ENGINE, and used Watt's first steam engine to drive a huge air pump in his factory for the large-scale manufacture of WROUGHT IRON.

will In law, a formal declaration, usually in the form of an executed document, of a person's wishes regarding the disposal of his or her property after death. It is valid if it meets the formalities of the law, which usually requires that it be witnessed. It may be considered invalid if, among other instances, the testator was mentally incapable of disposing of his or her property, if it imposes unreasonable or cruel demands as a condition of inheritance, or if the testator did not have clear title to the bequeathed assets. Any party who contests a will must bring the claim within a time specified by statute and must bear the burden of proof in demonstrating that the will is faulty. See also PROBATE.

Willamette River River, northwestern Oregon, U.S. It flows north for 300 mi (485 km) into the COLUMBIA RIVER near PORTLAND. Oregon's most populous cities are in its valley. The Fremont Bridge, a steel arch with a main span of 1,225 ft (373 m), crosses the river at Portland.

Willemstad \'vi-ləm-ˌstät\ City (pop., 1999 est.: 123,000), capital of the NETHERLANDS ANTILLES, WEST INDIES. Located on the southern coast of CURAÇAO, it was founded in 1634. Willemstad contains many Dutch colonial buildings and is the site of the oldest (1732) synagogue in continuous use in the Western Hemisphere. It is a centre of trade, petroleum storage and refining, banking, and tourism.

William I *known as* **William the Conqueror** (b. c. 1028, Falaise, Normandy—d. Sept. 9, 1087, Rouen) Duke of Normandy (1035–87) and king of England (1066–87). Though born out of wedlock, he succeeded his father as duke of Normandy, subduing rebellions and becoming the mightiest noble in France. In 1051 EDWARD THE CONFESSOR promised to make him heir to the English throne, but on Edward's death in 1066, Harold Godwineson, earl of Wessex (HAROLD II), was accepted as king. Determined to assert his right to the throne, William sailed from Normandy with an invasion force, defeated Harold at the Battle of HASTINGS, and was crowned king. The NORMAN CONQUEST was thus completed, though English rebellions continued until 1071. To secure England's frontiers, William invaded Scotland (1072) and Wales (1081). In 1086 he ordered the survey summarized in the DOMESDAY BOOK. He divided his lands between his sons, giving Normandy and Maine to ROBERT II and England to WILLIAM II.

William I *German* **Wilhelm Friedrich Ludwig** (b. March 22, 1797, Berlin—d. March 9, 1888, Berlin) King of Prussia (1861–88) and German emperor (1871–88). Son of FREDERICK WILLIAM III of Prussia, he fought in the war against NAPOLEON (1814) and thereafter devoted himself to the Prussian army and military affairs. He advocated the use of force against the rebels in 1848. The military governor of Rhineland province from 1849, he succeeded his brother on the Prussian throne in 1861. A conservative and a supporter of military reform, William insisted on a three-year term of military conscription, which the liberal lower chamber rejected in 1862. William was ready to abdicate but was dissuaded by OTTO VON BISMARCK, whom he had installed as prime minister (1862). He cautiously supported Bismarck's policies in the SEVEN WEEKS' WAR and the FRANCO-PRUSSIAN WAR. Proclaimed German emperor in 1871, he oversaw the continued rise of Germany as a European power.

William I *Dutch* **Willem** *known as* **William the Silent** (b. April 24, 1533, Dillenburg, Nassau—d. July 10, 1584, Delft, Holland) First stadtholder of the United Provinces of the Netherlands (1572–84). Son of William, count of Nassau-Dillenburg, he inherited the principality of Orange and other vast estates from his cousin in 1544. He was educated at the Habsburg imperial court in Brussels, then appointed by PHILIP II to the council of state (1555). He helped negotiate the Treaty of CATEAU-CAMBRÉSIS, earning his byname for keeping silent about secret policy decisions, and was named stadtholder (governor) in Holland, Zeeland, and Utrecht in 1559. Increasingly opposed to Philip's strict ordinances against Protestants, he led a revolt in 1568 that proved unsuccessful, but in 1572 he succeeded in uniting the northern provinces. He was proclaimed their stadtholder, and his position was solidified by the Pacification of GHENT (1576). He sought help from France in the revolt against Spain, and in 1579 he was outlawed by Philip. A reward was offered for his assassination, and in 1584 he was shot by a fanatical Catholic.

William I *Dutch* **Willem Frederik** (b. Aug. 24, 1772, The Hague, United Provinces of the Netherlands—d. Dec. 12, 1843, Berlin, Prussia)

© 2006 Encyclopædia Britannica, Inc.

King of The Netherlands and grand duke of Luxembourg (1815–40). Son of William V, prince of Orange, he married in 1791 and immigrated with his family to England after the French invasion of the Dutch Republic (1795). He sided with Prussia against Napoleon and lived in exile at the Prussian court until 1812. After the Dutch revolt against French rule, he became sovereign prince of the Dutch Republic (1813) and king of the United Netherlands (1815), which included Belgium, Liège, and Luxembourg. He led an economic recovery program that sparked a commercial revival, but his autocratic methods and imposition of Dutch as the official language provoked a revolt by Belgium (1830) that led to its independence. In 1840 he abdicated in favour of his son, William II.

William I *known as* **William the Lion** (b. 1143—d. Dec. 2, 1214, Stirling, Stirlingshire, Scot.) King of Scotland (1165–1214). He succeeded his father as earl of Northumberland (1152) but was forced to relinquish his earldom to England's Henry II in 1157. He succeeded his brother, Malcolm IV, as king of Scotland and in 1173 joined a revolt of Henry's sons in an attempt to regain Northumberland. Captured in 1174, he was released after submitting to Henry's overlordship. He bought his release from subjection in 1189. He continued to agitate for the restoration of Northumberland but was forced to renounce his claim by King John in 1209. William created many of the major burghs of modern Scotland.

William II *or* **William Rufus** (b. c. 1056—d. Aug. 2, 1100, near Lyndhurst, Hampshire, Eng.) King of England (1087–1100) and de facto duke of Normandy (1096–1100). He inherited England from his father, William I (the Conqueror), and quelled a rebellion (1088) by barons loyal to his brother Robert II. A tyrannical ruler, he brutally punished the leaders of a second revolt (1095). He forced St. Anselm, archbishop of Canterbury, to leave England and seized his lands (1097). He reduced the Scottish kings to vassals (1093), subjugated Wales (1097), and waged war on Normandy (1089–96), gaining control when Robert mortgaged the duchy. His death in a hunting accident may have been an assassination ordered by his brother Henry (later Henry I).

William II *German* **Friedrich Wilhelm Viktor Albert** *known as* **Kaiser Wilhelm** (b. Jan. 27, 1859, Potsdam, near Berlin, Prussia—d. June 4, 1941, Doorn, Neth.) German emperor (kaiser) and king of Prussia (1888–1918). Son of the future Frederick III and grandson of Britain's Queen Victoria, William succeeded his father to the throne in 1888. Two years later, he forced the resignation of Otto von Bismarck. He was characterized by his frequently militaristic manner and by his vacillating policies that undermined those of his chancellors, including Leo, count von Caprivi, and Bernhard, prince von Bülow. From 1897 he encouraged Adm. Alfred von Tirpitz to strengthen the German fleet and challenged France's position in Morocco (see Moroccan crises). He sided with Austria-Hungary in the crisis with Serbia (1914), and in World War I he encouraged the grandiose war aims of the generals and politicians. After Germany's defeat, he fled to The Netherlands, ending the monarchy in Germany, and lived in exile until his death.

William II *Italian* **Guglielmo** *known as* **William the Good** (b. 1154—d. Nov. 18, 1189, Palermo, Kingdom of Sicily) Last Norman king of Sicily (1166–89). His mother served as regent until 1171, after which he ruled alone, winning a reputation for clemency and justice. His friendship with Manuel I Comnenus ended when the Byzantine emperor thwarted William's proposed marriage to his daughter. Turning against the Byzantines, William allied with Frederick I Barbarossa. He agreed to his aunt's marriage to Frederick's son Henry (later Henry VI), giving Henry a claim to Sicily. He attacked the Byzantines (1185) with early success but was defeated within sight of Constantinople.

William II *Dutch* **Willem** (b. May 27, 1626, The Hague, United Provinces of the Netherlands—d. Nov. 6, 1650, The Hague) Prince of Orange, count of Nassau, and stadtholder of the Netherlands (1647–50). The son of Frederick Henry, prince of Orange, he married Mary Stuart, eldest daughter of Charles I of England, in 1641 and later succeeded to his father's offices (1647), which included the stadtholdership of all the provinces of the Netherlands except Friesland. Despite the treaty with Spain in 1648 that recognized the independence of the United Provinces, he planned to conquer part of the Spanish Netherlands (modern Belgium). He imprisoned members of the assembly of Holland who opposed his war policy but died of smallpox before his influence could be tested.

William II *Dutch* **Willem Frederik George Lodewijk** (b. Dec. 6, 1792, The Hague, United Provinces of the Netherlands—d. March 17, 1849, Tilburg, Neth.) King of The Netherlands and grand duke of Luxembourg (1840–49). Son of William I, he lived in exile with his family in England from 1795. He commanded Dutch troops in the Battle of Waterloo (1815). Sent by his father to Belgium in 1830 to appease the rebels, he failed to stop the independence movement. In 1840 he became king of The Netherlands on his father's abdication. As king, he helped stabilize the economy. In 1848 he oversaw passage of a new liberal constitution that expanded the authority of the ministers and assembly, established direct elections, and secured basic civil liberties.

William III *Dutch* **Willem Hendrik** (b. Nov. 14, 1650, The Hague, United Provinces of the Netherlands—d. March 19, 1702, London, Eng.) Stadtholder of the United Provinces of the Netherlands (1672–1702) and king of England (1689–1702). Son of William II, prince of Orange, and Mary Stuart, daughter of Charles I of England, he was born in The Hague soon after his father's death. The Act of Seclusion (1654) that barred the house of Orange from power in the United Provinces was rescinded in 1660, and William was appointed captain general and named stadtholder by popular acclaim in 1672. He successfully defended his country against Charles II of England and Louis XIV of France. In 1677 he married Mary (later Queen Mary II), daughter of the English duke of York (later James II). In 1688 William was invited by James's opponents to intervene against the Catholic ruler, and he landed with a Dutch army in Devon, Eng. He and Mary were proclaimed joint rulers of England in 1689; he ruled alone after Mary's death in 1694. He directed the European opposition to Louis XIV, which eventually led to the War of the Grand Alliance after William's death. In Britain he secured religious toleration and strengthened Parliament, granting independence to the judiciary in the Act of Settlement.

William III *Dutch* **Willem Alexander Paul Frederik Lodewijk** (b. Feb. 19, 1817, Brussels, Belg.—d. Nov. 23, 1890, Apeldoorn, Neth.) King of The Netherlands and grand duke of Luxembourg (1849–90). Son of William II, he succeeded to the throne on his father's death in 1849. Opposed to the liberal constitution of 1848, he adopted an anti-Catholic posture and from 1862 to 1868 was able to rule through the cabinet. He tried to sell his sovereignty over Luxembourg to France (1867) but yielded to Prussia's demand that the area be independent. Following this crisis, his influence over parliament declined. On his death, he was succeeded by his daughter, Wilhelmina.

William IV (b. Aug. 21, 1765, London, Eng.—d. June 20, 1837, Windsor Castle, near London) King of Great Britain and Ireland and of Hanover (1830–37). The son of George III, he entered the royal navy at age 13, fought in the American Revolution, and served in the West Indies, leaving the navy as a rear admiral in 1790 (he was later called "the Sailor King"). He angered his father by his numerous love affairs and fathered 10 illegitimate children by the actress Dorothea Jordan (1761–1816). In 1830 he succeeded his brother George IV as king. Opposed to parliamentary reform, William delayed consideration of the Reform Bill of 1832, but his prime minister, Earl Grey, persuaded him to promise to create enough peers in the House of Lords to carry it, forcing its passage. On William's death, the British crown passed to his niece, Victoria, and the Hanoverian crown to his brother Ernest Augustus, duke of Cumberland (1771–1851).

William and Mary, College of State-supported college in Williamsburg, Va. The second-oldest institution of higher education in the U.S. (after Harvard University), it was chartered in 1693 by King William III and Queen Mary II. Its alumni include Thomas Jefferson, John Marshall, James Monroe, John Tyler, and Gen. Winfield Scott. George Washington was the college's first American chancellor, from 1788 to 1799. The honour society Phi Beta Kappa was organized as a social fraternity there in 1776.

William of Auvergne \ō-'vern^{y}, ō-'vərn\ *French* **Guillaume d'Auvergne** (b. after 1180, Aurillac, France—d. 1249, Paris) French philosopher and theologian. Named bishop of Paris in 1228, William was a reformer who defended the rising mendicant orders against attacks by the secular clergy. After the church condemned the works of Aristotle, he became one of the first Western scholars to attempt to incorporate into Christianity whatever in Aristotle's thought was compatible with it. He was influenced by Avicenna and by the Neoplatonism of St. Augustine. His principal work, written in 1223–40, is *Magisterium divinale* ("The Divine Teaching").

William of Auxerre \ō-'ser\ *French* **Guillaume d'Auxerre** (b. c. 1150, Auxerre, bishopric of Auxerre—d. Nov. 3, 1231, Rome) French philosopher and theologian. After a long career at the University of Paris, he

© 2006 Encyclopædia Britannica, Inc.

was appointed in 1231 by Pope Gregory IX to a council to censor the works of Aristotle (which in 1210 had been deemed corruptive of Christianity) included in the university's curriculum. Seeing no reason to avoid the rational analysis of Christian revelation, he was on the verge of reorganizing the curriculum when he died. In his principal work, usually called the *Summa aurea* (written 1215–20), he treated such matters as God's triune nature, the problem of human choice, and the nature of virtue.

Williams, Daniel Hale (b. Jan. 18, 1858, Hollidaysburg, Pa., U.S.—d. Aug. 4, 1931, Idlewild, Mich.) U.S. surgeon. He graduated from Chicago Medical College. In 1891 he founded Provident Hospital in Chicago, the first interracial hospital in the U.S., to provide training for black interns and nurses. There in 1893 he performed the first successful heart surgery; the patient lived at least 20 years after Williams opened the thoracic cavity, sutured a wound of the pericardium (the sac around the heart), and closed the chest. In 1913 he became the only black charter member of the American College of Surgeons.

Williams, (George) Emlyn (b. Nov. 26, 1905, Mostyn, Flintshire, Wales—d. Sept. 25, 1987, London) Welsh actor and playwright. He made his acting debut in 1927 and won acclaim in London and New York City for his performance in his own play, the macabre *Night Must Fall* (1935; film, 1964). His most popular play was the autobiographical *The Corn Is Green* (1938; film, 1945), the story of a boy and his teacher in a Welsh mining town. He also acted in many films and was renowned for his public readings from Charles Dickens, Saki, and Dylan Thomas.

Williams, Eric (Eustace) (b. Sept. 25, 1911, Port of Spain, Trin.—d. March 29, 1981, St. Anne, near Port of Spain) First prime minister of independent Trinidad and Tobago (1962–81). He received a doctorate from the University of Oxford and served on the faculty of Howard University in the U.S. before founding the People's National Movement (PNM) in 1956 and taking his nation into the Federation of the West Indies in 1958 only to withdraw in favour of independence in 1962. Oil reserves helped boost the nation's income, and Williams remained popular until 1970, when an economic downturn led to unsuccessful revolts. He served as prime minister until his death. *Capitalism and Slavery* (1944) and *From Columbus to Castro: The History of the Caribbean, 1492–1969* (1970) were among his many books.

Williams, Hank *orig.* **Hiram King Williams** (b. Sept. 17, 1923, Georgiana, Ala., U.S.—d. Jan. 1, 1953, Oak Hill, W.Va.) U.S. singer and guitarist. Williams was born into poverty. He began playing guitar at age 8, made his radio debut at 13, and formed his first band, Hank Williams and his Drifting Cowboys, at 14. With the help of Fred Rose, his "Lovesick Blues" became a smash hit in 1949, and he joined the Grand Ole Opry that year after an extraordinary debut appearance. Among his best-selling recordings were "I'm So Lonesome I Could Cry," "Jambalaya," "Your Cheatin' Heart," and "Hey, Good Lookin'." He wrote almost all the songs he recorded. His death from heart failure at 29 may have resulted from drug and alcohol abuse. He remains perhaps the most revered figure in the history of country music. His son, Hank Williams, Jr., has had an exceptional recording career, and grandson Hank Williams III is also a musician.

Williams, Jody (b. Oct. 9, 1950, Putney, Vt., U.S.) American activist who in 1992 helped found the International Campaign to Ban Landmines (ICBL). In 1997 she and the ICBL were named corecipients of the Nobel Prize for Peace. She coordinated the launch of the ICBL with the cooperation of six international organizations, with the mission to abolish the use of antipersonnel land mines, of which tens of millions lay unexploded in more than 70 countries. Her efforts bore fruit in December 1997, when the Mine Ban Treaty was signed by more than 100 countries in Ottawa. By 2003 some 130 nations had ratified the treaty, but not the major mine-producing ones, such as the United States, Russia, and China. Williams was coauthor, with Shawn Roberts, of *After the Guns Fall Silent: The Enduring Legacy of Landmines* (1995).

Williams, Joe *orig.* **Joseph Goreed** (b. Dec. 12, 1918, Cordele, Ga., U.S.—d. March 29, 1999, Las Vegas, Nev.) U.S. singer and actor. Williams worked with Coleman Hawkins and Lionel Hampton before joining Count Basie's band in 1954. The success of "Every Day I Have the Blues" established Williams as a sophisticated blues singer with a powerful bass-baritone voice. After leaving the Basie band in 1961, Williams led small ensembles singing popular songs, ballads, and blues. During the 1980s he played the role of Grandpa Al on the television series *The Cosby Show*. His album *Nothin' but the Blues* (1984) won a Grammy Award.

Williams, John (Towner) (b. Feb. 8, 1932, New York, N.Y., U.S.) U.S. composer and conductor. Williams studied music at UCLA and Juilliard. He began his career as a jazz pianist but began to compose for TV and film in the 1960s. He has scored over 75 films, including *Jaws* (1975), the *Star Wars* trilogy, *Close Encounters of the Third Kind* (1977), *E.T.* (1982), *Schindler's List* (1993), and *Harry Potter and the Sorcerer's Stone* (2001), and has won five Academy Awards. He has also written many concert works. From 1980 to 1993 he was conductor of the Boston Pops.

Williams, Mary Lou *orig.* **Mary Elfrieda Scruggs** (b. May 8, 1910, Atlanta, Ga., U.S.—d. May 28, 1981, Durham, N.C.) U.S. pianist, composer, arranger, and bandleader. A child prodigy, she had her professional debut with big bands at age 12. Beginning in 1929, Williams wrote arrangements for many swing bands, including those of Andy Kirk (1898–1992) and Duke Ellington. Her 12-movement *Zodiac Suite* was performed by the New York Philharmonic in 1946. A pianist with strong roots in the blues and early jazz, Williams embraced the innovations of bebop and later free jazz, performing with a diverse array of jazz musicians, including Dizzy Gillespie and Cecil Taylor (b. 1933). In the 1960s and '70s she composed a number of liturgical pieces for jazz ensembles, including *Music for Peace* (1970), popularly known as "Mary Lou's Mass."

Williams, Ralph Vaughan See Ralph Vaughan Williams

Williams, Roger (b. 1603?, London, Eng.—d. Jan. 27/March 15, 1683, Providence, R.I.) English clergyman, colonist, and founder of Rhode Island. He arrived in Boston in 1631 and became pastor of the separatist Plymouth colony (1632–33). Banned from the Massachusetts Bay Colony for his beliefs, including his support for religious toleration and the rights of Indians and his opposition to civil authority, he founded the colony of Rhode Island and the town of Providence (1636) on land purchased from the Narragansett Indians. The colony established a democratic government and instituted separation of church and state, and it became a haven for Quakers and others seeking religious liberty. He obtained a charter for the colony (1643) and served as its first president, maintaining friendly relations with the Indians and acting as peacemaker for nearby colonies.

Williams, Ted *orig.* **Theodore Samuel Williams** (b. Aug. 30, 1918, San Diego, Calif., U.S.—d. July 5, 2002, Inverness, Fla.) U.S. baseball player, one of the greatest hitters of all time. Williams began playing professionally at age 17. He became an outfielder with the Boston Red Sox in 1939 and remained with the team until his retirement in 1960. Tall and thin, he was dubbed "the Splendid Splinter" but was also known more simply as "the Kid." A left-handed hitter, he compiled a lifetime batting average of .344, the eighth highest on record. He batted .406 in 1941, becoming the last .400 hitter of the century. His career slugging percentage (.634) is second only to that of Babe Ruth. Williams is the only player besides Rogers Hornsby to have twice won the batting Triple Crown (best average, most home runs, and most runs batted in in the same season). Despite losing five years of his career to service as a flyer in World War II and the Korean War, he hit a total of 521 home runs, capping his career with a home run in his final at bat. After retiring as a player, he managed the Washington Senators (1969–72) and became an accomplished fisherman.

Williams, Tennessee *orig.* **Thomas Lanier Williams** (b. March 26, 1911, Columbus, Miss., U.S.—d. Feb. 25, 1983, New York, N.Y.) U.S. playwright. The son of a traveling salesman and a clergyman's daughter, he lived in St. Louis from age 12. After attending several colleges he graduated from the University of Iowa (1938). He first won recognition for his group of one-act plays *American Blues* (1939). Wider success came with *The Glass Menagerie* (1944) and mounted with *A Streetcar Named Desire* (1947, Pulitzer Prize; film, 1951), *Camino Real* (1953), and *Cat on a Hot Tin Roof* (1955, Pulitzer Prize; film, 1958). His plays, which also include *Suddenly Last Summer* (1958; film, 1959) and *The Night of*

© 2006 Encyclopædia Britannica, Inc.

the Iguana (1961; film, 1964), describe a world of repressed sexuality and violence thinly veiled by gentility. He also wrote the novel *The Roman Spring of Mrs. Stone* (1950; film, 1961) and the screenplays for *The Rose Tattoo* (1955, adapted from his 1951 play) and *Baby Doll* (1956). A clear-sighted chronicler of fragile illusions, he is regarded as one of the greatest American playwrights.

Williams, Venus; and Williams, Serena (respectively b. June 17, 1980, Lynwood, Calif., U.S.; b. Sept. 26, 1981, Saginaw, Mich.) U.S. tennis players. The sisters were introduced to the sport by their father, who recognized their talent early on. Venus turned professional in 1994, and Serena followed suit a year later. Possessing powerful ground strokes and superb athleticism, the sisters were soon dominating women's professional tennis. Serena won the U.S. Open in 1999, and Venus won Wimbledon and the U.S. Open in 2000 and 2001. In 2002 Serena won the French Open, the U.S. Open, and Wimbledon, defeating Venus in the finals of each tournament. Serena captured her first Australian Open in 2003 and later in the year defended her Wimbledon title. In 2005 Serena won her second Australian Open, and Venus captured her third Wimbledon title.

Williams, William Carlos (b. Sept. 17, 1883, Rutherford, N.J., U.S.—d. March 4, 1963, Rutherford) U.S. poet. Trained as a pediatrician, Williams wrote poetry and practiced medicine in his hometown. He is noted for making the ordinary appear extraordinary through clear and discrete imagery, as in the fresh and direct impressions of the sensuous world expressed in "The Red Wheelbarrow," from *Spring and All* (1923). *Paterson* (1946–58), a five-part long poem, evokes a complex vision of modern American life. In 1963 he was awarded the Pulitzer Prize in poetry for *Pictures from Brueghel* (1962). His numerous prose works include essays, a trilogy of novels, short stories, drama, and autobiography.

Williams College Private liberal arts college in Williamstown, Mass. Established in 1793 and affiliated with the Congregational church, it has since become nondenominational. Williams has consistently rated as one of the best colleges in the U.S., offering bachelor's and master's degree programs in fine and applied arts and sciences. Campus facilities include notable collections of American, contemporary, and South Asian art and materials relating to U.S. history. Notable alumni include director Elia Kazan.

William's War, King See King William's War

Williamsburg City (pop., 2000: 11,998), southeastern Virginia, U.S. Located on a tidewater peninsula between the James and York rivers, it was settled in 1633 as Middle Plantation and served as a refuge from Indian attacks. The College of William and Mary was founded there in 1693. After the burning of nearby Jamestown in 1699, it became the capital of Virginia until 1780, when the capital was moved to Richmond. During the American Civil War, Confederate forces were defeated at the Battle of Williamsburg in 1862. Colonial Williamsburg, an extensive restoration of several hundred colonial buildings, was begun in 1926 and became part of the Colonial National Historical Park in 1936.

Willkie, Wendell L(ewis) (b. Feb. 18, 1892, Elwood, Ind., U.S.—d. Oct. 8, 1944, New York, N.Y.) U.S. politician. He moved to New York City in 1929 to become an attorney for the Commonwealth and Southern Corp., of which he was later president (1933–40). He led the opposition of utilities companies to competition from the federally funded Tennessee Valley Authority. His criticism of Pres. Franklin D. Roosevelt led to his dark-horse victory at the 1940 Republican Party presidential convention. After a vigorous campaign, he won only 10 states but received more than 22 million popular votes, the largest number received by a Republican to that time. After a worldwide tour, he wrote *One World* (1943), a best-selling plea for postwar international cooperation.

willow Any shrub or tree of the genus *Salix*, family Salicaceae, native mostly to northern temperate regions, and common in lowland and marshy areas. Willows are valued as ornamentals and for their shade, erosion control, and timber. Certain species yield salicin, the source of salicylic acid used in pain relievers. All species have alternate, usually narrow leaves, catkins, and seeds with long, silky hairs. Pussy willows, the male form of several shrubby species, have woolly catkins that form before the leaves appear and are considered one of the first signs of spring. Weeping willows have long drooping branches and leaves. Several species grow as small matted woody plants on the tundra. See photograph opposite.

willow herb Any of about 200 plants that make up the genus *Epilobium*, of the evening primrose family, especially fireweed (*E. angustifolium*; also called great willow herb). The young parts of some species can be cooked and eaten as potherbs. The plants are sometimes cultivated but must be carefully confined. The hairy willow herb, or codling-and-cream (*E. hirsutum*), is similar to fireweed but has hairy leaves and stalks and notched flower petals; in eastern North America it quickly establishes itself on cleared land. Rock fringe (*E. obcordatum*) is a low-growing form from the western U.S.

Wills, Bob *orig.* **James Robert Wills** (b. March 6, 1905, near Kosse, Texas, U.S.—d. May 13, 1975, Fort Worth, Texas) U.S. country music fiddler, singer, and songwriter. Wills learned fiddle from his father. In Tulsa, Okla., in 1934 he formed the Texas Playboys; their radio performances made him a star in the Southwest, and in 1942 the group moved to California, performing in dance halls and films. They pioneered the "western swing" genre, which blended traditional hoedown fiddling with big-band swing and blues. Wills's best-known compositions include "San Antonio Rose" and "Panhandle Rag."

Wills, Helen (Newington) *or* **Helen Wills Moody** *in full* **Helen Newington Wills Moody Roark** (b. Oct. 6, 1905, Centerville, Calif., U.S.—d. Jan. 1, 1998, Carmel, Calif.) U.S. tennis player. She won the first of seven U.S. singles titles in 1923. She took the gold medal in both singles and doubles at the 1924 Olympic Games. So overpowering was her game that from 1927 to 1932 she won every set she played in U.S. singles play. She took the Wimbledon title eight times (1927–30, 1932, 1933, 1935, 1938), a record only broken in 1990 by Martina Navratilova.

Wilmington City (pop., 2000: 72,664), northern Delaware, U.S. Located at the junction of the Delaware and Christina rivers, it is the state's largest city and its industrial, financial, and commercial centre and main port. The oldest permanent settlement in the Delaware valley, it was settled by Swedes in 1638. Called Fort Christina, it was captured by Peter Stuyvesant's Dutch forces in 1655; they were ousted by the English in 1664. A prosperous port after the Quakers moved there in the 1730s, it was renamed Wilmington in 1739. During the American Revolution the Battle of the Brandywine was fought nearby. In 1802 E.I. du Pont established a gunpowder mill there (see DuPont Co.).

Wilmot Proviso \prə-'vī-ˌzō\ (1846) Proposal in the U.S. Congress to prohibit the extension of slavery to the territories. Offered by Rep. David Wilmot (1814–68) as an amendment to a bill that purchased territory from Mexico, it prohibited slavery in the new territory. The proviso provoked a national debate that reflected the growing sectional discord between North and South. Despite repeated attempts, the Wilmot Proviso was never passed by both houses of Congress. Nevertheless, the principle became a basic tenet of the Republican Party.

Wilson, Alexander (b. July 6, 1766, Paisley, Renfrew, Scot.—d. Aug. 23, 1813, Philadelphia, Pa., U.S.) Scottish-born U.S. ornithologist. In Scotland he wrote poetry while working as a weaver and peddler; in 1792 his satiric works led to a fine and imprisonment. Impoverished, in 1794 he immigrated to the U.S., where he became a teacher. Influenced by William Bartram, he decided c. 1804 to write on North American birds, and he began studying art and ornithology in his leisure time. His pioneering work *American Ornithology* (9 vol., 1808–14) established him as a founder of the field. After publication of its first volume, he spent much of his time selling subscriptions for the expensive work and collecting specimens for the remaining volumes.

Weeping willow (*Salix babylonica*).
A TO Z BOTANICAL COLLECTION-EB INC.

Wilson, August (b. April 27, 1945, Pittsburgh, Pa., U.S.—d. Oct. 2, 2005, Seattle, Wash.) U.S. playwright. He was largely self-educated. A participant in the black aesthetic movement, he cofounded and directed Pittsburgh's Black Horizons Theatre (1968), published poetry in African American journals, and produced several plays, including *Jitney* (1982), before his *Ma Rainey's*

© 2006 Encyclopædia Britannica, Inc.

Black Bottom opened on Broadway in 1984. Inspired by the colloquial language, music, folklore, and storytelling tradition of African Americans, he continued his cycle of plays, each set in a different decade of the 20th century, with *Fences* (1986, Pulitzer Prize), *Joe Turner's Come and Gone* (1988), *The Piano Lesson* (1990, Pulitzer Prize), *Two Trains Running* (1992), *Seven Guitars* (1996), *Gem of the Ocean* (first produced 2003), *King Hedley II* (2005), and *Radio Golf* (first produced 2005).

Wilson, C(harles) T(homson) R(ees) (b. Feb. 14, 1869, Glencorse, Midlothian, Scot.—d. Nov. 15, 1959, Carlops, Peeblesshire) Scottish physicist. His invention of the Wilson CLOUD CHAMBER, a device that became widely used in the study of radioactivity, X rays, cosmic rays, and other particle phenomena, also led to the later development of the BUBBLE CHAMBER. He shared the 1927 Nobel Prize for Physics with ARTHUR COMPTON.

Wilson, Colin (Henry) (b. June 26, 1931, Leicester, Leicestershire, Eng.) British writer. Born into a working-class family, he initially thought of a career in science, then gravitated toward writing. At age 24 he published *The Outsider* (1957), a study of 20th-century alienation that had phenomenal success. His next book was dismissed as unoriginal or superficial, but *Ritual in the Dark* (1960) and *Adrift in Soho* (1961) helped repair his reputation. Many of his more than 70 books deal with the psychology of crime, the occult, human sexuality, and his own existential philosophy. *Alien Dawn* (1998) discusses the UFO phenomenon.

Wilson, Edmund (b. May 8, 1895, Red Bank, N.J., U.S.—d. June 12, 1972, Talcottville, N.Y.) U.S. critic and essayist. He attended Princeton University and initially worked as a reporter and magazine editor. Much of his writing, in which he probed diverse subjects with scholarship and common sense in clear and precise prose, was published in *The New Republic* and *The New Yorker*. Among his influential critical works are *Axel's Castle* (1931), a survey of the Symbolist poets; *To the Finland Station* (1940), a study of the thinkers who set the stage for the Russian Revolution; and *Patriotic Gore* (1962), analyzing American Civil War literature. His other writings include plays, poetry, the short-story collection *Memoirs of Hecate County* (1946), and five volumes of posthumously published journals. He was widely regarded as the leading critic of his time.

Edmund Wilson
ENCYCLOPÆDIA BRITANNICA, INC.

Wilson, Edmund B(eecher) (b. Oct. 19, 1856, Geneva, Ill., U.S.—d. March 3, 1939, New York, N.Y.) U.S. cell biologist. He joined the Columbia University faculty in 1891, where he became established as a pioneer in work on cell lineage (tracing the formation of different kinds of tissues from individual cells). His interests later extended to internal cellular organization and the problem of sex determination, leading to a series of papers (1905) on the role of chromosomes. Recognizing the importance of GREGOR MENDEL's findings, he realized that the role of chromosomes went far beyond the determination of sex and envisioned their function as important components in heredity as a whole, ideas that were a powerful force in shaping future genetic research.

Wilson, Edward O(sborne) (b. June 10, 1929, Birmingham, Ala., U.S.) U.S. biologist. He received his Ph.D. from Harvard University, where he taught from 1956. Recognized as the world's leading authority on ants, he discovered their use of pheromone for communication. His *The Insect Societies* (1971) was the definitive treatment of the subject. In 1975 he published *Sociobiology*, a highly controversial and influential study of the genetic basis of social behaviour in which he claimed that even a characteristic such as unselfish generosity may be genetically based and may have evolved through natural selection, that preservation of the gene rather than the individual is the focus of evolutionary strategy, and that the essentially biological principles on which animal societies are based apply also to human social behaviour. In *On Human Nature* (1978, Pulitzer Prize) he explored SOCIOBIOLOGY's implications in regard to human aggression, sexuality, and ethics. With Bert Hölldobler he wrote the major study *The Ants* (1990, Pulitzer Prize). In *The Diversity of Life* (1992) he examined how the world's species became diverse and the massive extinctions caused by 20th-century human activities. In *Consilience: The Unity of Knowledge* (1998) he proposed that all of existence can be organized and understood in accordance with a few fundamental natural laws.

Wilson, (James) Harold, Baron Wilson (of Rievaulx) (b. March 11, 1916, Huddersfield, Yorkshire, Eng.—d. May 24, 1995, London) British politician and prime minister (1964–70, 1974–76). The son of an industrial chemist, he was educated at the University of Oxford, where he collaborated with WILLIAM H. BEVERIDGE on work that led to the latter's 1942 report. In World War II he was drafted into the civil service and produced a study of the mining industry. His book *New Deal for Coal* (1945) was the basis for the LABOUR PARTY's plan to nationalize the coal mines. He was elected to the House of Commons in 1945 and appointed president of the Board of Trade (1947–51). Elected leader of the Labour Party in 1963, he became prime minister in 1964. He widened the party's voting majority in 1966 but his popularity declined in the late 1960s, partly because of his assumption of direct responsibility for the economy shortly before the pound was devalued in 1967. In his second term, he confirmed Britain's membership in the EUROPEAN ECONOMIC COMMUNITY (1975). He resigned unexpectedly in 1976 and was created a life peer in 1983.

Wilson, Harriet E. *orig.* **Harriet E. Adams** (b. 1828?, Milford, N.H.?, U.S.—d. 1863?, Boston, Mass.?) U.S. writer, probably the first African American to publish a novel in English in the U.S. Little is known of her history until 1850. She may have been an indentured servant in Milford, N.H., before becoming a domestic in Massachusetts. In 1851 she married a fugitive slave who ran off to sea before the birth of their son. Her one book, written to make money to reclaim her son from foster care, is *Our Nig* (1859), a largely autobiographical novel that treats racism in the pre-Civil War North. After 1863 Wilson disappeared from the public record.

Wilson, J(ohn) Tuzo (b. Oct. 24, 1908, Ottawa, Ont., Can.—d. April 15, 1993, Toronto, Ont.) Canadian geologist and geophysicist. He was the first graduate of a Canadian university in the field of geophysical studies (1930). After World War II he became a professor of geophysics at the University of Toronto. He established global patterns of faulting and the structure of the continents, and in the 1960s he became the world's leading spokesman for the theory of CONTINENTAL DRIFT. His studies also were important for the hypothesis of SEAFLOOR SPREADING and the theory of convection currents within the Earth. A range of mountains in Antarctica is named for him.

Wilson, James (b. Sept. 14, 1742, Fife, Scot.—d. Aug. 21, 1798, Edenton, N.C., U.S.) American colonial lawyer, politician, and jurist. Immigrating to North America in 1765, he taught Greek and rhetoric in the College of Philadelphia and then studied law under JOHN DICKINSON. In 1774 he published a widely read treatise proposing a commonwealth of British colonies. He was a member of the Committee of Correspondence, a delegate to the Continental Congress (1775–77), and a signer of the Declaration of Independence. He helped draft the U.S. Constitution and the Pennsylvania state constitution and delivered lectures that became landmarks in American jurisprudence. He served on the U.S. Supreme Court (1789–98).

Wilson, Lanford (Eugene) (b. April 13, 1937, Lebanon, Mo., U.S.) U.S. playwright. He began writing plays in 1962 and became cofounder and director of the Circle Repertory Company (1969–95), a regional theatre in New York City. His plays, which are known for their experimental staging, simultaneous dialogue, and deferred character exposition, include *Lemon Sky* (1970), the long-running hit *The Hot l Baltimore* (1973), *The Mound Builders* (1975), *Talley's Folly* (1979, Pulitzer Prize), *Burn This* (1987), and *By the Sea* (1996).

Wilson, Richard (b. Aug. 1, 1714, Penegoes, Montgomeryshire, Wales—d. May 15, 1782, Llanberis, Carnarvonshire) Welsh landscape painter. He worked as a portraitist for many years, but after a lengthy stay in Italy (1750–57) he worked almost exclusively in landscape, except for numerous drawings of Roman sites and buildings that he used in composing Italianate landscapes. A set of drawings made for Lord Dartmouth (dated 1754) show that he tempered his delicate observation of light and distance with the discipline of such 17th-century Classicists as NICOLAS POUSSIN. The landscapes he produced after his return to Britain influenced J.M.W. TURNER and JOHN CONSTABLE.

Wilson, Robert W(oodrow) (b. Jan. 10, 1936, Houston, Texas, U.S.) U.S. radio astronomer. He joined Bell Laboratories in 1963 and

© 2006 Encyclopædia Britannica, Inc.

headed its Radio Physics Research Department (1976–94). With his colleague Arno Penzias, he detected the cosmic background radiation, a discovery for which the two men shared a 1978 Nobel Prize (with Pyotr Kapitsa [1894–1984], who was honoured for research unrelated to theirs).

Wilson, Teddy *orig.* **Theodore Shaw Wilson** (b. Nov. 24, 1912, Austin, Texas, U.S.—d. July 31, 1986, New Britain, Conn.) U.S. pianist and bandleader. He began recording as the leader of small groups in 1935. These recordings, often featuring vocalist Billie Holiday, are classics of small-group swing. Wilson joined Benny Goodman's trio in 1936. After 1940 he worked primarily as a leader of small ensembles or as a solo pianist, showcasing his tasteful and refined amalgam of the styles of Fats Waller, Earl Hines, and Art Tatum.

Wilson, William Julius (b. Dec. 20, 1935, Derry Township, Pa., U.S.) U.S. sociologist. He spent 24 years on the University of Chicago faculty before moving to Harvard University in 1996. In *The Declining Significance of Race* (1978) and *The Truly Disadvantaged* (1987) he contends that entrenched black poverty stems neither from racism nor from welfare dependency but from changes in the global economy that pull low-skilled manufacturing jobs out of the inner city. In *When Work Disappears* (1996) he discusses, among other issues, how chronic joblessness erodes work skills. Wilson holds that only "race neutral" programs such as universal health care and government-financed jobs can alleviate the problems of black poverty in the inner city.

Wilson, (Thomas) Woodrow (b. Dec. 28, 1856, Staunton, Va., U.S.—d. Feb. 3, 1924, Washington, D.C.) 28th president of the U.S. (1913–21). He earned a law degree and later received his doctorate from Johns Hopkins University. He taught political science at Princeton University (1890–1902). As its president (1902–10), he introduced various reforms. With the support of progressives, he was elected governor of New Jersey. His reform measures attracted national attention, and he became the Democratic Party presidential nominee in 1912. His campaign emphasized his progressive New Freedom policy, and he defeated Theodore Roosevelt and William H. Taft to win the presidency. As president, he approved legislation that lowered tariffs, created the Federal Reserve System, established the Federal Trade Commission, and strengthened labour unions. In foreign affairs he promoted self-government for the Philippines and sought to contain the Mexican civil war. From 1914 he maintained U.S. neutrality in World War I, offering to mediate a settlement and initiate peace negotiations. After the sinking of the *Lusitania* (1915) and other unarmed ships, he obtained a pledge from Germany to stop its submarine campaign. Campaigning on the theme that he had "kept us out of war," he was narrowly reelected in 1916, defeating Charles Evans Hughes. Germany's renewed submarine attacks on unarmed passenger ships caused Wilson to ask for a declaration of war in April 1917. In a continuing effort to negotiate a peace agreement, he presented the Fourteen Points (1918). He led the U.S. delegation to the Paris Peace Conference. The Treaty of Versailles faced opposition in the Senate from the Republican majority led by Henry Cabot Lodge. In search of popular support for the treaty and its provision creating the League of Nations, Wilson began a cross-country speaking tour, during which he collapsed. He returned to Washington, D.C. (September 1919), where he suffered a massive stroke that left him partially paralyzed. In the months that followed, his wife Edith controlled access to him, made some decisions by default, and engineered a cover-up of his condition. He rejected any attempts to compromise his version of the League of Nations and urged his Senate followers to vote against ratification of the treaty, which was defeated in 1920. He was awarded the 1919 Nobel Prize for Peace.

Wilson disease *or* **hepatolenticular degeneration** \'hi-ˌpat-ə-lən-ˌtik-yə-lər\ Recessive hereditary defect (see recessiveness) that impairs one's ability to metabolize copper. In affected persons, copper accumulates in the basal ganglia (see ganglion) of the brain (involved in control of movement), causing progressive degeneration; forms a brownish ring at the margin of the cornea of the eye; and is deposited in the liver, gradually leading to cirrhosis. Other symptoms include tremor, lack of coordination, and personality changes. The disease usually appears in the person's teen years or twenties. Early diagnosis and treatment with a high-protein, low-copper diet and a substance to chelate copper can reverse the effects and prevent permanent brain and liver damage.

Wilson's Promontory Southernmost point of the Australian mainland, southern Victoria. The peninsula, 22 mi (35 km) long with a maximum width of 14 mi (23 km), projects into the Bass Strait and is almost an island. Its highest point is Mount Latrobe (2,475 ft [754 m]). Visited in 1798 by the English explorer George Bass, it was first called Furneaux Land; it was renamed for Thomas Wilson, an English merchant. In 1905 it was made a national park.

Wiltshire \'wilt-ˌshir\ Administrative (pop., 2001: 432,973), geographic, and historic county, southern England. It is located in a watershed separating the basins of the Bristol Channel, the English Channel, and the River Thames; its administrative centre is Trowbridge. Chalk uplands constitute much of the county, and in prehistoric times they were the most heavily populated parts of England; Wiltshire has many prehistoric monuments, including Stonehenge and Iron Age hill forts. The town of Salisbury, long an ecclesiastical centre, is renowned for its cathedral. There is an industrial centre at Swindon; otherwise, agriculture is the most important economic activity.

Wimbledon Municipal center in the Greater London borough of Merton, known as the site of the annual lawn-tennis All-England Championships. Held in late June and early July, the tournament is the oldest (founded 1877) and most prestigious in the world. It is one of four tournaments that make up the Grand Slam of tennis, and the only one still played on natural grass. Competition was opened to professionals in 1968.

Winchell, Walter *orig.* **Walter Winchel** (b. April 7, 1897, New York, N.Y., U.S.—d. Feb. 20, 1972, Los Angeles, Calif.) U.S. journalist and broadcaster. He entered vaudeville at age 13 and eventually began contributing tidbits to the *Vaudeville News*. Later, as a full-time gossip columnist, he moved to the *New York Daily Mirror*, where his widely syndicated column appeared until 1963. He had a weekly radio program from 1932 until the early 1950s. A prolific phrasemaker, he was noted for his slangy Broadway idiom. His opinionated news reports brought him a massive audience and great influence from the 1930s through the 1950s. He served as the unseen narrator of the television drama series *The Untouchables* (1959–63).

Winchester City and administrative district (pop., 2001: 107,213), central part of the administrative and historic county of Hampshire, England. Initially founded by Celtic peoples, it became important as Venta Belgarum under Roman rule. It was the capital of Wessex and a centre of learning under Alfred the Great; later it was the seat of the Danish king Canute's government. It remained important under the Norman kings until the emergence of London as the sole capital of England late in the 12th century. Winchester is known for its cathedral (11th–14th centuries), Britain's longest (556 ft [169 m]), and for Winchester College, founded in 1382.

Winchester, Oliver (Fisher) (b. Nov. 30, 1810, Boston, Mass., U.S.—d. Dec. 11, 1880, New Haven, Conn.) U.S. manufacturer of guns and ammunition. He initially set up a factory to manufacture dress shirts, and his success enabled him to purchase the Volcanic Repeating Arms Co. (1857), which became the Winchester Repeating Arms Co. (1867). His chief gun designer, B.T. Henry, created the lever-action Henry repeating rifle (patented 1860). Widely used in the American Civil War, it was the forerunner of a long line of Winchester guns, including the famous Model 73, a favourite weapon of settlers in the American West.

Winckelmann \'viŋ-kəl-ˌmän,\ *English* \'wiŋ-kəl-mən**, Johann (Joachim)** (b. Dec. 9, 1717, Stendal, Prussia—d. June 8, 1768, Trieste, Austria) German archaeologist and art historian. The son of a cobbler, he studied theology and medicine before he discovered Greek art. His essay *Reflections on the Painting and Sculpture of the Greeks* (1755) became a manifesto of the Greek ideal in education and art and was soon translated into several languages. After converting to Roman Catholicism, he moved to Rome (1755) and held important posts in the Vatican. There he wrote *History of the Art of Antiquity* (1764), which inaugurated the study of art history as a discipline and of archaeology as a humane science. His writings

Winckelmann, oil painting by Anton Raphael Mengs, 1758; in the Metropolitan Museum of Art, New York City
COURTESY OF THE METROPOLITAN MUSEUM OF ART, NEW YORK CITY, HARRIS BRISBANE DICK FUND, 1948

© 2006 Encyclopædia Britannica, Inc.

reawakened the popular taste for Classical art and were instrumental in generating the NEOCLASSICAL movement in the arts.

wind Movement of air relative to the surface of the Earth. Wind is an important factor in determining and controlling climate and weather. It is also the generating force of most ocean and freshwater waves. Wind occurs because of horizontal and vertical differences in atmospheric pressure. The general pattern of winds over the Earth is known as the general circulation, and specific winds are named for the direction from which they originate (e.g., a wind blowing from west to east is a westerly). Wind speeds are often classified according to the Beaufort scale.

Beaufort Scale

No.	Name	Wind speed, mph (kph)	Description
0	Calm	<1 (<1)	Calm; smoke rises vertically
1	Light air	1–3 (1–5)	Direction of wind shown by smoke but not by wind vanes
2	Light breeze	4–7 (6–11)	Wind felt on face; leaves rustle; wind vane moves
3	Gentle breeze	8–12 (12–19)	Leaves and small twigs in constant motion; wind extends light flag
4	Moderate breeze	13–18 (20–28)	Wind raises dust and loose paper; small branches move
5	Fresh breeze	19–24 (29–38)	Small-leaved trees begin to sway; crested wavelets form on inland waters
6	Strong breeze	25–31 (39–49)	Large branches move; overhead wires whistle; umbrellas difficult to control
7	Moderate gale or near gale	32–38 (50–61)	Whole trees sway; walking against wind is difficult
8	Fresh gale or gale	39–46 (62–74)	Twigs break off trees; moving cars veer
9	Strong gale	47–54 (75–88)	Slight structural damage occurs; shingles may blow away
10	Whole gale	55–63 (89–102)	Trees uprooted; or storm considerable structural damage occurs
11	Storm or violent storm	64–72 (103–117)	Widespread damage occurs
12	Hurricane	>72 (>117)	Widespread damage occurs

Wind Cave National Park National park, southwestern South Dakota, U.S. Established in 1903 to preserve limestone caverns and unspoiled prairie grassland in the BLACK HILLS, it covers an area of 28,292 ac (11,449 ha). Its caves contain 83 mi (134 km) of explored passages and have beautiful rock formations called boxwork, formed by CALCITE deposition in unique patterns. The park is also a wildlife refuge.

wind chill Still-air temperature that would have the same cooling effect on exposed skin as a given combination of temperature and wind speed. As the wind speed increases, the wind chill equivalent temperature decreases; e.g., an air temperature of 30 °F (–1.1 °C) with a wind speed of 20 mph (32.2 kph) produces a wind chill of 17 °F (–8 °C). Wind chill is often included in weather reports to describe how cold it feels. See illustration on following page.

wind power Use of the energy in winds to produce power. Though wind is irregular and spread out, it contains tremendous amounts of energy. Sophisticated wind TURBINES have been developed to convert this energy to electric power. The use of wind-energy systems grew considerably in the 1980s and '90s. Germany today produces more wind energy than any other country. Some 15,000 wind turbines are now in operation in California. See also WINDMILL.

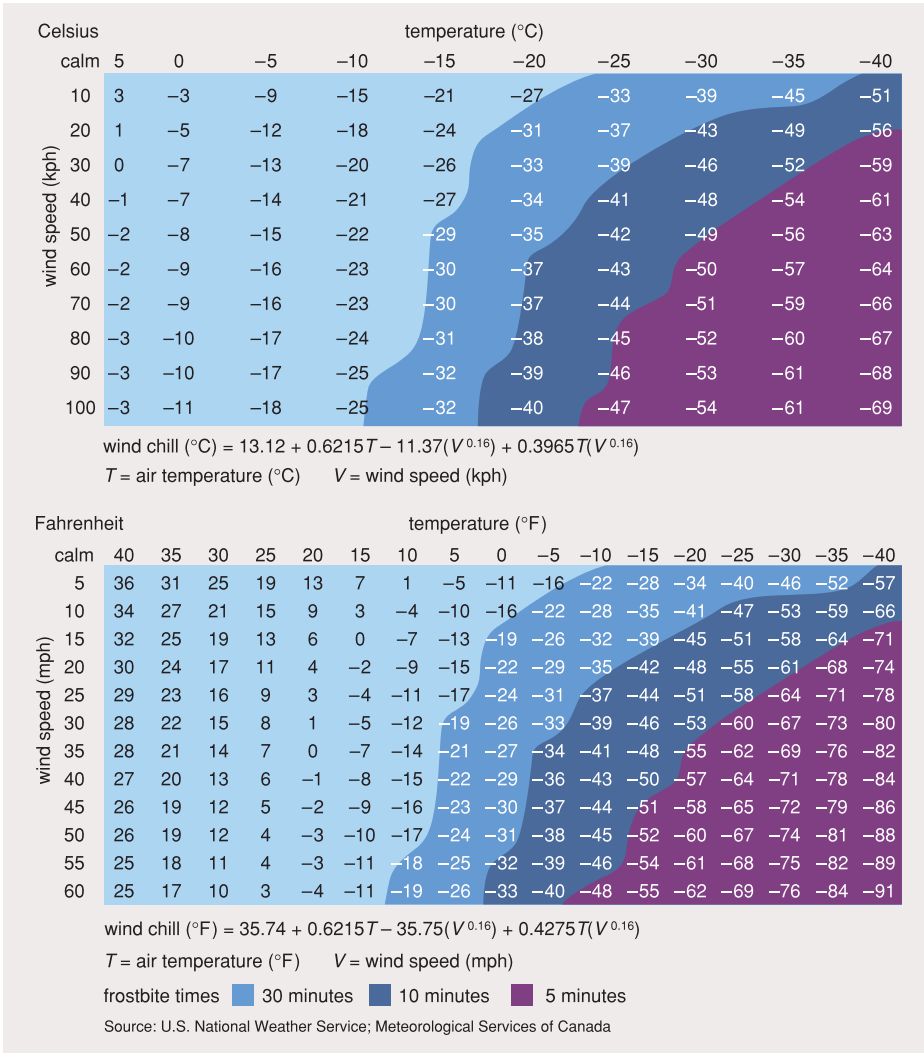
Wind River Range Mountain range, central ROCKY MOUNTAINS, west-central Wyoming, U.S. The range extends for 100 mi (160 km) northwest-southeast to the Sweetwater River and is part of the CONTINENTAL DIVIDE. It contains many peaks above 12,000 ft (3,658 m); the highest is Gannett Peak at 13,804 ft (4,207 m). The OREGON TRAIL ran through the historic South Pass (7,743 ft, or 2,360 m). Parts of Bridger and Shoshone national forests and Wind River Indian Reservation are in the range. The Wind River flows from the eastern side into the BIGHORN RIVER; the GREEN RIVER rises on its western slopes.

wind shear Rate of change of wind velocity with distance perpendicular to the wind direction. A very narrow zone of abrupt velocity change is known as a shear line. Wind shear is observed near the ground and in jet streams, where it may be associated with clear-air turbulence. Vertical wind shear is closely associated with the vertical flux of momentum, heat, and water vapour.

wind tunnel Device for producing a controlled stream of air to study the effects on objects such as aircraft moving through air or the effects of moving air on models of stationary objects such as buildings. Applications of wind-tunnel research range from testing of airframes (the structures of aircraft and spacecraft) to research on the BOUNDARY LAYER, TURBULENCE, DRAG, and LIFT. Measurements of air pressure and other characteristics at many points on the model yield information about how the total wind load is distributed. In addition to testing the effects of wind on aircraft and spacecraft, studies in wind tunnels have been used to solve design problems in automobiles, boats, trains, bridges, and buildings. See also AERODYNAMICS.

Windermere Lake, northwestern England. Located in the southeastern LAKE DISTRICT, it is the country's largest lake, 10.5 mi (17 km) long and 1 mi (1.6 km) wide; its area is 6 sq mi (16 sq km). It has a maximum depth of 219 ft (67 m). Part of the Lake District National Park, it is a popular tourist centre.

Windhoek \'vint-ˌhůk\ Town (pop., 1997 est.: 169,000), capital of Namibia. It is located in the central part of the country, in an area originally settled by African peoples. In 1890 the site of the present town was claimed for the German government. In 1915 South African forces occupied it and initiated their claim to the country, then known as South West Africa. When Namibia became independent in 1990, Windhoek became its capital. It is the country's main commercial and transportation centre.



Windischgrätz \ˌvin-dish-'grets**, Alfred, prince zu** (b. May 11, 1787, Brussels, Austrian Netherlands—d. March 21, 1862, Vienna, Austria) Austrian field marshal. He entered the Habsburg imperial army as an officer (1804) and rose through the ranks to become military commander for Bohemia (1840). In the REVOLUTIONS OF 1848, he suppressed the Czech rebels in Prague and crushed the insurrection in Vienna, where he was noted for his harsh military rule. Appointed field marshal (1848), he occupied Budapest in 1849 and drove the Hungarian rebels beyond the Tisza River. Although he was given supreme command of all imperial troops outside Italy, his gifts as a commander were mediocre, and differences with his brother-in-law, the Habsburg prime minister, prince zu SCHWARZENBERG, resulted in his recall (1849). Thereafter Windischgrätz retired to Bohemia.

windmill Machine for harnessing the energy of the wind using sails mounted on a rotating shaft. The sails are mounted at an angle or are given a slight twist, so that the force of wind against them has two components, one of which, in the plane of the sails, causes rotation. Like WATERWHEELS, windmills were among the original prime movers that replaced human beings as a source of power. Their most important traditional use was for grinding grain, though in certain areas their use in land drainage and water pumping was equally important. Windmill use became increasingly widespread in Europe (particularly the Netherlands) from the 12th century to the early 19th century, but thereafter slowly declined. Interest in windmills for generating electric power revived in the 1970s. See also WIND POWER.

window Opening in the wall of a building for light and air, and sometimes for framing a view. Since early times, the openings have been filled with stone, wooden, or iron grilles, with panes of glass or other translucent material such as mica or, in East Asia, paper. A window in a vertically sliding frame is called a sash window: a single-hung sash has only one half that moves; in a double-hung sash, both parts slide. A casement window swings open on hinges attached to the upright side of the frame. Awning windows swing outward on hinges attached to the top of the frame; hopper windows swing inward on hinges attached to the bottom of the frame. Large, fixed (nonoperating) areas of glass are commonly called picture windows. A bay window (see ORIEL) is an exterior projection of a BAY of a building that also forms an interior recess, providing better light and view than would a window flush with the building line. See also DIOCLETIAN WINDOW; ROSE WINDOW; SHŌJI.

USER INTERFACE and developed into an OPERATING SYSTEM. Version 1.0 (1985) provided a graphical user interface, MULTITASKING, and virtual MEMORY management; it ran on top of MS-DOS and was supported on Intel-based personal computers. Version 3.1 (1992) sold over 3 million copies in its first two months and helped establish Microsoft's dominance of the operating-system market for microcomputers. Windows 95 and Windows 98 (named for the years of their release) continued its success. Windows NT (1993), which can run on RISC-based computers as well as traditional Intel-based systems, is a high-end version of Windows intended for more powerful personal computers, workstations, and servers. Windows CE (1996) is an embedded operating system for PALM PCs and other handheld devices. Microsoft continues to release new versions of its operating system: Windows 2000 for corporate-oriented computers, Windows Me (2000) for consumer-oriented computers, and in 2001 a version for both environments, Windows XP. Today Windows runs on more than 90% of all personal computers.

Windsor City (pop., 2001: 208,402), southern Ontario, Canada. Located on the southern bank of the DETROIT RIVER, opposite DETROIT, Mich., U.S., it was settled by French farmers shortly after 1701, when a fort was established at Detroit. It was known first as "the Ferry" and later as Richmond before it was renamed in 1836. With its strategic location opposite Detroit, it became an industrial centre, an important railway terminus, and a busy port in GREAT LAKES shipping. Its manufactures include motor vehicles and parts, foods and beverages, and medicines. It is Canada's leading port of entry from the U.S.

Windsor, house of *formerly (1901–17)* **House of Saxe-Coburg-Gotha** Royal house of Britain, which succeeded the house of HANOVER on the death of its last monarch, Queen VICTORIA. The dynastic name of Saxe-Coburg-Gotha was that of Victoria's German-born husband, Prince ALBERT. The dynasty has included EDWARD VII, GEORGE V, EDWARD VIII, GEORGE VI, and ELIZABETH II. In view of the anti-German atmosphere of World War I, George V proclaimed in 1917 that all British male descendants of Queen Victoria would adopt the surname of Windsor.

Windsor, Wallis Warfield, duchess of (b. June 19, 1896, Blue Ridge Summit, Pa., U.S.—d. April 24, 1986, Paris, France) U.S. socialite who became the wife of Prince Edward, duke of Windsor (EDWARD VIII), after the latter had abdicated the British throne in order to marry her. She had earlier married Earl Spencer in 1916. After their divorce (1927), she married Ernest Simpson (1928) and moved with him to London. As a member of fashionable British society, she met Edward, prince of Wales, and the two gradually fell in love. She filed for divorce in 1936 with the intention of marrying Edward (by then King Edward), but as a woman twice divorced, she was unacceptable as a prospective British queen. Edward renounced the throne, and after she received her divorce they were married in 1937. The two thereafter lived a well-publicized international social life, residing mainly in France.

Windsor Castle Principal British royal residence, on the River Thames in Windsor, Berkshire, southern England. It comprises two quadrilateral building courts, or upper and lower wards, separated by the Round Tower (erected by HENRY II), a massive structure built on a mound and visible for many miles. The present-day complex has been reworked repeatedly since WILLIAM THE CONQUEROR first constructed a stockade on the site. The lower ward includes the Albert Memorial Chapel and St. George's Chapel, the burial place of 10 sovereigns. The upper ward, part of which was damaged by fire in 1992, includes the monarch's private apartments, visitors' apartments, and the royal library.

windsurfing Sport of riding a sailboard, a modified surfboard with a movable mast. Steered from a standing position, sailboards are capable of moderately high speeds and are usually used on lakes, or close to shore—sometimes within the surf zone—on the ocean. The sport originated in the U.S. in the late 1960s and quickly grew in popularity. It was introduced at the Olympic Games in 1984.

Windward Islands Island group, Lesser ANTILLES, West Indies. Located at the eastern end of the CARIBBEAN SEA, they include DOMINICA (sometimes classified as part of the LEEWARD ISLANDS), MARTINIQUE, ST. LUCIA, ST. VINCENT, GRENADA, and the chain of small islands known as the GRENA-

DINES. Though near the general area, TRINIDAD AND TOBAGO and BARBADOS are usually not considered part of the group.

wine ALCOHOLIC BEVERAGE made from the fermented juice of GRAPES. Wine may also be made from various fruits and plant parts. Though known by the ancients, wine was not drunk in its matured form until the development of the bottle and cork in the late 17th century. In wine manufacture, grapes are crushed and strained, and the juice (called must) is sealed in vats along with YEAST (*Saccharomyees ellipsoideus*) and often sulfur dioxide, which suppresses wild yeasts and organisms. FERMENTATION continues for several weeks, and then the wine is drawn off ("racked") into wooden barrels or other containers for a second fermentation ("aging"). It is clarified and bottled before undergoing final maturation. Wines may be classified according to colour as red, rosé (pink), or white; colour depends on whether the skins of red grapes are allowed to ferment with the juice. Wine taste is described as sweet or dry, sweet wines being high in sugar content and dry wines containing little or no sugar. Sparkling wines, such as CHAMPAGNE, contain suspended carbon dioxide, the result of bottling the wine before fermentation is complete. Fortified wines, such as PORT and SHERRY, contain added brandy. The leading wine-producing countries are France, Italy, Spain, the U.S., Argentina, Germany, Australia, South Africa, Portugal, and Romania.

Winfrey, Oprah (b. Jan. 29, 1954, Kosciusko, Miss., U.S.) U.S. television talk-show host and actress. After enduring an impoverished and troubled childhood, she became a news anchor for a local CBS television station in Tennessee at age 19. After graduating from Tennessee State University, she worked as a television reporter and anchor in Baltimore, Md., where she cohosted her first talk show (1977–83), and moved to Chicago to host *A.M. Chicago* (1984), which became that city's highest-rated morning show. The renamed *Oprah Winfrey Show* was syndicated in 1986, making her the first African American woman to host a successful national daytime talk show. Initially sensationalist, the enormously popular show gradually took on an uplifting and therapeutic tone. In 1986 she also formed her own television production company, Harpo Productions. In 1996 she introduced "Oprah's Book Club" to foster reading by endorsing certain books. She appeared in the movies *The Color Purple* (1985) and *Beloved* (1998).

wing In zoology, one of the paired structures certain animals use for flying. Bat and bird wings are modifications of the VERTEBRATE forelimb. In birds, the fingers are reduced and the forearm is lengthened. The primary flight feathers propel the bird forward, and the secondaries (on the upper wing) provide lift. Bat wings consist of a membrane stretched over slender, elongated arm and hand bones. Insect wings are folds of integument ("skin"). Most insects have two pairs of wings; DIPTERANS (flies) have only one developed pair, and BEETLES have two but use only one for flying. The two wings on a side usually move together, but DRAGONFLY wings work independently.

Winnebago \ˌwi-nə-'bā-gō\ North American Indian people who live in the Midwestern U.S., notably Iowa, Wisconsin, and Nebraska. Their language belongs to the Siouan language family, and their name is derived from a Fox name meaning "People of the Stinking Water." They call themselves Hochungra, meaning "People of the Big Speech [or Parent Speech]." Before the 17th century, the Winnebago lived in what is now eastern Wisconsin. By the early 19th century, as a result of their participation in the fur trade, they had expanded into southwestern Wisconsin and northwestern Illinois. They lived in villages of dome-shaped wigwams; there they cultivated corn, squash, beans, and tobacco and hunted bison. Their major ceremony was the medicine dance, in which both men and women participated. Membership in the 12 CLANS was determined by the father, and the clans were important units in social life. The Winnebago were involved in the BLACK HAWK War of 1832, after which most of the tribe was removed to other Midwestern states. At the turn of the 21st century they numbered some 12,000.

Winnemucca, Sarah Hopkins See Sarah Winnemucca HOPKINS

Winnipeg City (pop., 2001: metro. area, 671,274), capital of Manitoba, Canada. Located at the confluence of the RED RIVER OF THE NORTH and the ASSINIBOINE RIVER, Winnipeg was settled as a French fur-trading post in 1738. In the early 19th century THOMAS DOUGLAS founded a Scottish settlement there. Development ensued with the arrival of Canada's first transcontinental railroad in 1885. Following disastrous floods in 1950, much of the city was rebuilt. It is a cultural, financial, commercial, industrial, and government centre.

Winnipeg, Lake Lake, south-central Manitoba, Canada. Fed by many rivers, including the SASKATCHEWAN, RED RIVER OF THE NORTH, and WINNIPEG, it is drained to the northeast by the NELSON RIVER. It is 264 mi (425 km) long, up to 68 mi (109 km) wide, and has an area of 9,416 sq mi (24,387 sq km). The Canadian explorer Pierre LA VERENDRYE visited the lake in 1733. With an average depth of 50 ft (15 m), it is important for shipping, commercial fishing, and recreation.

Winnipeg River River, southeastern Manitoba and southwestern Ontario, Canada. It issues from the Lake of the WOODS and flows northwest for about 200 mi (320 km) before entering the southeastern part of Lake WINNIPEG. It served as a route for early European explorers and fur traders. There are numerous hydroelectric power plants along its course.

Winnipegosis \ˌwi-nə-pə-'gō-səs**, Lake** Lake, western Manitoba, Canada. Located west of Lake WINNIPEG, it is a remnant of glacial Lake Agassiz. Numerous streams feed the 2,075-sq-mi (5,374-sq-km) lake, which drains southeastward into Lake MANITOBA. It is more than 150 mi (240 km) long, up to 32 mi (51 km) wide, and has a maximum depth of 833 ft (254 m). It was explored in 1739 by Pierre LA VERENDRYE and later served as part of a fur-trading route. It now is important for commercial fishing.

Winnipesaukee \ˌwi-nə-pə-'sȯ-kē**, Lake** Lake, east-central New Hampshire, U.S. New Hampshire's largest lake, it covers an area of 71 sq mi (184 sq km) and is 20 mi (32 km) long by 12 mi (19 km) wide. It is dotted with 274 islands. Its outlet, the Winnipesaukee River, flows about 20 mi (32 km) southwest to enter the MERRIMACK RIVER. It is a popular summer recreation area.

Winogradsky \vyin-ə-'grät-skē**, Sergey (Nikolayevich)** (b. Sept. 1, 1856, Kiev, Russian Empire—d. Feb. 25, 1953, Brie-Comte-Robert, France) Russian microbiologist. In studying the physiology of sulfur bacteria, he showed that the colourless ones oxidize hydrogen sulfide to sulfur and then to sulfuric acid in the absence of light (1887). He discovered two groups of microbes (1889-90), each involved in one step of nitrification (oxidation of ammonia to nitrites and nitrites to nitrates), and established a new genus for each. He also proposed new ways to study soil microorganisms, particularly those symbiotic with legumes.

Winslow, Edward (b. Oct. 18, 1595, Droitwich, Worcestershire, Eng.—d. May 8, 1655, at sea, near Jamaica, British West Indies) British-American colonist. In 1620 he sailed on the *Mayflower* to New England, where he was a founder of the PLYMOUTH colony. He served on the governor's council (1624–47) and was governor of the colony (1633–34, 1636–37, 1644–45). He traded with the Wampanoag Indians and won the friendship of their chief, MASSASOIT. As a commissioner of the United Colonies of New England, he often went to England to represent the interests of the Massachusetts Bay and Plymouth colonies. In 1646 he returned to England and held minor offices under OLIVER CROMWELL. He died aboard a ship on an expedition to the West Indies.

Winslow, Josiah (b. c. 1629, Plymouth colony—d. Dec. 18, 1680, Marshfield, Plymouth colony) American colonist. The son of EDWARD WINSLOW, he succeeded MYLES STANDISH as commander of PLYMOUTH colony's military forces in 1656. He was appointed assistant governor of the colony (1657–73) and served as a member of the directorate of the NEW ENGLAND CONFEDERATION. He was the first native-born colonial governor of Plymouth colony (1673–80) and established its first public school. In KING PHILIP'S WAR he was commander in chief of the confederation's military forces (1675–76).

librarian of Harvard University. He edited the *Narrative and Critical History of America* (1884–89) and wrote several books.

Winston-Salem City (pop., 2000: 185,776), north-central North Carolina, U.S. With High Point and Greensboro it forms a tri-city industrial area. Salem was laid out by Moravian colonists in 1766. R.J. Reynolds founded his tobacco company there in 1875 (see R.J. Reynolds Tobacco). Winston was founded in 1849 and named for an American Revolutionary War soldier. The two towns were consolidated as Winston-Salem in 1913. Tobacco dominates its diversified industries, which include the manufacture of cigarettes, textiles, beer, rubber, leather, and petroleum.

Winter War See Russo-Finnish War

wintergreen Any of several evergreen plants in the heath order (Ericales). They grow as woodland wildflowers and are cultivated as garden ground cover. They are also grown as a source of oil of wintergreen, a volatile, pungent oil used to flavour candies and chewing gum and to soothe muscular aches. Wintergreen is an alternative common name for several woodland herbs: those of the genus *Pyrola* (shinleaf), comprising about 12 species of creeping perennials, and *Gaultheria procumbens* (also called teaberry and checkerberry; see also snowberry), with white flowers and spicy red berries.

Wintergreen (*Gaultheria procumbens*)
ROGER AND JOY SPURR—BRUCE COLEMAN INC./EB INC.

Winthrop, John (b. Jan. 22, 1588, Edwardstone, Suffolk, Eng.—d. April 5, 1649, Boston, Massachusetts Bay Colony) American colonial political leader, first governor of the Massachusetts Bay Colony. In 1629 he joined the Massachusetts Bay Co., and he was elected governor of the colony that was to be established by the company in New England. An ardent Puritan, he envisioned a colony based on his religious beliefs. He guided the colonists on his arrival in North America in 1630 and was elected governor 12 times during the period from 1631 to 1648. Though widely respected, he was criticized for opposing the formation of a representative assembly (1634), and the colony's limitations on religious freedom were decried by Roger Williams and Anne Hutchinson. His son, John Winthrop (1606–76), was an influential governor of Connecticut (1659–76).

John Winthrop, detail of an oil painting, school of Sir Anthony Van Dyck, *c.* 1625–49; in the collection of the American Antiquarian Society, Worcester, Mass.

wire drawing Making of wire, generally from a rod or bar. The wire-drawing process consists of pointing the rod, threading the pointed end through a die, and attaching the end to a drawing block. The block, made to revolve by an electric motor, pulls the lubricated rod through the die, reducing it in diameter and increasing its length. Fine wire is made by a multiple-block machine, because the reduction cannot be performed in a single draft.

wire service See news agency

wireless communications System using radio-frequency, infrared, microwave, or other types of electromagnetic or acoustic waves in place of wires, cables, or fibre optics to transmit signals or data. Wireless devices include cell phones, two-way radios, remote garage-door openers, television remote controls, and GPS receivers (see Global Positioning System). Wireless modems, microwave transmitters, and satellites make it possible to access the Internet from anywhere in the world. A Wireless Markup Language (WML) based on XML is intended for use in such narrow-band devices as cellular phones and pagers for the transfer and display of text.

Wisconsin State (pop., 2000: 5,363,675), northern Midwest, U.S. It covers an area of 56,153 sq mi (145,436 sq km), including part of Lake Michigan; its capital is Madison. Wisconsin is bordered by the western portion of Lake Superior and the Upper Peninsula of Michigan to the north; Lake Michigan to the east; Illinois to the south; and Minnesota and Iowa to the west and southwest, with the upper Mississippi River acting as border between these states and Wisconsin. With many unique landforms, including the Door Peninsula between Lake Michigan and Green Bay, its northern area has one of the greatest concentrations of lakes in the world. The Wisconsin River crosses the state. Forests cover about 45% of it. Originally inhabited by the Adena, or Mound Builders, the region was home to several different Indian tribes, including the Ojibwa, Menominee, and Winnebago, when Europeans arrived. The French explorer Jean Nicolet visited Wisconsin in 1634; the first permanent European settlement was established in 1717. The area remained under French control until 1763, when France ceded it to Great Britain after the French and Indian War. After the American Revolution the region was ceded to the U.S. The American settlers dispossessed the Indians of their land (see Black Hawk) and settled the region. It became the Wisconsin Territory in 1836. It was admitted to the Union as the 30th state in 1848. The Progressive movement (see Progressive Party) began in Wisconsin c. 1900, resulting in the passage of legislation that made the state a leader in social reform. It is a major milk, butter, and cheese producer in the U.S. Tourism and recreation also are economically important. Wisconsin ports handle much of the Great Lakes domestic freight shipping.

Wisconsin River River, central and southwestern Wisconsin, U.S. It rises near the Wisconsin-Michigan border and flows south through central Wisconsin, then turns west and enters the Mississippi River after a course of 430 mi (690 km). It is navigable for small craft for about 200 mi (320 km) from its mouth. Lake Wisconsin is formed by a hydroelectric dam on the river near Prairie du Sac.

Wise, Isaac Mayer (b. March 29, 1819, Steingrub, Bohemia, Austrian Empire—d. March 26, 1900, Cincinnati, Ohio, U.S.) Rabbi and organizer of Reform Judaism in the U.S. After emigrating from Bohemia, in 1854 he accepted a pulpit in Cincinnati, a post he held the rest of his life. He propagandized tirelessly for centralized Reform institutions and was instrumental in the formation of the Union of American Hebrew Congregations and of the Central Conference of American Rabbis, both of which he presided over. In 1857 he compiled a standard Reform prayer book, *Minhag America*. Though he failed to unite American Jews of all persuasions, he did bring about unanimity among Reform Jews.

Wise, Stephen Samuel (b. March 17, 1874, Budapest, Hung., Austria-Hungary—d. April 19, 1949, New York, N.Y., U.S.) Hungarian-born U.S. Reform rabbi, political activist, and Zionist leader. His family immigrated to the U.S. when he was an infant. He earned his Ph.D. at Columbia University in 1901 and was trained as a rabbi. In 1907, after declining a post at an influential congregation because of inadequate assurances of free speech in the pulpit, he founded the Free Synagogue. In 1898 he attended the Second Zionist Congress and helped found the Zionist Organization of America. A prominent member of the Democratic Party, he helped win U.S. government approval of the Balfour Declaration. In 1922 he founded the Jewish Institute of Religion, a seminary for liberal rabbis, which merged with Hebrew Union College in 1950.

Wister, Owen (b. July 14, 1860, Philadelphia, Pa., U.S.—d. July 21, 1938, North Kingstown, R.I.) U.S. novelist. A well-to-do Easterner who graduated from Harvard, he spent his summers in the West from 1885. After practicing law for two years, he devoted himself to a literary career. His novel *The Virginian* (1902), the story of a cattle-ranch foreman who depends for his life on a harsh code of ethics, was a great popular success and helped establish the cowboy as an American folk hero and stock fictional character; the novel became the basis of a play, numerous films, and even a television series. His other major work was *Roosevelt: The Story of a Friendship, 1880–1919* (1930), detailing his long acquaintance with his Harvard classmate Theodore Roosevelt.

wisteria *or* **wistaria** \wis-ˈtir-ē-ə\ Any of the twining, usually woody vines that make up the genus *Wisteria*, of the pea family (see LEGUME), native mostly to Asia and North America. The leaves are pinnately compound (feathery). They are widely cultivated for their attractive spreading growth and beautiful, profuse flowers (blue, purple, rose, or white), which grow in large, drooping clusters. American wisteria (*W. frutescens*) and Kentucky wisteria (*W. macrostachya*) are native to the U.S.

witan \ˈwi-tän\ *or* **witenagemot** \ˈwi-tᵊn-ə-gə-ˌmōt\ Council of the Anglo-Saxon kings in medieval England. Usually attended by high-ranking nobles and bishops, the witan was expected to advise the king on all matters on which he chose to ask its opinion. It attested his grants of land to churches or laymen, consented to his issue of new laws, and helped him deal with rebels and disaffected subjects. Its composition and time of meeting were determined at the king's pleasure.

witch hazel family Family Hamamelidaceae, comprising 23 genera of shrubs and trees, native to tropical and warm temperate regions. The six species of the genus *Hamamelis* include such ornamentals as witch hazel, winter hazel, and *Fothergilla*, which are outstanding for their early flowering and fall leaf colour. Members of the family are characterized by simple leaves and by flowers with four or five petals and sepals each. American, or common, witch hazel (*H. virginiana*) flowers in fall and retains yellow, cuplike calyxes (collections of sepals) through the winter. The common name refers to the forked twigs that were sometimes used for water-witching, or DOWSING to locate underground water. The fragrant liniment witch hazel is made from the dried leaves and sometimes from twigs and bark. Brilliant autumn leaf colour is an outstanding trait of IRONWOOD (*Parrotia persica*). Another genus, *Altingia*, has seven species, all Asian and all valued for their timber. *A. excelsa* is one of the largest trees of the Asian tropics, sometimes reaching a height of 82 ft (25 m).

witchcraft and sorcery Use of alleged supernatural powers, usually to control people or events. Sorcery is sometimes distinguished from witchcraft in that sorcery may be practiced by anyone with the appropriate knowledge, using charms, spells, or potions, whereas witchcraft is considered to result from inherent mystical power and to be practiced by invisible means. Modern witches, however, claim that their craft is learned, and therefore another distinction between witchcraft and sorcery is that sorcery is always used with evil intent. Controversies over witchcraft and sorcery have been especially prevalent in close-knit communities experiencing decline or misfortune and embroiled in petty social conflict and scapegoating. In ancient Greece, witchcraft was mentioned as early as Homer (see CIRCE). The best-known sorceress in Classical times was the legendary MEDEA. The Roman Horace describes two witches in his *Satires*. The Bible contains several references to witches, notably the Witch of Endor consulted by Saul (1 Samuel 28). The early Church Fathers held that witchcraft was a delusion and denounced its practice. In the Middle Ages, witchcraft was believed to involve demonic possession. It was also associated with heresy and so came within the scope of the INQUISITION. In the witch-hunts of the 16th–17th centuries, European courts frequently regarded witches and sorcerers alike as candidates for burning. Although estimates of the number killed vary widely, it is likely that between 40,000 and 60,000 people were executed and many more were tortured and imprisoned during the witch-hunts. In the 20th century the modern witchcraft movement, WICCA, was established and promoted respect for nature and a pantheistic worldview. Belief in witchcraft is apparent in traditional societies throughout the world. The Navajo protect themselves against witches with sand or pollen paintings, and in African societies people seek aid from medical doctors and witch doctors, the former for treatment of the "external" causes of the illness and the latter for the "internal". See also MAGIC; SALEM WITCH TRIALS.

Witherspoon, John (b. Feb. 15, 1723, Gifford, East Lothian, Scot.—d. Nov. 15, 1794, Tusculum, N.J., U.S.) Scottish-American clergyman. Ordained a Presbyterian minister (1745), he served in Scottish parishes until 1768, when he was sent to North America to become president of the College of New Jersey (later Princeton University). As president, he expanded the curriculum and increased enrollment. A supporter of colonists' rights, he was a member of the local COMMITTEE OF CORRESPONDENCE (1775–76) and the Continental Congress (1776–79, 1780–82); he was the only clergyman to sign the DECLARATION OF INDEPENDENCE. He helped organize the American Presbyterian Church as a national body (1785–89).

Witt \ˈvit, ˈwit**, Katarina** (b. Dec. 3, 1965, Karl-Marx-Stadt, E.Ger.) German figure skater. She won the first of six European championships in 1983 and went on to win two Olympic gold medals (1984, 1988) and four World Championships (1984, 1985, 1987, 1988). She was popular with audiences, who prized her grace and elegance as much as her technical abilities. She turned professional in 1988.

Witte \ˈvi-tə**, Sergey (Yulyevich), Count** (b. June 29, 1849, Tiflis, Georgia, Russian Empire—d. March 13, 1915, Petrograd, Russia) Russian statesman and premier (1905–06). He entered the imperial administrative service in 1871 and served as minister of finance (1892–1903). He improved communications, promoted construction of the TRANS-SIBERIAN RAILWAY, and planned to modernize the Russian Empire. He represented Russia in the negotiations that ended the RUSSO-JAPANESE WAR. Although opposed to constitutionalism, he persuaded Tsar NICHOLAS II to issue the OCTOBER MANIFESTO in 1905 and was appointed the first constitutional premier. He organized the repression of all the forces of disruption in 1905–06—e.g., the St. Petersburg Soviet, or workers' council, the troop mutinies in the Far East, strikes in South Russia, and peasant uprisings in the Baltic provinces—and he concluded arrangements with European bankers for a series of loans that restored Russian finances. In 1906 the tsar, favouring a more conservative regime, replaced him with PYOTR STOLYPIN. He never returned to office, and in 1914–15 he vainly opposed Russian entry into World War I and was sympathetic to peace feelers put out by the German government through Witte's own German banker.

Wittelsbach \ˈvi-təls-ˌbäk̲**, house of** German noble family that ruled in Bavaria from the 12th to the 20th century. In 1124 Otto V, count of Scheyern (d. 1155), moved the family residence to the castle of Wittelsbach and took its name. In 1180 his son Otto VI became Otto I, duke of Bavaria. In 1214 Otto II obtained the Palatinate of the Rhine. A descendant, LOUIS IV, as Holy Roman emperor, divided the lands and granted the PALATINATE to his nephew, Rupert, who obtained the title of elector (r. 1353–90). Several divisions of ducal Bavaria were reunited under Albert IV (d. 1508). The Bavarian dukes became electors from 1623, and the last direct line died out in 1777. The Palatine branch united with Bavaria in 1799 under Duke Maximilian IV Joseph, who became king of Bavaria (1806) as MAXIMILIAN I. His descendants (including LOUIS I and LOUIS II) were kings until the abdication of Louis III in 1918.

Wittgenstein \ˈvit-gən-ˌshtīn**, Ludwig (Josef Johann)** (b. April 26, 1889, Vienna—d. April 29, 1951, Cambridge, Cambridgeshire, Eng.) Austrian-born English philosopher, regarded by many as the greatest philosopher of the 20th century. He was born into an immensely wealthy and cultivated family. In 1908 he went to Manchester, Eng., to study aeronautics. He soon developed an obsessive interest in the philosophy of logic and mathematics, and in 1911 he went to Cambridge to study logic with BERTRAND RUSSELL. Within a year he had learned all Russell had to teach; he then went to Norway, where he worked on logic in isolation in a wooden hut he built by the side of a fjord. There he developed in embryo what became known as the "picture theory" of meaning, a central tenet of which is that a proposition can express a fact by virtue of sharing with it a common structure, or "logical form." When World War I broke out he joined the Austrian army, winning several decorations for bravery while serving on the Russian front. During the war he worked on a manuscript that was later published as *Tractatus Logico-Philosophicus* (1922). Believing that he had solved all the major problems of philosophy, he abandoned the subject after the war and spent the next 10 years as a schoolteacher and doing other odd jobs in a remote Austrian village. Meanwhile, the *Tractatus* had attracted the attention of philosophers in Cambridge and Vienna, including those of the VIENNA CIRCLE of logical positivists (see LOGICAL POSITIVISM), some of whose meetings Wittgenstein was persuaded to join. He returned to Cambridge in 1929. During the early 1930s his ideas changed rapidly, and he gradually abandoned the doctrines of the *Tractatus*; indeed, he began to conceive of philosophy in radically different terms, as not the construction of theories designed to answer philosophical questions but as the activity of clearing up conceptual confusions arising from inattention to or misunderstandings of ordinary uses of language. What became known as the works of the "later Wittgenstein"—including *Remarks on the Foundations of Mathematics* (1956), *Philosophical Grammar* (1974), *Philosophical Remarks* (1975), and especially *Philosophical Investigations* (1953)—can be considered attempts to refine and definitively express this new approach. Though he worked with fierce energy and wrote prodigiously, he would allow none of his work from this period to be published in his lifetime. In 1939 he was appointed to the chair in philosophy at Cambridge previously held by G.E. MOORE. Disliking professional philosophy, he resigned the post

in 1947 to live in seclusion in Ireland and then with various friends. Diagnosed with terminal cancer in 1949, he continued working intensively until two days before his death. See also ANALYTIC PHILOSOPHY.

Witz \'vits**, Konrad** (b. c. 1400, Rottweil, Baden-Württemberg—d. c. 1445, Basel or Geneva, Swiss Confederation) German-born Swiss painter. In 1434 he entered the painters' guild in Basel, where he worked most of his life. Little else is known of his life. His masterpiece, *The Miraculous Draft of Fishes* (1444), from an altarpiece for the cathedral of Geneva, exemplifies such precise realism that the light reflected off the water's surface is carefully distinguished from the light reflected off the stones beneath the shallow water. He was one of the first German painters to show the influence of early Netherlandish art and one of the first European artists to incorporate realistic landscapes into religious paintings.

Władysław II Jagiełło \vlä-'dis-läf...yäg-'yel-lō\ (b. c. 1351—d. May 31/June 1, 1434, Grodek, near Lwów, Galicia, Pol.) Grand duke of Lithuania (1377–1401) and king of Poland (1386–1434), founder of the JAGIELLON DYNASTY. He had to defeat rivals, including his cousin VYTAUTAS, in order to secure his rule in Lithuania. He married the Polish queen Jadwiga (1386) after agreeing to Christianize Lithuania and unite it with Poland. He regained Ruthenia from Hungary (1387) and made the prince of Moldavia his vassal. He signed a treaty (1401) recognizing Vytautas as duke on the condition that Poland and Lithuania pursued a common foreign policy, and together they broke the power of the TEUTONIC ORDER.

Wodehouse \'wůd-ˌhaůs**, Sir P(elham) G(renville)** (b. Oct. 15, 1881, Guildford, Surrey, Eng.—d. Feb. 14, 1975, Southampton, N.Y., U.S.) English-born U.S. novelist, short-story writer, lyricist, and playwright. He lived for long periods in the U.S. and France after 1909, and he settled in the U.S. after World War II. He is best known as the creator of the character of the young bachelor Bertie Wooster and his effortlessly superior manservant, Jeeves, who appeared in comic stories and novels from "Extricating Young Gussie" (1915) to *Much Obliged, Jeeves* (1971). Wodehouse wrote more than 90 books and 20 film scripts and collaborated on many plays and musical comedies, writing lyrics for JEROME KERN (*Leave It to Jane,* 1917; *Show Boat*, 1927), GEORGE GERSHWIN (*Oh, Kay!*, 1926), and others.

Wolcott, Oliver (b. Nov. 20, 1726, Windsor, Conn.—d. Dec. 1, 1797, Litchfield, Conn., U.S.) American public official. He was a member of the Connecticut council (1771–86), a delegate to the Continental Congress (1775–76, 1778, 1780–84), and a signer of the DECLARATION OF INDEPENDENCE. He raised a local militia to fight in the American Revolution and led troops in the defense of Connecticut (1779). As a commissioner of northern Indian affairs, he negotiated the Treaty of FORT STANWIX. He served as lieutenant governor (1787–96) and later governor (1796–97) of Connecticut.

wolf Any of three extant species of CANINE. The gray, or timber, wolf (*Canis lupus*) is the ancestor of all domestic dogs. It once had the largest distribution of any mammal except human beings, but it is now found primarily in Canada, Alaska, the Balkans, and Russia. Wolves are intelligent and social. Their primary prey are deer, moose, and caribou, though they feed on many smaller animals as well. Because wolves have killed livestock, they have been persecuted by farmers and ranchers. A male gray wolf may be 7 ft (2 m) long and weigh up to 175 lb (80 kg); it is the largest living wild canid. Gray wolves live in hierarchical packs whose territories cover at least 38 sq mi (100 sq km) and hunt mostly at night. The much smaller red wolf (*C. rufus*), once widespread in the south-central U.S., has been bred in captivity and reintroduced. The Abyssinian wolf (*C. simensis*) of Ethiopia was formerly considered a JACKAL. See also DIRE WOLF.

Wolf \'vȯlf,\ *English* \'wůlf**, Christa** *orig.* **Christa Ihlenfeld** (b. March 18, 1929, Landsberg an der Warthe, Ger.) German novelist, essayist, and screenwriter. She was reared in a middle-class, pro-Nazi family; after Germany's defeat in 1945, she moved with her family to East Germany. Her work reflects her experiences during World War II and her postwar life in a communist state. Her novels include *Divided Heaven* (1963), which brought her political favour; *The Quest for Christa T.* (1968), severely attacked in East Germany; *A Model Childhood* (1976); *Cassandra* (1983), her most widely read book, linking nuclear and patriarchal power; and *What Remains* (1990), on government surveillance and her own links to the East German secret police.

Wolf \'vȯlf**, Hugo (Filipp Jakob)** (b. March 13, 1860, Windischgraz, Austria—d. Feb. 22, 1903, Vienna) Austrian composer. He entered the Vienna Conservatory at age 15, but, as a rabid Wagnerian, he lost patience with his teachers' conservatism and soon left. By age 18 he probably had contracted the syphilis that would make him mentally unstable and eventually kill him. His volatile personality made it difficult for him to keep private students. As a critic (1884–87), he attracted attention for his vituperative comments. His productivity came in bursts; in 1888–89 he produced the remarkable songs of the *Mörike Lieder*, the *Eichendorff Lieder*, the *Goethe Lieder*, and much of the *Spanish Songbook*—more than half his total output. After beginning the *Italian Songbook* in 1891, he wrote nothing for three years, then quickly composed the opera *Der Corregidor* (1896) and finished the *Italian Songbook* (1896). In 1897 he suffered a complete breakdown, and he thereafter lived largely in an asylum.

wolf spider Name that originally referred to a species of southern European SPIDER (*Lycosa tarentula*) but now refers to more than 175 spider species (family Lycosidae) found in North America, Europe, and north of the Arctic Circle. The body of *L. tarentula*, the largest species, is about 1 in. (2.5 cm) long. Most species have a long, broad, hairy brown body; stout, long legs; and strong, prominent jaws. Wolf spiders chase and pounce upon their prey, hunting mostly at night. Most species build a silk-lined, tubular nest in the ground, which they dig with their heavy front legs. A few species spin webs. The bite of *L. tarentula* produces no ill effects in humans.

Wolfe, Elsie de See Elsie DE WOLFE

Wolfe \'wůlf**, James** (b. Jan. 2, 1727, Westerham, Kent, Eng.—d. Sept. 13, 1759, Quebec) British army commander. After a distinguished military career in Europe, in 1758 he helped lead Gen. JEFFERY AMHERST's successful expedition against the French on Cape Breton Island. In 1759 he was appointed commander of the British army on its mission to capture Quebec from the French. In the ensuing Battle of QUEBEC, he defeated the French in a battle lasting less than an hour. Wounded twice early in the battle, he died of a third wound, but not before he knew Quebec had fallen to his troops.

COURTESY OF THE NATIONAL PORTRAIT GALLERY, LONDON

Wolfe \'wůlf**, Thomas (Clayton)** (b. Oct. 3, 1900, Asheville, N.C., U.S.—d. Sept. 15, 1938, Baltimore, Md.) U.S. writer. Wolfe studied at the University of North Carolina and in 1923 moved to New York City, where he taught at New York University while writing plays. *Look Homeward, Angel* (1929), his first and best-known novel, and *Of Time and the River* (1935) are thinly veiled autobiographies. In *The Story of a Novel* (1936) he describes his close working relationship with the editor MAXWELL PERKINS, who helped him shape the chaotic manuscripts for his first two books into publishable form. His short stories were collected in *From Death to Morning* (1935). After his death at age 37 from tuberculosis, the novels *The Web and the Rock* (1939) and *You Can't Go Home Again* (1940) were among the works extracted from the manuscripts he left.

Wolfe, Tom *orig.* **Thomas Kennerly Wolfe, Jr.** (b. March 2, 1930, Richmond, Va., U.S.) U.S. journalist and novelist. He earned a doctorate from Yale University and then wrote for newspapers and worked as a magazine editor, becoming known as a proponent of New Journal-

© 2006 Encyclopædia Britannica, Inc.

ism, the application of fiction-writing techniques to journalism. *The Electric Kool-Aid Acid Test* (1968) chronicles the life of a traveling group of hippies. *The Right Stuff* (1979; film, 1983) examines the first U.S. astronaut program. Other controversial nonfiction books attacked fashionable 1960s leftism, modern abstract art, and international architectural styles. His novel *The Bonfire of the Vanities* (1987; film, 1990), a novel of urban greed and corruption, was a best-seller. Wolfe's second novel, *A Man in Full*, was published in 1998.

Wolff \'vȯlf**, Christian, Freiherr (baron) von** (b. Jan. 24, 1679, Breslau, Silesia—d. April 9, 1754, Halle, Prussia) German philosopher, mathematician, and scientist. He was educated at the universities of Breslau, Jena, and Leipzig and was a pupil of Gottfried Wilhelm Leibniz. He wrote numerous works in theology, psychology, botany, and physics but is best known as a leading spokesman of German rationalism. His series of essays, all beginning under the title *Rational Ideas,* covered many subjects and expounded Leibniz's theories in popular form.

Wölfflin \'vœlf-lin**, Heinrich** (b. June 21, 1864, Basel, Switz.—d. July 19, 1945, Basel) Swiss art historian. He was educated at the universities of Basel, Berlin, and Munich, and his doctoral thesis already showed the approach he was later to develop: an analysis of form based on a psychological interpretation of the creative process. His chief work, *Principles of Art History* (1915), synthesized his ideas into a complete aesthetic system that was to become of great importance in art criticism. He eschewed the popular anecdotal approach and emphasized the formal stylistic analysis of drawing, composition, light, colour, subject matter, and other pictorial elements as they were handled similarly by the painters of a particular period or national school.

wolfram See tungsten

Wolfram von Eschenbach \'vȯlf-räm-fȯn-'esh-ən-ˌbäk̲\ (b. c. 1170—d. c. 1220) German poet. An impoverished Bavarian knight, Wolfram apparently served a succession of lords. The epic "Parzival," one of his eight surviving lyric poems, is one of the masterpieces of the Middle Ages; likely based on a romance by Chrétien de Troyes, it introduced the theme of the Holy Grail into German literature. Richard Wagner used it as the basis for his last opera, *Parsifal* (1882). Wolfram's influence on later poets was profound, and, with Hartmann von Aue and Gottfried von Strassburg, he is one of the three great Middle High German epic poets.

Wollaston \'wä-ləs-tən\ **Lake** Lake, northeastern Saskatchewan, Canada. It is 70 mi (113 km) long and 25 mi (40 km) wide, with an area of 1,035 sq mi (2,681 sq km). It drains through two outlets—one northwestward through the Fond du Lac River to Lake Athabasca and the Mackenzie River system, the other northeastward via the Cochrane River to Reindeer Lake and the Churchill River system. The lake was used as a link between the two river systems after its discovery by Peter Fidler in about 1800. It is noted for its fishing.

Wollstonecraft \'wəl-stənˌkraft**, Mary** (b. April 27, 1759, London, Eng.—d. Sept. 10, 1797, London) English writer. She taught school and worked as a governess and as a translator for a London publisher. Her early *Thoughts on the Education of Daughters* (1787) foreshadowed her mature work on the place of women in society, *A Vindication of the Rights of Woman* (1792), whose core is a plea for equality in the education of men and women. The *Vindication* is widely regarded as the founding document of modern feminism. In 1797 she married the philosopher William Godwin; she died days after the birth of their daughter, Mary (see Mary Shelley), that same year.

Wolof \'wō-lȯf\ Muslim people of Senegal, The Gambia, and Mauretania. They speak a language of the Atlantic branch of the Niger-Congo family. In the 14th–16th century the Wolof maintained a powerful empire. Traditional Wolof society was highly stratified, consisting of royalty, an aristocracy, a warrior class, commoners, slaves, and members of despised artisan castes. Today most Wolof (numbering some 5 million) are farmers, but many live and work in Dakar, Senegal, and Banjul, The Gambia. Wolof women are renowned for their elaborate hair styles, abundant gold ornaments, and voluminous dresses. Nearly half the people of Senegal are Wolof.

Wolsey \'wůl-zē**, Thomas, Cardinal** (b. c. 1475, Ipswich, Suffolk, Eng.—d. Nov. 29, 1530, Leicester, Leicestershire) English prelate and statesman. He served as chaplain to Henry VII and later Henry VIII, for whom he organized the successful campaign against the French (1513). On Henry's recommendation, the pope made Wolsey successively bishop of Lincoln (1514), archbishop of York (1514), cardinal (1515), and papal legate (1518). In 1515 Henry appointed him lord chancellor of England, which added to his power and wealth. Wolsey sought to bring peace to Europe, but in 1521 he allied with Emperor Charles V against France. Although he introduced judicial and monastic reforms, he became unpopular for raising taxes. In 1529 he failed to persuade the pope to grant Henry an annulment of his marriage to Catherine of Aragon, for which he soon lost favour and was stripped of his offices except the archbishopric of York. In 1530 he was arrested for treason for corresponding with the French court, and he died on his way to face the king.

wolverine *or* **skunk bear** Solitary, voracious, nocturnal carnivore (*Gulo gulo*) that inhabits northern timberlands worldwide. Wolverines are 26–36 in. (65–90 cm) long and 14–18 in. (36–45 cm) high, and weigh 20–65 lbs (9–30 kg); the bushy tail is 5–10-in. (13–26-cm) long. They have short bowed legs, hairy soles, and long, sharp claws. Their long, coarse hair, used to trim parkas, is blackish brown, with a light horizontal strip. The anal glands secrete an unpleasant-smelling fluid. A cunning, fearless predator, the wolverine will attack almost any animal, including sheep, deer, and small bears.

Wolverine (*Gulo gulo*)
ALAN G. NELSON/ROOT RESOURCES

woman suffrage Right of women by law to vote in national and local elections. Women's voting rights became an issue in the 19th century, especially in Britain and the U.S. In the U.S. the woman suffrage movement arose from the antislavery movement (see abolitionism) and from the advocacy of figures such as Lucretia Mott and Elizabeth Cady Stanton, who believed that equality should extend to both women and African Americans. They organized the Seneca Falls Convention (1848), which issued a declaration calling for woman suffrage and for the right of women to educational and employment opportunities. In 1850 Lucy Stone held the movement's first national convention. Stanton and Susan B. Anthony formed the National Woman Suffrage Association in 1869 to secure an amendment to the Constitution granting women the right to vote, while Stone founded the American Woman Suffrage Association to seek similar amendments to state constitutions; in 1890 the two organizations merged as the National American Woman Suffrage Association. Following Wyoming's lead in 1890, states began adopting such amendments; by 1918 women had won suffrage in 15 states. After a woman suffrage amendment was passed by Congress, a vigorous campaign brought ratification, and in August 1919 the 19th Amendment became part of the Constitution. In Britain the first woman suffrage committee was formed in Manchester in 1865. In the 1870s suffragists submitted petitions bearing nearly three million signatures. Despite growing support, suffrage bills were continually defeated; in frustration, some suffragists became militant activists under the leadership of Emmeline and Christabel Pankhurst. Parliament finally passed the Representation of the People Act in 1918, by which time women had already won voting rights in New Zealand (1893), Australia (1902), Finland (1906), Norway (1913), the Soviet Union (1917), Poland (1918), Sweden (1919), Germany (1919), and Ireland (1922). After World War II woman-suffrage laws were adopted in many countries, including France, Italy, India, and Japan.

Woman's Christian Temperance Union (WCTU) U.S. temperance-movement organization. Founded in Cleveland, Ohio, in 1874, it used educational, social, and political means to promote legislation. Its president (1879–98) was Frances Willard (1839–1898), an effective

© 2006 Encyclopædia Britannica, Inc.

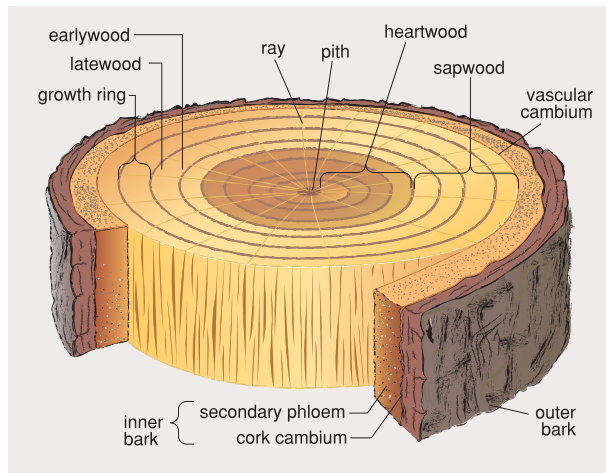
speaker and lobbyist who also led the World's Woman's Christian Temperance Union from its founding in 1883. The WCTU was instrumental in promoting nationwide temperance and in the eventual adoption of PROHIBITION.

womb See UTERUS

wombat Either of two species (family Vombatidae) of nocturnal Australian MARSUPIALS that are heavily built, 28–47 in. (70–120 cm) long, and tailless. The single newborn develops in the mother's pouch for about five months. Wombats eat grasses, tree bark, and shrub roots. They make a grassy nest at the end of a long burrow. The common wombat (*Vombatus ursinus*) of southeastern Australia and Tasmania, considered a pest, has coarse dark hair and short ears. The rare Queensland hairy-nosed wombat (*Lasiorhinus barnardi*) has fine fur and longer ears; protected by law, the population lives principally in a national park.

Common wombat (*Vombatus ursinus*). WARREN GARST-TOM STACK AND ASSOCIATES

Women's Army Corps (WAC) U.S. Army unit. It was established (as the Women's Auxiliary Army Corps) by Congress to enlist women for auxiliary noncombat duty in WORLD WAR II. Its first head was OVETA C. HOBBY. By 1945 nearly 150,000 women had served. Women relieved thousands of men of their clerical assignments, and many performed nontraditional jobs such as radio operator, electrician, and air-traffic controller. After the war the government requested former servicewomen to reenlist to meet the staffing needs of army hospitals and administrative centres. The WAC became part of the regular army with the passage of the 1948 Women's Armed Services Integration Act. The WAC remained a separate unit of the U.S. Army until 1978, when male and female forces were integrated.



women's movement Diverse social movement, largely based in the U.S., seeking equal rights and opportunities for women in their economic activities, personal lives, and politics. It is recognized as the "second wave" of the larger feminist movement. While first-wave FEMINISM of the 19th and early 20th centuries focused on women's legal rights, such as the right to vote, the second-wave feminism of the "women's movement" peaked in the 1960s and '70s and touched on every area of women's experience—including family, sexuality, and work. A variety of U.S. women's groups, including the NATIONAL ORGANIZATION FOR WOMEN, sought to overturn laws that enforced discrimination in matters such as contract and property rights and employment and pay. The movement also sought to broaden women's self-awareness and challenge traditional stereotypes of women as passive, dependent, or irrational. An effort in the 1970s to pass the EQUAL RIGHTS AMENDMENT failed, but its aims had been largely achieved by other means by the end of the 20th century.

Wonder, Stevie *orig.* **Steveland Judkins** *later* **Steveland Morris** (b. May 13, 1950, Saginaw, Mich., U.S.) U.S. SOUL-MUSIC singer, songwriter, and musician. Blind virtually from birth, he was a skillful performer on the piano and other instruments by age eight. The family moved to Detroit, and at 10 he signed with the fledgling MOTOWN label. His first hit, "Fingertips, Part 2" (1963), was followed by many top-selling singles, including "Up-Tight" and "I Was Made to Love Her." After studying composition at USC, he continued to enjoy enormous success in the 1970s and '80s with such albums as *Talking Book* (1972) and *Songs in the Key of Life* (1976) and such hits as "Superstition," "Ebony and Ivory," and "I Just Called to Say I Love You." He has spoken out against nuclear war, worked to end apartheid in South Africa, and raised funds for his eye-disease facility, Wonderland.

Wonders of the World, Seven See SEVEN WONDERS OF THE WORLD

Wonhyŏ Daisa \'wən-'hyō-'da-ˌsä\ (b. 617, Korea—d. 686, Korea) Korean Buddhist priest. He was the first to systematize Korean Buddhism, bringing the various Buddhist doctrines into a unity that served both philosophers and laypeople. He advocated maintaining harmony between the real and the ideal in life in order to pursue spiritual goals. His works, mainly in the form of commentaries on MAHAYANA SUTRAS, had profound influence on Chinese, Japanese, and Korean Buddhists. He is considered the greatest of the ancient Korean religious teachers and one of the 10 sages of the ancient Korean kingdom of Silla.

wood Hard, fibrous material formed by the accumulation of secondary XYLEM produced by the vascular CAMBIUM. It is the principal strengthening tissue found in the stems and roots of TREES and SHRUBS. Wood forms around a central core (pith) in a series of concentric layers called GROWTH RINGS. A cross section of wood shows the distinction between heartwood and sapwood. Heartwood, the central portion, is darker and composed of xylem cells that are no longer active in the life processes of the tree. Sapwood, the lighter area surrounding the heartwood, contains actively conducting xylem cells. Wood is one of the most abundant and versatile natural materials on earth, and unlike coal, ores, and petroleum, is renewable with proper care. The most widely used woods come from two groups of trees: the CONIFERS, or SOFTWOODS (e.g., PINE, SPRUCE, FIR), and the broadleaves, or HARDWOODS (e.g., OAK, WALNUT, MAPLE). Trees classified as hardwoods are not necessarily harder than softwoods (e.g., BALSA, a hardwood, is one of the softest woods). Density and moisture content affect the strength of wood; in addition to load-bearing strength, other variable factors often tested include elasticity and toughness. Wood is insulating to heat and electricity and has desirable acoustical properties. Some identifying physical characteristics of wood include colour, odour, texture, and grain (the direction of the wood fibres). Some 10,000 different wood products are commercially available, ranging from lumber and plywood to paper, from fine furniture to toothpicks. Chemically derived products from wood and wood residues include cellophane, charcoal, dyestuffs, explosives, lacquers, and turpentine. Wood is also used for fuel in many parts of the world.

Cross section of a tree trunk. Wood is secondary xylem produced by growth of the vascular cambium tissue. Sapwood is xylem that conveys water and dissolved minerals from the roots to the rest of the tree. The darker heartwood is older xylem that has been infiltrated by gums and resins and has lost its ability to conduct water. Each growth layer is distinguished by earlywood (springwood), composed of large thin-walled cells produced during the spring when water is usually abundant, and the denser latewood (summerwood), composed of small cells with thick walls. Growth rings vary in width as a result of differing climatic conditions; in temperate climates, a ring is equivalent to one year's growth. Certain conducting cells form rays that carry water and dissolved substances radially across the xylem. Bark comprises the tissues outside the vascular cambium, including secondary phloem (which transports food made in the leaves to the rest of the tree), cork-producing cells (cork cambium), and cork cells. The outer bark, composed of dead tissue, protects the inner region from injury, disease, and desiccation.

Wood, Grant (b. Feb. 13, 1892, near Anamosa, Iowa, U.S.—d. Feb. 12, 1942, Iowa City, Iowa) U.S. painter. He was trained as a craftsman and designer as well as a painter. On a visit to Germany in 1928, he was strongly influenced by the sharp detail of 15th-century German and Flemish paintings, and he soon abandoned his IMPRESSIONIST manner for the detailed, realistic manner for which he is known. His *American Gothic* caused a sensation when exhibited in 1930. A telling portrait of the sober, hardworking Midwestern farmer, it has become one of the best-known icons of U.S. art, though it is often misinterpreted: the woman is not the man's wife but rather the unmarried daughter designated to stay on the farm to assist her widowed father.

© 2006 Encyclopædia Britannica, Inc.

Wood, Leonard (b. Oct. 9, 1860, Winchester, N.H., U.S.—d. Aug. 7, 1927, Boston, Mass.) U.S. army officer. He studied medicine and became a contract surgeon with the U.S. Army. In the Spanish-American War he and his friend Theodore Roosevelt recruited and commanded the volunteer Rough Riders. Promoted to brigadier general, Wood served as military governor of Cuba (1899–1902) and organized a modern civil government. After service in the Philippines, he was chief of staff of the U.S. Army (1910–14). Though he had advocated preparedness for war, as a Republican he was passed over for a command post in World War I by the Democratic administration. He later served as governor general of the Philippines (1921–27).

Wood, Natalie *orig.* **Natasha Gurdin** (b. July 20, 1938, San Francisco, Calif.—d. Nov. 29, 1981, off Catalina Island, Calif.) U.S. film actress. She began appearing in movies at age five, and she won acclaim for her role in *Miracle on 34th Street* when she was only nine. A dark-haired beauty of Russian-French extraction, she moved easily into teenage and adult leading roles in *Rebel Without a Cause* (1955), *Splendor in the Grass* (1961), *West Side Story* (1961), *Love with the Proper Stranger* (1963), *Inside Daisy Clover* (1966), and *Bob & Carol & Ted & Alice* (1969). She drowned in a boating accident.

wood alcohol See methanol

Wood Buffalo National Park Park, western Canada. Situated between Athabasca and Great Slave lakes, it was established in 1922; it occupies an area of 17,300 sq mi (44,807 sq km). The world's largest park, it is a vast region of forests and plains, crossed by the Peace River and dotted with lakes. The habitat of the largest remaining herd of wood buffalo (bison) on the North American continent, as well as of bear, caribou, moose, and beaver, it also provides nesting grounds for the endangered whooping crane.

wood duck North American duck (*Aix sponsa*, family Anatidae); a popular game bird. Wood ducks, 17–21 in. (43–52 cm) long, nest in a tree cavity up to 50 ft (15 m) off the ground; they have long-clawed toes for perching. Both sexes have a head crest in winter. The beautifully coloured male has a purple and green head, red-brown breast flecked with white, and bronze sides; the female has a white eye ring and duller colouring. Ducklings eat aquatic insects and other small organisms; adults prefer acorns or other nuts. Hunted nearly to extinction for its flesh and feathers, it has been restored to healthy populations by strong conservation efforts.

Drake wood duck (*Aix sponsa*)
GRANT HEILMAN

Wood family English family of Staffordshire potters, a major force in the development of Staffordshire wares from peasant pottery to an organized industry. Its most prominent members were Ralph Wood (1715–72), his brother Aaron (1717–85), and his son Ralph, Jr. (1748–95). Ralph, Jr., was related through his mother to Josiah Wedgwood, and the two names were often linked professionally. The elder Ralph became famous for his extremely well-modeled figures with coloured glazes, and he is credited with introducing the Toby mug. Ralph, Jr., produced a variety of figures, colouring them with enamel rather than glazes, and supplied some of them to Wedgwood. Aaron's son William (1746–1808) was employed as a modeler by Wedgwood. His brilliant brother Enoch (1759–1840) apprenticed with Wedgwood but by 1783 was established as an independent potter in partnership with his cousin Ralph, Jr. In 1818 he continued his firm as Enoch Wood & Sons. Much of his earthenware was exported to the U.S. The firm closed in 1846. See also Staffordshire figure.

wood louse See pill bug, sow bug

wood mouse See field mouse

wood rat *or* **pack rat** Any of 22 species (genus *Neotoma*, family Cricetidae) of rodents that are nocturnal vegetarians of North and Central American deserts, forests, and mountains. Wood rats are buff, gray, or reddish brown, usually with white undersides and feet. They have large ears and are 9–19 in. (23–47 cm) long, including the 3–9-in. (8–24-cm) furry tail. The nest, up to 3 ft (1 m) across and usually built of twigs or cactus, is placed in a protected spot (e.g., under a rock ledge). Wood rats are sometimes called pack rats because they collect material to deposit in their dens.

wood thrush One of the 11 species of thrushes (in the genus *Hylocichla*, or *Catharus*) called nightingale thrushes because of their rich songs. *H. mustelina* is common in eastern U.S. broadleaf forests; it is 8 in. (20 cm) long and has drab, spotted plumage and a rusty-colored head.

wood warbler Any of about 120 species of lively North and Central American songbirds in the family Parulidae. Wood warblers superficially resemble the true warblers of the Old World but are usually more brightly coloured (at least in the breeding season) and smaller (about 5 in. [13 cm] long). They commonly inhabit woodlands and sometimes marshes and dry scrub. Their songs are buzzy and monotonous. The usual nest is a tidy cup in a bush or tree. They lay two to five speckled eggs. See also blackpoll warbler; chat; redstart.

woodbine Any of many species of vines belonging to various flowering-plant families, especially the Virginia creeper (*Parthenocissus quinquefolia*, family Vitaceae) of North America and the Eurasian woodbine honeysuckle (*Lonicera periclymenum*, family Caprifoliaceae). The Virginia creeper, also called American ivy, attaches to walls, fences, and large tree trunks by means of disk-tipped tendrils. Its leaves display spectacular fall colour from yellow to red-purple. Woodbine honeysuckle has grayish green leaves and fragrant, yellowish white flowers.

woodchuck *or* **groundhog** Reddish brown or brown species (*Marmota monax*) of solitary marmot inhabiting fields and forest edges in Alaska, Canada, and the eastern and central U.S. Woodchucks are 17–20 in. (42–52 cm) long, have a 4–6-in. (10–15-cm) tail, and weigh 4–14 lbs (2–6 kg). They are good diggers, swimmers, and climbers. Their burrows have a main entrance and an escape tunnel. See also Groundhog Day.

woodcock Any of five species (family Scolopacidae) of plump, sharp-billed migratory birds of damp, dense woodlands in North America, Europe, and Asia. With eyes set far back on the head, a woodcock has a 360° field of vision. The buffy-brown, mottled plumage provides camouflage. A solitary bird, most active at dusk, it drums its feet to coax earthworms to the surface and then extracts them with its long, forceps-like bill; it may eat twice its weight in worms each day. The female American woodcock (*Scolopax*,or *Philohela, minor*) is about 11 in. (28 cm) long; the male is slightly smaller. The male's striking courtship display includes a long, repeated spiraling and dropping sequence. Woodcocks have been popular game birds.

woodcut Design printed from a plank of wood incised parallel to the vertical axis of the wood's grain. One of the oldest methods of making prints, it was used in China to decorate textiles from the 5th century. Printing from wood blocks on textiles was known in Europe from the early 14th century but developed little until paper began to be manufactured in France and Germany at the end of the 14th century. In the early 15th century, religious images and playing cards were first made from wood blocks. Black-line woodcut reached its greatest perfection in the 16th century with Albrecht Dürer and his followers. In the late 19th and early 20th centuries, artists such as Edvard Munch, Paul Gauguin, and the German Expressionists rediscovered the expressive potential of woodcuts. Woodcuts have played an important role in the history of Japanese art (see ukiyo-e).

Woodhull, Victoria *orig.* **Victoria Claflin** (b. Sept. 23, 1838, Homer, Ohio, U.S.—d. June 10, 1927, Norton Park, Bremons, Worcestershire, Eng.) U.S. social reformer. She and her sister Tennessee Claflin (1845–1923) were raised in a family of traveling spiritualists. After Victoria's marriage (1853) to Canning Woodhull ended in 1864, the sisters opened a successful brokerage firm in New York. They founded *Woodhull and Claflin's Weekly* (1870), which advocated equal rights for women, a single standard of morality for both sexes, and free love. A splinter group of radical suffragists formed a political party in 1872 and nominated Woodhull for president with Frederick Douglass as vice president. In 1872 the sisters published the first English translation of the *Communist Manifesto*. For printing news of an alleged adulterous affair by Henry Ward Beecher, they were charged with libel but acquitted (1873). They moved to England (1877), where they lectured, worked for charities, and married wealthy Englishmen. Woodhull and her daughter published the eugenics journal *Humanitarian* (1892–1910).

© 2006 Encyclopædia Britannica, Inc.

Woodland culture Any of the prehistoric cultures of eastern North America dating from the 1st millennium BC. The category includes cultures such as the ADENA and HOPEWELL. Woodland cultures were characterized by the raising of corn, beans, and squash, the fashioning of distinctive pottery, the use of the bow and arrow, and the building of burial mounds. Most of these cultures were replaced by the MISSISSIPPIAN CULTURE in the 1st millennium AD.

woodpecker Any of about 180 species (family Picidae) of mostly nonmigratory, solitary birds found nearly worldwide. Woodpeckers spiral up tree trunks, probing for insects, and chisel nest holes in dead wood by means of rapidly repeating blows of the beak. Though they spend their entire life in trees, only the few ground-feeding species can perch. Some species eat fruits and berries or tree sap. Woodpeckers are usually silent, except in spring, when males call loudly and drum on hollow wood. Species range from 6 to 18 in. (15 to 46 cm) long. All have a straight, chisel-like bill, and most are patterned in black, white, or yellow and bright colours. See also FLICKER; IVORY-BILLED WOODPECKER; SAPSUCKER.

Woods, Lake of the Lake astride the Canadian-U.S. boundary, southwestern Ontario, southeastern Manitoba, and northern Minnesota. Irregular in shape, it is 70 mi (110 km) long and up to 60 mi (95 km) wide. It has an area of 1,727 sq mi (4,472 sq km), of which 642 sq mi (1,663 sq km) are in U.S territory. It has an estimated 25,000 mi (40,000 km) of shoreline and more than 14,000 islands. It receives the Rainy River from the southeast and drains north through the WINNIPEG RIVER into Lake WINNIPEG. Visited by French explorers in 1688, it became an important fur-trading route between the GREAT LAKES and western Canada. The Northwest Angle, the northernmost point of the coterminous U.S., is separated from the rest of Minnesota by a part of the lake.

Woods, Tiger *orig.* **Eldrick Woods** (b. Dec. 30, 1975, Cypress, Calif., U.S.) U.S. golfer. The child of a Thai mother and an African American father, Woods was a golf prodigy and won the first of three consecutive U.S. Junior Amateur Championships (1991–93) when he was 15 years old. In 1994 at age 18 he became the youngest winner of the U.S. Amateur competition, which he also won in 1995 and 1996. In 1997 Woods at age 21 became the youngest player and the first of African or Asian descent ever to win the MASTERS TOURNAMENT, winning by a record margin of 12 strokes. Winner of five other PGA tournaments in 1997, Woods became the youngest player ever ranked first in world golf competition. On July 23, 2000, Woods became the fifth player—after Gene Sarazen, Jack Nicklaus, Ben Hogan, and Gary Player—in golf history, and the youngest, to achieve a career grand slam of the four major championships (the Masters, U.S. Open, British Open, and PGA Championship). In 2005 he completed his second career grand slam.

Woodson, Carter G(odwin) (b. Dec. 19, 1875, New Canton, Va., U.S.—d. April 3, 1950, Washington, D.C.) U.S. historian. Born into a poor family, he supported himself as a coal miner and was unable to enroll in high school until he was 20. He went on to receive a Ph.D. from Harvard University. In 1915 he founded the Association for the Study of Negro Life and History to encourage the study of African American history; he also edited the association's *Journal of Negro History*. In the early 1920s he founded Associated Publishers to bring out books on African American life and culture. Among his works was the college text *The Negro in Our History* (1922).

Woodstock *in full* **Woodstock Music and Art Fair** ROCK MUSIC festival held near Bethel, N.Y., U.S. (its site was to have been the nearby town of Woodstock), on Aug. 15–17, 1969. It attracted about 450,000 young rock fans and featured performers such as the GRATEFUL DEAD, Jefferson Airplane, JIMI HENDRIX, the Who, and JANIS JOPLIN. The festival, the participants of which exhibited extraordinary good feeling in the face of rain and organizational chaos, marked the high point of U.S. youth counterculture in the 1960s. It was documented in the film *Woodstock* (1970). The festival was revived with mixed success on its 25th and 30th anniversaries.

Woodward, C(omer) Vann (b. Nov. 13, 1908, Vanndale, Ark., U.S.—d. Dec. 17, 1999, Hamden, Conn.) U.S. historian. He graduated from Emory University in 1930 and received his Ph.D. from the University of North Carolina. His writings on the American South and the Civil War, including *The Strange Career of Jim Crow* (1955) and *The Burden of Southern History* (1961), transformed the nation's understanding of the region. He edited *Mary Chesnut's Civil War* (1981, Pulitzer Prize) and *The Oxford History of the United States*. At his death he was professor emeritus at Yale University.

Woodward, Robert B(urns) (b. April 10, 1917, Boston, Mass., U.S.—d. July 8, 1979, Cambridge, Mass.) U.S. chemist. He attended MIT and taught at Harvard University (1938–79). Recognizing that physical measurement revealed molecular structure better than chemical reaction, in 1940–42 he developed "Woodward's rules" for determining structure by ultraviolet spectroscopy. In 1945 his methods finally clarified the structure of penicillin and of many more complex natural products. He proposed the correct biosynthetic pathway of steroid hormones. He was the most accomplished synthesist of complex organic compounds, including quinine (1944) and vitamin B_{12} (1971, in more than 100 reactions), a task that led to the fundamental concept of conservation of orbital symmetry. He received a 1965 Nobel Prize, and in 1963 the new Woodward Research Institute in Basel, Switz., was named for him.

woodwind instrument Any musical wind instrument that produces sound by either directing a stream of air against the edge of a hole or by making a reed or a double reed vibrate (see REED INSTRUMENT). In a BRASS INSTRUMENT, by contrast, the airstream passes directly from the player's vibrating lips into the air column. The orchestral woodwinds include the FLUTE, piccolo, CLARINET, OBOE, ENGLISH HORN, and BASSOON. Other woodwinds include the SAXOPHONE, RECORDER, PANPIPE, *SHAKUHACHI*, and SHAWM.

wool Animal fibre that is the protective covering, or fleece, of sheep or such other hairy mammals as goats and camels. Wool is readied by washing (lanolin is the by-product), CARDING, sometimes combing, then spinning. Coarser than such textile fibres as cotton, linen, silk, and rayon, wool is resilient after limited stretching or compression, so fabrics and garments made from wool tend to retain shape, drape well, and resist wrinkling. Wool is warm and lightweight and takes dyes well. Woolen YARNS, usually made from shorter fibres, are thick and full and are used for such items as TWEED fabrics and blankets. WORSTEDS usually are made from longer fibres.

Woolf \'wůlf**, (Adeline) Virginia** *orig.* **Adeline Virginia Stephen** (b. Jan. 25, 1882, London, Eng.—d. March 28, 1941, near Rodmell, Sussex) British novelist and critic. Daughter of LESLIE STEPHEN, she and her sister became the early nucleus of the BLOOMSBURY GROUP. She married Leonard Woolf in 1912; in 1917 they founded the Hogarth Press. Her best novels—including *Mrs. Dalloway* (1925) and *To the Lighthouse* (1927)—are experimental; in them she examines the human experience of time, the indefinability of character, and external circumstances as they impinge on consciousness. *Orlando* (1928) is a historical fantasy about a single character who experiences England from the Elizabethan era to the early 20th century, and *The Waves* (1931), perhaps her most radically experimental work, uses interior monologue and recurring images to trace the inner lives of six characters. Such works confirmed her place among the major figures of literary modernism. Her best critical studies are collected in *The Common Reader* (1925, 1932). Her long essay *A Room of One's Own* (1929) addressed the status of women, and women artists in particular. Her other novels include *Jacob's Room* (1922), *The Years* (1937), and *Between the Acts* (1941). She also wrote a biography of ROGER FRY. Her health and mental stability were delicate throughout her life; in a recurrence of mental illness, she drowned herself. Her diaries and correspondence have been published in several editions.

Woollcott \'wůl-kət**, Alexander (Humphreys)** (b. Jan. 19, 1887, Phalanx, N.J., U.S.—d. Jan. 23, 1943, New York, N.Y.) U.S. author, critic, and actor. He joined the *New York Times* in 1909 and became its drama critic in 1914. Known for his acerbic wit, he became the self-appointed leader of the Algonquin Round Table, the informal luncheon club at New York's Algonquin Hotel in the 1920s and '30s that included GROUCHO MARX, DOROTHY PARKER, ROBERT SHERWOOD, and GEORGE S. KAUFMAN. He later contributed articles to *The New Yorker* and wrote such books as *Two Gentlemen and a Lady* (1928) and *While Rome Burns* (1934). He inspired the play *The Man Who Came to Dinner* (1939).

woolly bear *or* **wooly bear** CATERPILLAR of a TIGER MOTH. The larva of the Isabella tiger moth (*Isia isabella*), known as the banded woolly bear, is brown in the middle and black at both ends. The width of the black bands is purported to predict the severity of the coming winter: the narrower the bands, the milder the weather will be.

Woolworth Co. Historic U.S. merchandising company. F.W. Woolworth (1852–1919) founded his first "five- and ten-cent" store in 1879. By 1904 there were 120 stores in 21 states. The company's New York headquarters, the Woolworth building (completed 1913), was the world's tallest skyscraper from 1913 to 1930. By 1929 Woolworth had about 2,250

© 2006 Encyclopædia Britannica, Inc.

outlets. Its stores continued to proliferate in the U.S. and Britain, and it acquired other chains dealing in sportswear, shoes, and children's wear. From 1992 it began closing hundreds of stores and selling off subsidiaries; in 1998 it changed its name to Venator Group, Inc., and announced its intention to focus on sporting goods. In 2001 the company name was changed to Foot Locker, Inc.

wootz (steel) \'wüts\ Steel produced by a method known in ancient India. The process involved preparation of porous iron, hammering it while hot to release slag, breaking it up and sealing it with wood chips in a clay container, and heating it until the pieces of iron absorbed carbon from the wood and melted. The steel thus produced had a uniform composition of 1–1.6% carbon and could be heated and forged into bars for later use in fashioning articles, such as the famous medieval Damascus swords. See also bloomery process.

Worcester \'wůs-tər\ City (pop., 2000: 172,648), central Massachusetts, U.S. On the Blackstone River, the original settlement (1673) of Worcester was disbanded during King Philip's War (1675–76) and a later settlement was established in 1713. Textile manufacturing began in 1789; the first corduroy cloth in the U.S. was produced there. Industrial development occurred after the opening (1828) of the Blackstone Canal. An early abolitionist centre, Worcester became an important stop on the Underground Railroad. It is a commercial and industrial centre and the state's second largest city. Among its institutions of higher education are College of the Holy Cross and Clark University (1887).

Worcester City and administrative district (pop., 2001: 93,358), administrative and historic county of Worcestershire, west-central England. Located on the River Severn, it was settled before AD 680. During the Middle Ages it was an important wool town and also became known for its glove making. Oliver Cromwell and his Parliamentarian army routed Charles II and his Scottish army in the Battle of Worcester, effecting an end to the English Civil Wars. In 1751 John Wall founded the porcelain industry for which the town became famous, and in 1838 the condiment known as Worcestershire sauce was introduced there by Lea & Perrins. The town's noted cathedral (11th–14th century) contains the tombs of King John and Prince Arthur, the eldest son of Henry VII. Cathedral Grammar School and Royal Grammar School were founded in the 16th century.

word processing Preparation of textual documents on computer. A word-processing system typically consists simply of a personal computer linked to a computer printer, but it may instead employ a terminal linked to a mainframe computer. Word processing differs from typewriter typing in numerous ways. Electronic text can be moved around at will; misspelled terms can be corrected throughout the document by means of a single command; spelling and grammar checkers can automatically alert the user to apparent errors of spelling, punctuation, and syntax; and the document's format, layout, and type fonts and sizes can be changed repeatedly until a satisfactory design is achieved. Since all editing ideally occurs on-screen, word processing can result in decreased paper usage and simplified editing. When the final draft is ready, the document can be printed out (in multiple copies if necessary), sent as an e-mail attachment, shared on a computer network, or simply stored as an electronic file.

Worde \'wôrd**, Wynkyn de** *orig.* **Jan van Wynkyn** (b. Alsace—d. 1534/35) Alsatian-born British printer. He was employed at William Caxton's press from its founding in 1476 until Caxton's death, when he took over the concern. Unlike Caxton and many other contemporary printers, he did not edit or translate. An astute businessman, he published at least 600 titles after 1501, and he was the first printer in England to use italic type (1524).

Wordsworth, Dorothy (b. Dec. 25, 1771, Cockermouth, Cumberland, Eng.—d. Jan. 25, 1855, Rydal Mount, Westmorland) English writer. An inspiring influence on her brother William Wordsworth, she lived with him from 1795 onward. Her *Alfoxden Journal 1798* (1897)—from the period when he and Samuel Taylor Coleridge produced *Lyrical Ballads* (1798)—and *Grasmere Journals 1800–03* (1897) are intimate records of their lives. Both are appreciated for their imaginative descriptions of nature, their perfection of style, and their revelation of her personality as well as for the light they throw on her brother. In 1829 severe illness left her an invalid, and her mind was clouded in her last 20 years.

Wordsworth, William (b. April 7, 1770, Cockermouth, Cumberland, Eng.—d. April 23, 1850, Rydal Mount, Westmorland) English poet. Orphaned at age 13, Wordsworth attended Cambridge University, but he remained rootless and virtually penniless until 1795, when a legacy made possible a reunion with his sister Dorothy Wordsworth. He became friends with Samuel Taylor Coleridge, with whom he wrote *Lyrical Ballads* (1798), the collection often considered to have launched the English Romantic movement. Wordsworth's contributions include "Tintern Abbey" and many lyrics controversial for their common, everyday language. About 1798 he began writing *The Prelude* (1850), the epic autobiographical poem that would absorb him intermittently for the next 40 years. His second verse collection, *Poems, in Two Volumes* (1807), includes many of the rest of his finest works, including "Ode: Intimations of Immortality." His poetry is perhaps most original in its vision of the organic relation between man and the natural world, a vision that culminated in the sweeping metaphor of nature as emblematic of the mind of God. The most memorable poems of his middle and late years were often cast in elegaic mode; few match the best of his earlier works. By the time he became widely appreciated by the critics and the public, his poetry had lost much of its force and his radical politics had yielded to conservatism. In 1843 he became England's poet laureate. He is regarded as the central figure in the initiation of English Romanticism.

work In economics and sociology, the activities and labour necessary for the survival of society. As early as 40,000 BC, hunters worked in groups to track and kill animals, while younger or weaker members of the tribe gathered food. When agriculture replaced hunting and gathering, the resulting surplus of food allowed early societies to develop and some of its members to pursue crafts such as pottery, weaving, and metallurgy. Historically, rigid social hierarchies caused nobles, clergy, merchants, artisans, and peasants to pursue occupations defined largely by hereditary social class. Craft guilds, influential in the economic development of medieval Europe, limited the supply of labour in each profession and controlled production. The establishment of towns led to the creation of new occupations in commerce, law, medicine, and defense. The coming of the Industrial Revolution, spurred by technological advances such as steam power, changed working life profoundly. Factories divided the work once done by a single craftsman into a number of distinct tasks performed by unskilled or semiskilled workers (see division of labour). Manufacturing firms grew larger in the 19th century as standardized parts and machine tools came into use, and ever-more-specialized positions for managers, supervisors, accountants, engineers, technicians, and salesmen became necessary. The trend toward specialization continued into the 21st century, giving rise to a number of disciplines concerned with the management and design of work, including production management, industrial relations, personnel administration, and systems engineering. By the turn of the 21st century, automation and technology had spurred tremendous growth in service industries.

work In physics, the measure of energy transfer that occurs when an object is moved over a distance by an external force, some component of which is applied in the direction of displacement. For a constant force, work W is equal to the magnitude of the force F times the displacement d of the object, or $W = Fd$. Work is also done by compressing a gas, by rotating a shaft, and by causing invisible motions of particles within a body by an external magnetic force. No work is accomplished by simply holding a heavy stationary object, because there is no transfer of energy and no displacement. Work done on a body is equal to the increase in energy of the body. Work is expressed in units called joules (J). One joule is equivalent to the energy transferred when a force of one newton is applied over a distance of one metre.

workers' compensation Program through which employers bear some of the cost of their employees' work-related injuries and occupational illnesses or disabilities. It was first introduced in Germany in 1884. In Britain and the U.S. in the late 19th century, there was a movement to secure the right of injured workers to compensation and to improve working conditions through court decisions, employer liability statutes, and safety codes. By the mid-20th century most countries in the world had adopted some sort of workers' compensation. Some systems take the form of compulsory social insurance; in others the employer is legally required to provide certain benefits, but insurance is voluntary. The system of workers' compensation serves as an economic incentive for employers to prevent accidents and illness among employees, since liability for medical costs and the income lost by placing workers in hazardous environments can easily exceed the costs of establishing safe working conditions.

Workers' Opposition (1920–21) Group within the Soviet Union's Communist Party that championed workers' rights and trade-union control

© 2006 Encyclopædia Britannica, Inc.

over industry. It was formed in 1919 to resist the central party's increasing control over local party units and trade unions. In 1920 it objected to Leon Trotsky's plan to transform trade unions into state organs. Led by Aleksandra Kollontay and others, the group insisted that the unions, as true representatives of the proletariat, should control the national economy. At the 10th Party Congress (1921), its platform was rejected and it was ordered to disperse.

working dog Any of various breeds of dog bred as guard, herding, draft, or rescue animals. Breeds range from medium to large, but all are sturdy and muscular, intelligent and loyal. Guard breeds include the Akita, boxer, bullmastiff, Doberman pinscher, giant and standard schnauzers, Great Dane, mastiff, and Rottweiler. Livestock guard breeds include the Great Pyrenees, komondor (Hungary), kuvasz (Tibet), and Pyrenean mountain dogs (Britain). Herding dogs include the German shepherd, Shetland sheepdog, and Welsh corgi. Breeds developed for hauling and rescue work include the Bernese mountain dog, Portuguese water dog, Newfoundland, St. Bernard, and sled dog.

Workingmen's Party First labour-oriented U.S. political party. It was formed in Philadelphia (1828) and New York (1829) by craftsmen, skilled journeymen, and reformers who demanded a 10-hour workday, free public education, abolition of debtor imprisonment, and an end to competition from prison contract labour. Leaders included Thomas Skidmore, Fanny Wright, Robert Dale Owen, and George H. Evans, who established the *Working Man's Advocate*, the first labour newspaper, in 1829. Factional disputes split the party in the 1830s, and many in New York joined the reform Locofoco Party.

Works Progress Administration See WPA

workstation Computer intended for use by one person, but with a much faster processor and more memory than an ordinary personal computer. Workstations are designed for powerful business applications that do large numbers of calculations or require high-speed graphical displays; the requirements of CAD/CAM systems were one reason for their initial development. Because of their need for computing power, they are often based on RISC processors and generally use UNIX as their operating system. An early workstation was introduced in 1987 by Sun Microsystems; workstations introduced in 1988 from Apollo, Ardent, and Stellar were aimed at 3D graphics applications. The term workstation is also sometimes used to mean a personal computer connected to a mainframe computer, to distinguish it from "dumb" display terminals with limited applications.

World Bank Specialized agency of the United Nations system, established at the Bretton Woods Conference for postwar reconstruction. It is the principal international development institution. Its five divisions are the International Bank for Reconstruction and Development (IBRD; its main component), the International Development Association (IDA), the International Finance Corporation (IFC), the Multilateral Investment Guarantee Agency (MIGA), and the International Center for Settlement of Investment Disputes (ICSID). The IDA (founded 1960) makes interest-free loans to the bank's poorest member countries. The IFC (founded 1956) lends to private businesses in developing countries. The MIGA (founded 1985) supports national and private agencies that encourage foreign direct investment by offering insurance against noncommercial risks. The ICSID (founded 1966) was developed to relieve the IBRD of the burden of settling investment disputes. See also International Monetary Fund.

World Council of Churches (WCC) Christian ecumenical organization founded in 1948 in Amsterdam. It functions as a forum for Protestant and Eastern Orthodox denominations, which cooperate through the WCC on a variety of undertakings and explore doctrinal similarities and differences. It grew out of two post-World War I ecumenical efforts, the Life and Work Movement (which concentrated on practical activities) and the Faith and Order Movement (which focused on doctrinal issues and the possibility of reunion). The impetus for these two organizations sprang from the International Missionary Conference in Edinburgh in 1910, the first such cooperative effort since the Reformation. The Roman Catholic church, though not a member of the WCC, sends representatives to its conferences. The more fundamentalist Protestant denominations have also refused to join.

World Court See International Court of Justice

World Cup Major international football (soccer) competition. The tournament brings together 32 qualifying national teams from around the world, culminating in a match between the two top teams. It has been held every fourth year since 1930 (except during World War II). Followed and watched by billions of people worldwide, it has by far the greatest audience of any single sporting event in the world. Several competitions in other sports also use the name "world cup."

World Food Programme (WFP) Organization established in 1961 by the United Nations to help alleviate world hunger. The world's largest food-aid organization (providing food aid to some 75 million people annually), the WFP aims to assist the approximately 15% of the world's population that is hungry. Its Food-for-Life program aids victims of both natural and man-made disasters by collecting and transporting food to crisis areas. Contributions of commodities, cash, and services (primarily shipping) help beneficiaries to maintain balanced diets. Its Food-for-Growth programs are directed at vulnerable groups—including children, pregnant and nursing women, and the elderly—and its Food-for-Work program encourages self-reliance by providing food in return for labour. Its headquarters are in Rome.

World Health Organization (WHO) Public-health agency of the UN, established in Geneva in 1948 to succeed two earlier agencies. Its mandate is to promote "the highest possible level of health" in all peoples. Its work falls into three categories. It provides a clearinghouse for information on the latest developments in disease and health care and establishes international sanitary standards and quarantine measures. It sponsors measures for the control of epidemic and endemic disease (including immunization campaigns and assistance in providing sources of pure water). Finally, it encourages the strengthening of public-health programs in member nations. Its greatest success to date has been the worldwide eradication of smallpox (1980).

World Heritage site Any of various areas or objects designated as having "outstanding universal value" under the Convention Concerning the Protection of the World Cultural and Natural Heritage. This convention, adopted by UNESCO in 1972, provides for international cooperation in preserving and protecting cultural and natural treasures throughout the world. Each site on the list is under strict legal protection by the government of the nation in which it is situated. Among the cultural sites are many of the world's most famous buildings. The ratio of cultural to natural sites on the list is roughly three to one. See table opposite.

world music Musical genre incorporating diverse styles from Africa, eastern Europe, Asia, South and Central America, the Caribbean, and nonmainstream Western folk sources. The term was first coined largely in response to the sudden increase of recordings in non-English languages that were released in Great Britain and the United States in the 1980s, but by the early 1990s world music had become a bona fide musical genre and counterpoint to the increasingly synthetic sounds of Western pop music. Initially, African popular music and world music were virtually synonymous, and the genre's biggest stars included the Nigerians King Sunny Ade and Fela Anikulapo Kuti and the Senegalese Youssou N'Dour. Moreover, one of its earliest advocates was the Cameroonian-born Frenchman Francis Bebey. By the 21st century world music encompassed everything from Pakistani singer Nusrat Fateh Ali Khan and the pop-flamenco of the French group the Gipsy Kings to "ambient-global" projects that merged so-called ethnic voice samples with state-of-the-art rhythm programming.

World Series Annual championship of U.S. major league baseball, played between the top team of the American League (AL) and that of the National League (NL). First held in 1903, it was canceled the following year after the New York Giants (NL) refused to play Boston (AL). The series resumed in 1905 and continued annually until a players' strike in 1994 forced its cancellation that year. A seven-game series has been standard since 1922.

World Trade Center Complex formerly consisting of seven buildings around a central plaza, near the southern tip of Manhattan. Its huge twin towers (completed 1970–72) were designed by Minoru Yamasaki (1912–86). At 1,368 ft (417 m) and 1,362 ft (415 m) tall, they were the world's tallest buildings until surpassed in 1973 by the Sears Tower in Chicago. The towers were notable for the relationship of their simple, light embellishment to their underlying structure. In 1993 a bomb planted by terrorists exploded in the underground garage, killing several people and injuring some 1,000. A much more massive attack occurred on Sept. 11, 2001, when first One World Trade Center and then Two World Trade Center were struck by hijacked commercial airliners that were deliberately flown into them. Shortly thereafter both of the heavily damaged

towers, as well as adjacent buildings, collapsed into enormous piles of debris. The attacks claimed the lives of some 2,750 people. Thousands more were injured. See SEPTEMBER 11 ATTACKS.

World Trade Organization (WTO) INTERNATIONAL ORGANIZATION based in Geneva that supervises world trade. It was created in 1995 to replace the GENERAL AGREEMENT ON TARIFFS AND TRADE (GATT). Like its predecessor, it aims to lower trade barriers and encourage multilateral trade. It monitors members' adherence to GATT agreements and negotiates and implements new agreements. Critics of the WTO, including many opponents of economic GLOBALIZATION, have charged that it undermines national sovereignty by promoting the interests of large MULTINATIONAL CORPORATIONS and that the trade liberalization it encourages leads to environmental damage and declining living standards for low-skilled workers in developing countries. By the early 21st century, the WTO had more than 145 members.

world tree Centre of the world, a widespread motif in myths and folktales among various peoples, especially in Asia, Australia, and North America. There are two main forms. In the vertical tradition, the tree extends between and connects earth, heaven, and the underworld; oracles, judgments, and other prophetic activities are performed at its base. In the horizontal tradition, the tree is planted at the centre of the world and is protected by supernatural guardians; it is the source of terrestrial fertility and life.

World War I *or* **First World War** (1914–18) International conflict between the CENTRAL POWERS—Germany, Austria-Hungary, and Turkey—and the ALLIED POWERS—mainly France, Britain, Russia, Italy, Japan, and (from 1917) the U.S. After a Serbian nationalist assassinated Archduke FRANCIS FERDINAND of Austria in June 1914, a chain of threats and mobilizations resulted in a general war between the antagonists by mid-August. Prepared to fight a war on two fronts, based on the SCHLIEFFEN PLAN, Germany first swept through neutral Belgium and invaded France. After the FIRST BATTLE OF THE MARNE (1914), the Allied defensive lines were stabilized in France, and a war of attrition began. Fought from lines of trenches and supported by modern artillery and machine guns, infantry assaults gained little ground and were enormously costly in human life, especially at the BATTLES OF VERDUN and the SOMME (1916). On the Eastern Front, Russian forces initially drove deep into East Prussia and German Poland (1914) but were stopped by German and Austrian forces at the BATTLE OF TANNENBERG and forced back into Russia (1915). After several offensives, the Russian army failed to break through the German defensive lines. Russia's poor performance and enormous losses caused widespread domestic discontent that led to the RUSSIAN REVOLUTION OF 1917. Other fronts in the war included the DARDANELLES CAMPAIGN, in which British and Dominion forces were unsuccessful against Turkey; the Caucasus and Iran (Persia), where Russia fought Turkey; Mesopotamia and Egypt, where British forces fought the Turks; and northern Italy, where Italian and Austrian troops fought the costly BATTLES OF THE ISONZO. At sea, the German and British fleets fought the inconclusive BATTLE OF JUTLAND, and Germany's use of the submarine against neutral shipping eventually brought the U.S. into the war in 1917. Though Russia's armistice with Germany in December 1917 released German troops to fight on the Western Front, the Allies were reinforced by U.S. troops in early 1918. Germany's unsuccessful offensive in the SECOND BATTLE OF THE MARNE was countered by the Allies' steady advance, which recovered most of France and Belgium by October 1918 and led to the November ARMISTICE. Total casualties were estimated at 10 million dead, 21 million wounded, and 7.7 million missing or imprisoned. See also Battles of CAPORETTO and YPRES; FOURTEEN POINTS; LUSITANIA; PARIS PEACE CONFERENCE; Treaties of BREST-LITOVSK, NEUILLY, SAINT-GERMAIN, SÈVRES, TRIANON, and VERSAILLES; EDMUND H.H. ALLENBY, FERDINAND FOCH, JOHN FRENCH, DOUGLAS HAIG, PAUL VON HINDENBURG, JOSEPH-JACQUES-CÉSAIRE JOFFRE, ERICH LUDENDORFF, JOHN PERSHING.

World War II *or* **Second World War** (1939–45) International conflict principally between the AXIS POWERS—Germany, Italy, and Japan—and the ALLIED POWERS—France, Britain, the U.S., the Soviet Union, and China. Political and economic instability in Germany, combined with bitterness over its defeat in WORLD WAR I and the harsh conditions of the Treaty of VERSAILLES, allowed ADOLF HITLER and the NAZI PARTY to rise to power. In the mid-1930s Hitler began secretly to rearm Germany, in violation of the treaty. He signed alliances with Italy and Japan to oppose the Soviet Union and intervened in the SPANISH CIVIL WAR in the name of anticommunism. Capitalizing on the reluctance of other European powers to oppose him by force, he sent troops to occupy Austria in 1938 (see ANSCHLUSS) and to annex Czechoslovakia in 1939. After signing the GERMAN-SOVIET NONAGGRESSION PACT, Germany invaded Poland on Sept. 1, 1939. Two days later France and Britain declared war on Germany. Poland's defeat was followed by a period of military inactivity on the Western Front (see PHONY WAR). At sea Germany conducted a damaging submarine campaign by U-BOAT against merchant shipping bound for Britain. By early 1940 the Soviet Union had divided Poland with Germany, occupied the Baltic states, and subdued Finland in the RUSSO-FINNISH WAR. In April 1940 Germany overwhelmed Denmark and began its conquest of Norway. In May German forces swept through The Netherlands and Belgium on their BLITZKRIEG invasion of France, forcing it to capitulate in June and establish the VICHY FRANCE regime. Germany then launched massive bombing raids on Britain in preparation for a cross-Channel invasion, but, after losing the BATTLE OF BRITAIN, Hitler postponed the invasion indefinitely. By early 1941 Hungary, Romania, and Bulgaria had joined the Axis, and German troops quickly overran Yugoslavia and Greece in April. In June Hitler abandoned his pact with the Soviet Union and launched a massive surprise invasion of Russia, reaching the outskirts of Moscow before Soviet counterattacks and winter weather halted the advance. In East Asia Japan expanded its war with China and seized European colonial holdings. In December 1941 Japan attacked U.S. bases at Pearl Harbor and in the Philippines. The U.S. declared war on Japan, and the war became truly global when the other Axis Powers declared war on the U.S. Japan quickly invaded and occupied most of Southeast Asia, Burma, the Neth-

© 2006 Encyclopædia Britannica, Inc.

erlands East Indies, and many Pacific islands. After the crucial U.S. naval victory at the Battle of Midway (1942), U.S. forces began to advance up the chains of islands toward Japan. In the North Africa Campaigns the British and Americans defeated Italian and German forces by 1943. The Allies then invaded Sicily and Italy, forcing the overthrow of the fascist government in July 1943, though fighting against the Germans continued in Italy until 1945. In the Soviet Union the Battle of Stalingrad (1943) marked the end of the German advance, and Soviet reinforcements in great numbers gradually pushed the German armies back. The massive Allied invasion of western Europe began with the Normandy Campaign in western France (1944), and the Allies' steady advance ended in the occupation of Germany in 1945. After Soviet troops pushed German forces out of the Soviet Union, they advanced into Poland, Czechoslovakia, Hungary, and Romania and had occupied the eastern third of Germany by the time the surrender of Germany was signed on May 8, 1945. In the Pacific an Allied invasion of the Philippines (1944) was followed by the successful Battle of Leyte Gulf and the costly Battles of Iwo Jima and Okinawa (1945). Atomic bombs were dropped on Hiroshima and Nagasaki in August 1945, and Japan's formal surrender on September 2 ended the war. Estimates of total military and civilian casualties varied from 35 million to 60 million killed, including about 6 million Jews who died in the Holocaust. Millions more civilians were wounded and made homeless throughout Europe and East Asia. See also Anti-Comintern Pact; Atlantic Charter; Battles of El Alamein, the Atlantic, the Bulge, Guadalcanal, and the Philippine Sea; Casablanca, Potsdam, Tehran, and Yalta conferences; Dunkirk Evacuation; lend-lease; Munich agreement; Nürnberg Trials; Siege of Leningrad; Sino-Japanese Wars; Omar Bradley, Winston Churchill, Dwight D. Eisenhower, Douglas MacArthur, Bernard Law Montgomery, Benito Mussolini, George Patton, Erwin Rommel, Franklin Roosevelt, Joseph Stalin, Yamamoto Isoroku, Georgy K. Zhukov.

World Wide Web (WWW) *or* **Web** Leading information-exchange service of the Internet. It was created by Tim Berners-Lee and his colleagues at CERN and introduced to the world in 1991. The Web gives users access to a vast array of documents that are connected to each other by means of hypertext or hyperlinks. A hypertext document with its corresponding text and hyperlinks is written in HTML and is assigned an on-line address, or URL. The Web operates within the Internet's basic client-server architecture. Individual HTML files with unique electronic addresses are called Web pages, and a collection of Web pages and related files (such as graphics files, scripted programs, and other resources) sharing a set of similar addresses (see domain name) is called a Web site. The main or introductory page of a Web site is usually called the site's home page. Users may access any page by typing in the appropriate address, search for pages related to a topic of interest by using a search engine, or move quickly between pages by clicking on hyperlinks incorporated into them. Though introduced in 1991, the Web did not become truly popular until the introduction of Mosaic, a browser with a graphical interface, in 1993. Subsequently, browsers produced by Netscape and Microsoft have become predominant.

World Wildlife Fund *or* **World Wide Fund for Nature** Largest privately supported international conservation organization in the world. Founded in 1961 by a small group of European scientists, naturalists, and business and political leaders, including Peter Markham Scott, the organization raises funds and channels them to other conservation groups. It directs its efforts toward protecting endangered environments such as coral reefs, saving endangered species, and addressing global threats such as pollution. It has helped establish and manage parks and reserves, and was instrumental in saving the giant panda (whose image it uses as its symbol) and other endangered species.

world's fair Specially constructed attraction showcasing the science, technology, and culture of participating countries and enterprises. World fairs have often featured outstanding architectural designs and introduced significant inventions. The first was held in England in 1756; more than 300 have been held since. The most notable include the 1851 Crystal Palace Exhibition (London), the 1876 U.S. International Centennial Exposition (Philadelphia), the 1893 World's Columbian Exposition (Chicago), the 1901 Pan-American Exposition (Buffalo, N.Y.), the 1904 St. Louis World's Fair, the 1910 Brussels World's Fair, the 1933–34 Century of Progress (Chicago), the 1939–40 Golden Gate Exposition (San Francisco), the 1939–40 New York World's Fair, the 1964–65 New York World's Fair, the 1967 Montreal Exposition, and the 1998 World Exposition (Lisbon).

worm Any of thousands of species of unrelated invertebrate animals that typically have a soft, slender, elongated body with no appendages. The major phyla are Platyhelminthes (flatworms), Annelida (annelids, or segmented worms), Nemertea (ribbon worms), Acanthocephala (spiny-headed worms), and Aschelminthes (nematodes and others). There are several minor phyla. Length ranges from microscopic (e.g., some aschelminths) to more than 100 ft (30 m) (some ribbon worms). Worms are found worldwide on land and in water. They may be parasitic or free-living and are important as soil conditioners, parasites, and a link in the food chain in all ecosystems. See also fluke, pinworm, polychaete, rotifer, tapeworm, tube worm.

Wormley Conference (Feb. 26, 1877) Meeting to resolve the disputed U.S. presidential election of 1876 between Samuel Tilden and Rutherford B. Hayes. Leaders of the Democratic and Republican parties met at Wormley's Hotel in Washington, D.C., to reach a compromise that would forestall the Democrats' protest of the Electoral Commission's decision to award the disputed electoral votes from three Southern states to Hayes, enabling him to defeat Tilden 185 to 184. In return for the Democrats' acquiescence in the decision, Republicans promised to withdraw troops from the South, end Reconstruction and Northern interference in Southern politics, and vote for railroad construction and other internal improvements in the South. The compromise satisfied the Southern Democrats, and Hayes was declared the winner on March 2, 1877.

Worms \'vȯrms,\ *English* \'wərmz**, Concordat of** (1122) Compromise between Pope Calixtus II and Emperor Henry V (r. 1106–25) to settle the Investiture Controversy, reached at Worms, Germany. It marked the end of the first phase of conflict between Rome and what was becoming the Holy Roman Empire and made a clear distinction between the spiritual side of a prelate's office and his position as a landed magnate and vassal of the crown. Bishops and abbots were to be chosen by the clergy, but the emperor was to decide contested elections. Those selected were to be invested first with the powers and privileges of their office as vassal (granted by the emperor) and then with their ecclesiastical powers and lands (granted by church authority).

Worms, Diet of Meeting of the Diet (assembly) of the Holy Roman Empire at Worms, Ger., in 1521, where Martin Luther defended the principles of the Reformation. Luther had already been excommunicated by Pope Leo X, but Emperor Charles V granted him safe conduct to a hearing at the Diet. On April 17, 1521, Luther refused to recant his views. Disorder broke out, the emperor adjourned the proceedings, and Luther was obliged to go into hiding. In May the Diet issued the Edict of Worms, declaring Luther an outlaw and a heretic and banning his writings.

worsted \'wůs-təd, 'wər-stəd\ Wool yarn made of long-staple fibres that have been combed to remove unwanted short fibres and make them lie parallel. In the spinning operation, which gives the necessary twist to hold the fibres together, worsted yarns are more tightly twisted than are the bulkier woolen yarns. The soft, heavy yarn is strong and durable and is often used for sweaters. Worsteds are also used for fine dress fabrics and suit material.

Worth, Charles Frederick (b. Oct. 13, 1825, Bourne, Lincolnshire, Eng.—d. March 10, 1895, Paris, France) British-born French fashion designer. In 1845 he left England, where he had been a bookkeeper, and worked in a Paris dress accessories shop. In 1858 he opened his own ladies' tailor shop and soon gained the patronage of the empress Eugénie. He was a pioneer of the "fashion show" (the preparation and showing of a collection), the first man to become prominent in the field of fashion, and the first designer to create dresses intended to be copied and distributed throughout the world. He became the dictator of Paris fashion and was especially noted for his elegant Second Empire gowns. He invented the bustle, which became standard in women's fashion in the 1870s and '80s.

Wotan See Odin

Wouk \'wōk**, Herman** (b. May 27, 1915, New York, N.Y., U.S.) U.S. novelist. His experience serving aboard a destroyer-minesweeper in World War II provided material for *The Caine Mutiny* (1951, Pulitzer Prize; film, 1954), a drama of naval tradition that presented the unforgettable character Captain Queeg. *The Winds of War* (1971) and *War and Remembrance* (1978) together represent a two-volume novel of the war. His other novels include *Marjorie Morningstar* (1955) and *The Glory* (1994).

wound *or* **trauma** Break in any body tissue due to external action (including surgery). It may be closed (blunt trauma) or open (penetrating trauma). Blood vessels, nerves, muscles, bones, joints, and internal organs may be damaged. A closed wound can be caused by impact, twisting, bending, or deceleration (as in a car crash). It can range from a minor bruise or sprain to a skull fracture with brain damage or a spinal-cord injury with paralysis. In an open wound, foreign matter such as bacteria, dirt, and clothing fragments entering through broken skin or mucous membrane may result in infection. Other factors affecting severity include depth, surface area, degree of tearing, and structures damaged. Minor wounds need only first aid. For others, after examination and perhaps diagnostic imaging and exploratory surgery, treatment may include fluid replacement or drainage, sterilization and antibiotics, tetanus antitoxin, and repair of damaged structures. A closed wound may need to be opened or an open one sutured closed. See also burn, coagulation, crush injury, dislocation, scar.

Wounded Knee Hamlet and creek in southwestern South Dakota, the site of two conflicts between the Sioux Indians and the U.S. government. In 1890 the Sioux had been inspired by the Ghost Dance movement to take up arms and reclaim their heritage, but federal military intervention quelled the rebellion. On December 29 a young brave became involved in a scuffle while surrendering, and a trooper was killed. Soldiers fired at the Indians, killing more than 200 men, women, and children. Thirty soldiers also died. The so-called Battle of Wounded Knee is regarded as the final episode in the conquest of the North American Indian. In 1973 some 200 members of the American Indian Movement took the reservation hamlet by force, declared it an independent nation, and vowed to stay until the government agreed to address Indian grievances; a siege by federal marshals ended when the Indians surrendered in exchange for a promise of negotiations.

Wovoka \wō-'vō-kə\ (b. 1858?, Utah Territory, U.S.—d. October 1932, Walker River Indian Reservation, Nev.) Paiute religious leader. In 1889 Wovoka announced that during a trance God had told him that his people's ancestors would rise from the dead, buffalo would return to the plains, and the white man would vanish if the people would perform a ritual dance. The Ghost Dance cult arose and quickly spread to other tribes, notably the militant Sioux, and Wovoka was worshiped as a new messiah. After the Wounded Knee massacre, Wovoka's following dissipated and the movement died out.

Wozniak, Stephen G(ary) (b. Aug. 11, 1950, San Jose, Calif., U.S.) U.S. computer engineer. He designed electronic devices and games while still in his teens. In the 1970s he worked for Hewlett-Packard. In 1976 he and Steven Jobs founded Apple Computer, Inc. Badly injured in a 1981 plane crash, he took a leave from Apple, but he returned to work on the revolutionary Macintosh computer. He left Apple for good in 1985, the year he was awarded the National Medal of Technology. He has since taught in elementary school.

WPA *in full* **Works Progress Administration** *later (1939–43)* **Work Projects Administration** U.S. work program for the unemployed. Created in 1935 under the New Deal, it aimed to stimulate the economy during the Great Depression and preserve the skills and self-respect of unemployed persons by providing them useful work. During its existence, it employed 8.5 million people in the construction of 650,000 mi (1,046,000 km) of roads, 125,000 public buildings, 75,000 bridges, 8,000 parks, and 800 airports. The WPA also administered the WPA Federal Art Project, the Theater Project, and the Writers' Project, which provided jobs for unemployed artists, actors, and writers. In 1943, with the virtual elimination of unemployment by the wartime economy, the WPA was terminated.

WPA Federal Art Project Extensive visual-arts project, part of the Works Progress Administration established by Franklin D. Roosevelt during the Great Depression. It employed artists with a wide range of experience and styles and had great influence on subsequent U.S. movements. At its peak in 1936, it provided work for more than 5,000 artists from relief rolls. Over the eight years of its existence, its employees produced 2,566 murals, more than 100,000 easel paintings, about 17,700 sculptures, and nearly 300,000 fine prints. The project also developed an audience by establishing more than 100 community art centres and galleries in regions where art was generally unknown. The total federal investment was about $35 million. It was the first major attempt at U.S. government patronage of the visual arts.

Wrangel, Pyotr (Nikolayevich), Baron (b. Aug. 27, 1878, Novo-Aleksandrovsk, Lith., Russian Empire—d. April 25, 1928, Brussels, Belg.) Russian general who led the anti-Bolshevik forces in the Russian Civil War. A member of an old German baronial family, he served in the Russian imperial guards and commanded a Cossack division in World War I. After the Russian Revolution of 1917, he joined the anti-Bolshevik "White" forces of Anton Denikin. After capturing Tsaritsyn (now Volgograd) in 1919, he became commander of the Whites in April 1920 and tried to rally support from the peasants and Cossacks. He launched an offensive in Ukraine in June, but by November the Red Army had defeated the Whites and forced them to retreat to the Crimea. After evacuating his troops to Constantinople, he lived in exile in western Europe.

Wrangel Island Island, northeastern Russia. Located in the Arctic Ocean, it is crossed by the 180th meridian. It has an area of some 2,800 sq mi (7,300 sq km). Although it reaches an altitude of 3,596 ft (1,096 m) at Sovetskaya Mountain, there are no glaciers. The Russian explorer Ferdinand P. Wrangel, for whom the island was later named, determined its location from accounts of Siberian natives but did not land there during his mapping of the Siberian coast in the early 1820s. Russian fur traders subsequently visited the island, and it was sighted by U.S. vessels in 1867 and 1881. Survivors of a sunken Canadian ship reached Wrangel in 1914, and the leader of the expedition created an international incident in the early 1920s when he claimed Wrangel for Canada without authorization. The Soviet Union then annexed the island, and permanent occupation began in 1926. Wrangel Island State Reserve, established in 1976, occupies 1,730,000 ac (700,000 ha).

Wrangell Mountains Range, southern Alaska, U.S. It extends south for about 100 mi (160 km) from the Copper River to the Saint Elias Mountains near the Yukon border. Many peaks exceed 10,000 ft (3,000 m); the highest are Mount Blackburn (16,390 ft [4,990 m]), Mount Bona (16,500 ft [5,029 m]), and Mount Sanford (16,237 ft [4,950 m]). Most of the summits are extinct volcanoes. Snowfields drain into glaciers as long as 45 mi (72 km). The range forms a major part of Wrangell–Saint Elias National Park.

Wrangell–Saint Elias National Park National park, southeastern Alaska, U.S. Proclaimed a national monument in 1978, the area underwent boundary and name changes in 1980. The largest park in the U.S. national park system, it has an area of 12,318,000 ac (4,987,000 ha). At the convergence of the Chugach, Wrangell, and Saint Elias mountain ranges, it includes the largest assemblage of glaciers and the greatest collection of peaks above 16,000 ft (4,880 m) on the continent.

wrasse \'ras\ Any of some 300 species (family Labridae) of slender, often brilliantly coloured, fishes, found worldwide in tropical and temperate seas, often on coral reefs. Species range from 2 in. (5 cm) to 7 ft (2 m) long. Wrasses have thick lips, large scales, long fins, and large, often protruding, canine teeth. Most eat invertebrates; some species, called cleaner wrasses, pick off and eat the external parasites of larger fishes. The tautaug (*Tautoga onitis*) is an edible species.

wren Any of 59 species (family Troglodytidae) of chunky songbirds, found in the Western Hemisphere. One species, *Troglodytes troglodytes*, has spread to the Old World; typical of the family, it is about 4 in. (10 cm) long and dark-barred brown, with a short, slightly downcurved bill, short rounded wings, and short cocked tail. Common throughout the Western Hemisphere is the house wren. The largest U.S. species (8 in., or 20 cm, long) is the cactus wren of southwestern deserts. Wrens hunt insects in marshes, rocky wastes, or shrubbery, revealing their presence by chatter and loud song. They nest in holes, in thickets, or on ledges.

Wren, Sir Christopher (b. Oct. 20, 1632, East Knoyle, Wiltshire, Eng.—d. Feb. 25, 1723, London) British architect, astronomer, and geometrician. He taught astronomy at Gresham College, London (1657–61) and Oxford (1661–73), and did not turn to architecture until 1662, when

© 2006 Encyclopædia Britannica, Inc.

he was engaged to design the Sheldonian Theatre at Oxford. Though Classical in form, the theatre was roofed with novel wood trusses that were the product of Wren's scholarly and empirical approach. As King's Surveyor of Works (1669–1718), he had a hand in the rebuilding of more than 50 churches destroyed in the Great Fire of London. Meanwhile, he was evolving designs for Saint Paul's Cathedral, a work that occupied him until its completion in 1710. Other works, generally in the English Baroque style, include the classical Trinity College library, Cambridge (1676–84), additions to Hampton Court (begun 1689), and Greenwich Hospital (begun 1696). Wren was buried in Saint Paul's; nearby is the famous inscription: "Reader, if you seek a monument, look around."

Sir Christopher Wren, detail of an oil painting by Sir Godfrey Kneller, 1711; in the National Portrait Gallery, London.

wrench *or* **spanner** Tool, usually operated by hand, for tightening bolts and nuts. A wrench basically consists of a lever with a notch at one or both ends for gripping the bolt or nut so that it can be twisted by a pull at right angles to the axes of the lever and the bolt or nut. Open-end wrenches have ends with straight-sided slots that fit over the part being tightened; box-end wrenches have ends that enclose the nut and have six, eight, 12, or 16 points inside the head. A socket wrench is essentially a short pipe with a square or hexagonal hole and either a permanent or a removable handle.

wrestling Sport in which two competitors grapple with and strive to trip or throw each other down or off-balance. It is practiced in various styles, including freestyle wrestling, in which contestants can use holds above and below the waist, and Greco-Roman wrestling, which allows only holds above the waist. Sambo is a style of Russian origin employing judo techniques. Sumo wrestling is a specialized Japanese variety. U.S. professional wrestling is today among the most popular of all spectator sports, though it principally involves wildly flamboyant showmanship, including such nonclassical moves as kicks to the head that would be lethal if they were not actually pulled.

Wright, Sir Almroth Edward (b. Aug. 10, 1861, Middleton Tyas, Yorkshire, Eng.—d. April 30, 1947, Farnham Common, Buckinghamshire) British bacteriologist and immunologist. While teaching at the Army Medical School in Netley (from 1892), he developed a typhoid immunization that used killed typhoid bacilli. It made Britain the only country with troops immunized against typhoid at the start of World War I, the first war in which fewer British soldiers died of infection than from trauma. He also developed vaccines against enteric tuberculosis and pneumonia. He was well known for advancing autogenous vaccines (vaccines prepared from a patient's own bacteria).

Wright, Frances *known as* **Fanny Wright** (b. Sept. 6, 1795, Dundee, Angus, Scot.—d. Dec. 13, 1852, Cincinnati, Ohio, U.S.) Scottish-born American social reformer. After travels in the U.S., she published *Views of Society and Manners in America* (1821), which was widely read and praised. Returning to the U.S. in 1824, she bought and freed slaves and settled them at Nashoba, a socialist, interracial community she established in Tennessee (1825–28). She worked with Robert Dale Owen in New York (1829) and defied convention by lecturing widely, attacking slavery, religion, traditional marriage, and the unequal treatment of women. She was a co-leader of the Workingmen's Party. After marrying and living in France (1831–35), she returned to the U.S. and became a supporter of Andrew Jackson and the Democratic Party.

Wright, Frank Lloyd (b. June 8, 1867, Richland Center, Wis., U.S.—d. April 9, 1959, Phoenix, Ariz.) U.S. architect. After studying engineering briefly at the University of Wisconsin, he worked for the firm of Dankmar Adler (1844–1900) and Louis Sullivan in Chicago before opening his own practice there in 1893. Wright became the chief practitioner of the Prairie school, building about 50 Prairie houses from 1900 to 1910. Early nonresidential buildings include the forward-looking Larkin Building in Buffalo, N.Y. (1904; destroyed 1950), and Unity Temple in Oak Park, Ill. (1906). In 1911 he began work on his own house, Taliesin, near Spring Green, Wis. The lavish Imperial Hotel in Tokyo (1915–22, dismantled 1967) was significant for its revolutionary floating cantilever construction, which made it one of the only large buildings to withstand the earthquake of 1923. In the 1930s he designed his low-cost Usonian houses, but his most admired house, Fallingwater, in Bear Run, Pa. (1936), is an extravagant country retreat cantilevered over a waterfall. His Johnson Wax Building (1936–39), an example of humane workplace design, touched off an avalanche of major commissions. Of particular note is the Guggenheim Museum (1956–59), which has no separate floor levels but instead uses a spiral ramp, realizing Wright's ideal of a continuous space. Throughout his career he retained the use of ornamental detail, earthy colours, and rich textural effects. His sensitive use of materials helped to control and perfect his dynamic expression of space, which opened a new era in American architecture. Often considered the greatest U.S. architect of all time, his greatest legacy is "organic architecture," or the idea that buildings harmonize both with their inhabitants and with their environment.

Wright, Mickey *orig.* **Mary Kathryn Wright** (b. Feb. 14, 1935, San Diego, Calif., U.S.) U.S. golfer. Noted for her classic swing, her long drives, and her superior iron play, she won a record number of LPGA tournaments (82), including an unmatched 13 in one season (1963), and remains the only four-time winner of the LPGA Championship (1958, 1960, 1961, 1963). Twice named Woman Athlete of the Year by the Associated Press (1963, 1964), she has been called the greatest woman golfer of all time.

Wright, Richard (b. Sept. 4, 1908, near Natchez, Miss., U.S.—d. Nov. 28, 1960, Paris, France) U.S. novelist and short-story writer. Wright, whose grandparents had been slaves, grew up in poverty. After migrating north he joined the Federal Writers' Project in Chicago, then moved to New York City in 1937. He was a member of the Communist Party in the years 1932–44. He first came to wide attention with a volume of novellas, *Uncle Tom's Children* (1938). His novel *Native Son* (1940), though considered shocking and violent, became a best-seller. The fictionalized autobiography *Black Boy* (1945) vividly describes his often harsh childhood and youth. After World War II he settled in Paris. He is remembered as one of the first African American writers to protest white treatment of blacks.

Wright, Sewall (b. Dec. 21, 1889, Melrose, Mass., U.S.—d. March 3, 1988, Madison, Wis.) U.S. geneticist. He earned his doctorate at Harvard University. His earliest studies included investigation of the effects of inbreeding and crossbreeding on guinea pigs, animals he later used in studying the effects of gene action on coat and eye colour. With J.B.S. Haldane and R.A. Fisher, he developed a mathematical basis for modern evolutionary theory using statistical techniques. He originated a theory that could guide the use of inbreeding and crossbreeding in livestock improvement. He is perhaps best known for his concept of genetic drift.

Wright, Wilbur; and Wright, Orville (respectively b. April 16, 1867, near Millville, Ind., U.S.—d. May 30, 1912, Dayton, Ohio; b. Aug. 19, 1871, Dayton, Ohio, U.S.—d. Jan. 30, 1948, Dayton) U.S. inventors who achieved the first powered, sustained, and controlled airplane flight. The brothers first worked in printing-machinery design and later in bicycle manufacturing, which financed their early experiments in airplane design. To test flight control, essential to successful powered flight, they built and flew three biplane gliders (1900–02). Propeller and engine innovations led to their first powered airplane, which Orville flew successfully for 12 seconds and Wilbur later flew for 59 seconds at Kill Devil Hills, N.C. (near the village of Kitty Hawk), on Dec. 17, 1903. Their flyer of 1905 could turn, bank, circle, and remain airborne for over 35 minutes. They demonstrated their planes in Europe and the U.S.; in 1908 Wilbur gave over 100 exhibition flights in France, setting a duration record of 2 hours and 20 minutes. They established an aircraft company and produced planes for the U.S. Army. After Wilbur's death from typhoid, Orville sold his interest in the company, which later merged with the company of Glenn H. Curtiss.

Wriothesley, Thomas See 1st Earl of Southampton

writ In common law, an order issued in the name of a sovereign or court commanding a person to perform or refrain from performing a specified act. It was a vital official instrument in Old English law. A plaintiff would

© 2006 Encyclopædia Britannica, Inc.

commence a suit by choosing the proper form of action and obtaining a writ appropriate to the remedy sought; its issuance forced the defendant to comply or to appear in court. Writs were also constantly in use for financial and political purposes of government. Though the writ no longer governs civil pleading and has lost many of its applications, the extraordinary writs, especially of HABEAS CORPUS, mandamus (commanding the performance of a ministerial act), prohibition (commanding an inferior court to stay within its jurisdiction), and CERTIORARI, reflect its historical importance as an instrument of judicial authority.

writing System of human visual communication using signs or symbols associated by convention with units of LANGUAGE—meanings or sounds—and recorded on materials such as paper, stone, or clay. Its precursor was PICTOGRAPHY. Logography, in which symbols stand for individual words, typically develops from pictography. Logography requires thousands of symbols for all possible words and names. In phonographic systems, the symbol associated with a word also stands for similar- or identical-sounding words. Phonographic systems may evolve to the point where symbols represent syllables, constituting a syllabary. An ALPHABET provides symbols for all the consonants and vowels.

Writs of Assistance See Writs of ASSISTANCE

Wrocław \'vrôt-ˌswäf\ *German* **Breslau** City (pop., 2000 est.: 633,857), southwestern Poland. Located on the ODER RIVER, it originated in the 10th century at the crossroads of the trade route linking the Black Sea to western Europe. In 1138 it became the first capital of SILESIA. The Tartars destroyed Wrocław in 1241. Rebuilt, it passed to BOHEMIA with the rest of Silesia in 1335 and to the HABSBURGS in 1526. In 1741 it fell to Prussia under the rule of FREDERICK II (the Great), and it eventually became part of Germany. During World War II Wrocław was besieged (1945) by Soviet troops. The city was assigned to Poland by the POTSDAM CONFERENCE of 1945. Heavily damaged during the war, it was rebuilt and is now a major commercial city.

wrought iron One of the two forms in which IRON is obtained by SMELTING. Wrought iron is a soft, easily worked, fibrous metal. It usually contains less than 0.1% CARBON and 1–2% SLAG. It is superior for most purposes to CAST IRON, which is hard and brittle because of its higher carbon content. In antiquity, iron was smelted directly by heating ore in a forge with charcoal, which served both as fuel and reducing agent. While still hot, the iron-and-slag mixture was removed as a lump and worked (wrought) with a hammer to expel most of the slag and weld the iron into a coherent mass. Wrought iron began to take the place of bronze (being far more available) in Asia Minor in the 2nd millennium BC; its use for tools and weapons was established in China, India, and the Mediterranean by the 3rd century BC. Later, in Europe, wrought iron was produced indirectly from cast iron (see PUDDLING PROCESS). With the invention of the BESSEMER PROCESS and OPEN-HEARTH PROCESS, STEEL supplanted wrought iron for structural purposes, and its use in the 20th century has been principally decorative.

wu Fundamental Daoist philosophical concept. *Wu* ("not-being"), *you* ("being"), *wuming* ("the nameless"), and *youming* ("the named") are interdependent and grow out of one another. *Wu* and *you* are two aspects of the DAO. Not-being does not mean nothingness but rather the absence of perceptible qualities; in LAOZI's view, it is superior to being. It is the void that harbours in itself all potentialities and without which even being lacks its efficacy. According to the scholar He Yan (d. 249), *wu* is beyond name and form and hence is absolute, complete, and capable of accomplishing anything. See also DAOISM.

Wu Cheng'en *or* **Wu Ch'eng-en** \'wü-'chəŋ-'ən\ (b. c. 1500, Shanyang, Huaian, China—d. c. 1582, Huaian) Chinese novelist and poet. He received a traditional Confucian education and became known for his clever poetry and prose composition in the classical style. Interested in bizarre stories, he used oral and written folktales as the basis of the novel *Xiyouji* (*Journey to the West*, also partially translated as *Monkey*), published anonymously in 1592. It relates the comic mishaps and adventures of the 7th-century monk XUANZANG, who traveled to India looking for sacred texts, and his entourage of three animal spirits: a monkey, a pig, and a fish. It satirizes Chinese society and government and contains religious and philosophical elements drawn from Buddhism, Daoism, and Neo-Confucianism. Only two volumes of his other writings have survived.

Wu-lu-mu-ch'i See ÜRÜMQI

Wu Sangui *or* **Wu San-kuei** \'wü-'sän-'gwā\ (b. 1612, Liaodong, China—d. Oct. 2, 1678, Hengzhou, Hunan province) Chinese general who invited the MANCHU into China and helped them establish the QING DYNASTY. Though he had for many years battled the Manchu on China's northeastern frontier, he turned to them for aid when the MING-DYNASTY capital at Beijing fell to rebel leader LI ZICHENG. The Manchu forces defeated Li and then set up their own dynasty, in which Wu served many years. Only when he was put in charge of eliminating the remnants of Ming resistance in southwestern China did he break away, creating his own state in the area of Yunnan and Guizhou. Two other commanders had set up similar states in neighbouring southern provinces; in 1673 Wu led the three in rebellion. After Wu's death, his grandson continued the rebellion until 1681, when it was finally crushed. See also DORGON.

Wu-ti See WUDI

Wu Zetian See WUHOU

Wuchang \'wü-'chäŋ\ *or* **Wu-ch'ang** Industrial city (pop., 1999 est.: 227,856), part of the tri-city conurbation of WUHAN, Hubei province, central China. It is the oldest of the Wuhan cities, probably dating from the HAN DYNASTY. It was the capital of the kingdom of Wu in the 3rd century AD, as well as capital of an administrative district under the YUAN DYNASTY (1279–1368) and later capital of HUBEI province (until 1950). In 1911 it was the starting point of the revolution against the imperial regime. The Japanese occupied the city in 1938–45; the Chinese communists took it in 1949. It became part of Wuhan in 1950.

Wudi *or* **Wu-ti** \'wü-'dē\ *orig.* **Liu Che** (b. 156 BC—d. March 29, 87 BC) Emperor of the Chinese HAN DYNASTY who vastly increased its authority and its influence abroad and made CONFUCIANISM China's state religion. Under Wudi, China's armies drove back the nomadic XIONGNU tribes that plagued the northern border, incorporated southern China and northern and central Vietnam into the empire, and reconquered Korea. Their farthest expedition was to Fergana (in modern Uzbekistan). Wudi's military campaigns strained the state's reserves; seeking new income, he decreed new taxes and established state monopolies on salt, iron, and wine.

Wuhan \'wü-'hän\ *or* **Wu-han** City (pop., 1999 est.: 3,911,824), capital of HUBEI province, east-central China. It is located at the confluence of the HAN and YANGTZE (Chang) rivers and is a conurbation of three cities that merged in 1950: Hankou, on the north bank of the Yangtze; Hanyang, across the Han; and WUCHANG, on the south bank of the Yangtze. The chief industrial and commercial centre of central China, it is a hub of maritime, river, rail, and road transportation. It serves as the collection and distribution point for the products of the middle Yangtze valley and for western and southwestern China. It has numerous industries, including iron- and steel-producing complexes. It is the seat of Wuhan University and the Central China Technical University.

Wuhou *or* **Wu-hou** \'wü-'hō\ *or* **Wu Zetian** \'wü-dzə-'tyan\ (b. 624, Wenshui, Shanxi province, China—d. Dec. 16, 705, Louyang) Empress of China during the TANG DYNASTY. She began her career as the concubine of the emperor TAIZONG but became the consort of his son. She eliminated her female rivals and became empress in 655. By 660, through dismissal, exile, and execution, she had eliminated those who opposed her. Because the emperor was sickly, Wuhou was able to rule in his name; after his death she ruled in the name of her sons, at last declaring herself ruler in her own name in 690. To support her reign, she claimed to be an incarnation of the bodhisattva MAITREYA. Though long vilified for her cruelty and her methods of maintaining power, she supported the development of a scholarly bureaucracy to replace rule by aristocratic families, stabilized the dynasty, and unified the empire.

Wundt \'vůnt\, **Wilhelm** (b. Aug. 16, 1832, Neckarau, near Mannheim, Baden—d. Aug. 31, 1920, Grossbothen, Ger.) German physiologist and psychologist, the founder of EXPERIMENTAL PSYCHOLOGY. After earning a medical degree, he studied briefly with JOHANNES PETER MÜLLER and later assisted HERMANN VON HELMHOLTZ. At the University of Heidelberg in 1862, following publication of his *Contributions to the Theory of Sense Perception* (1858–62), he gave the first course in scientific psychology. In *Principles of Physiological Psychology* (1873–74) he claimed that psychology must be based directly on experience and that its proper method was that of controlled introspection. At the University of Leipzig (1875–1917), he established the first psychological laboratory (1879) and founded the first journal of psychology (1881). His later works include *Outline of Psychology* (1896) and *Ethnic Psychology* (10 vol., 1900–20).

Wupatki \wů-'pat-kē\ **National Monument** National monument, north-central Arizona, U.S. Situated along the Little Colorado River, the

© 2006 Encyclopædia Britannica, Inc.

monument was established in 1924 and comprises more than 800 red sandstone pueblos built during the 11th–13th centuries. It has an area of 55 sq mi (142 sq km).

Wuppertal \'vù-pər-ˌtäl\ City (pop, 2002 est.: 364,784), northwestern Germany. Located on the Wupper River, it was formed as Barmen-Elberfeld in 1929 through the amalgamation of the towns of Barmen, Elberfeld, Beyenburg, Cronenberg, Ronsdorf, and Vohwinkel. Its name was changed to Wuppertal in 1930. The region was noted for its textile production as early as the 16th century, and the modern city remains a textile-manufacturing centre. Other industrial products include chemicals, rubber, and machinery. Wuppertal has numerous parks and public gardens and a well-known zoo.

Wurlitzer, (Franz) Rudolph (b. Jan. 30, 1831, Schöneck, Saxony—d. Jan. 14, 1914, Cincinnati, Ohio, U.S.) German-born U.S. musical instrument manufacturer. He immigrated to the U.S. in 1853 and with his brother founded the Wurlitzer Co. in 1872. His son Howard (1871–1928) introduced the innovation of automatic instruments, which led to the firm's production of self-playing ORGANS, electronically controlled organs, and finally the organs it is best known for, in which vibrating reeds rather than pipes produce the sound.

Württemberg \'vær-təm-ˌberk,\ *English* \'wür-təm-ˌbərg\ Former state, Germany. Its territory approximated the central and eastern areas of the present-day German state of Baden-Württemberg. The capital was STUTTGART. Originally inhabited by Celts, Württemberg was occupied successively by Suevi, Romans, Alemanni, and Franks. In the Middle Ages it was part of SWABIA. Württemberg became an electorate in 1803 and a kingdom in 1806. A constitutional monarchy (1819–1918), it became an independent republic in 1918 but joined the WEIMAR REPUBLIC in 1919. Württemberg came under the control of the Third Reich in 1934. During World War II the Allies overran it (1945). It was made part of Baden-Württemberg in 1952.

Wuwang *or* **Wu-wang** \'wü-'wäŋ\ (fl. 11th century BC, China) Founder and first ruler of the ZHOU DYNASTY. After establishing the Zhou dynasty, Wuwang, assisted by his brother, ZHOUGONG, consolidated his rule by establishing a feudalistic form of government in which territory was bestowed on relatives and vassals willing to acknowledge Zhou suzerainty. He was regarded by later Confucians as a wise king.

Wyandot *or* **Huron** North American Indian people living in Lorette, north of Quebec city, Que., and in southwestern Ontario, Can.; and in Kansas and Oklahoma, U.S. Their language is of the IROQUOIAN family. At first contact, the people who mostly call themselves Wyandot lived in Ouendake (Huronia), between Georgian Bay and Lake Simcoe. Their villages, sometimes palisaded, consisted of large, bark-covered dwellings that housed several families related through maternal descent. Crops included corn, beans, squash, sunflowers, and tobacco. Hunting and fishing were of lesser importance. Villages were divided into CLANS, the chiefs of which formed councils. Women were influential in clan affairs, and clan matrons had the responsibility of selecting political leaders. The Wyandot were bitter enemies of tribes of the IROQUOIS CONFEDERACY, with whom they competed in the fur trade. Iroquois invasions in 1648–50 devastated the tribe, forcing a remnant westward. Today the Wyandot, or Wyandotte, as they are known in the U.S. number about 6,800 in the U.S. and Canada.

Wyat, Thomas *or* **Thomas Wyatt** *later* **Sir Thomas** (b. 1503, Allington, near Maidstone, Kent, Eng.—d. Oct. 6, 1542, Sherborne, Dorset) English poet. A member of the court circle of Henry VIII, he was apparently admired for his skill in music, languages, and arms. He served a number of diplomatic missions, but his reputation rests on his poetic achievements, especially his introduction into English literature of the Italian SONNET and TERZA RIMA verse form and the French RONDEAU. His works, unusual for their time in carrying a strong sense of individuality, include *Certayne Psalmes …drawen into Englyshe meter* (1549), three satires, and songs.

Wyatt, John (b. April 1700, Lichfield, Staffordshire, Eng.—d. Nov. 29, 1766, Birmingham, Warwickshire) British mechanic who contributed to the development of power spinning. He began his career as a carpenter, but by 1730, with financial support from LEWIS PAUL, he was working on machines for boring metal and making files. The spinning machine (see DRAWING FRAME), first patented in 1738, was almost certainly Paul's idea, with Wyatt providing technical skill; its principle was to draw the fibres through sets of rollers turning at different speeds. It was superseded by RICHARD ARKWRIGHT'S WATER FRAME in the 1770s.

Wycherley \'wi-chər-lē**, William** (b. 1640, Clive, near Shrewsbury, Shropshire, Eng.—d. Jan. 1, 1716, London) English dramatist. After attending Oxford and studying law, Wycherley became a man-about-town with an interest in theatre. Within the framework of the comedy of manners, he attempted to reconcile a deep-seated puritanism with his ardent physical nature. *Love in a Wood* (1671) first won him favour in the Restoration court, and *The Plain-Dealer* (1676) satirized rapacious greed. In *The Country-Wife* (1675), perhaps his best work, a satirical comment on excessive jealousy and complacency is blended with a richly comic and bawdy presentation. He eventually lost favour at court and spent seven years in debtor's prison until he was rescued by JAMES II.

Wycliffe \'wi-ˌklif**, John** (c. 1330–1384) British theologian, philosopher, and church reformer. He earned a doctor-of-divinity degree from Oxford in 1372. Named by EDWARD III to a deputation to discuss English differences with the papacy, he represented the government in its attempts to limit the church's power in England. His preaching against church policies, in which he argued that the church itself was sinful and should relinquish its possessions and return to evangelical poverty, attracted wide attention, and in 1377 the pope called for his arrest. In 1379 he began systematically attacking the foundations of Roman Catholicism, notably by repudiating the doctrine of transubstantiation and by denying that the church hierarchy represented a line of authoritative succession from Jesus. In 1380 he became involved in a translation of the Bible into English, seeking to bypass the church in making the law of God accessible to all literate people. His followers were known as LOLLARDS. He was blamed by his ecclesiastical superiors for inciting the PEASANTS' REVOLT (1381); many of his works were subsequently banned. His writings later inspired the leaders of the REFORMATION, most notably MARTIN LUTHER.

Wye, River River, eastern Wales and western England. It flows from the moorlands of central Wales southeast across the English border and continues south into the estuary of the River SEVERN. It is about 130 mi (210 km) long. The ruins of Tintern Abbey (the inspiration for WILLIAM WORDSWORTH's poem) are on its banks. It has rich salmon fisheries.

Wyeth \'wī-əth**, Andrew (Newell)** (b. July 12, 1917, Chadds Ford, Pa., U.S.) U.S. painter. He was trained by his father, N.C. WYETH. His subject matter comes almost entirely from the area around Chadds Ford and around his summer home in Cushing, Maine. Though his technique is precise and detailed, he uses it to achieve an unreal, visionary quality. His palette is restricted largely to earth colours. His famous *Christina's World* (1948), depicting a polio victim seemingly trying to climb a hill, exemplifies his mastery of unusual angles and his use of light to pinpoint time. Between 1971 and 1985 Wyeth secretly painted Helga Testorf, his neighbour in Chadds Ford, creating hundreds of images of her, including nudes. He was the first painter ever awarded the Presidential Medal of Freedom (1963) and the first artist to receive the Congressional Gold Medal (1990). His son Jamie (b. 1946) has also had a successful painting career.

Christina's World, tempera on gesso panel by Andrew Wyeth, 1948; in the Museum of Modern Art, New York City.

Wyeth, N(ewell) C(onvers) (b. Oct. 22, 1882, Needham, Mass., U.S.—d. Oct. 19, 1945, Chadds Ford, Pa.) U.S. illustrator and muralist. Raised on a farm, he learned drafting and illustration in Boston before studying with the master illustrator Howard Pyle (1853–1911). He first found success in depicting the American West. During his career he contributed his memorable illustrations to more than 100 books, including a famous series of children's classics, including *Treasure Island*, *Kidnapped*, *King Arthur*, *Robin Hood*, and *The Black Arrow*, and he also produced numerous murals in public buildings. He was the teacher of his son, the painter Andrew Wyeth.

Wyler, William (b. July 1, 1902, Mulhouse, France—d. July 27, 1981, Beverly Hills, Calif., U.S.) French-born U.S. film director. After studies in France and Switzerland, he immigrated to New York in 1920. Working for Universal Pictures, he became a director of low-budget westerns, but he established a serious reputation with *Counsellor-at-Law* (1933) and went on to direct successes such as *Dodsworth* (1936), *Wuthering Heights* (1939), and *The Little Foxes* (1941). His films are noted for their clear narrative style and sensitive handling of human relationships. He won Academy Awards for *Mrs. Miniver* (1942) and *The Best Years of Our Lives* (1946), and he later directed popular movies such as *Roman Holiday* (1953), *Ben-Hur* (1959, Academy Award), and *Funny Girl* (1968).

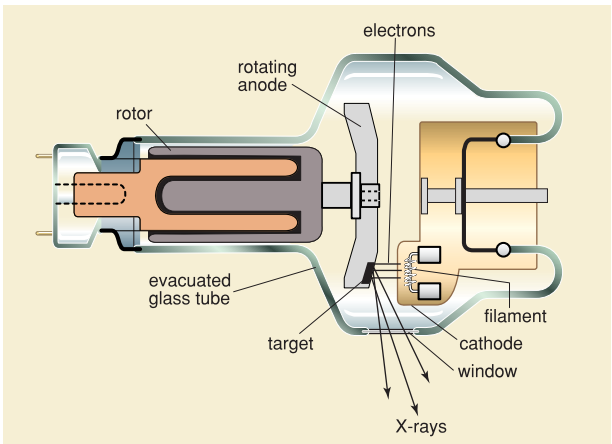
Wynette \wī-'net**, Tammy** *orig.* **Virginia Wynette Pugh** (b. May 5, 1942, Itawamba county, Miss., U.S.—d. April 6, 1998, Nashville, Tenn.) U.S. country music singer. Her father, a musician, died when she was an infant, and her mother left her to be raised by grandparents. She worked as a beautician before appearing on Porter Wagoner's country music television show. In 1967–68 she had hits with "Your Good Girl's Gonna Go Bad," "D-I-V-O-R-C-E," and her anthem, "Stand by Your Man." She was married to George Jones (1969–75), with whom she recorded many duet hits; despite their divorce, they continued to collaborate on recordings, including her last album, *One* (1996). She recorded 20 number-one country hits and 50 albums.

Wyoming State (pop., 2000: 493,782), western U.S. It covers an area of 97,813 sq mi (253,334 sq km); its capital is Cheyenne. Wyoming is bordered on the north and northwest by Montana, on the east by South Dakota and Nebraska, on the south by Colorado, on the southwest by Utah, and on the west by Idaho. It contains part of the Great Plains and the Black Hills. Its ranges of the Rocky Mountains include the Bighorn, Tetons, and Wind River. Wyoming's highest point is Gannett Peak, at 13,804 ft (4,207 m). The Continental Divide crosses the state northwest to southeast. About three-fourths of its rivers drain eastward into the Missouri-Mississippi system. Its largest lake is Yellowstone Lake. Wyoming was already inhabited by Plains Indians, including the Shoshone, when it was first visited by European explorers during the 18th century. The Oregon and Overland trails crossed it. Most of the area was acquired by the U.S. from France in the Louisiana Purchase. The Lewis and Clark Expedition did not cross the area, but a member of the group, John Colter, strayed from the expedition and spent time in Wyoming. It was included in several U.S. territories before the organization of the Wyoming Territory in 1868. It adopted woman suffrage in 1869 and in 1889 was the first state to include that right in its constitution. In the years preceding statehood, it developed a thriving cattle industry. It was admitted to the Union in 1890 as the 44th state. In 1924 it elected the first U.S. woman governor, Nellie Tayloe Ross. Though livestock is still important to its modern economy, mining is increasingly influential and tourism is growing.

Wyoming Massacre (July 3, 1778) Killing of American settlers by the British in the Wyoming Valley of Pennsylvania. In the American Revolution, British Col. John Butler led a force of 1,000 loyalists and Iroquois allies against 5,000 settlers in the valley, many of whom were gathered at Forty Fort. A band of men and boys left the fort to meet the attackers and was defeated; 360 settlers were killed, and others who escaped to the woods died of starvation. Butler's forces continued their raids on frontier settlements in New York, which led to American action against the Iroquois. See also Iroquois Confederacy.

Wyszyński \vi-'shin-skē**, Stefan** (b. Aug. 3, 1901, Zuzela, near Łomża, Pol., Russian Empire—d. May 28, 1981, Warsaw, Pol.) Polish cardinal and primate of Poland. Ordained in 1924, he was assigned to the basilica at Włocławek. He founded and directed the Christian Workers University (1935–39), then joined the Polish resistance in World War II. He was appointed successively bishop of Lublin (1946), primate of Poland (1948), and cardinal (1952). For refusing to consent to communist demands, he was placed under house arrest (1953–56). After his release, he reached a compromise on church and state matters with Władysław Gomułka that avoided a potential Soviet invasion of Poland, and he thereafter maintained the unity of the church in an uneasy coexistence with the communist government. He later lent cautious support to such Polish movements as the Workers' Defense Committee, Solidarity, and Rural Solidarity, which sought greater freedom from the late 1970s onward. A doctrinal conservative, his last major act was to negotiate with the Polish authorities over the visit of Pope John Paul II to Poland in 1979.

Wythe \'with**, George** (b. 1726, Elizabeth City county, Va.—d. June 8, 1806, Richmond, Va., U.S.) U.S. jurist and statesman. Admitted to the bar in 1746, he was a member (1754–55, 1758–68) and clerk (1769–75) of the Virginia House of Burgesses. He practiced law in Williamsburg, Va., where he taught Thomas Jefferson. At the College of William and Mary (1779–89) he became the first professor of law in the U.S.; among his pupils was John Marshall. A delegate to the Continental Congress, he signed the Declaration of Independence. In 1776 he was appointed, with Jefferson and two others, to revise the laws of Virginia. As a chancery judge (1778–1806), he asserted, in *Commonwealth* v. *Caton* (1782), the power of courts to refuse to enforce unconstitutional laws. He was a member of the Constitutional Convention (1787) and of the Virginia convention (1788) that ratified the Constitution of the United States.



© 2006 Encyclopædia Britannica, Inc.

X-ray Electromagnetic radiation of extremely short wavelength (100 nanometres to 0.001 nanometre) produced by the deceleration of charged particles or the transitions of electrons in atoms. X-rays travel at the speed of light and exhibit phenomena associated with waves, but experiments indicate that they can also behave like particles (see wave-particle duality). On the electromagnetic spectrum, they lie between gamma rays and ultraviolet radiation. They were discovered in 1895 by Wilhelm Conrad Röntgen, who named them X-rays for their unknown nature. They are used in medicine to diagnose bone fractures, dental cavities, and cancer; to locate foreign objects in the body; and to stop the spread of malignant tumours. In industry, they are used to analyze and detect flaws in structures. See illustration below.

X-ray astronomy Study of astronomical objects and phenomena that emit radiation at X-ray wavelengths. Because Earth's atmosphere absorbs most X-rays, X-ray telescopes and detectors are taken to high altitudes or into space by balloons and spacecraft. In 1949 detectors aboard sounding rockets showed that the Sun gives off X-rays, but it is a weak source; it took 30 more years to clearly detect X-rays from other ordinary stars. Beginning with the Uhuru X-ray satellite (launched 1970), a succession of space observatories carried increasingly sophisticated instruments into Earth orbit. Astronomers discovered that most types of stars emit X-rays but usually as a tiny fraction of their energy output. Supernova remnants are more powerful X-ray sources; the strongest sources known in the Milky Way Galaxy are certain binary stars in which one star is probably a black hole. In addition to myriad point sources, astronomers have found a diffuse background of X-ray radiation emanating from all directions; unlike cosmic background radiation, it appears to have many distant individual sources. The Chandra X-Ray Observatory and XMM-Newton X-ray satellite (both launched 1999) have made numerous discoveries relating to the nature and quantity of black holes in the universe, the evolution of stars and galaxies, and the composition and activity of supernova remnants.

X-ray diffraction Phenomenon in which the atoms of a crystal, by virtue of their uniform spacing, cause an interference pattern of the waves in an incident beam of X-rays. The crystal's atomic planes act on the X-rays in the same way a uniformly ruled grating acts on a beam of light (see polarization). The interference pattern is specific to each substance and gives information on the structure of the atoms or molecules in the crystal. See also William Henry Bragg.

Xanthus \'zan-thəs\ *or* **Xanthos** Ancient city of Lycia, Anatolia. Situated near the mouth of the Xanthus (modern Eşen Çayı) River in present-day southwestern Turkey, its ruins include a theatre, temples, and tombs. A number of pieces were taken for the British Museum. The ancient city was twice besieged and destroyed: in 540 BC by the Persians of the Achaemenian dynasty and in 42 BC by the Romans. The ruins were designated a UNESCO World Heritage site in 1988.

An X-ray tube. Electrons "boil" off the cathode when the filament is heated by a current. A high voltage between cathode and anode causes the electrons to accelerate toward the anode, which rotates to avoid overheating of the target. When the electrons strike the anode's target area, X-rays are emitted.

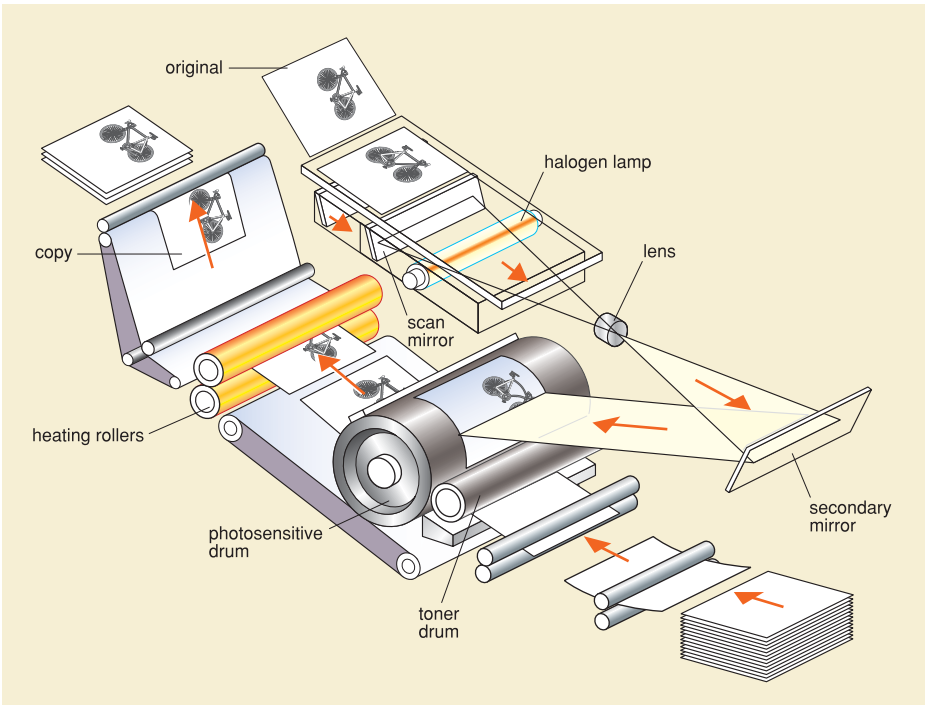
Xavier \'zā-vē-ər**, Saint Francis** (b. April 7, 1506, Xavier Castle, near Sangüesa, Navarre—d. Dec. 3, 1552, Sancian Island, China; canonized March 12, 1622; feast day December 3) Spanish-born French missionary to the Far East. Born into a noble Basque family, he was educated at the University of Paris, where he met Ignatius of Loyola and became one of the first seven members of the Jesuits. He was ordained in 1537, and in 1542 he embarked on a three-year mission to India. In 1545 he established missions in the Malay Archipelago, and in 1549 he traveled to Japan, where he was the first to introduce Christianity systematically. He returned to India in 1551 and died the following year while attempting to secure entrance to China. He is believed to have baptized about 30,000 converts; his success was partly due to adaptation to local cultures. In 1927 he was named patron of all missions.

Xenakis \zen-ä-'kēs,\ *English* \ze-'nä-kis**, Iannis** (b. May 29, 1922, Brăila, Rom.—d. Feb. 4, 2001, Paris, France) Romanian-born Greek-French composer. His Greek family returned to Greece in 1932, and he studied engineering. A wartime resistance fighter, he was forced to flee Greece in 1947 when he was denounced as a communist. He worked closely with the architect Le Corbusier (1947–59), while studying composition with Olivier Messiaen and others. Interested in expressing mathematical structures in music, he used the term "stochastic music" to refer to situations in which the number of elements precludes prediction of what each element will do but the overall behaviour of the group is determinate (see stochastic process). He often based his compositions on standard concepts of mathematics and physics, such as the Fibonacci sequence (*Metastasis*, 1954), the Boltzmann constant (*Pithoprakta*, 1956), and Markov chains (*Analogique A* and *Analogique B*, 1958–59).



Xenocrates \zi-'näk-rə-ˌtēz\ (d. 314 BC, Athens) Greek philosopher. A pupil of Plato, he succeeded Speusippus (d. 339/338 BC) as head of Plato's Academy. His writings are lost except for fragments, but his doctrines, as reported by Aristotle, appear to resemble those of Plato. He divided all of reality into three realms: the sensibles, or objects of sensation; the intelligibles, or objects of true knowledge, such as Plato's forms (see form); and the bodies of the heavens, which mediate between the sensibles and the intelligibles and are therefore objects of "opinion." A second threefold division separated gods, men, and "demons." He maintained that the origin of philosophy lies in mankind's desire to be happy, happiness being defined as the acquisition of the perfection that is peculiar and proper to mankind (see eudaemonism).

xenon \'zē-ˌnän\ Chemical element, chemical symbol Xe, atomic number 54. One of the noble gases, it is colourless, odourless, tasteless, and nearly inert, combining only with fluorine and oxygen and in complexes (see bonding). Xenon occurs in slight traces in Earth's atmosphere and in rocks. Obtained by fractional distillation of liquefied air, it is used in luminescent tubes (see electric discharge lamp), flash lamps, lasers, and tracer studies and as an anesthetic.

Xenophanes of Colophon \zi-'näf-ə-ˌnēz...'kä-lə-fən\ (b. c. 560, Colophon, Ionia—d. c. 478 BC) Greek poet, religious thinker, and reputed precursor of philosophy of the Eleatics. Though some critics consider Parmenides the founder of the Eleatic school, Xenophanes' philosophy, which found expression primarily in the poetry he recited on his travels, probably anticipated Parmenides' views. Fragments of his epics reflect his contempt for anthropomorphism and for popular acceptance of Homeric mythology.

Xenophon \'zen-ə-ˌfän\ (b. 431, Attica, Greece—d. shortly before 350 BC, Attica) Greek historian. Born of a well-to-do Athenian family, Xenophon was critical of extreme democracy and for a time was exiled as a traitor. He served with the Greek mercenaries of the Persian prince Cyrus, an experience on which he based his best-known work, the *Anabasis*. Its prose was highly regarded in antiquity and exerted a strong influence on Latin literature. His other works include *On Horsemanship*; *On Hunting*; *Cyropaedia*, a historical novel about Cyrus II; *Oeconomicus*, a treatise on estate management; and his completion of a work by the historian Thucydides.

© 2006 Encyclopædia Britannica, Inc.

Light shining on the item to be copied is reflected off a mirror, through a lens, and off a second mirror to form an image on a photosensitive (selenium-coated) drum. The drum's surface charge varies with the light and dark areas of the image. The toner drum delivers tiny black particles (toner) to the dark, charged areas of the image. The toner-based image is then transferred to paper rolled onto the drum, the negatively charged toner particles being attracted by a positive charge under the sheet, and the paper is heated to set the toner. The copy paper itself originally provided the treated surface, but the innovation of the selenium-coated drum permitted the use of ordinary paper. Light projection permits the printed image to be enlarged or reduced by any desired percentage.

© MERRIAM-WEBSTER INC.

xerography \zə-'rä-grə-fē\ Image-forming process that relies on a photoconductive substance whose electrical resistance decreases when light falls on it. Xerography is the basis of the most widely used document-copying machines (see PHOTOCOPIER). The process was invented in the 1930s by U.S. physicist Chester F. Carlson (1906–1968) and developed in the 1940s and '50s by XEROX CORP. (then called Haloid). Light passing through or reflected from a document reaches a selenium-coated drum surface onto which negatively charged particles of ink (toner) are sprayed, forming an image of the document on the drum. As a sheet of paper is passed close to the drum, a positive electric charge under the sheet attracts the negatively charged ink particles, transferring the image to the copy paper. Heat briefly applied fuses the ink particles to the paper. The first commercially successful xerographic copier was introduced in 1959.

Xerox Corp. Major U.S. corporation. It was founded as Haloid Co. in 1906 to make and sell photographic paper. It changed its name to Haloid Xerox Co. in 1958, and to Xerox Corp. in 1961. Xerox marketed the first xerographic, plain-paper copier in 1960 (see XEROGRAPHY), and the product was so successful that the company has had to wage a continuing campaign to prevent the trademark Xerox from becoming a generic term. In addition to copiers, Xerox sells scanners, FAX machines, printers, software, and servers for networked printing. Its headquarters are in Stamford, Conn.

Xerxes I \'zərk-ˌsēz\ *Persian* **Khshayarsha** (b. c. 519 BC—d. 465 BC, Persepolis) Persian king (486–465 BC) of the ACHAEMENIAN DYNASTY. The son of DARIUS I, he had been governor of Babylon before his succession. He ferociously suppressed rebellions in Egypt (484) and Babylonia (482). To avenge Darius's defeat by the Greeks at the Battle of MARATHON, he spent three years raising a massive army and navy. When a storm destroyed the bridges he had built to cross the Hellespont, he had them rebuilt and for seven days oversaw the crossing of his army, numbering 360,000 troops by modern estimates, supported by more than 700 ships. The Persians broke through at the Battle of THERMOPYLAE and pillaged Athens, but then lost their navy at the Battle of SALAMIS (480). Xerxes returned to Asia, leaving the army behind; it withdrew after its defeat at the Battle of PLATAEA (479). In Persia he began an extensive building campaign at PERSEPOLIS. Drawn unwittingly into palace intrigues, he killed his brother's family at the queen's demand. He was murdered by members of his court. His setback in Greece was regarded as the beginning of the decline of the Achaemenid dynasty. See photograph below.

Xhosa \'ǩō-sə\ People living primarily in East Cape province, South Africa. They form part of the southern NGUNI group of Bantu-speaking peoples. In the late 18th and early 19th centuries, the series of conflicts called the Kaffir ("Infidel") Wars engaged the Xhosa against the European settlers. Eventually the Xhosa were defeated and their territory annexed. Between 1959 and 1961 the Xhosa inhabited the nonindependent black states of TRANSKEI and CISKEI created by the white South African government. In the 1960s many Xhosa became migrant labourers. Today they number some 7.8 million. See photograph on opposite page.

Xi \'shē, 'shi\ **River** *Chinese* **Xi Jiang** *or* **Hsi Chiang** *English* **West River** River system, southern CHINA. Known as the Nanpan and then the Hongshui in its upper course, the Xi proper begins as it enters Guangdong province from eastern GUANGXI autonomous region. It flows east through Guangdong and then through the vast Pearl River delta before entering the South CHINA SEA west of HONG KONG near MACAU; the city of GUANGZHOU (Canton) is in its delta. It is about 1,200 mi (1,930 km) long, shorter than other important Chinese rivers, but its volume of flow is second only to that of the YANGTZE RIVER (Chang Jiang). It is the great commercial waterway of southern China, linking the delta cities with the interior.

Xi Xia *or* **Hsi Hsia** \'shē-shē-'ä\ Kingdom of TANGUT tribes that was established in the 11th century and flourished through the early 13th. Founded by Li Yuanhao, who named it after the ancient Chinese state of Xia, it existed in an uneasy truce with China's Southern SONG DYNASTY and the LIAO DYNASTY of the Inner Asian Khitan tribes until it was conquered by GENGHIS KHAN.

Xerxes I, detail of a bas-relief of the north courtyard in the treasury at Persepolis, late 6th–early 5th century BC; in the Archaeological Museum, Tehrān.

COURTESY OF THE ORIENTAL INSTITUTE, THE UNIVERSITY OF CHICAGO

Xia dynasty *or* **Hsia dynasty** \shē-'ä\ (c. 2070–c. 1600 BC) Quasi-legendary first dynasty of China, preceding the SHANG. In Chinese histories it is said to have been founded by Yu and to have had 17 rulers. Archaeological sites in Henan and Shanxi provinces in northeastern and eastern China have been tentatively identified with Xia culture. See also ERLITOU CULTURE.

Xia Gui *or* **Hsia Kuei** (fl. 1195–1224, Qiantang, Zhejiang province, China) Chinese master of landscape painting. Xia served in the Imperial Painting Academy, and most sources

© 2006 Encyclopædia Britannica, Inc.

Xhosa women dancing as they return to their village from the fields.
AUTHENTICATED NEWS INTERNATIONAL

agree that he followed the stylistic tradition of an earlier landscapist in the academy, Li Tang. Xia and his contemporary, Ma Yuan, were the most influential members of the academy, and a school of painting inspired by them came to be known as the Ma-Xia school. Most of Xia's surviving works are album leaves painted on silk. A typical work by him is exquisitely calculated and perfectly balanced, conveying with great precision a scene glimpsed through haze, sharply focused at a few points but obscured at others. Chinese writers spoke of his use of a "split brush" (i.e., the brush tip divided so as to make two or more strokes at once) in painting tree foliage and of his freehand drawing "without employing a ruler." While his influence was considerable, it was only in modern times that he came to be recognized as one of the leading masters of Chinese landscape painting and one of art's great interpreters of nature.

Xi'an \'shē-'än\ *or* **Hsi-an** *conventional* **Sian** City (pop., 2003 est.: 2,657,900), capital of Shaanxi province, east-central China. Located on the Wei River, the site served as the capital of several dynasties beginning in the 11th century BC. It became one of the most splendid cities of the ancient world during the Tang dynasty (AD 618–907) and was a thriving commercial centre. Marco Polo visited in the 13th century. It was an entry point in the 1920s for communist ideology from the Soviet Union. In 1936, after Nationalist leader Chiang Kai-shek had been kidnapped there (see Xi'an Incident), the communists and Nationalists formed a united front against Japanese invaders. It is the site of several educational institutions and numerous temples and pagodas. It became an important tourist destination after the discovery of the nearby tomb of Emperor Shihuangdi, with its army of 6,000 life-size terra-cotta warriors (designated a UNESCO World Heritage site in 1987).

Xi'an Incident *or* **Sian** \'shyan\ **Incident** (1936) Seizure of Nationalist leader Chiang Kai-shek by one of his generals, Chang Hsüeh-liang (Zhang Xueliang; 1898–2001), in order to persuade Chiang to postpone his war on the Chinese communists until the invading Japanese had been defeated. As a result of the incident, the Nationalists and communists formed an alliance that turned its attention to the Japanese in Manchuria. See also Manchukuo; People's Liberation Army.

Xiang \'shyäŋ\ **River** *or* **Hsiang River** *conventional* **Siang River** River, Hunan province, southeastern China. One of the principal tributaries of the Yangtze River (Chang Jiang), it flows 500 mi (800 km) from the mountains in northern Guangxi autonomous region, through Hunan province, into Dongting Lake, and then into the Yangtze. Large vessels from the Yangtze can reach as far as Changsha via the Xiang. The river has been a north-south trade route for centuries.

Xiang Yu *or* **Hsiang Yü** \shē-'äŋ-'yǖ\ (b. 232 BC, state of Chu, China—d. 202 BC, Anhui province) Chinese aristocratic general and cultural hero. He overthrew the Qin dynasty and tried to return China to a pre-Qin ruling system. His forces were overwhelmed by Liu Bang (Gaozu), founder of the Han dynasty, and Xiang Yu chose suicide over capture. His heroism has been glorified in Chinese stories and poetry.

xiao *or* **hsiao** \'shyau̇\ *Chinese* **"filial piety"** In Confucianism, the attitude of obedience, devotion, and care toward one's parents and other elders considered fundamental to moral conduct. Originally rooted in the hierarchical ideology of Chinese feudalism, it was raised to a moral precept by Confucius, who cited it as the basis of ren. It is seen as the basis not only of family harmony but of social and political stability.

Xibo See Wenwang

Xin See Wang Mang

Xingkai Hu See Lake Khanka

Xingu \'shēŋ-'gü\ **River** River, central and northern Brazil. Formed by several headstreams, it flows north through northeastern Mato Grosso state and central Pará state into the Amazon River near its mouth. Though approximately 1,300 mi (2,100 km) long, it is navigable for only about 125 mi (200 km) upstream from where it joins the Amazon; its central part is a series of rapids 400 mi (644 km) long. In the 1950s Xingu National Park was designated as a preserve for Brazil's Indians, including the Tchikao, who were threatened by extinction.

Xining \'shē-'niŋ\ *or* **Hsi-ning** City (pop., 1999 est.: 604,812), capital of Qinghai province, western China. Located in a valley of the Huang River, on what was traditionally the main trade route from northern China into Tibet, the region was a frontier county under the Han dynasty and again under the Sui and Tang. In 763 it was taken by Tibetans and called Qingtangcheng. It was recovered by the Song dynasty in 1104 and renamed Xining (meaning "peace in the west"). It became an important religious centre under the Tibetans, and Qinghai's largest lamasery was nearby. It was named provincial capital when Qinghai became an independent province in 1928. Its industries include leather processing plants and steelworks.

Xinjiang \'shin-'jyäŋ\ *or* **Hsin-chiang** *conventional* **Sinkiang** *in full* **Uygur Autonomous Region of Xinjiang** Autonomous region (pop., 2002 est.: 19,050,000), northwestern China. It is bordered by the Kashmir region, Afghanistan, Tajikistan, Kyrgyzstan, Kazakhstan, Russia, and Mongolia, Gansu and Qinghai provinces, and Tibet. China's largest political unit, it covers some 635,900 sq mi (1,646,900 sq km). The capital is Ürümqi. Inhabited since early times by nomad tribes, it is an area of rugged mountains and desert basins. The Silk Road traversed the region. It came under the control of local leaders with the fall of the Han dynasty in the 3rd century AD and was regained by China in the 7th century. It was successively subject to the Tibetans, Uighurs, and Arabs and was conquered by Genghis Khan in the 13th century. Again under Chinese rule during the Manchu dynasty, it was established as Xinjiang province c. 1884. It came under Chinese communist rule in 1949. It was reconstituted as an autonomous region in 1955. It has mineral resources, heavy industry (including iron and steel works), and some agricultural production.

Xiongnu *or* **Hsiung-nu** \shē-'u̇ŋ-'nü\ Nomadic pastoral people of Central Asia. The Xiongnu at the end of the 3rd century BC formed a great tribal league that dominated much of Central Asia for more than 500 years. Their threat to the northern Chinese frontier throughout this period led to China's eventual conquest of northern Korea and southern Manchuria during the Han dynasty. Excavation of Xiongnu graves has revealed remains of Chinese, Iranian, and Greek textiles, indicating a wide trade with distant peoples.

Xipe Totec \'shē-pā-'tō-tek, 'hē-pā-'tō-tek\ Pre-Columbian Mexican god of spring and of new vegetation; he is also the patron of precious metals. Originating with the Zapotec Indians, he was adopted by the Aztecs. A symbol of new vegetation, he is always depicted in art wearing a freshly flayed skin, representing the "new skin" that covers the earth in spring. In the second ritual month of the Aztec calendar, priests sacrificed human victims by removing their hearts or shooting them with arrows, flayed the bodies, and put on the skins, which were dyed yellow and called "golden clothes."

Xiuhtecuhtli \ˌshē-ü-'tā-kůt-lē\ Aztec god of fire and creator of all life. With Chantico, his feminine counterpart, he was believed to be a representation of Ometecuhtli. Xiuhtecuhtli's festivals coincided with the two extremes in the climatological cycle, the heat of August and the cold of January. He was also the centre of a ritual transfer of fire from temple to temple that occurred once every 52 years, at the end of the Aztec calendar cycle.

Xiwangmu \'shē-'wäŋ-'mü\ *or* **Hsi Wang-Mu** In ancient Chinese Daoist mythology, the queen of the female immortals. A former mountain spirit who had been transformed into a beautiful woman, she ruled a para-

© 2006 Encyclopædia Britannica, Inc.

dise called West Flower, while her husband, Mu Gong, guarded males in his East Flower paradise. Her garden contained rare flowers and the peach of immortality, which blooms once in 3,000 years.

XML *in full* **Extensible Markup Language.** MARKUP LANGUAGE developed to be a simplified and more structural version of SGML. It incorporates features of HTML (e.g., HYPERTEXT linking), but is designed to overcome some of HTML's limitations. For example, it is designed to be extensible (i.e., designed to allow the creation of customized markup tags), which HTML is not. It is also designed to represent data by meaning rather than by layout (as it is represented in HTML). Like SGML, it is a metalanguage (a language for dealing with languages); it allows users to create a language tailored specifically to their needs.

Xochicalco \ˌsō-chē-ˈkäl-kō\ Ancient TOLTEC city known for its impressive ruins and feathered-serpent pyramid. It is located on several hilltops near CUERNAVACA, Morelos state, Mex. Built mainly in the 8th–9th century, it became an important trading centre and religious centre, and it was turned into a defensive stronghold before the Spanish conquest (c. 1520). The main temple pyramid is known for its lower facing of intricately carved stones. The reliefs, which show a strong Mayan influence, portray plumed serpents, priests with elaborate headdresses, squatting warriors, calendar glyphs, and fire symbols.

Xu Beihong *or* **Hsü Pei-hung** (b. July 19, 1895, Yixing, Jiangsu province, China—d. Sept. 26, 1953, Beijing) Chinese artist and art educator. Xu became an itinerant professional painter in his early teens and an art teacher before reaching age 20. He first visited Shanghai in 1912, and over the next few years he studied Western-style painting. In 1918 Xu traveled to Beiping (now Beijing), where he was appointed a teacher at the Beiping University's Art Research Association. During this period Xu began to teach that only the realist approach from recent Western painting could revive Chinese painting. After studying in Paris and Berlin, Xu held a large-scale, one-person exhibition in Shanghai in 1926 that firmly established his fame as a modern Chinese master. He was best known for his history paintings, portraits, and pictures of horses, cats, and other animals, and he was competent both in Western media and in the traditional Chinese ink-and-wash method. His rigorous and stylish illustrations of horses were especially highly acclaimed by Chinese critics and connoisseurs and helped gain him an international reputation. In 1927 Xu returned permanently to China, where he continued to teach.

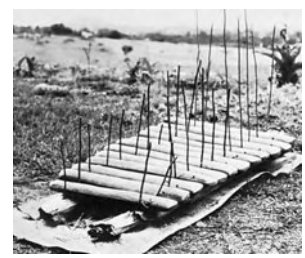
Xu Yue (b. c. 185, Donglai, China—d. c. 227, China) Chinese astronomer and mathematician. He wrote several books, of which only *Shushu jiyi* ("Memoir on the Methods of Numbering") is extant; some scholars question its authenticity. The treatise was used as an auxiliary mathematics textbook in the Tang (618–907) and Song (960–1279) state universities. Its first part provides three methods of assigning the powers of 10 up to $10^{4,096}$ to traditionally established terms for "large numbers" and alludes to a method of indefinite generation of even larger numbers. The second part contains descriptions of various devices for representing, if not actually manipulating, large numbers. Among them the book mentions a device resembling the ABACUS, which some scholars believe originated in China.

Xuanxue *or* **hsüan-hsüeh** \ˈshwän-ˈshwe\ *Chinese* **"Dark Learning"** Intellectual movement in China in the 3rd–4th century that arose during a period of disenchantment with CONFUCIANISM. Founded by Wang Bi (226–249), the movement drastically reinterpreted Confucian sources and incorporated aspects of DAOISM. Wang and his followers tried to determine whether the nature of ultimate reality was being or nothingness and sought to discover if the principle underlying a thing was universal or particular. The movement played an important role in the development of Chinese BUDDHISM.

Xuanzang *or* **Hsüan-tsang** \ˈshwän-ˈdzäŋ\ (b. 600, Guoshi, China—d. 664, Chang'an) Chinese Buddhist monk and pilgrim to India. He received a classical Confucian education before converting to Buddhism. Troubled by discrepancies in the sacred texts, he left for India in 629 to study the religion at its source. He traveled by foot across Central Asia and reached India in 633. After study at the famous Nalanda monastery, he returned home in 645 to a hero's welcome, bringing back hundreds of Buddhist texts, including some of the most important Mahayana scriptures, and spent the rest of his life translating. Influenced by the YOGACARA school, he established the Weishi ("Ideation Only") school of Buddhism, which won many followers in Japan as the Hossō school. The classic novel *Xiyou ji* was inspired by his life.

Xuanzong *or* **Hsüan-tsung** \ˈshüən-ˈdzùŋ\ *orig.* **Li Longji** (b. 685, Louyang, China—d. April 762, Chang'an) Sixth emperor (r. 712–756) of the TANG DYNASTY of China, which during his reign achieved its greatest prosperity and cultural brilliance. Xuanzong reformed the bureaucracy, increased tax revenues through reregistering the population, improved the transportation system, and established a permanent military force along China's northern frontiers. Toward the end of his reign, he withdrew increasingly from government and came under the influence of his consorts, including the notorious beauty Yang Guifei. The AN LUSHAN REBELLION of 755–756 forced him to flee the capital, CHANG'AN (modern Xi'an), and he abdicated in favour of the heir apparent.

Xunzi *or* **Hsün-tzu** \ˈshüən-ˈdzə̀\ (b. c. 300, Zhao kingdom, China—d. c. 230 BCE, Lanling, Chu kingdom) Chinese scholar and philosopher. He belonged to the academy of philosophy in the state of Qi before becoming magistrate of a district in Chu in 255. His major work, the *Xunzi*, taught that humanity is evil by nature and can become good only through rigorous training. This view provoked much controversy because it opposed the teachings of MENCIUS, who believed in innate human goodness. Xunzi's teachings were later eclipsed when the *Mencius* became a Confucian classic. Xunzi is regarded as one of the three great philosophers of the classical period of Confucianism in China.



XX, Les See Les VINGT

xylem \ˈzī-ləm\ Part of a plant's vascular system that conveys water and dissolved minerals from the roots to the rest of the plant and furnishes mechanical support. Xylem constitutes the major part of a mature woody stem or root and the wood of a tree, and consists of specialized water-conducting tissues made up mostly of several types of narrow, elongate, hollow cells. Xylem formation begins when the actively dividing cells of growing root and shoot tips give rise to primary xylem. Eventually the primary xylem is covered by secondary xylem produced by the CAMBIUM. The primary xylem cells die, forming a hard skeleton that supports the plant but loses its conducting function. Thus, only the outer part of the wood (secondary xylem) serves in water conduction.

J.M. LANGHAM

xylophone PERCUSSION INSTRUMENT consisting of a set of tuned wooden bars that are struck with mallets. Primitive xylophones may consist of logs of graded length laid across two supporting logs; a pit may be dug underneath to serve as a resonator. The xylophone has long been one of the principal instruments of African music; it is also important in the Indonesian GAMELAN. The MARIMBA is a Latin American xylophone. In the modern orchestral xylophone, the bars are laid out on a stand in keyboard arrangement, with vertical resonating tubes suspended under each bar. See also GLOCKENSPIEL; VIBRAPHONE.

African log *amadinda* xylophone; property of the Uganda Museum, Kampala
HILLEGEIST/KUBIK

XYZ Affair (1797–98) Diplomatic incident between the U.S. and France. Pres. JOHN ADAMS sent special envoys ELBRIDGE GERRY and JOHN MARSHALL to France to help CHARLES C. PINCKNEY negotiate an agreement to protect U.S. shipping from French privateers. Before the three could meet with CHARLES-MAURICE DE TALLEYRAND, they were approached by three of his agents—called X, Y, and Z in diplomatic correspondence to Adams—who suggested a bribe of $250,000 to Talleyrand and a loan of $10 million to France as preconditions for negotiations. Adams rejected the French demands and reported the mission had failed. When he was forced to reveal the correspondence, public outrage was followed by calls for war with France. The ALIEN AND SEDITION ACTS were passed to restrict potential French sympathizers. The Convention of 1800 ended a period of undeclared naval warfare between the U.S. and France.

Y2K bug *or* **Year 2000 bug** *or* **millennium bug** Potential problem in computers and computer networks at the beginning of the year 2000. Until the 1990s, most computer programs used only the last two digits to designate the year, the first two digits being fixed at 19. As the year 2000 approached, many programs had to be partly rewritten or replaced to prevent interpretation of "00" as 1900 rather than 2000. It was feared that such a misreading would lead to software and hardware failures in computers used in such important areas as banking, utilities systems, government records, and so on, with the potential for widespread chaos on and following Jan. 1, 2000. Up to $200 billion may have been spent (half in the U.S.) to upgrade computers and application programs to be Y2K-compliant. Despite international alarm, few major failures occurred, partly because these measures were effective and partly because the likely incidence of failure was exaggerated.

Ya-lung River See YALONG RIVER

yacht \'yät\ Sail- or motor-driven vessel used for racing or recreation. The term is popularly applied to large recreational engine-powered boats; the sailboats known as yachts and used for racing are usually light and comparatively small. Until the mid-19th century, yachts were designed along the lines of naval craft such as SCHOONERS and cutters. Yacht design was greatly affected by the 1851 success of the *America* in the race that established the AMERICA'S CUP. In the 20th century, notably after World War II, smaller racing and recreational craft became more common. See also SAILING.

yachting See SAILING

Yagoda \yə-'gō-də**, Genrikh (Grigoryevich)** (b. 1891, Łodz, Pol., Russian Empire—d. March 15, 1938, Moscow, Russia, U.S.S.R.) Soviet politician. A leader of the Cheka secret police (1920–24) and its successor, the OGPU (1924–34), and a close associate of JOSEPH STALIN, he organized the Soviet's forced-labour camps from 1930 and became a member of the Communist Party's Central Committee in 1934. As head of the Commissariat of Internal Affairs, or NKVD, he prepared the first of the PURGE TRIALS (1936). In 1937 he was replaced as police chief by NIKOLAY YEZHOV and himself became a victim of the widespread purges. Accused of being a member of a "Trotskyite" conspiracy intent on destroying the Soviet Union through sabotage, he was convicted, sentenced to death, and executed.

yahrzeit *or* **jahrzeit** \'yär-ˌtsīt\ In JUDAISM, the anniversary of the death of a parent or close relative, commonly observed by burning a candle for an entire day. On that day, the KADDISH is recited in the synagogue, and the TORAH is read. Some mark the anniversary by studying portions of the MISHNA, choosing those sections from the sixth division that begin with letters from the name of the deceased. Yahrzeit developed from an early Jewish custom of fasting on the anniversaries of deaths of certain leaders, and some Jews still fast on yahrzeit.

Yahweh See TETRAGRAMMATON

yak Massive OX (*Bos grunniens mutus*) of high Tibetan plateaus. Bulls grow to 6 ft (1.8 m) at the shoulder hump. The wild yak's hair is black and short, except for a long, shaggy fringe on the flanks and tail. The horns spread outward and upward; the head is held low. Wild females and young live in large herds; mature bulls form smaller groups. Yaks graze on grass and require much water, eating snow in winter. Wild yaks are now endangered. Domestic yaks, which breed freely with domestic cattle, are used as pack, draft, milk, and beef animals. The hide provides leather; the tail, fly whisks; the fringe hair, ropes; the dried dung, fuel.

Yak (*Bos grunniens*).
RUSS KINNE/PHOTO RESEARCHERS

Yakima \'ya-kə-ˌmȯ, 'ya-kə-mə\ **River** River, south-central Washington, U.S. Rising in the CASCADE RANGE, it flows southeast for about 200 mi (320 km) to join the COLUMBIA RIVER near Kennewick. The Yakima and its tributaries irrigate about 460,000 acres (190,000 hectares) in the river valley.

yakuza \'yä-kü-zə\ Japanese gangsters. Yakuza, who trace their roots back to RŌNIN (masterless samurai), often adopt samurai-like rituals and identify themselves with elaborate body tattoos. They traditionally engage in such organized-crime pursuits as extortion, blackmail, smuggling, prostitution, drugs, and gambling, and they control many restaurants, bars, trucking companies, and taxi fleets in Japanese cities. In the 1980s they also became involved in land speculation, fueling the "bubble economy" that burst by the end of the decade. From a high of more than 180,000 in the early 1960s, their membership has dropped to less than half that number. They are organized into some 2,000 gangs, most affiliated under the umbrella of one of a dozen or fewer conglomerate gangs. Yakuza gangs are rigidly hierarchical and follow strict codes of behaviour.

Yale University Private university in New Haven, Conn., a traditional member of the IVY LEAGUE. Founded in 1701, it is the third-oldest institution of higher learning in the U.S. Yale's initial curriculum emphasized classical studies and strict adherence to orthodox Puritanism. Medical, divinity, and law schools were added in 1810, 1822, and 1824. The geologist Benjamin Silliman (1779–1864), who taught at Yale from 1802 to 1853, did much to expand the experimental and applied sciences. Beginning in the mid 19th century, schools of architecture, art, drama, forestry, graduate studies, management, music, and nursing were organized. Yale's library, with more than 10 million volumes, is one of the largest in the U.S. Its extensive art galleries were established in 1832. The Peabody Museum of Natural History houses important collections of PALEONTOLOGY, ARCHAEOLOGY, and ethnology. Yale is one of the most highly regarded schools in the nation; its graduates have included several U.S. presidents.

Yalong \'yä-lůŋ\ **River** *or* **Ya-lung River** River, SICHUAN province, southern China. It rises in mountains at an elevation of nearly 16,500 ft (5,000 m) in QINGHAI province and flows into the YANGTZE RIVER (Chang Jiang) on the YUNNAN border. It is 822 mi (1,323 km) long. It is torrential for most of its course and is unnavigable.

Yalow \'ya-lō**, Rosalyn (Sussman)** *orig.* **Rosalyn Sussman** (b. July 19, 1921, New York, N.Y., U.S.) U.S. medical physicist. She received a Ph.D. in physics from the University of Illinois. She developed the technique of radioimmunoassay (RIA) by combining techniques from radioisotope tracing and immunology. RIA proved a very sensitive and simple way to measure tiny concentrations of biological substances or drugs in blood or other body fluids. She originally applied RIA to study blood insulin levels in diabetes mellitus (1959), but the method soon found hundreds of other applications. In 1976 she became the first woman awarded the Albert Lasker Prize, and in 1977 she shared a Nobel Prize with ANDREW V. SCHALLY and ROGER C.L. GUILLEMIN.

Yalta City (pop., 2001: 82,000), southern CRIMEA, Ukraine. It faces the BLACK SEA on the southern shore of the Crimean Peninsula. Settlement on the site dates from prehistoric times, but modern Yalta developed only in the early 19th century, becoming a town in 1838. Its mild winters and scenic location between sea and mountains have made it one of the most popular vacation and health resorts of Ukraine. In 1945 during World War II it was the site of the Allied leaders' YALTA CONFERENCE.

Yalta Conference (Feb. 4–11, 1945) Conference of Allied leaders at Yalta to plan Germany's defeat in World War II. FRANKLIN ROOSEVELT, WINSTON CHURCHILL, and JOSEPH STALIN discussed the postwar occupation of Germany, postwar assistance to the German people, German disarmament, war-crimes trials, the fate of the defeated or liberated states of eastern Europe, voting in the future UNITED NATIONS SECURITY COUNCIL, and German reparations. Stalin agreed to enter the war against Japan after the German surrender. Roosevelt died two months later, and Stalin broke his promise to allow democratic elections in eastern Europe. See also POTSDAM CONFERENCE; TEHRĀN CONFERENCE.

Yalu \'yä-lü\ **River** *Chinese* **Yalu Jiang** *or* **Ya-lü Chiang** *Korean* **Amnok** \'äm-ˌnək\ **-kang** River, eastern Asia, between northeastern China and North Korea. Some 491 mi (790 km) long, it rises on the northern border of North Korea, then flows to Korea Bay. It is an important source of hydroelectric power and is navigable by smaller vessels for most of its course. It became a political boundary in the 14th century. During the KOREAN WAR, as UN forces battled toward it in 1950, Chinese troops crossed it, in effect marking their entry into the war.

© 2006 Encyclopædia Britannica, Inc.

yam Any of several plant species of the genus *Dioscorea* (family Dioscoreaceae, or yam family), native to warmer regions of both hemispheres. A number of species are cultivated for food in the tropics; in certain tropical cultures, notably of West Africa and New Guinea, the yam is the primary agricultural commodity and the focal point of elaborate ritual. The edible tuberous roots, which vary in taste from sweet to bitter to tasteless, are eaten as cooked starchy vegetables. Often boiled and then mashed, they may also be fried, roasted, or baked. True yams are botanically distinct from the SWEET POTATO, though in the U.S. the names are commonly interchanged. *Dioscorea mexicana* contains a chemical that can suppress ovulation in humans and is used as the basis for birth-control pills. The so-called yam bean is the legume JICAMA.

Yama \'yə-mə\ In Indian mythology, the lord of death. The VEDAS describe him as the first man who died. The son of the sun god SURYA, he presides over the resting place of the dead. In the Vedas, he was a cheerful king of the departed ancestors, but in later mythology he became known as the just judge who punished the deceased for their sins.

Yamagata Aritomo \ˌyä-mə-'gä-tə-ˌär-ē-'tō-mō\ (b. Aug. 3, 1838, Hagi, Japan—d. Feb 1, 1922, Tokyo) First prime minister under Japan's parliamentary regime (1889–91, 1898–1900). As a SAMURAI youth in CHŌSHŪ province, Yamagata was among those who answered the foreign threat with the slogan "Sonnō jōi" ("Revere the emperor, expel the barbarians"). In 1864 Western gunboats bombarded the Chōshu coast, convincing him of the need for modern armaments. After participating in the MEIJI RESTORATION, he went abroad to research military institutions, returning to become commander of an imperial force of 10,000 troops. When he introduced conscription, bearing arms ceased to be the exclusive prerogative of a warrior class. His forces defeated SAIGŌ TAKAMORI's rebellion in 1877. In politics he was more conservative than his contemporary ITŌ HIROBUMI, favouring a strong executive. As prime minister, his policies were expansionist; Japan sent the largest of all foreign forces to China to quell the BOXER REBELLION. He increased the autonomy of the military and tried to suppress an incipient social-labour movement. After retirement, he continued to wield power as a GENRO (elder statesman). See also MEIJI CONSTITUTION; MEIJI PERIOD.

Yamal \yə-'mäl\ **Peninsula** Peninsula between the Kara Sea and the Gulf of Ob, northwestern SIBERIA, west-central Russia. It has a total length of 435 mi (700 km), a maximum width of 150 m (240 km), and an area of 47,100 sq mi (122,000 sq km). There are large natural gas deposits on its western coast.

Yamamoto Isoroku \ˌyä-mä-'mō-tō-ˌē-sō-'rō-kù\ (b. April 4, 1884, Nagaoka, Japan—d. April 18, 1943, Solomon Islands) Japanese naval officer. He fought in the Russo-Japanese War and thereafter rose to become commander in chief of Japan's Combined Fleet in 1941. When it was decided to go to war with the U.S., Yamamoto asserted that the only chance for a Japanese victory lay in a surprise attack that would cripple U.S. naval forces in the Pacific and conceived of the surprise attack on PEARL HARBOR. He then sought to destroy the remnants of the U.S. fleet, principally its aircraft carriers, but the Japanese lost the resulting Battle of MIDWAY in June 1942. His campaign in the Solomon Islands was also unsuccessful. He was killed when the U.S. (which had broken the Japanese communications codes) discovered his whereabouts and shot down his plane over Bougainville island.

Yamasee \'yä-mə-sē\ **War** (1715–16) Conflict between Indians and American colonists. Indian resentment of colonial settlers and traders in South Carolina led a group of Yamasee Indians to kill 90 whites in 1715. Other tribes soon joined the Yamasee in their raids on trading posts and plantations. Colonial military assistance from neighbouring colonies and war supplies from New England helped end the raids. Many defeated Indians escaped to Florida, where they joined runaway black slaves and other Indians to form what later became known as the Seminole tribe.

Yamato Takeru \yä-'mä-tō-tä-'ke-rü\ Japanese folk hero who may have lived in the 2nd century AD. The son of the 12th emperor, Keiko, he was responsible for expanding the territory of the Yamato court. In stories, he subdued two Kumaso warriors by disguising himself as a woman and killing them while they were drunk. With a miraculous sword he then cut away the burning grass fire set by the Ainu tribesmen and escaped. On the plains of Tagi, he became ill, changed into a white plover, and disappeared. His tomb at Ise is known as the Mausoleum of the White Plover.

Yamazaki Ansai \'yä-mä-ˌzä-kē-'än-ˌsī\ (b. Jan. 24, 1619, Kyōto, Japan—d. Oct. 16, 1682, Kyōto) Japanese exponent of the philosophy of the Chinese Neo-Confucianist ZHU XI. Early in life he was a Buddhist monk, but he gradually rejected Buddhism in favour of Confucianism, which he began to teach to thousands of students. He reduced NEO-CONFUCIANISM to a simple moral code, which he then blended with native Shintō religious doctrines. He equated Neo-Confucian principles and theories with Shintō legends and divinity, creating a philosophical system that took on greater authority than its sources possessed alone. His thought was one of the sources of the extreme nationalism and emperor worship that developed later in Japan.

Yamm \'yäm\ Ancient West Semitic deity who ruled the oceans, rivers, lakes, and underground springs. At the beginning of time, Yamm was awarded the divine kingship by EL, the head of the pantheon. One day, Yamm's messengers requested that the gods send BAAL to become Yamm's servant. Baal refused to go, and engaged Yamm in battle. After a furious fight, Yamm was slain and the kingship was given to Baal. Yamm may have been the same deity as Lotan (Hebrew: "Leviathan"), who was represented as a dragon or serpent.

Yamoussoukro \ˌyä-mü-'sü-krō\ Town (pop., 1995 est.: 110,000), capital designate of Côte d'Ivoire. From 1960 to 1993 it served as the country's "second capital" because it was the birthplace, home, and unofficial headquarters of Pres. FÉLIX HOUPHOUËT-BOIGNY. It was designated the official capital in 1983 and shares some of the functions of the former national capital, ABIDJAN. Fishing and forestry are important to its economy. It is the site of the basilica of Notre-Dame de la Paix, the world's largest Christian church, an almost exact replica of St. Peter's in Rome.

Yamuna \'yə-mə-nə\ **River** River, north-central India. Rising in the HIMALAYAS, it flows south and southeast 855 mi (1,376 km) into the GANGES RIVER at ALLAHABAD; their confluence is a sacred place to Hindus. The Yamuna's upper course forms a long section of the border between Uttar Pradesh and Haryana states.

Yancey, William Lowndes (b. Aug. 10, 1814, Warren county, Ga., U.S.—d. July 27, 1863, Montgomery, Ala.) U.S. politician. He was admitted to the bar and served as editor of the *Greenville Mountaineer*. During the nullification crisis, he took a firm Unionist stand. He served in the U.S. House of Representatives (1844–46), and in response to the WILMOT PROVISO he drafted the Alabama Platform (1848), which asserted slaveholders' rights to take their chattel with them to the new territories. He later added secession to the platform. He helped create the League of United Southerners (1858) and supported the Southern Democrats in their nomination of JOHN C. BRECKINRIDGE for president (1860). He drafted Alabama's secession ordinance and served in the Confederate government (1861–63).

Yang, Chen Ning *known as* **Frank Yang** (b. Sept. 22, 1922, Hofei, Anhwei, China) Chinese-born U.S. theoretical physicist. He immigrated to the U.S. in 1945 and studied with EDWARD TELLER at the University of Chicago. He showed that PARITY is violated when elementary particles decay. This and other work in PARTICLE PHYSICS earned him and Tsung-Dao Lee (b. 1926) a 1957 Nobel Prize. His research focused mostly on interactions involving the WEAK FORCE among ELEMENTARY PARTICLES. He also worked in STATISTICAL MECHANICS.

Yang Hui *literary name* **Qianguang** (fl. c. 1261–75, Qiantang, Zhejiang province, China) Mathematician active in the great flowering of Chinese mathematics during the Southern SONG DYNASTY. His books are among the few contemporary Chinese mathematics works to survive. A collected edition of his works (1378) was transmitted farther to the east, where it was particularly influential. In Korea it was reprinted during the reign of SEJONG in 1433, and it was copied again by the Japanese mathematician SEKI TAKAKAZU.

yangban \'yäŋ-ˌban\ *Korean* **"two groups"** Highest social class of the Korean CHOSŎN dynasty (1392–1910). It consisted of both *munban* (civilian officials) and *muban* (military officials). Though the term originated in the KORYŎ dynasty (935–1392), it was only later applied to the highest of four social classes. The *yangban* were granted land and stipends and were the only social class permitted to take the civil service examinations. The *yangban* system was discarded in 1894.

Yangdi *or* **Yang-ti** \'yäŋ-'dē\ *orig.* **Yang Guang** (b. 569, China—d. 618, Jiangdu, Jiangsu province) Second ruler of the Chinese SUI DYNASTY. Under Yangdi, canals were built and great palaces erected. In 608 he built a great canal linking the rice-producing areas in the south with the densely populated north, and he extended this system in 610, contributing to what

© 2006 Encyclopædia Britannica, Inc.

was to become the Grand Canal network. He embarked on military campaigns in Vietnam and Inner Asia. Three expeditions to Korea were so disastrous that the Chinese people turned against him; he was assassinated in southern China. One of his former officials reunited the empire and established the Tang dynasty. See also Wendi.

Yangôn \ˌyäŋ-ˈgōn\ *formerly* **Rangoon** City (pop., 2004 est.: 4,455,500), principal port, and capital of Myanmar (Burma), on the Yangôn River. It was a fishing village until the present city was founded in the mid-1750s by King Alaungpaya; he developed it as a port. The British occupied it 1824–26 during the First Anglo-Burmese War and again took it in 1852 during the Second Anglo-Burmese War. After the British annexation of all of Burma in 1886, Rangoon became the capital city. During World War II the Japanese advanced on and occupied the city, and it suffered considerable damage. It handles more than four-fifths of Myanmar's foreign commerce. In 2005 Myanmar government offices began to be moved to a new administrative centre at Pyinmana, some 200 mi (320 km) north of Yangôn.

Yangshao culture \ˈyäŋ-ˈshaù\ (5000–3000 BC) Prehistoric culture of China's Huang He (Yellow River) basin, represented by several sites at which painted pottery has been uncovered. In Yangshao culture, millet was cultivated, some animals were domesticated, chipped and polished stone tools were used, silk was produced, and pottery was fired in kilns dug into the ground. See also Banpo.

Yangtze Gorges Dam Project See Three Gorges Dam Project

Yangtze \ˈyäŋ-ˈtsə̄\ **River** *Chinese* **Chang** \ˈchäŋ\ **Jiang** *or* **Ch'ang Chiang** River, China. Rising in the Tanggula Mountains in west-central China, it flows southeast before turning northeast and then generally east across south-central and east-central China to the East China Sea near Shanghai. It is known as the Jinsha in its upper course. It is the world's third longest river, 3,915 mi (6,300 km) long. Its chief tributaries are the Yalong, Min, Jialing, Han, and Wu rivers. Several large cities, including Shanghai, Nanjing, Wuhan, and Chongqing, lie in the river's basin, which is known as the granary of China. Large ships can sail to Wuhan, and smaller vessels can reach Yichang; it becomes harder to navigate above Yichang because of the gorges that occur between Chongqing and Yichang. Work on the controversial Three Gorges Dam Project—first discussed in the 1920s and promoted in the 1950s by Mao Zedong—was inaugurated in 1994. Located west of Yichang, it will enable freighters to navigate 1,400 mi (2,250 km) inland from the East China Sea to Chongqing.

Yanofsky \ya-ˈnȯf-skē**, Charles** (b. April 17, 1925, New York, N.Y., U.S.) U.S. geneticist. He received his Ph.D. from Yale University. He was part of the research team that first demonstrated that certain mutant genes produce inactive proteins. Later, working with *E. coli*, he showed that the sequence of the nitrogenous bases that form part of the structure of the genetic material corresponds to the amino acid sequence of proteins. Investigating the biochemical actions of suppressor mutations (changes in a gene that reverse the visible effects of mutation in a second gene), he found that suppression restored the ability to form an active enzyme in a mutant that had previously produced an inactive protein.

Yanomami *or* **Yanomamö** South American Indians who live in the remote forest of the Orinoco River basin in southern Venezuela and the northern reaches of the Amazon River basin in Brazil. They are hunters and gatherers who also grow crops in gardens by practicing shifting cultivation. Their reputation as a fierce people perpetually at war has been challenged since the late 20th century. Because their survival was threatened by incursions of Brazilian miners, in 1991 the Brazilian government set aside an area of 36,000 sq mi (93,000 sq km) as a homeland.

Yao \ˈyaù\ Various Bantu-speaking peoples inhabiting southern Tanzania, northern Mozambique, and southern Malawi. In the colonial era the Yao were prominent as slave traders. They were never completely united but lived as small groups ruled by chiefs. By 1900 they had come under German, Portuguese, or British rule. Today numbering 2.2 million, the Yao practice shifting (slash-and-burn) horticulture. Most are Muslims.

Yao \ˈyaù\ In Chinese mythology, one of three legendary emperors, along with Shun and Dayu, of the golden age of antiquity (c. 24th century BC). All three were exalted by Confucius as models of virtue, righteousness, and unselfish devotion. See photograph opposite.

Yaoundé \yaùn-ˈdā\ City (pop., 2001 est.: urban agglom., 1,481,000), capital of Cameroon. It was founded in 1888 while Cameroon was a German protectorate. The area came under French control, and it was declared the capital of French Cameroun in 1922. In 1940–46 it was replaced as the capital by Douala, but, after Cameroon achieved independence in 1960, it again became the seat. It contains several small manufacturing and processing industries (sawmills and printing presses), and it is the area's agricultural market.

Yaqui \ˈyä-kē\ American Indian people living in southern Sonora state on the west coast of Mexico. They were settled agriculturalists who offered stubborn resistance to the first Spanish invaders and only gradually came under mission influence. In the 19th century they fought against Mexican encroachment on their fertile lands, and they were finally quelled with difficulty in 1887. Thousands were subsequently deported. In the 1930s much of their land was returned to them. Irrigation projects have led to a shift from subsistence agriculture to cash cropping (wheat, cotton, and crops for vegetable oil). They number about 25,000 in Mexico and more than 9,000 in Arizona.

Yarborough \ˈyär-ˌbər-ō**, Cale** *in full* **William Caleb Yarborough** (b. March 27, 1939, Timmonsville, S.C., U.S.) U.S. stock-car racer. He began racing stock cars in the early 1960s. He was the first to win the NASCAR championships for three consecutive years (1976–78). He also won the Daytona 500 three times (1968, 1977, 1983) and the Atlanta 500 four times (1967, 1968, 1974, 1981).

yard Unit of length equal to 36 inches, or 3 feet (see foot), in the U.S. Customary System or 0.9144 metre in the International System of Units. A cloth yard, used to measure cloth, is 37 in. long; it was also the standard length for arrows. In casual speech, a yard (e.g., of concrete, gravel, or topsoil) may refer to a cubic yard.

Yarmūk \yär-ˈmük\ **River** River, northwestern Jordan. It rises in southwestern Syria and flows southwest to its confluence with the Jordan River. For most of its total course of about 50 mi (80 km), it forms the boundary between Syria and Jordan. A major battle along the river between invading Muslim Arabs and Byzantine forces in 636 AD established Muslim dominance in Palestine. That dominance, broken only by the period of the Crusades (1099–1291), lasted until World War I (1914–18). Since the Six-Day War of 1967, the lower river valley has been under Israeli control.

yarn Continuous strand of fibres grouped or twisted together and used to construct textile fabrics. Yarns are made from both natural and synthetic fibres, in filament or staple form. Filament is very long fibre, including the natural fibre silk and the synthetic fibres. Most fibres that occur in nature are fairly short, or staple, and synthetic fibres may be cut into short, uniform lengths to form staple. Spinning is the process of drawing out and twisting a mass of cleaned, prepared fibres. Filament yarns generally require less twist than do staple yarns. More twist produces stronger yarn; low twist produces softer, shinier yarn. Two or more single strands may be twisted together to form ply yarn. Knitting yarns have less twist than weaving yarns. Thread, used for sewing, is a tightly twisted ply yarn.

Yaroslav \yə-rə-ˈslȧf\ *known as* **Yaroslav the Wise** (b. 980—d. Feb. 2, 1054) Grand prince of Kiev (1019–54). A son of Vladimir I, he defeated his brother Svyatopolk the Accursed to become ruler of Kiev. He consolidated the state through administrative reforms and military campaigns, codified laws, and promoted the spread of Christianity. He also built many fortifications and churches in the Byzantine style, including the Cathedral of St. Sophia. Yaroslav regained Galicia from the Poles and expanded Kievan possessions in the Baltic region, but his military campaign against Constantinople was a failure (1043).

Yao, imaginative portrait by an artist of the Ch'ien-lung period (1735–96); in the Metropolitan Museum of Art, New York City.

Yarqon \yär-ˈkōn\ **River** River, west-central Israel. It rises near Rosh Ha-Ayin and flows westward for about 16 mi (26 km) to the Mediterranean Sea near northern Tel Aviv-Jaffa. It marks the boundary between the Plain of Sharon and the coastal

W | X | Y | Z

© 2006 Encyclopædia Britannica, Inc.

lowlands. Since the construction and expansion of the Yarqon-Negev Project in the 1950s (see NEGEV), the water level has gone down, and pollution has increased. During World War I (1914–18), it was the site of several important British victories over the Ottoman Empire in the Allied Powers' conquest of Palestine.

yarrow \'yar-ō\ Any of about 80 species of perennial herbs that make up the genus *Achillea* in the COMPOSITE FAMILY, native mainly to the northern temperate zone. Some species are cultivated as garden ornamentals. They have toothed, often finely cut, sometimes aromatic leaves. Many small white, yellow, or pink flowers are often grouped into flat-topped clusters, which can be dried for winter bouquets.

Yarrow (*Achillea millefolium* variety *lanulosa*)
DENNIS E. ANDERSON

Yāsīn \yä-'sēn**, 'Abd al-Salām** (b. 1928) Moroccan religious leader. A former school inspector fluent in English and French, he began practicing Sufism in the 1960s. By the early 1970s he had adopted a more political view of Islam and was influenced by the writings of the Egyptian Islamists Ḥasan al-BANNĀ and Sayyid QUṬB. After sending a letter to the king of Morocco advocating the establishment of an Islamic state—a consistent theme in his work—he was confined to a mental institution (1974–77), and in 1986 he founded a movement, Charity and Justice. From 1989 he was under house arrest.

yaws *or* **frambesia** \fram-'bē-zhə\ Contagious tropical disease, caused by a variant of the SPIROCHETE that causes SYPHILIS. Yaws spreads mainly by discharge from skin sores, not sexual activity. It is common in children, who usually become immune. In the first stage, a skin sore starts as a wartlike thickening, cracks open, leaks fluid, and bleeds easily. A month or more later, multiple sores erupt. The third stage (much rarer than in syphilis) involves destruction of skin, mucous membranes, and bones. PENICILLIN cures early-stage yaws. Prevention requires isolation and prompt treatment and personal and group hygiene.

Yayoi \'yä-ˌyȯi\ **culture** (c. 250 BC–c. AD 250) Prehistoric culture of Japan subsequent to JŌMON CULTURE. It arose on the island of Kyushu and spread northeastward across Honshu. The Yayoi people mastered bronze and iron casting, wove hemp, and employed a Chinese method of wet-paddy rice cultivation. Yayoi pottery is unglazed; early examples have incised decorations, but pieces produced in the last stage of the period are often undecorated. Chinese-style bronze mirrors and coins indicate contact with HAN DYNASTY China.

Yazīd \yä-'zēd\ **I** (b. c. 645, Arabian Peninsula—d. 683, Damascus, Syria) Second caliph (680–683) of the UMAYYAD DYNASTY. He oversaw the events at the Battle of KARBALAʾ (680), which contributed to the eventual split of Islam into Sunnite and Shīʿite sects. He succeeded his father, MUĀʿWIYAH I, as caliph, keeping Muāʿwiyah's advisers and retaining most of his policies, while reforming the financial system, adjusting tax policy, and improving the irrigation system of the Damascus oasis. See also FITNAH; al-Ḥusayn ibn ʿAlī.

Yazīdī \'yä-zi-dē\ Middle Eastern religion, a syncretic combination of Zoroastrian, Manichaean, Jewish, Nestorian Christian, and Islamic elements. Its adherents, numbering fewer than 100,000, are found in Iraq, Turkey, Syria, Armenia, the Caucasus, and Iran. Most speak Kurdish. They believe that they were created separately from the rest of humankind and segregate themselves from the rest of society. In Yazīdī belief, seven angels, subordinate to a supreme but uninvolved God, rule the universe. The belief that God restored the Devil to his position as chief of the angels upon the Devil's repentance has earned the Yazīdī an undeserved reputation as Devil worshipers. Their chief saint is Sheikh ʿAdī, a 12th-century Muslim mystic. Their name derives from YAZĪD I (c. 645–683), from whose supporters they may be descended.

Yazoo land fraud \ya-'zü\ (1795–1814) Scheme to sell land in Georgia. After legislators were bribed to sell Georgia's western land claims around the Yazoo River to four land companies for $500,000, public anger forced a newly elected Georgia legislature to rescind the act (1796) and return the money. Much of the land had meanwhile been resold to third parties, who refused the money and maintained their claim to the property. The state ceded its claim to the U.S. in 1802. In 1810 the U.S. Supreme Court ruled that the 1796 rescinding law was an unconstitutional infringement on a contract. By 1814 the U.S. government assumed possession of the territory and awarded the claimants over $4 million.

Yazoo \ya-'zü\ **River** River, west-central Mississippi, U.S. Formed by the confluence of the TALLAHATCHIE and Yalobusha rivers north of Greenwood, Miss., it meanders 189 mi (304 km) south and southwest to join the MISSISSIPPI RIVER above Vicksburg. Its basin is protected from flooding by an extensive system of levees.

Yeager \'yā-gər**, Chuck** *orig.* **Charles Elwood Yeager** (b. Feb. 13, 1923, Myra, W.Va., U.S.) U.S. test pilot. He served as a fighter pilot in World War II and became a flight instructor and test pilot after the war. Chosen to test-fly the secret experimental X-1 aircraft, on Oct. 14, 1947, he became the first person to break the sound barrier in flight, which was approximately 662 mph (1,066 km/hr) at an altitude of 40,000 ft (12,000 m). A brash and colourful personality, he retired with the rank of brigadier general in 1975 and received the Presidential Medal of Freedom in 1985.

year Time required for the Earth to travel once around the Sun, slightly less than 365¼ days. This fractional number makes necessary the periodic adjustment of days in any calendar that is to be kept in step with the seasons. In the GREGORIAN CALENDAR, a common year contains 365 days, and every fourth year is a leap year of 366 days except for any year that is divisible by 100 but not divisible by 400 (e.g., 1900 was not a leap year).

Year 2000 bug See Y2K BUG

yeast Any of certain economically important and usually single-celled fungi (see FUNGUS), most of which are classified as ascomycetes. Found worldwide in soils and on plant surfaces, yeasts are especially abundant in sugary mediums such as flower nectar and fruits. The types commonly used in the production of bread, beer, and wine are selected strains of *Saccharomyces cerevisiae*; the small cakes and packets used contain billions of individual yeast cells, each of which can ferment approximately its own weight of glucose per hour. Dried yeast is 50% protein and is rich in B vitamins; brewer's yeast is sometimes taken as a vitamin supplement. Some yeasts are mild to dangerous pathogens of humans and other animals. *Candida albicans*, for example, irritates oral and vaginal linings, and *Histoplasma* and *Blastomyces* cause persistent lung infections.

Yeats \'yāts**, William Butler** (b. June 13, 1865, Sandymount, Dublin, Ire.—d. Jan. 28, 1939, Roquebrune-Cap-Martin, France) Irish poet, dramatist, and prose writer. The son of a well-known painter, Yeats early developed an interest in mysticism and visionary traditions as well as in Irish folklore, and both interests would continue to be sources of poetic imagery for him. His early volumes include the poetry volume *The Wanderings of Oisin* (1889) and the essay collection *The Celtic Twilight* (1893). In 1889 he fell in love with Maud Gonne, a brilliant, beautiful Irish patriot who inspired his involvement in Irish nationalism but did not reciprocate his feelings. With Lady AUGUSTA GREGORY and others, he founded the theatre that became the ABBEY THEATRE; throughout his life he would remain one of its directors. He contributed plays to its repertoire, including *The Countess Cathleen* (1899), *On Baile's Strand* (1905), and *Deirdre* (1907). His poetry changed decisively in the years 1909–14: the otherworldly, ecstatic atmosphere of the early lyrics cleared and his work gained in concreteness and complexity, often dealing with political themes, though his interest in mysticism and his passion for Maud Gonne continued unabated. With *Responsibilities* (1914) and *The Wild Swans at Coole* (1917) he began the period of his highest achievement. Some of his greatest verse appears in *The Tower* (1928), *The Winding Stair* (1929), and *Last Poems* (1939). The individual poems of the latter are largely held together by the system of symbolism he developed in *A Vision* (1925), which used astrological images to link individual psychology with the larger patterns of history. Yeats was a member of the Irish Senate (1922–28). He won the Nobel Prize for Literature in 1923, and he is regarded by some as the greatest English-language poet of the 20th century.

sia. An ironworks was established in 1721, and a fortress, named after Empress Catherine I, was founded there in 1722. It grew as the centre for all the ironworks of the Ural Mountains region, and its importance increased with the building of a highway (1783) and the Trans-Siberian Railroad. It achieved notoriety as the place where Tsar Nicholas II and his family were held prisoner and executed by the Bolsheviks in 1918. In 1924 it was renamed Sverdlovsk in honour of Yakov Sverdlov. The city reverted to its original name after the breakup of the U.S.S.R. in 1991. It is a major industrial centre, especially for heavy machinery.

Yelizavetpol See Gäncä

yellow bunting See yellowhammer

Yellow Emperor See Huangdi

yellow fever Acute infectious tropical disease, sometimes occurring in temperate zones. Abrupt onset of headache, backache, fever, nausea, and vomiting is followed by either recovery with immunity or by higher fever, slow pulse, and vomiting of blood. Patients may die in a week. Jaundice is common (hence the name). One of the world's great plagues for 300 years, it is caused by a virus transmitted by several species of mosquitoes. Carlos Finlay suggested and Walter Reed proved this means of spread, leading to near elimination of the disease through mosquito control (see William Gorgas). Treatment consists of supportive care, particularly fever reduction. Control of mosquitoes near cities and live-virus vaccines—developed by Max Theiler (1899–1972), who won a 1951 Nobel Prize for his work—have made yellow fever completely preventable.

yellow jacket Any of 35–40 species (genus *Dolichovespula* or *Vespula*) of social wasps, principally of the Northern Hemisphere, named for the black bands on its yellow abdomen. They differ from other wasps in having their wings folded longitudinally when at rest. *Dolichovespula* species typically build exposed nests. *Vespula* species build concealed nests underground or in protected cavities; when a nest is stepped on, the colony may erupt in an angry, stinging swarm. Nest size varies widely; some nests can be held in one hand, whereas nests in warmer climates may weigh half a ton.

yellow journalism In newspaper publishing, the use of lurid features and sensationalized news in newspaper publishing to attract readers and increase circulation. The phrase was coined in the 1890s to describe tactics employed in the furious competition between two New York papers, Joseph Pulitzer's *World* and William Randolph Hearst's *Journal*. When Hearst hired away from Pulitzer a cartoonist who had drawn the immensely popular comic strip "The Yellow Kid," another cartoonist was hired to draw the comic for the *World*; the rivalry excited so much attention that the competition was dubbed *yellow journalism*. Techniques of the period that became permanent features of U.S. journalism include banner headlines, coloured comics, and copious illustrations.

yellow poplar See tulip tree

Yellow River See Huang He

Yellow Sea *Chinese* **Huang Hai** \'hwäŋ-'hī\ Large inlet of the western North Pacific Ocean, between northeastern China and the Korean peninsula. Renowned for its fishing grounds, it connects with the East China Sea on the south; the Shandong Peninsula extends into it from the west. Two major arms of it are the Bo Hai (northwest) and Korea Bay (north). Excluding the Bo Hai, it has an area of about 161,000 sq mi (417,000 sq km) and a maximum depth of 338 ft (103 m). It derives its name from the colour of the silt-laden water discharged into it by major Chinese rivers, including the Liao and the Huang He (Yellow River), both of which flow into the Bo Hai. Leading port cities include Qingdao and Dalian in China, Inch'ŏn in South Korea, and Namp'o in North Korea.

Yellow Turbans Chinese secret society founded during a time of pestilence (2nd century AD). The rebels' yellow headdresses signified their association with the earth element, which they believed would succeed the (red) fire element that represented Han rule. The sect was Daoist in inspiration, like the contemporaneous Five Pecks of Rice sect. Its rebellion (AD 184–c. 204) against the tyrannical eunuchs who influenced the emperor contributed to the fall of the Han dynasty. See also Daoism.

yellowhammer *or* **yellow bunting** Songbird species (*Emberiza citrinella*, family Emberizidae) found from Britain to central Asia. The name is derived from the German *Ammer* ("bunting"). Yellowhammers are 6 in. (16 cm) long and have a streaked brown body, yellow-tinged head and breast, and a rapid song. In the southern U.S., the yellow-shafted flicker is called yellowhammer because of its drumming.

Yellowknife City (pop., 2001: 16,541), capital of Northwest Territories, Canada. Lying on the northwestern shore of the Great Slave Lake near the mouth of the Yellowknife River, the city was founded in 1935, one year after gold was discovered in the area. It took its name from the Yellowknife band of Athabascan Indians. Gold mining remains the chief economic activity. There are also reserves of diamonds in the region. The capital since 1967, it is the largest community and the chief administrative, commercial, and educational centre in the territories.

yellowlegs Either of two species (genus *Tringa*, family Scolopacidae) of shorebirds. They have trim, gray-brown and white streaked bodies; long bills; and long, bright yellow legs. Both species breed in Canada and winter in South America and eat small fish and other aquatic creatures. The lesser yellowlegs (*T. flavipes*), about 10 in. (25 cm) long, appears in sizable flocks on mudflats during migration; it has a flat call of one or two notes. Less common is the greater yellowlegs (*T. melanoleuca*), which is about 14 in. (35 cm) long and has a longer, stouter, slightly upturned bill; its call is a clear three-note whistle.

Lesser yellowlegs (*Tringa flavipes*)
MARY M. TREMAINE—ROOT RESOURCES

Yellowstone Lake Lake, Yellowstone National Park, northwestern Wyoming, U.S. It lies at 7,731 ft (2,356 m) above sea level, the largest body of water in North America at so high an altitude. It is fed and drained by the Yellowstone River. About 20 mi (32 km) long and 14 mi (23 km) wide, it has a maximum depth of 390 ft (119 m) and a surface area of 137 sq mi (354 sq km). It is a haven for rare species of waterbirds, including trumpeter swans, and is prized for trout fishing.

Yellowstone National Park National preserve in northwestern Wyoming, southern Montana, and eastern Idaho, U.S. The oldest national park in the U.S. (and in the world), it was established by the U.S. Congress in 1872; it covers 3,468 sq mi (8,983 sq km). The Gallatin, Absaroka, and Teton mountain ranges extend into it. Yellowstone has unusual geologic features, including fossil forests and eroded basaltic lava flows. It also has 10,000 hot springs, which erupt as steam vents, fumaroles, and geysers. Old Faithful, the park's most famous geyser, erupts every 33 to 120 minutes. There are many lakes and rivers, including Yellowstone Lake, Shoshone Lake, the Snake River, and the Yellowstone River. In 1988 an extensive series of forest fires temporarily laid waste to large areas of the park.

Yellowstone River River, northwestern Wyoming and southern and eastern Montana, U.S. The river rises in Wyoming. It enters Yellowstone National Park and feeds into Yellowstone Lake, below which it plunges 422 feet (129 m) in two spectacular waterfalls and enters the Grand Canyon of the Yellowstone River. It then continues north into Montana. There it flows northeast into the Missouri River on the Montana–North Dakota boundary. It is 692 mi (1,114 km) long and has been developed extensively for irrigation. Its principal tributaries are the Bighorn, Tongue, and Powder rivers. It was first explored in 1806 during the Lewis and Clark Expedition.

Yeltsin, Boris (Nikolayevich) (b. Feb. 1, 1931, Sverdlovsk, Russia, U.S.S.R.) Russian politician and president of Russia (1990–99). After attending the Urals Polytechnic Institute, he worked at construction projects in western Russia (1955–68). He became Communist Party leader in Sverdlovsk in 1976, and he was an ally of Mikhail Gorbachev. Gorbachev later charged Yeltsin with eliminating corruption in the Moscow party organization, and as first secretary (mayor) of Moscow (1985–87) he proved a determined reformer. His criticism of the slow pace of reform led to a break with Gorbachev, and Yeltsin lost his position. In 1989 he was elected to the new Soviet parliament by a landslide, then became president of the Russian Republic (1990) and resigned from the Communist Party. In 1991 he won the presidency again in the first popular election in Russian history. When communist hard-liners staged a coup against Gorbachev, Yeltsin successfully opposed it, facing down its leaders with a dramatic outdoor speech in Moscow. He led the establishment of the

© 2006 Encyclopædia Britannica, Inc.

Commonwealth of Independent States (1991) and began to transform Russia's economy into one based on free markets and private enterprise. Hardliners staged an unsuccessful coup against Yeltsin in 1993. When Chechnya unilaterally declared independence, Yeltsin sent troops to fight the rebels (1994). The Chechnya situation and Russia's deepening economic distress lessened his popularity, but he won reelection over a Communist Party challenger in 1996. After suffering a heart attack, he spent several months recovering. Continuing poor health led to his resignation on Dec. 31, 1999. He was succeeded by Vladimir Putin.

Boris Yeltsin, 1991.

Yelü Chucai *or* **Yeh-lü Ch'u-ts'ai** \'ye-'lü-'chüt-'sī\ (b. 1190—d. 1244) Chinese statesman of Khitan extraction, adviser to Genghis Khan and his son Ögödei. He established a formal bureaucracy and rationalized taxation system for the Mongol-controlled portions of China. By persuading Ögödei to spare the inhabitants of northern China in order to utilize their wealth and skills, Yelü gave the Mongols access to the Chinese weapons that later enabled them to conquer the Song dynasty. See also Mongol; Yuan dynasty.

Yemen \'ye-mən\ *officially* **Republic of Yemen** Country, Middle East, southwestern Asia. It occupies the southern tip of the Arabian Peninsula and also includes the island of Socotra in the Indian Ocean and the Kamaran island group in the Red Sea. Area: 214,300 sq mi (555,000 sq km). Population (2005 est.): 20,044,000. Capital: Sanaa. The population is mainly Arab. Language: Arabic (official). Religion: Islam (official; mostly Sunni). Currency: Yemeni rial. From the Gulf of Aden and the Red Sea, a narrow coastal plain leads to highlands that cover most of the country. The northern region extends into the southern and southwestern Rub' al-Khali desert. Mineral resources include iron ore, salt, petroleum, and natural gas, all of which are exploited. Agriculture is important; industries include petroleum and salt production. Yemen is a republic with two legislative houses; its head of state is the president, and the head of government is the prime minister. Tribal affiliations remain strong and directly affect local and national policy. Yemen was the home of ancient Minaean, Sabaean, and Ḥimyārite kingdoms. The Romans invaded the region in the 1st century AD. In the 6th century it was conquered by Ethiopians and Persians. Following the adoption of Islam in the 7th century, it was ruled nominally under a caliphate. The Egyptian Ayyūbid dynasty ruled there in the late 12th–early 13th century, after which the region passed to the Rasūlids. From c. 1520 through 1918 the Ottoman Empire maintained varying degrees of control, especially in the northwestern section. A boundary agreement was reached in 1934 between the northwestern territory (controlled by a local religious leader), which subsequently became the Yemen Arab Republic (North Yemen), and the southeastern British-controlled territory, which subsequently became the People's Democratic Republic of Yemen (South Yemen). Relations between the two Yemens remained tense and were marked by conflict throughout the 1970s and '80s. The two officially united as the Republic of Yemen in 1990. Its 1993 elections were the first free, multiparty general elections held in the Arabian Peninsula, and they were the first in which women participated. In 1994, after a two-month civil war, a new constitution was approved.

Yenişeri See Janissary

Yenisey \yi-ni-'sā\ **River** River, central Russia. One of the longest rivers in Asia, it rises in the borderland of south-central Russia and Mongolia and flows generally north along the edge of the West Siberian Plain to empty into the Kara Sea. Along its course it receives numerous tributaries, including the Angara River. Approximately 1,900 mi (3,000 km) of the river's 2,540-mi (4,090-km) course (calculated from the Great Yenisey River) are navigable.

yerba maté See maté

Yerevan *formerly* **Erivan** \,yer-ə-'vän\ City (pop., 2004 est.: 1,101,900), capital of Armenia. Fortified since the 8th century BC and part of Armenia since the 6th century BC, it developed as an important centre of the caravan trade. Over the centuries, its rulers have included the Romans, Arabs, Turks, and Russians; it fell to the latter in 1827. In 1920 it became the capital of independent Armenia and remained so during the period of Soviet rule and after independence was restored. Its industries include those producing chemicals, aluminum, automobiles, and electrical machinery.

Yermak Timofeyevich (d. Aug. 6, 1584/85, Siberia) Cossack leader. In 1579 he was enlisted by the merchant Stroganov family to defend its possessions against attacks by Siberian tribesmen. He set out with an expeditionary force of 840 Cossacks and reached the central Tatar khanate of Sibir in 1582. With their firearms, Yermak and his army defeated the numerically superior forces of Khan Kuchum and occupied the capital, Sibir. Though later killed in a revolt of Kuchum's forces, Yermak was considered the conqueror of Siberia and became a hero of Russian folklore.

Yerushalayim See Jerusalem

Yesenin \yi-'s^{y}en^{y}-in**, Sergey (Aleksandrovich)** *or* **Sergey Esenin** (b. Oct. 3, 1895, Konstantinovo, Ryazan province, Russia—d. Dec. 27, 1925, Leningrad) Russian poet. From a peasant family, he celebrated what he called "wooden Russia" (traditional culture) over modern, industrialized society in works beginning with *Radunitsa* (1916), and he believed the Revolution of 1917 would lead to the peasant millennium he envisioned. Taking up the life of a rowdy and blasphemous exhibitionist, he wrote cynical, swaggering tavern verse such as that contained in *Ispoved khuligana* (1921; "Confessions of a Hooligan"). In 1922 he married dancer Isadora Duncan, though neither could speak the other's language. His efforts to adjust to the revolutionary era were unsuccessful, and he hanged himself at age 30. Though frowned on by the authorities, he was very popular in Russia both during his life and afterward.

yeshiva \yə-'shē-və\ Academy of higher Talmudic learning. Through its biblical and legal exegesis and application of scripture, the yeshiva has defined and regulated Judaism for centuries. Traditionally, it is the setting for the training and ordination of rabbis. Following the destruction of the Second Temple of Jerusalem, a series of yeshivas were set up around the Levant to codify and explain centuries of Jewish scholarship. In medieval times, yeshivas flourished in Europe wherever there were large populations of Jews. The first yeshiva in the U.S., 'Etz Ḥayyim (1886), later became Yeshiva University (1945).

Yeshiva University Private university in New York City. It was established in 1886 as Yeshiva Eitz Chaim; in 1915 it merged with a Jewish

© 2006 Encyclopædia Britannica, Inc.

theological seminary. Today the university is independent, although its curriculum emphasizes Jewish culture and history. Yeshiva consists of a liberal arts college, a college for women, a college of Hebraic studies, and the Albert Einstein College of Medicine, as well as schools of Judaic studies, Talmudic studies, business, law (the Cardozo School), social work, education, and graduate studies, among others.

Yeti See Abominable Snowman

Yevtushenko \yif-tù-'shen-kə**, Yevgeny (Aleksandrovich)** (b. July 18, 1933, Zima, Irkutsk *oblast*, Russian S.F.S.R.) Russian poet. The descendant of Ukrainians exiled to Siberia, he grew up in Moscow and in the small town that is the setting of his first important narrative poem, *Zima Junction* (1956). He became the spokesman for the post-Stalin generation of Russian poets with his internationally publicized demands for greater artistic freedom, which signaled an easing of Soviet control over artists in the late 1950s and '60s. He revived brash, slangy language and traditions such as love lyrics and personal lyrics, frowned upon under Stalinism. His poem "Baby Yar" (1961) was an attack on lingering Soviet anti-Semitism; his most ambitious cycle of poems is *Bratsk Station* (1966). He became famous worldwide for his passionate recitations.

yew Any of about eight species of ornamental evergreens in the genus *Taxus*, family Taxaceae (the yew family), distributed throughout the Northern Hemisphere. Two species are always shrubby, but the others may reach heights of 77 ft (25 m). The plants have many branches, covered with needlelike leaves. Yew wood is hard, fine-grained, and heavy, with white or creamy sapwood and amber to brown heartwood. Once popular for cabinetwork, implements, and archery bows, it is used more today for articles either carved or turned on a lathe. Other trees called yew but not in this family are the plum-yew (family Cephalotaxaceae) and Prince Albert yew (family Podocarpaceae).

Yezhov \yi-'zhòf**, Nikolay (Ivanovich)** (b. 1895, St. Petersburg, Russia—d. after January 1939) Soviet secret-police chief. He joined the Communist Party in March 1917 and was a political commissar in the Red Army during the Russian Civil War. Thereafter he rose through political posts, and by 1927 he was a functionary for the Moscow party's central committee and a favourite of Joseph Stalin. He became a member of the party's Central Committee (1934) and succeeded Genrikh Yagoda as chief of the Soviet security police, or NKVD (1936). He instituted the most severe stage of the Great Purge (see purge trials), known as Yezhovshchina. By 1938 he had become the object of Stalin's suspicions and was replaced by Lavrenty Beria as head of the NKVD. He disappeared in 1939 and was probably executed.

Yggdrasill \'ig-drə-ˌsil\ In Norse mythology, the world tree. One of its roots extended into the underworld, another into the land of the giants, and the third into Asgard. At its base were three wells: the Well of Fate, from which the tree was watered by the Fates; the Roaring Kettle, in which dwelt Nidhogg, the monster that gnawed the tree's roots; and Mimir's Well, the source of wisdom, for whose water Odin sacrificed an eye. After the Ragnarok, Yggdrasill, though badly shaken, is to be the source of new life.

Yi dynasty See Choson dynasty

Yi Hwang \'ē-'hwäŋ\ (b. 1501—d. 1570) Korean religious leader, the foremost Korean Confucian. He helped shape the character of Korean Confucianism through his creative interpretation of Zhu Xi's teaching. His *To Become a Sage: The Ten Diagrams on Sage Learning*, an aid for educating the king, offered a depiction of all the major concepts in Song-dynasty learning. He elevated the level of Confucian dialogue to a new height of intellectual sophistication through his correspondence with Ki Taesung (1527–72). In their so-called four-seven debate, they discussed the relationship between Mencius's four basic human feelings (commiseration, shame, modesty, right versus wrong) and seven emotions.

Yi Song-gye \'yē-'sùŋ-'gye\ *or* **T'aejo** \'tī-'jō\ (b. 1335—d. 1408) Founder of the Korean Chosŏn dynasty (1392–1910). A military leader in the Koryŏ dynasty, he rose through the ranks by battling invading forces. He defeated his rivals and drove out the last king of the Koryŏ dynasty, taking the throne in 1392. He established his capital at Hanyang (now Seoul). He and his successors redistributed land, which had been concentrated in the hands of a few high-ranking bureaucrats, throughout the various levels of officialdom. In a break with the past, he made Neo-Confucianism the state religion, replacing Buddhism. Farming was made the centre of the economy. In foreign relations, he maintained a close relationship with China's Ming dynasty.

Yi Sun-shin \'yē-'sùn-'shin\ (b. April 28, 1545, Seoul, Korea—d. Dec. 16, 1598, off Noryang) Korean admiral and national hero. He worked on developing the *kŏbuksŏn* ("turtle ship"), thought to be the first ironclad battleship. As a result of Yi's preparations, his forces, unlike most of the Korean military, were ready to fight when the Japanese under Toyotomi Hideyoshi invaded in 1592. His sea victories effectively cut off the Japanese troops in Korea from their supplies. In 1597 he was falsely accused of disloyalty and demoted to the rank of common soldier. When the Japanese launched a second invasion and largely destroyed the Korean navy, Yi was reinstated and soon restored Korea's control of the seas. He was killed by a stray bullet as he pursued the retreating Japanese.

Yibin \'ē-'bin\ *or* **I-pin** *conventional* **Suchow** \'sü-'jō\ City (pop., 2003 est.: 312,462), southern Sichuan province, south-central China. It is located at the junction of the Min and Yangtze (Chang) rivers. A county administration was set up there in the 2nd century BC. It first received the name Yibin in AD 742. The Chinese hold expanded there during the Song dynasty (960–1279). By the Qing dynasty (1644–1911) it was Xuzhou (Hsü-chou) superior prefecture, known to Europeans as Suifu. In 1912 it reverted to Yibin. In 1913 steamship communication with Chongqing was opened, and Yibin grew into a major collection and distribution centre. It has long been known for its salt deposits, which now supply a large chemical plant.

Yichang \'ē-'chäŋ\ *or* **I-ch'ang** City (pop., 1999 est.: 481,277), western Hubei province, east-central China. An ancient city, it is located at the head of navigation on the Yangtze River (Chang Jiang), below the entrance to the gorges of the Daba Mountains. As the gateway to the rich province of Sichuan, it was often disputed during times of Chinese political turmoil. It was made a treaty port for foreign trade in 1877; a Western quarter grew beside it, and many Western commercial firms established branches there. It was occupied by the Japanese and badly damaged during World War II, but the city and its shipyards have been rebuilt. It is now an industrial centre and a distribution point for the region's manufactured goods.

Yiddish drama Productions of the professional Yiddish theatre. European Jewish drama originated in the Middle Ages, when dancers and jesters entertained at Purim celebrations. By the 16th century, these entertainments had become elaborate plays performed in Yiddish, the language of the majority of central and eastern European Jews. The professional Yiddish theatre dates from 1876, when Abraham Goldfaden (1840–1908) wrote a well-received musical sketch in Romania and organized a troupe to perform his songs and plays. In 1883 anti-Semitic laws in Russia that forbade Yiddish plays compelled many actors and playwrights to immigrate to England and the U.S. The playwright Jacob Gordin (1853–1909) brought new material and adaptations to the U.S. Yiddish theatre, including *The Jewish King Lear* (1892), starring Jacob P. Adler, founder of a family of Yiddish- and English-speaking actors. In 1918 Maurice Schwartz founded and directed the Yiddish Art Theatre, which trained actors such as Jacob Ben-Ami and Muni Weisenfreund (later known as Paul Muni). World War II destroyed most Yiddish culture in eastern Europe, and by the late 20th century only a few Yiddish theatres survived in New York City, London, Bucharest, and Warsaw.

Yiddish language Language of Ashkenazic Jews and their descendants (see Ashkenazi), written in the Hebrew alphabet. Yiddish developed from southeastern dialects of Middle High German carried into central and eastern Europe beginning in the 12th century; it has been strongly influenced by Hebrew and Aramaic, from which it draws 12–20% of its lexicon. The isolation of eastern European speakers from High German and their exposure to Slavic languages, particularly Polish and Ukrainian, led to a primary distinction between West and East Yiddish dialects. From the late 18th century most Jews remaining in central Europe gave up Yiddish in favour of German; it has now virtually died out. East Yiddish dialects differ markedly in realization of vowels; there are central, northeastern, and southeastern dialects. A flourishing literary language in the 19th and early 20th century, Yiddish declined dramatically due to suppression, massive migration, assimilation, and Nazi genocide. The language nevertheless continues to flourish among the ultra-Orthodox Hasidim in numerous countries and among secular students of Yiddish at leading universities, including Columbia University (New York), Hebrew University (Jerusalem), McGill University (Montreal), the University of Oxford, and the University of Paris. Yiddish is spoken by three million people worldwide.

Yijing *or* **I Ching** \'ē-'jiŋ\ *Chinese* **"Book of Changes"** Ancient Chinese text, one of the Five Classics of Confucianism. The main body of the work, traditionally attributed to Wenwang, contains a discussion of the divinatory system used by wizards in the Zhou dynasty. A supplementary section of "commentaries," believed to date from the Warring States period (475–221 BC), is a philosophical exposition that attempts to explain the world and its ethical principles. The book's cosmology, which involves humans and nature in a single system, has made it universally popular.

Yima \ya-'mä, 'yē-mə\ In ancient Iranian religion, the first man, son of the Sun, and progenitor of the human race. In one legend, Yima became king in a golden age in which need, death, disease, aging, and extremes of temperature were banished from the earth because of his virtue. This golden age ended when Ahura Mazdā foretold a terrible winter. Yima was instructed to build an underground domain, take in the best individuals from each species to preserve their seed, and then reemerge after the winter to repopulate the earth. In Zoroastrian legends, Yima was replaced by Gayōmart.

Yin dynasty See Shang dynasty

yin-yang In East Asian thought, the two complementary forces or principles that make up all aspects and phenomena of life. Yin is earth, female, dark, passive, and absorbing; it is present in even numbers and in valleys and streams and is represented by the tiger, the colour orange, and a broken line. Yang is heaven, male, light, active, and penetrating; it is present in odd numbers and mountains and is represented by the dragon, the colour azure, and an unbroken line. Together they express the interdependence of opposites.

Yinchuan \'yin-'chwän\ *or* **Yin-ch'uan** City (pop., 1999 est.: 469,180), capital of Ningxia autonomous region, north-central China. It is located near the western end of the Great Wall. Originally a county in the 1st century BC, it became the capital of the Xi Xia dynasty in 907 AD. In 1227 it came under the Mongol dynasty and was later under the Ming and the Qing dynasties. In 1928 it became the capital of the newly formed Ningxia province. In 1954 when Ningxia province was abolished, the city became part of Gansu province. With the establishment of the Ningxia autonomous region in 1958, Yinchuan once again became the capital. Largely nonindustrial, it is the chief agricultural market and distribution centre for the area.

ylang-ylang *or* **ilang-ilang** \ˌē-ˌläŋ-'ē-ˌläŋ\ South Asian evergreen tree (*Cananga odorata*) of the custard apple family. The name means "flower of flowers" in the Tagalog language. Tall (77 ft, or 25 m) and slim, it has smooth bark and is covered year-round with drooping, long-stalked, rich-scented flowers that have six narrow, greenish-yellow petals. The pointed oval leaves have wavy edges. Clustered, oval black fruits hang from long stalks. Leis are made from the blooms, and a delicate fragrance is distilled from the flowers. The woody ylang-ylang vine (*Artabotrys odoratissimus*), in the same family, is popular on trellises and patios in warm, moist climates.

YMCA *in full* **Young Men's Christian Association** Nonsectarian, nonpolitical Christian lay movement that aims to develop high standards of Christian character among its members. It originated in London in 1844 when 12 young men formed a club to improve the spiritual condition of young tradesmen. The first U.S. club was formed in Boston in the 1850s. YMCA programs include sports and physical education, camping, formal and informal education, and citizenship activities. It also runs hotels, residence halls, and cafeterias. National councils are members of the World Alliance of YMCAs (established 1855), headquartered in Geneva. The YMCA was charged with sponsoring educational and recreational facilities in prisoner-of-war camps by the Geneva Convention of 1929. It now operates in dozens of countries. The Young Women's Christian Association (YWCA) was founded in Britain (1877) to address the needs of women from rural areas who came to the cities to find work; in the U.S. (founded 1906), it has championed racial equality. The Young Men's and Young Women's Hebrew Association (YM-YWHA) developed in the mid-19th century from Jewish men's literary societies in the U.S. and now exists in some 20 other countries worldwide.

Ymir See Aurgelmir

Yoga One of the six orthodox systems (darshans) of Indian philosophy, which has had widespread influence on many schools of Indian thought. It is better known through its practical aspect than its intellectual content, which is largely based on the philosophy of Samkhya. Holding that the evolution of the world occurred in stages, Yoga attempts to reverse this order so that a person reenters his or her state of purity and consciousness. Generally, the Yoga process involves eight stages, which may require several lifetimes to pass through. The first two stages are ethical preparations emphasizing morality, cleanliness, and devotion to God. The next two stages are physical preparations that condition the body to make it supple, flexible, and healthy; the physical aspects of Yoga have been most successfully popularized in the West. The fifth stage involves control of the mind and senses to withdraw from outward objects. The remaining three stages entail the cultivation of increasingly concentrated states of awareness, which will ultimately lead to release from the cycle of rebirth. See also chakra, kundalini.

Yogacara \'yō-gä-'chä-rä\ *or* **Vijnanavada** \vij-ˌnä-nə-'vä-də\ Idealistic school of Mahayana Buddhism. It rejects the complete realism of Theravada Buddhism and the practical realism of the Madhyamika school, preferring a more complicated position in which the reality perceived by humans does not exist but only appears to do so by virtue of the capacity of the mind to perceive patterns of continuity and regularity. Yogacara emerged in India about the 2nd century and was introduced into China in the 7th century by Xuanzang. It was transmitted to Japan in the mid-7th century as Hossō.

yogurt Semisolid, fermented, often flavoured milk food. Yogurt is known and consumed in almost all parts of the world. It is traditionally made by adding common strains of *Streptococcus* and *Lactobacillus* bacteria to raw milk. The culture is produced by taking a portion of a previous batch. In modern commercial yogurt making, a blend of concentrated sterilized milk and milk solids is inoculated with the two bacteria; sometimes *L. acidophilus* or a lactose-fermenting yeast is also added. The product is then incubated four or five hours at 110–112 °F (43–44 °C) until curd forms. Various flavours and sweetening may be added.

Yoho National Park National park, southeastern British Columbia, Canada. It occupies 507 sq mi (1,313 sq km) of the western and central slopes of the Rocky Mountains and is adjacent to Banff and Kootenay national parks. Known for the Burgess Shale archaeological site, geologic treasures, diverse wildlife, and scenic landscape, it was established as a national park in 1886. Features include glaciers, ice fields, steep mountains, and broad valleys. Black and grizzly bears, moose, mule deer, wapiti (elk), and mountain goats inhabit the park.

Yojoa \yō-'hō-ä**, Lake** Lake, central Honduras. The country's largest inland lake, it has an area of 110 sq mi (285 sq km). It is volcanic in origin and sits at an elevation of 2,133 ft (650 m). It and the surrounding region are popular tourist destinations.

Yokohama Seaport city (pop., 2003 est.: 3,466,875), east-central Honshu, Japan. The country's principal port and second largest city, it is located on the western shore of Tokyo Bay and is part of the Tokyo urban-industrial complex. It was a small fishing village when U.S. naval officer Matthew Perry visited in 1854 to negotiate Japanese trading possibilities. In 1859 it was opened for foreign settlement and trade. Yokohama was destroyed by earthquake and fire in 1923 and severely damaged by U.S. air raids in 1945 during World War II, but it was rebuilt both times. It produces textiles, chemicals, ships, machinery, petroleum products, and automobiles.

Yom Kippur \ˌyōm-kē-'půr, ˌyäm-'ki-pər\ *English* **Day of Atonement** Jewish religious holiday, observed on the 10th day of the lunar month of Tishri (in late September or early October). It concludes the 10 days of repentance that begin with Rosh Hashanah. Its purpose is to purify the individual and community by forgiving the sins of others and by repenting one's own sins against God. Before the destruction of the Temple of Jerusalem, the high priest performed a sacrificial ceremony that concluded with the death of a scapegoat. Today it is marked by fasting and abstention from sex. Its eve, when the Kol Nidre is recited, and the entire day of Yom Kippur, are spent in prayer and meditation.

Yongding River *or* **Yung-ting River** River, northeastern China. It rises beyond the Great Wall in Hebei province and flows southeastward through Beijing municipality. It continues through Tianjin municipality, where it becomes the principal stream forming the Hai River, which flows from the Yongding's junction with the Grand Canal to its mouth at the Bo Hai. About 300 mi (500 km) long, it is navigable in its lower reaches.

Yŏngjo \'yòŋ-jō\ (r. 1724–76) King of the Korean Chosŏn dynasty. A reformer, Yŏngjo reinstated the universal military service tax but then

© 2006 Encyclopædia Britannica, Inc.

reduced it by half, making up the deficiency with other taxes. He adopted an accounting system and reduced an onerous cloth tax. Yŏngjo upgraded the status of the offspring of commoners, but his social reforms could not keep up with the speed of societal change.

Yongle emperor *or* **Yung-lo emperor** \'yůŋ-'le\ *orig.* **Zhu Di** (b. May 2, 1360, Yingtian [Nanjing], China—d. Aug. 5, 1424, Yumuchuan, Inner Mongolia) Third emperor of China's Ming dynasty, which he raised to its greatest power. Son of the Hongwu emperor, founder of the Ming, he was his father's favourite. He was enfeoffed as the Prince of Yan (the region around present-day Beijing) and spent his youth patrolling the northern frontier and keeping the Mongols fragmented. When his nephew succeeded to the throne, Zhu Di rebelled and became emperor in 1402. As emperor, he worked to extend China's sway. He sent out ships of exploration, most notably under Zheng He; these returned with envoys bearing tribute to acknowledge China's overlordship. He became the only ruler in Chinese history to be acknowledged suzerain by the Japanese. A foray into Annam (now Vietnam), which he attempted to incorporate into China, led to years of guerrilla warfare. He five times led large armies north to the Gobi Desert, forestalling the creation of a Mongol confederation that might have threatened China. He transferred China's capital from Nanjing to Beijing. He built the Forbidden City and repaired the Grand Canal so that Beijing could be provisioned without relying on sea transport. He sponsored the compilation and publication of the Confucian Classics and the preparation of the *Yongle dadian* ("Great Canon of the Yongle Era"), an 11,000-volume compendium.

yoni \'yō-nē\ In Hinduism, a representation of the female sexual organ and feminine generative power, the symbol of the goddess Shakti (see shakti). The yoni is often associated with the phallic linga, the symbol of the god Shiva. The linga is depicted in art as resting in the yoni, their union representing the eternal process of creation and regeneration.

Yonkers City (pop., 2000: 196,086), southeastern New York, U.S. It is located on the Hudson River north of New York City. Once the site of an American Indian village, it was part of a purchase made by the Dutch West India Co. from the Indians in 1639. In 1646 it was included in a grant of land made to "Jonkheer" Adriaen van der Donck. The southern portion of old Yonkers was annexed to what later became the Bronx in 1874. Industry is well diversified and includes printing and publishing and the manufacture of elevators, chemicals, electronic components, and clothing.

Yonne \'yȯn\ **River** River, north-central France. It flows north out of Nièvre *département* into the Seine River at Montereau-faut-Yonne. The Yonne is 182 mi (293 km) long and is navigable for 70 mi (113 km) downstream from Auxerre.

Yorck von Wartenburg \'yȯrk-fȯn-'vär-tən-ˌbůrk**, Johann (David Ludwig), Count** (b. Sept. 26, 1759, Potsdam, Prussia—d. Oct. 4, 1830, Klein-Öls, Silesia) Prussian army commander. After serving with the Prussian army (1772–79) and Dutch army (1779–87), he rejoined the Prussian army and fought in Poland (1794) and later in the war against France (1806). Promoted to major general, he helped reorganize the army, developing the tactics of the infantry scout and the line of skirmishes. In 1812 he led the Prussian contingent of Napoleon's invading army into Russia. During the French retreat, he concluded an accord with Russia that opened the way for Prussia to join the Allied powers against Napoleon. He was made a count in 1814 and a field marshal in 1821.

Yoritomo See Minamoto Yoritomo

York Former city (pop., 2001: 150,255), southeastern Ontario, Canada. In 1998 it joined the cities of Toronto, Etobicoke, Scarborough, and North York and the borough of East York to become the City of Toronto. Occupying an area of 9 sq mi (23 sq km), York was established in 1967 through the amalgamation of the former township of York and the town of Weston. The original York township was formed in 1793.

York *ancient* **Eboracum** City and unitary authority (pop., 2001: 181,131), geographic county of North Yorkshire, historic county of Yorkshire, England. Located at the confluence of the Ouse and Foss rivers, it is the cathedral city of the archbishop of York and was historically the ecclesiastical capital of northern England. It was also the seat of the historic county of Yorkshire. York was a Celtic and then a Roman settlement. Constantine I was proclaimed Roman emperor in York in AD 306. It was conquered by the Danes in 867. York suffered severely in the Norman conquest of northern England in the 11th century. During the Middle Ages it was a prosperous wool-trading town and the performance site of the York plays. It has a manufacturing economy and a tourist industry fostered by its medieval sites.

York, Alvin C(ullum) (b. Dec. 13, 1887, Pall Mall, Tenn., U.S.—d. Sept. 2, 1964, Nashville, Tenn.) U.S. World War I hero. He worked as a blacksmith and was drafted into the U.S. Army in 1917 after being denied conscientious-objector status. In the Meuse-Argonne offensive (October 1918), his patrol of 17 men was ordered to attack a German machine-gun nest. Pinned down behind enemy lines, he advanced alone to attack the enemy gunners, killing 25 and forcing the others to surrender. As he marched them back to U.S. lines, he captured more German soldiers for a total of 132 prisoners. He received the Congressional Medal of Honor, and his autobiography (1928) was the basis of the movie *Sergeant York* (1941).

York, Cape Northern point of Cape York Peninsula, Queensland, Australia. Australia's northernmost point, it is about 15 mi (25 km) long and 12 mi (19 km) wide; it juts into the Torres Strait. Cape York was named in 1770 by Capt. James Cook for the duke of York, brother of King George III.

York, house of Younger branch of the Plantagenet dynasty, descended from Edward III's fifth son, Edmund of Langley (1341–1402), 1st duke of York. In the 15th century the Yorkists took the throne from the house of Lancaster; the Yorkist kings were Edward IV, Edward V, and Richard III. The Wars of the Roses between the two houses continued until Richard's death at the Battle of Bosworth Field in 1453. The marriage of Henry VII, the first Tudor king, to the daughter of Edward IV, merged the house of York with the house of Tudor.

York plays Cycle of 48 plays performed in the Middle Ages by craft guilds in York, Eng. The York cycle, which dates from the 14th century, is of unknown authorship; it covers the story of the Fall of Man and his redemption, from the creation of the angels to the Final Judgment. The plays, performed on the summer feast day of Corpus Christi, were given in chronological order, on pageant wagons proceeding from one selected place to another. See also mystery play.

York University Privately endowed university in North York, Ont., Can., founded in 1959. It has faculties of administrative studies, arts, education, environmental studies, fine arts, and graduate studies as well as schools of law, business, and of pure and applied science. Among its research units are centres for the study of refugees, atmospheric chemistry, law and public policy, and computers in education.

Yorke Peninsula Promontory, southeastern South Australia. It is located between Spencer Gulf to the west and Gulf Saint Vincent and Investigator Strait to the east and south. It extends southward 160 mi (260 km) and is 20–35 mi (32–56 km) wide. Sighted by the English in 1802, it was named for Charles P. Yorke, first lord of the Admiralty.

Yorkshire \'yȯrk-ˌshir\ Historic county, northern England. Yorkshire was divided into three administrative counties—North Riding, East Riding, and West Riding—and the city of York. For most purposes the ridings were separate administrative units for a thousand years; Yorkshire and the ridings, comprising the country's largest county, ceased to exist with the administrative reorganization of 1974. Yorkshire was an agricultural, fishing, and manufacturing centre. Its main cities and towns include Leeds, Sheffield, Kingston upon Hull, Bradford, and Wakefield.

Yorkshire terrier *or* **Yorkie** Breed of toy dog developed in the mid-19th century in Yorkshire and Lancashire, Eng. Its lineage appears to include terriers such as the Skye and Dandie Dinmont. Its outstanding feature is its straight, silky coat, parted on the back from nose to tail and long enough to sweep the ground. Its coat colour is dark blue-gray, with tan on the head and chest. It may grow to 9 in. (23 cm) tall and weigh up to 7 lb (3 kg).

Yorktown, Siege of (1781) American-French land and sea campaign against the British that virtually ended the American Revolution. About 7,500 British troops under Charles Cornwallis occupied defensive positions at the coastal port of Yorktown, Va., on Aug. 1, 1781. They were opposed by a smaller American force under the marquis de Lafayette, assisted by Anthony Wayne and Frederick Steuben. From New York, George Washington ordered Lafayette to prevent Cornwallis's escape by land. French troops under the count de Rochambeau joined Washington's forces and marched south. Linking up with a French fleet at the head of Chesapeake Bay, they joined Lafayette's forces on September 28, and the

© 2006 Encyclopædia Britannica, Inc.

14,000 troops besieged the British position. Cornwallis waited for British reinforcements under Henry Clinton to arrive by sea; but now outnumbered, outgunned, and running low on food, he surrendered his 8,000 men and 240 guns on October 19. The siege ended fighting in the war and virtually guaranteed success to the American cause.

Yoruba \'yȯr-ə-bə\ One of Nigeria's three largest ethnic groups, numbering more than 22 million. The many dialects comprising the Yoruba language belong to the Benue-Congo branch of the Niger-Congo family. The Yoruba states, including the Oyo empire, were built in the 11th–16th centuries. Yorubaland remains divided into politically autonomous kingdoms, each centred on a capital city or town and headed by a hereditary king (*oba*), traditionally considered sacred. Most Yoruba men are farmers, growing yams, corn, and millet as staples; cocoa is a cash crop. Yoruba women control much of the complex market system. Craftsmen work in blacksmithing, weaving, leatherworking, glassmaking, bronze casting, and ivory- and wood-carving. Though some Yoruba are now Christians or Muslims, belief in their traditional religion continues, and it remains alive, too, in the New World countries to which may Yoruba were transported to work as slaves (see Candomblé; Macumba; Santería; vodun). The Yoruba language has an extensive literature of poetry, short stories, myths, and proverbs.

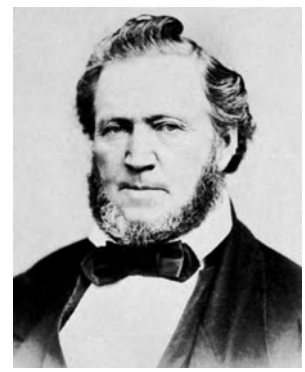
Yorubaland \'yȯr-ù-bə-ˌland\ Area of western Africa, in present-day Nigeria. It once comprised several states headed by individual Yoruba kings. It flourished for centuries before disputes between minor rulers, difficulties in maintaining trade routes, and invasions led to its decline, beginning in the late 18th century. Oyo, Ife, Ibadan, and Oshogbo are cities with historical Yoruba background.

Yosemite \yō-'se-mə-tē\ **Falls** Two waterfalls, Yosemite National Park, central California, U.S. Formed by creeks tumbling into the Yosemite River valley, the upper falls drop 1,430 ft (436 m) and the lower, 320 ft (98 m). With the cascades between, the total drop from the crest of the upper to the base of the lower is 2,425 ft (739 m), one of the world's longest cataracts.

Yosemite National Park National preserve, central California, U.S. Made a national park in 1890, it encompasses 761,320 ac (308,106 ha) in the Sierra Nevada range. Its many features include giant redwood groves with trees thousands of years old, Yosemite Falls, Bridalveil Fall (620 ft [189 m]), and huge domes and peaks; the greatest of these is El Capitan, a granite buttress that is 3,604 ft (1,098 m) high.

Yoshida Shigeru \'yō-shē-dä-shē-'ge-rù\ (b. Sept. 22, 1878, Tokyo, Japan—d. Oct. 20, 1967, Ōiso) Japanese prime minister after World War II. He served as ambassador to Britain in the 1930s. Late in the war (June 1945) he was arrested for attempting to force an early Japanese surrender; he was not freed until the start of the Allied occupation (September). He first became prime minister in 1946. Between 1946 and 1954 he formed five separate cabinets, guiding Japan back to economic prosperity and setting a course for postwar cooperation with the U.S. and Europe. In 1951 he negotiated the peace treaty that ended World War II; he also negotiated a security pact between Japan and the U.S. He retired from politics in 1955. See also Shōwa period.

Yoshida Shōin \'yō-shē-dä-'shō-ēn\ (b. Sept. 20, 1830, Nagato province, Japan—d. Nov. 21, 1859, Edo) Japanese teacher of military tactics in the domain of Chōshū. He studied "Dutch learning" (European studies) in Nagasaki and Edo (modern Tokyo) and was deeply influenced by the pro-emperor thinkers in the domain of Mito. His radical pro-emperor stance influenced young samurai in Chōshū to overthrow the Tokugawa shogunate. He was executed for an assassination plot against the shogun's representative in Kyōto. See also Kido Takayoshi; Tokugawa period.



Yoshitsune See Minamoto Yoshitsune

Youghiogheny \ˌyä-kə-'gā-nē\ **River** River in northeastern West Virginia, northwestern Maryland, and southwestern Pennsylvania, U.S. It rises in West Virginia, near the western edge of Maryland, and flows north through northwestern Maryland into Pennsylvania to enter the Monongahela River at McKeesport after a course of 135 mi (217 km). It is the only river in western Maryland that does not flow south into the Potomac River.

Youmans \'yü-mənz**, Vincent (Millie)** (b. Sept. 27, 1898, New York, N.Y., U.S.—d. April 5, 1946, Denver, Colo.) U.S. songwriter. He started writing songs while in the navy during World War I and later worked as a song plugger in Tin Pan Alley. He collaborated with lyricists such as Ira Gershwin and Oscar Hammerstein on the Broadway musicals *Wildflower* (1923), *No, No, Nanette* (1925), *Hit the Deck* (1927), *Great Day* (1928), and the first Fred Astaire-Ginger Rogers vehicle, *Flying Down to Rio* (1933). His standards include "Tea for Two," "More Than You Know," "Time on My Hands," and "Carioca."

Young, Andrew *in full* **Andrew Jackson Young, Jr.** (b. March 12, 1932, New Orleans, La., U.S.) U.S. politician. He earned a divinity degree in 1955 and became a pastor at several African American churches in the South. Active in the civil rights movement, he worked with Martin Luther King, Jr., and Ralph Abernathy in the Southern Christian Leadership Conference (1961–70). He served in the U.S. House of Representatives (1972–77). An early supporter of Jimmy Carter, he was appointed U.S. ambassador to the UN (1977–79), the first African American to hold the post. He served as mayor of Atlanta (1982–90).

Young, Brigham (b. June 1, 1801, Whitingham, Vt., U.S.—d. Aug. 29, 1877, Salt Lake City, Utah) U.S. religious leader, second president of the Mormon church. He settled in Mendon, N.Y., in 1829 and was baptized into Joseph Smith's Church of Jesus Christ of Latter-day Saints in 1832. In 1834 he joined the Mormons in Missouri, and when they were driven out in 1838, he organized their move to Nauvoo, Ill. He established a Mormon mission in England in 1839. After Smith's murder in 1844, Young took over the church. He led the persecuted Mormons from Illinois to Utah (1846–48), choosing the site of Salt Lake City for the new Mormon headquarters. Elected president of the Mormons in 1847, he became governor of the provisional state of Deseret in 1849 and of the territory of Utah in 1850. His dictatorial autonomy and legalization of polygamy led Pres. James Buchanan to replace him as governor in 1857 and send the army to assert federal supremacy in the so-called Utah War, but Young remained head of the Mormon church until his death. He took more than 20 wives and fathered 47 children.

Brigham Young

Young, Coleman (b. May 24, 1918, Tuscaloosa, Ala., U.S.—d. Nov. 29, 1997, Detroit, Mich.) U.S. politician. He moved with his family to Detroit in 1923. At Ford Motor Co. he became involved in union activities and civil rights activism. In World War II, he served with the Tuskegee Airmen. He later cofounded the National Negro Labor Council, which he disbanded in the 1950s to avoid turning over its membership list during an investigation by the House Un-American Activities Committee. He was elected to the Michigan senate in 1964, and in 1968 he became the Democratic National Committee's first African American member. As mayor of Detroit (1973–93), he focused on revitalizing the crime-ridden city by attracting new businesses and reinforcing the police department. He retired after an unprecedented five terms.

Young, Cy *orig.* **Denton True Young** (b. March 29, 1867, Gilmore, Ohio, U.S.—d. Nov. 4, 1955, Newcomerstown, Ohio) U.S. baseball pitcher. Young, 6 ft 2 in. (1.88 m) tall, was a powerful right-handed thrower. His dominating fastball earned him the nickname "Cy," short for "cyclone." He began his major league career in 1890 with the Cleveland Indians (National League); after his Cleveland years (1890–98), he pitched for the St. Louis Cardinals (1899–1900), the Boston Red Sox (1901–08), the Cleveland Indians again (American League, 1909–11), and the Boston Braves (1911). In each of 16 seasons he won more than 20 games; in five he won more than 30. Though many early records are in dispute, he won more major league games (509 or 511) than any other pitcher in history. Among his other records are games started (816 or 818), completed starts (750 or 751), and innings pitched (7,356 or 7,377). In 1904 he pitched the first perfect game (no player reaching first base). The annual Cy Young Award, instituted in 1956, originally honoured the best major league pitcher; since 1967 it has been given to the best pitcher in each league.

Young, Lester (Willis) (b. Aug. 27, 1909, Woodville, Miss., U.S.—d. March 15, 1959, New York, N.Y.) U.S. tenor saxophonist. Young joined

© 2006 Encyclopædia Britannica, Inc.

Count Basie's band in 1936 and was recognized as a major new stylist on the instrument. His small-group recordings from the late 1930s with Basie and vocalist Billie Holiday are classics. He was nicknamed Prez by Holiday (short for "President of the saxophone"). Young's subtle harmonies and unconventional rhythmic independence influenced both bebop and cool-jazz musicians; his gentle tone and ethereal lyricism inspired an entire school of jazz saxophone playing.

Lester Young, c. 1955.
REPRINTED WITH PERMISSION OF *DOWN BEAT* MAGAZINE

Young, Neil (b. Nov. 12, 1945, Toronto, Ont., Can.) Canadian rock singer and songwriter. He began his career as a folksinger in Winnipeg and later moved to Los Angeles, Calif., U.S., where he formed the rock group Buffalo Springfield with Stephen Stills. In 1968 he released a solo album; in 1969 he joined Stills, David Crosby, and Graham Nash, to form Crosby, Stills, Nash and Young. His high-pitched, nasal vocals were instantly recognizable in any band. With a new band, Crazy Horse, he had great success with albums such as *Harvest* (1972) and *Comes a Time* (1978). In the 1980s he experimented with rockabilly and electronic music.

Young, Thomas (b. June 13, 1773, Milverton, Somerset, Eng.—d. May 10, 1829, London) English physicist. Trained as a physician, he practiced medicine at St. George's Hospital (from 1811 until his death) but spent much of his time on scientific research. He was the first to describe and measure astigmatism (1800–01) and the first to explain colour sensation in terms of retinal structures corresponding to red, green, and violet (1801). He established the principle of interference of light, thus resurrecting the century-old wave theory of light (1801). He explained capillarity independently of Pierre-Simon Laplace. Investigating elasticity, he proposed Young's modulus, a numerical constant that describes the elastic properties of a solid undergoing tension or compression. His other work included measuring the size of molecules and surface tension in liquids. With J.-F. Champollion, he helped decipher the inscriptions on the Rosetta Stone (1813–14).

Young Algerians Algerian nationalist group. Formed shortly before World War I (1914–18), they were a loosely organized group of French-educated workers in the modernized French sector. The Young Algerians were "assimilationists," willing to consider permanent union with France on the condition that native Algerians be given the full rights of French citizens. In the years following the war, such gradualist reformers found themselves opposed by radical nationalists demanding complete independence. See also Ferhat Abbas; Association of Algerian Reformist 'Ulamā'; National Liberation Front.

Young America movement U.S. political concept popular in the 1840s. Inspired by European youth movements of the 1830s (see Young Italy), the U.S. group was formed as a political organization in 1845 by Edwin de Leon and George H. Evans. It advocated free trade, expansion southward into the territories, and support for republican movements abroad. It became a faction in the Democratic Party in the 1850s. Sen. Stephen A. Douglas promoted its nationalistic program in an unsuccessful effort to compromise sectional differences.

Young Italy *Italian* **Giovine Italia** Movement founded by Giuseppe Mazzini in 1831 to work for a united, republican Italian nation. In contrast to earlier independence movements of the Carbonari, Young Italy was to be based on support from the Italian people, who would be educated in their political role. To propagate his ideas, Mazzini published the journal *Giovine Italia* (1832–34). The movement spread in northern Italy and by 1833 included more than 50,000 members. It staged revolts in the 1830s and '40s, but it failed to win popular support for insurrection. In 1848 Mazzini replaced Young Italy with the Italian National Committee. After 1850 his influence declined as leadership of the movement for Italian unification passed to Camillo Benso, count di Cavour. See also Risorgimento.

Young Men's Christian Association See YMCA

Young Plan (1929) Renegotiation of Germany's World War I reparations payments by a committee chaired by the U.S. lawyer Owen D. Young (1874–1962) in Paris. The Young Plan, a revision of the Dawes Plan, reduced the amount due from Germany to $26.3 billion, to be paid over 59 years, and ended foreign controls on German economic life. It went into effect in 1930, but the world depression affected Germany's ability to pay. When Adolf Hitler came to power in 1933, he repudiated the obligations of the Treaty of Versailles, including reparations.

Young Tunisians Political party formed in 1907 by French-educated Tunisian intellectuals to oppose French rule. They demanded complete control of the country's government and administration and full citizenship rights for both Tunisians and Frenchmen. They protested the Italian invasion of Libya (1911) and rioted against French actions at home. The French exiled its leaders, driving the party underground until 1920, when it reemerged and reorganized itself as the Destour Party, which remained active until 1957. See also Habib Bourguiba.

Young Turks *Turkish* **Jöntürkler** Coalition of young dissidents who ended the sultanate of the Ottoman Empire. Consisting of college students and dissident soldiers, the group succeeded in 1908 in forcing Abdülhamid II to reinstitute the 1876 constitution and recall the legislature. They deposed him the following year, reorganized the government, and began modernizing and industrializing Turkish society. They joined the Central Powers during World War I (1914–18). Facing defeat, they resigned a month before the war ended. See also Mustafa Kemal Atatürk; Enver Pasha; Midhat Pasha.

Younghusband, Sir Francis Edward (b. May 31, 1863, Murree, India—d. July 31, 1942, Lytchett Minster, Dorset, England) British army officer and explorer. He forced the conclusion of the Anglo-Tibetan Treaty (1904) that gained Britain long-sought trade concessions. His two initial attempts to negotiate trade and frontier issues with Tibet failed despite British military action; he then marched to Lhasa with British troops and forced the conclusion of a trade treaty, though the Dalai Lama, Tibet's leader, had fled. See also amban.

Youngstown City (pop., 2000: 82,026), northeastern Ohio, U.S. Located on the Mahoning River, near the Pennsylvania border, it was founded in 1797. Ohio's first furnace to produce iron was built nearby in 1805. In 1855 the Sault Sainte Marie locks were opened, making the rich iron ores from the upper Great Lakes region available; railroad lines were later built to transport ores and coal to Youngstown. By 1920 it had become one of the largest steel-producing centres in the U.S. Its products now include aluminum, rubber, and paper products. Youngstown State University was established in 1908.

Yourcenar \yür-sə-'när**, Marguerite** *orig.* **Marguerite de Crayencour** (b. June 8, 1903, Brussels, Belg.—d. Dec. 17, 1987, Northeast Harbor, Maine, U.S.) Belgian-born French-U.S. novelist, essayist, and short-story writer. Independently wealthy after her father's death, she led a nomadic life until World War II, when she settled in the U.S. with the American woman who would be her lifelong companion and translator. Her works are noted for their rigorously classical style, their erudition, and their psychological subtlety. Her masterpiece is *Memoirs of Hadrian* (1951), a historical novel of the 2nd-century Roman Empire. Other works include the novels *Coup de grâce* (1939) and *The Abyss* (1968), *Oriental Tales* (1938), and the prose poem "Fires" (1936). In 1980 she became the first woman in history to be elected to the Académie Française.

GISÈLE FREUND 1971

youth hostel Supervised shelter providing inexpensive overnight lodging, particularly for young people. Often located in scenic or historic areas, hostels range from simple farmhouses to hotels able to house several hundred people. Guests often cook their own meals, make their own beds, and do other chores; in return they receive lodging at much less than the usual commercial rate. Hostels place limits on the length of stay and formerly set a maximum-age limit for guests. The hosteling movement was founded by Richard Schirrmann, a German schoolteacher con-

© 2006 Encyclopædia Britannica, Inc.

cerned about the health of young people breathing polluted air in industrial cities. Common in Germany in the early 1900s, youth hostels spread through Europe and other parts of the world after World War I, and an international organization was formed in 1932; currently known as Hostelling International and based in London, its membership includes national federations in more than 60 countries, comprising some 4,000 hostels. Some hostels still impose age limits.

Ypres \'ēpr²**, Battles of** Three costly battles in World War I in western Flanders. In the first battle (Oct. 12–Nov. 11, 1914), the Germans were stopped on their march to the sea, but the Allied forces were then surrounded on three sides. The second battle (April 22–May 25, 1915) marked the Germans' first use of poison gas as a weapon. In the third and longest battle (July 31–Nov. 6, 1917), also called the Battle of Passchendaele, the British were initially successful in breaking through the left wing of the German lines. The seasonal rains soon turned the Flanders countryside into an impassable swamp, but Gen. Douglas Haig persisted in his offensive. On November 6 Haig's troops, including the Canadian Corps, occupied the ruins of Passchendaele, barely five miles from the start of the offensive. Total Allied and German casualties exceeded 850,000, including the deaths of 325,000 British soldiers.

Ypsilanti family \ˌip-sə-'lan-tē\ Greek family prominent in the 19th century. Early members were Greek Phanariots (residents of the Greek quarter of Constantinople) distinguished in the Ottoman imperial service. Constantine Ypsilanti (1760–1816) was governor of Moldavia (1799–1801) and Walachia (1802–6) when he encouraged Serbians to rebel against Turkey. He was forced to flee to Russia, where his son Alexander Ypsilanti (1792–1828) became an officer in the Russian imperial guard. As the leader of the secret Greek organization Philikí Etaireía (1820), he promoted the cause of Greek freedom and led an unsuccessful attack on the Turks at Dragasani (1821). His brother, Demetrios Ypsilanti (1793–1832), carried on the cause in the War of Greek Independence and served as commander of the Greek forces 1828–30.

Yrigoyen, Hipólito See Hipólito Irigoyen

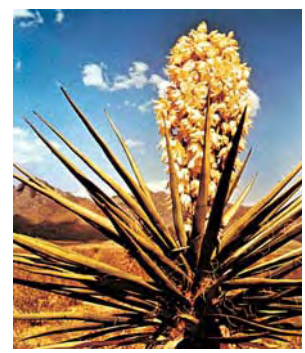
Yser River \ē-'zer\ River, northern France and Belgium. Rising in northern France, it flows through western Belgium and enters the North Sea near Nieuwpoort after a course of 48 mi (77 km). Its estuary was probably as far inland as Loo into the 10th century, but gradual land reclamation has since reduced it to a narrow tidal creek. During World War I (1914) the German advance toward Calais and the English Channel coast was halted at the river when Nieuwpoort sluices were flooded; this checked the German advance and allowed the Allies to set up an impregnable position.

Ysyk \ˌi-sik**, Lake** *Russian* **Lake Issyk-Kul'** \ˌi-sik-'kəl\ Lake, northeastern Kyrgyzstan. Situated in the northern Tien Shan, it is one of the largest mountain lakes in the world, having a surface area of some 2,425 sq mi (6,280 sq km) and reaching 2,303 ft (702 m) in depth. Its name (from the Kyrgyz word for "hot lake") refers to the fact that it does not freeze during the winter. To conserve the lake's wildlife, the Issyk-Kul' Preserve was founded in 1948.

Yuan Chiang See Red River

Yuan dynasty *or* **Yüan** \yü-'än\ **dynasty** *or* **Mongol dynasty** (1206–1368) Dynasty established in China by Mongol nomads. Genghis Khan occupied northern China in 1215, but not until 1279 did Kublai Khan take control of southern China. The Mongols established their capital at Beijing (then called Dadu). They rebuilt the Grand Canal and put the roads and postal stations in good order. Paper money, which had had limited circulation under the Song, came to be used throughout the empire. Advances were made in astronomy, medicine, and mathematics, and trade was carried out throughout the Mongol empire from the plains of eastern Europe across the steppes to Mongolia and China. Many foreigners came to China (notably Marco Polo), and many Chinese traveled to Iran, Russia, and even western Europe. The Chinese resented the Mongol conquerors, whose governmental system discriminated against them. Chinese artists demonstrated passive resistance by withdrawing and turning to personal expression. Literati painting became popular; the novel developed, and new dramatic forms also appeared. Disputes over succession weakened the central government from 1300 on, and rebellions were frequent, many connected with secret societies such as the Red Turbans. The dynasty was overthrown in 1368 by the future Hongwu emperor. See also Ming dynasty.

Yuan \'ywen, 'ywän\ **River** River, southeast-central China. It rises in Guizhou province, then flows northeast in Hunan province to Dongting Lake. It is some 635 mi (1,020 km) long and is navigable for most of its course.



Yuan Shikai *or* **Yüan Shih-kai** \yü-'än-'shir-'kī\ (b. Sept. 16, 1859, Xiangcheng, Henan province, China—d. June 6, 1916, Beijing) Chinese army leader and president of the Republic of China (1912–16). He began his military career serving in Korea in the 1880s. In 1885 he was made Chinese commissioner at Seoul; his promotion of China's interests contributed to the outbreak of the Sino-Japanese War (1894–95). The war destroyed China's navy and army, and the task of training a new army fell to Yuan. When his division was the only one to survive the Boxer Rebellion (1900), his political stature increased. He played a decisive part in China's modernization and defense programs and enjoyed the support of the empress dowager Cixi. On her death he was dismissed, only to be called back following the overthrow of the Qing dynasty in 1911–12, when he became the first president of the new republic; Sun Yat-sen had previously served as the provisional president. Impatient with the new National Assembly, he ordered the assassination of Song Jiaoren, leader of the Nationalist Party in 1913. He quelled a subsequent revolt, but his efforts to found his own dynasty (1915–16) failed.

yuca See cassava

Yucatán \yü-kä-'tän\ State (pop., 2000: 1,658,210), northern Yucatán Peninsula, southeastern Mexico. It covers an area of 14,827 sq mi (38,402 sq km); its capital is Mérida. Yucatán occupied virtually the entire peninsula when it became a state in 1824, but the creation of the states of Campeche (1858) and Quintana Roo (1902) from parts of Yucatán, as well as later boundary changes, reduced it to its present size. Long occupied by rural Maya Indians who speak little Spanish, it is the site of many ancient Maya ruins.

Yucatán Peninsula Peninsula, northeastern Central America. It lies between the Gulf of Mexico and the Caribbean Sea; its 76,300-sq-mi (197,600-sq-km) territory includes the Mexican states of Campeche, Quintana Roo, and Yucatán and, in the south, large parts of Belize and Guatemala. It is about 200 mi (320 km) wide and has a coastline of about 700 mi (1,100 km). The area had long been home to many pre-Columbian civilizations before Spanish explorer Hernán Cortés traversed its inland portion in 1525. Spanish rule was subsequently established, but since that time many independent Maya Indians have kept to its inland rural areas and resisted the authority of the central government. Its coastal area, with many beaches and resorts, and its ancient archaeological sites, including Chichén Itzá, Uaxactún, and Uxmal, are major tourist destinations, as is the resort city of Cancún.

yucca \'yə-ˌkə\ Any of about 40 species of succulent plants (genus *Yucca*) of the lily family, native to southern North America. Most species lack a stem and have a rosette of stiff, sword-shaped leaves at the base and clusters of waxy white flowers. The Joshua tree (*Y. brevifolia*) has a stem more than 33 ft (10 m) high. Commonly cultivated as ornamentals for their unusual appearance and attractive flower clusters are the aptly named Spanish bayonet (*Y. aloifolia*), Spanish dagger (*Y. gloriosa*), and Adam's needle, or bear grass (*Y. filamentosa*). Yucca moths (genus *Tegeticula*) inhabit yucca bushes, each moth species adapted to a particular yucca species. The yucca can be fertilized by no other insect, and the moth can use no other plant to raise its larvae.

Yudenich \yü-'dye-nyich**, Nikolay (Nikolayevich)** (b. July 30, 1862, Moscow, Russia—d. Oct. 5, 1933, Saint-Laurent-du-Var, France) Russian commander of anti-Bolshevik forces in the Russian Civil War. A career army officer who joined the Imperial Army in 1879, he commanded in the Russo-Japanese War and was promoted to general in 1905. In World War I he led Russian troops in the Caucasus (1914–15, 1917). After retiring to Estonia, he organized anti-Bolshevik forces there and launched an

© 2006 Encyclopædia Britannica, Inc.

unsuccessful offensive toward Petrograd (St. Petersburg). He renewed his offensive in coordination with other White forces but was stopped by the Red Army and forced to retreat to Estonia, where he disbanded his army (1920). He fled to France, where he died in exile.

Yue Fei *or* **Yüeh Fei** \yüe-'e-'fā\ (b. 1103, Tangyin, Henan province, China—d. Jan. 27, 1142, Lin'an, Zhejiang province) One of China's greatest generals and national heroes. When the Juchen overran northern China and captured the Song-dynasty capital at Kaifeng, Yue Fei accompanied the future emperor Gaozong into the south, where the Southern Song was established. Yue Fei prevented the advance of the Juchen in the south and was able to recover and secure some of the occupied territory in central China. His attempt to push north and recapture all of the lost territory was opposed by the minister Qin Hui, who had Yue executed. Yue has been extolled for his resistance to foreign domination.

yuga \'yü-gə\ Unit of the cosmic cycle in Hindu cosmology. Each yuga is progressively shorter than the preceding one, corresponding to a decline in the moral and physical state of humanity. Four such yugas make up a mahayuga; 2,000 mahayugas make up the basic cosmic cycle, the kalpa. The first yuga was an age of perfection that lasted 1,728,000 years. The fourth and most degenerate yuga began in 3102 BC and will last 432,000 years. At the close of this yuga, the world will be destroyed, to be recreated after a period of quiescence as the cycle resumes.

Yugoslavia Former federated country situated on the west-central Balkan Peninsula of southern Europe. Between 1929 and 2003, three federations bore the name Yugoslavia ("Land of the South Slavs"). After the Balkan Wars of 1912–13 ended Turkish rule in the Balkan Peninsula and Austria-Hungary was defeated in World War I, a Kingdom of Serbs, Croats, and Slovenes was established, comprising the former kingdoms of Serbia and Montenegro (including Serbian-held Macedonia), as well as Croatia, Bosnia and Herzegovina, Austrian territory in Dalmatia and Slovenia, and Hungarian land north of the Danube River. The Kingdom of Yugoslavia, officially proclaimed in 1929 by King Alexander I and lasting until World War II, covered 95,576 sq mi (247,542 sq km). The postwar Socialist Federal Republic of Yugoslavia covered 98,766 sq mi (255,804 sq km) and had a population of about 24 million by 1991. In addition to Serbia and Montenegro, socialist Yugoslavia included four other republics now recognized as independent states: Bosnia and Herzegovina, Croatia, Macedonia, and Slovenia. The "third Yugoslavia," inaugurated on April 27, 1992, had roughly 45% of the population and 40% of the area of its predecessor and consisted of the republics of Serbia and Montenegro, which in 2003 abandoned the name Yugoslavia and renamed the country Serbia and Montenegro.

Historical map of Yugoslavia showing the boundaries of the country from 1946 to 1992.

Yukaghir See Siberian peoples

Yukon *or* **Yukon Territory** Territory (pop., 2001 est.: 30,000), northwestern Canada. Bounded by Alaska, U.S., to the west, and the Canadian Northwest Territories to the east and British Columbia to the south, its capital is Whitehorse. Drained by the Yukon River system, it has some of the highest mountains in North America, notably the Saint Elias Mountains and Mount Logan, Canada's highest peak. It was originally settled by American Indians and the Inuit (Eskimo). The first European visitor (1825) was British explorer John Franklin, who was seeking the Northwest Passage. Sporadic settlement occurred thereafter. The discovery of gold in the 1870s later resulted in the Klondike gold rush. In 1898 it was separated from the Northwest Territories and given territorial status. The economic boost from the gold rush soon abated, and the exploitation of other minerals expanded and continued throughout the 20th century. Its economic mainstays, though, are government services and tourism.

Yukon River River, northwestern North America. Formed by the confluence of the Lewes and Pelly rivers in southwestern Yukon Territory, Can., it is 1,980 mi (3,190 km) long. It flows northwest across the Yukon border into Alaska, then southwest across central Alaska to the Bering Sea. It is the third longest river in North America; its entire course of 1,265 mi (2,035 km) in Alaska is navigable. It attracted attention following the rich gold strikes in 1896 on one of its Canadian tributaries, the Klondike River (see Klondike gold rush).

Yuma \'yü-mə\ Any of various North American Indian peoples living mostly in California and Arizona, U.S. Their languages belong to the Hokan language family. They once lived in the lower Colorado River valley and adjacent areas in Arizona, California, and Mexico. The river Yuma (including the Mojave, Yuma, and Maricopa) lived along the lower Colorado and middle Gila rivers; the upland Yuma (including the Hualapai, Havasupai, and Yavapai) inhabited western Arizona south of the Grand Canyon. The river Yuma were primarily farmers; the upland Yuma also practiced hunting and gathering. Both lacked settled villages. Yuma religion is characterized by belief in a supreme creator, faith in dreams, and ritual use of song narratives. At the turn of the 21st century, they numbered more than 4,000.

Yung-ning See Nanning

Yungang \'yʊn-'gäŋ\ **caves** *or* **Yün-kang caves** Series of magnificent Chinese Buddhist cave temples, created in the 5th century AD during the Northern Wei dynasty period. There are about 20 major cave temples and many smaller niches and caves, stretching for over half a mile. They are among the earliest remaining examples of the first flowering of Buddhist art in China. The predominant sculptural style is a synthesis of various foreign influences, including Persian, Byzantine, and Greek, with elements ultimately derived from the Buddhist art of India.

Yunnan \yüe-'nän\ *or* **Yün-nan** Province (pop., 2002 est.: 43,330,000), southern China. It is bordered by Vietnam, Laos, and Myanmar, Sichuan and Guizhou provinces, and Guangxi and Tibet autonomous regions. It has an area of 168,400 sq mi (436,200 sq km), and its capital is Kunming. Its population is one of China's most ethnically mixed, comprising more than 20 nationalities. The terrain is largely mountainous, especially in the north and west. It is crossed by three major river systems—the Yangtze (Chang; there known as the Jinsha), the Mekong, and the Salween—and is the source of two others—the Xi (there known as the Nanpan and Hongshui) and the Yuan. Because of its isolation, the region was independent during the historical development of China. The Mongols overran it in the 13th century. In 1855–73 it was the scene of the great Panthay (Muslim) rebellion. Part of the province was seized by the Japanese in World War II. Yunnan is now noted for its agricultural production, especially of rice, as well as for its extensive mining industry.

Z particle Electrically neutral carrier of the WEAK FORCE and the neutral partner of the electrically charged W PARTICLE. It is nearly 100 times more massive than the PROTON and has a lifetime of only about 10^{-25} second. Z particles were first observed in 1983 by Carlo Rubbia and Simon van der Meer at CERN. Further studies have shown a natural variation in mass that is related to the particle's lifetime through the UNCERTAINTY PRINCIPLE. Measurements show that when Z particles decay to neutrino-antineutrino pairs (see PAIR PRODUCTION), they produce only three types of lightweight neutrino, indicating that there are only three sets each of LEPTONS and QUARKS.

Zab \'zäb\ **River** Either of two tributaries of the TIGRIS RIVER. The Great Zab rises in the mountains of Kurdistan and flows about 260 mi (420 km) south and southwest through southeastern Turkey and northern Iraq, joining the Tigris below Mosul, Iraq. The Little Zab flows about 230 mi (370 m) through northwestern Iran and northern Iraq before entering the Tigris about 50 mi (80 km) below the Great Zab. The two rivers double the flow of the Tigris during the floods of March and April.

Zacatecas \ˌsä-kä-'tā-käs\ State (pop., 2000: 1,353,610), north-central Mexico. It covers an area of 28,283 sq mi (73,252 sq km); its capital is ZACATECAS city. Located within a central plateau, it is traversed by several mountain ranges; the state's average elevation is about 7,700 ft (2,350 m). Its mineral wealth was discovered soon after the Spanish conquest, and some of its mines date from the mid-16th century. Agriculture, livestock raising, and meat processing are also important to the economy.

Zacatecas City (pop., 2000: 113,947), capital of ZACATECAS state, Mexico. It lies in a deep, narrow ravine about 8,200 ft (2,500 m) above sea level. Founded in 1548, two years after silver was discovered in the area, it was given city status in 1585. Until the 19th century, the mines around Zacatecas yielded one-fifth of the world's silver. Mining is still important to the economy, but the city is also a commercial and manufacturing centre and is noted for its cathedral. The extensive Indian ruins of Chicomóztoc are nearby, southwest of the city.

zaddik See TZADDIQ

Zadkine \zäd-'kēn**, Ossip** (b. July 14, 1890, Smolensk, Russia—d. Nov. 25, 1967, Paris, France) Russian-born French sculptor. Educated in England, he moved to Paris in 1909 and studied at the École des Beaux-Arts. Influenced by both CUBISM and Classical Greek sculpture, he developed a unique figurative style featuring concave and convex forms, lines, and parallel planes. During World War II he taught at New York City's Art Students League. His large bronze *To a Destroyed City* (1951–53), an homage to Rotterdam, is regarded as a masterpiece. In 1950 he received the grand prize for sculpture at the Venice Biennale, and in the 1960s he received commissions for statues in Jerusalem, Amsterdam, and elsewhere.

Zadokite Fragments See DAMASCUS DOCUMENT

Zaghlūl \zag-'lül**, Sa'd** (b. July 1857, Ibyānah, Egypt—d. Aug. 23, 1927, Cairo) Egyptian statesman. He initially cooperated with the British occupation of Egypt, but his attitude changed on his election to the Legislative Assembly in 1912. Britain declared martial law, established a protectorate, and dissolved the assembly during World War I (1914–18), after which he led a delegation (Arabic: *wafd*) that demanded recognition as the people's representatives and called for abolition of the British protectorate. When these requests were turned down, widespread disorder broke out that was not quelled even when Zaghlūl, who had been deported to Malta, was brought back and was elected prime minister at the head of the Wafd party in 1924. He resigned after a year of violent unrest but later served as president of the Chamber of Deputies, where he was able to exercise some control over his more extreme followers.

Zagreb \'zä-ˌgreb\ City (pop., 2001: 691,724), capital of CROATIA. It was first mentioned in 1093, when a Roman Catholic bishopric was established there. In medieval times the area contained a civil and an ecclesiastical settlement. Rivals until the 19th century, they were joined when a spate of new building occurred and expanded onto the SAVA RIVER floodplain. At the time of the Croatian national revival in the 19th century, Zagreb was the centre of both a pan-Yugoslav movement and a Croatian independence movement. During the civil war following Croatia's secession from Yugoslavia in 1991, Zagreb sustained heavy damage. It is Croatia's principal industrial centre. It is also the seat of the Academy of Sciences and Arts and of the University of Zagreb (1669).

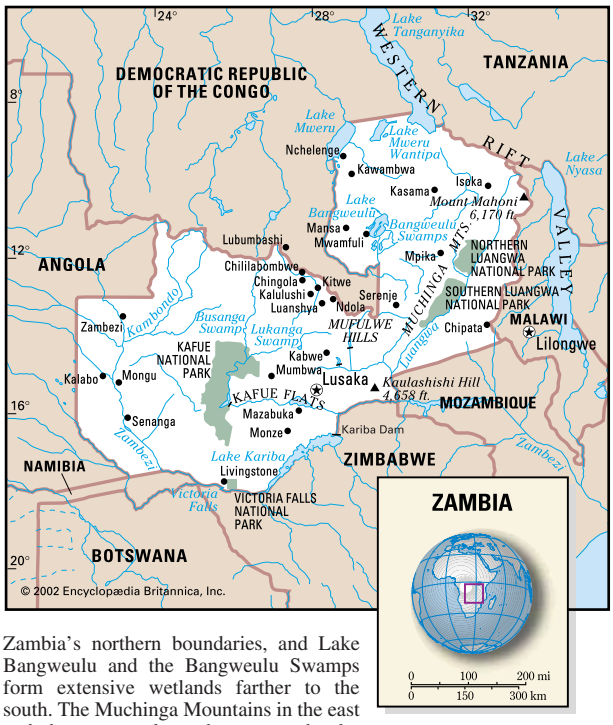
Zagreus \'zā-grē-əs, 'za-grē-əs\ In GREEK MYTHOLOGY, the son of ZEUS and his daughter PERSEPHONE. Zeus intended to make Zagreus his heir and bestow on him unlimited power, but a jealous HERA urged the TITANS to attack the child. They tore Zagreus to pieces and consumed all but his heart, which ATHENA managed to save and bring to Zeus, who swallowed it. Zeus then begot a son with SEMELE, and this child, made from the heart of Zagreus, was DIONYSUS.

Zaharias \zə-'har-ē-əs**, Babe Didrikson** *or* **Babe Didrikson** *orig.* **Mildred Ella Didrikson** (b. June 26, 1911, Port Arthur, Texas, U.S.—d. Sept. 27, 1956, Galveston, Texas) U.S. athlete who excelled in several sports. She became a remarkable performer in basketball and track and field and later a leading golfer. In 1930–32 she was a member of the women's All-America basketball team. During the same period she also won eight events and tied in a ninth in national championship competition in track and field. In the 1932 Olympics she won gold medals in the 80-m hurdles and javelin throw; she was deprived of the high-jump gold medal for using a then-unorthodox method. As a golfer from 1946, she won numerous championships, including the U.S. and British women's amateur tournaments (1946, 1947) and the U.S. Women's Open (1948, 1950, 1954).

zaibatsu \zī-'bät-sü\ *Japanese* **"wealthy clique"** Large capitalist enterprises of pre-World War II Japan, similar to CARTELS or trusts but usually organized around a single family. One *zaibatsu* might operate companies in many areas of economic importance; all *zaibatsu* owned their own banks, which they used as a means for mobilizing capital. After the war the *zaibatsu* were dissolved: stock owned by the parent companies was put up for sale and individual companies were freed from the control of parent companies. After the signing of the peace treaty in 1951, many companies began associating into what became known as enterprise groups; these differed from *zaibatsu* primarily in the informal manner that characterized policy coordination and in the limited degree of financial interdependency between member companies. Modern-day *keiretsu* are similar.

za'īm \zä-'ēm\ Political leader, either an officeholder or power broker. The term has been used especially in Lebanon, where it designated the power brokers of the various sectarian communities.

Zaire See Democratic Republic of the CONGO



Zaire River See CONGO RIVER

Zama \'zā-mə**, Battle of** (202 BC) Engagement in which the Romans under SCIPIO AFRICANUS THE ELDER decisively defeated the Carthaginians led by HANNIBAL, ending the Second PUNIC WAR. As the Romans marched on Carthage, Hannibal returned from Italy to defend the city. He was overwhelmed by a combined force of Romans and Numidians under MASINISSA. Carthage ceded Spain to Rome, gave up most of its ships, and began paying a 50-year indemnity to Rome.

Zambezi \zam-'bē-zē\ **River** River, south-central Africa. It rises in northwestern Zambia, flows south across eastern Angola and western Zambia to the border of Botswana, then turns east and forms the Zambia-Zimbabwe border. It then crosses central Mozambique and empties into the MOZAMBIQUE CHANNEL at Chinde. About 2,200 mi (3,500 km) long, it is navigable in three long stretches, separated by rapids and by VICTORIA FALLS. It drains the entire south-central region of the continent. Its many tributaries include the KWANDO, KAFUE, and SHIRE. It was explored by DAVID LIVINGSTONE in the early 1850s.

Zambia *officially* **Republic of Zambia** *formerly* **Northern Rhodesia** Landlocked country, south-central Africa. Area: 290,585 sq mi (752,612 sq km). Population (2005 est.): 11,262,000. Capital: LUSAKA. The population is composed almost entirely of BANTU-speaking African ethnic groups. Languages: English (official); some 80 local languages are also spoken. Religions: Christianity (Protestant, other Christians, Roman Catholic); also traditional beliefs, Islam. Currency: kwacha. The country consists of a high plateau through which the ZAMBEZI (including VICTORIA FALLS), KAFUE, and Luangwa rivers flow. Lakes MWERU and TANGANYIKA touch

© 2006 Encyclopædia Britannica, Inc.

Zambia's northern boundaries, and Lake Bangweulu and the Bangweulu Swamps form extensive wetlands farther to the south. The Muchinga Mountains in the east and the ranges along the eastern border have the highest elevations in the country. There are forests of Zambezi teak in the southwest. Zambia's economy depends heavily on the production and export of copper. Other important mineral resources include lead, zinc, cobalt, coal, and gold. Agriculture also is important. There is some manufacturing. Zambia is a republic with one legislative house; its head of state and government is the president. Ancestors of the Tonga reached the region early in the 2nd millennium AD, but other peoples from Congo (Kinshasa) and Angola reached the country only in the 17th–18th century. Portuguese trading missions were established early in the 18th century. Emissaries of CECIL RHODES and the British South Africa Company concluded treaties with most of the Zambian chiefs during the 1890s. The company administered the region known as Northern Rhodesia until 1924, when it became a British protectorate. It was part of the Central African Federation of Rhodesia and Nyasaland in 1953–63. In 1964 Northern Rhodesia became independent as the Republic of Zambia. A constitutional amendment enacted in 1991 allowed opposition parties. However, the country continued to experience political tension and government corruption.

Zamboanga \ˌzäm-bō-ˈwäŋ-gä\ Port city (pop., 2000: 601,794), western MINDANAO, Philippines. Founded in 1635 as a fort by the Spanish, it later became the chief market of the southern Philippines. In World War II it was a Japanese defense headquarters and was taken by U.S. troops in 1945. It exports rubber, pearls, copra, and mahogany and is a centre for Moro brass ware and bronze ware. It is also a tourist resort.

Zamora, Niceto Alcalá See NICETO ALCALÁ ZAMORA

Zamyatin \ˌzə-ˈmya-tʲin**, Yevgeny (Ivanovich)** *or* **Yevgeny Zamiatin** (b. Feb. 1, 1884, Lebedyan, Tambov province, Russia—d. March 10, 1937, Paris, France) Russian novelist, playwright, and satirist. Educated as a naval engineer, he combined a scientific career with writing. A chronic dissenter, he was a Bolshevik before the Russian Revolution of 1917 but disassociated himself from the party afterward. His ironic criticism of literary politics kept him out of official favour. His most ambitious work, the novel *We* (1924; banned in the Soviet Union until 1989), was the first anti-utopian novel and the literary ancestor of ALDOUS HUXLEY's *Brave New World* and GEORGE ORWELL's *Nineteen Eighty-four*.

Zande \ˈzan-dē\ *or* **Azande** \ə-ˈzan-dē\ People of central Africa who live in The Sudan, Congo (Kinshasa), and Central African Republic. They speak an Adamawa-Ubangi language of the Niger-Congo family. They occupy widely scattered family homesteads, subsisting through agriculture and hunting. Patrilineal CLANS are numerous. Witchcraft, magic, and divination are major features of social life. The Zande number about 3.8 million.

Zangwill \ˈzaŋ-gwil**, Israel** (b. Feb. 14, 1864, London, Eng.—d. Aug. 1, 1926, Midhurst, West Sussex) English novelist, playwright, and Zionist leader. The son of eastern European immigrants, Zangwill drew on his own experience in *Children of the Ghetto* (1892), which aroused great interest. His *The King of Schnorrers* (1894) is a picaresque novel about an 18th-century rogue, and *Dreamers of the Ghetto* (1898) contains essays on famous Jews. The metaphor of America as a crucible wherein various nationalities are transformed into a new race comes from his play *The Melting Pot* (1908). He is remembered as one of the earliest English interpreters of Jewish immigrant life.

Zanuck \ˈza-nək**, Darryl F(rancis)** (b. Sept. 5, 1902, Wahoo, Neb., U.S.—d. Dec. 22, 1979, Palm Springs, Calif.) U.S. film producer and executive. He worked as a steelworker, garment factory foreman, and a professional boxer while pursuing his career as a writer, and in 1924 he was hired as a screenwriter for Warner Brothers. After writing scripts for more than 35 movies, he was made a producer. He promoted the conversion to sound by producing *The Jazz Singer* (1927). In 1933 he cofounded Twentieth Century Pictures, which soon merged with the Fox Film Corp. As the controlling executive of TWENTIETH CENTURY-FOX, he produced films such as *The Grapes of Wrath* (1940), *Gentleman's Agreement* (1947), and *Viva Zapata!* (1952). He resigned in 1956, but he returned as president in 1962 to effect the company's financial recovery with hits such as *The Longest Day* (1962), *The Sound of Music* (1965), and *Patton* (1970). He retired as chairman in 1971.

Zanzibar Chief island (pop., 2002: 622,459) of Tanzania. Located in the Indian Ocean off the coast of east-central Africa, it has an area of 637 sq mi (1,651 sq km). Zanzibar city (pop., 2002: 205,870), the island's principal port and commercial centre, is on the western side. Both Zanzibar and Pemba islands are believed to have once formed part of the African continent. In the late 17th century, Zanzibar came under the control of Omani Arabs, and the sultan of Oman made Zanzibar city his capital in 1832. In 1861 Zanzibar was separated from Oman and became an independent sultanate. Under Sultan Barghash (r. 1870–88), most of the mainland territories were lost to European powers. In 1890 the British proclaimed a protectorate over Zanzibar and Pemba islands. In 1963 the sultanate regained its independence and became a member of the COMMONWEALTH. The sultanate was overthrown in 1964, and a republic was established. It then joined with Tanganyika to form the Republic of Tanzania. The economy depends on agriculture and fishing.

Zapata \sä-ˈpä-tä**, Emiliano** (b. Aug. 8, 1879, Anenecuilco, Mex.—d. April 10, 1919, Morelos) Mexican revolutionary and champion of the rural poor. A mestizo peasant, he was orphaned at age 17 and took responsibility for his brothers and sisters. He led his neighbours in protests against the hacienda that had appropriated their land and eventually led them in taking the land by force. He organized a small force to help FRANCISCO MADERO unseat PORFIRIO DÍAZ. Dissatisfied with the pace of LAND REFORM under Madero, Zapata led a guerrilla campaign that took land back from the haciendas and returned it to the communal Indian *EJIDO*s. He was instrumental in the defeat of Gen. VICTORIANO HUERTA after Huerta deposed and assassinated Madero. With PANCHO VILLA he occupied Mexico City and began to implement land reform, but he was tricked, ambushed, and killed by the forces of VENUSTIANO CARRANZA, whom the U.S. had recognized as president.

Zapata, 1912

Zapopan \ˌsä-pō-ˈpän\ City (pop., 2000: 910,690), north-central JALISCO state, west-central Mexico. Located in the Guadalajara River valley, it is

W | X | Y | Z

© 2006 Encyclopædia Britannica, Inc.

a commercial and manufacturing centre for an agricultural area that produces corn, sugarcane, cotton, fruits and vegetables, and livestock. Beekeeping and tourism also contribute to the economy. The 17th-century Basilica of Zapopan is the site of annual pilgrimages.

Zaporizhzhya \ˌzäp-ə-'ri-zhə\ *formerly (until 1921)* **Aleksandrovsk** City (pop., 2001: 815,000), on the Dnieper River in southeastern Ukraine. In 1770 the fortress of Aleksandrovsk was built to ensure government control over the Zaporizhzhya Cossacks, whose headquarters were nearby. The settlement became a town in 1806. The city expanded during the 1927–32 construction of the Dnieper hydroelectric station, then the largest in the world. The dam was destroyed in World War II but was later rebuilt. Zaporizhzhya has a major iron and steel plant; automobiles are also manufactured.

Zapotec \ˌzä-pə-'tek\ Indian population living in the state of Oaxaca, southern Mexico. Early Zapotec civilization, centred on Monte Albán (near the modern city of Oaxaca), produced the first writing in Mesoamerica and devised the 52-year round calendar later borrowed by other groups. Present-day traditional Zapotec society is largely agricultural, and members practice shifting cultivation. The major crafts include pottery and weaving. The Zapotecs profess Roman Catholicism, but belief in spirits and myths persists. See also Mesoamerican civilization.

Zara, Siege of (1202) Major episode of the Fourth Crusade, the first attack on a Christian city by a Crusading army. Zara (modern Zadar, Cro.), a vassal city of Venice, had rebelled and placed itself under Hungary's protection in 1186. Over the objections of Pope Innocent III, the Venetians diverted the Fourth Crusade from Palestine and Egypt, using financial pressure to persuade the Crusaders to besiege Zara. The city soon surrendered, and the army went on to attack Constantinople in 1203–04.

Zaragoza \ˌzä-rä-'gō-sä\ *or* **Saragossa** \ˌsar-ə-'gä-sə\ City (pop., 2001: 614,905), northeastern Spain. The capital of the Aragon autonomous community (*comunidad autónoma*), Zaragoza is located on the southern bank of the Ebro River. The Celtiberian town of Salduba at the site was taken by the Romans at the end of the 1st century BC and made a colony named Caesaraugusta, from which its present name derives. It became an episcopal see in the 3rd century AD, and it was taken by the Moors c. 714. It was the capital of the kingdom of Aragon from the 12th to the 15th century. It underwent two sieges (1808–09) by the French, which were commemorated in Lord Byron's *Childe Harold*. It is an industrial centre and the site of the annual National Trade Fair. Notable buildings include Romanesque and Gothic churches and palaces. Its university was founded in 1474.

Zarathustra See Zoroaster

Zaria \'zär-ē-ə\ *formerly* **Zazzau** Historic kingdom and traditional emirate, northern Nigeria. It was founded in the 11th century and was the southernmost of the original seven Hausa Bakwai states. Islam was introduced c. 1456, and there were Muslim Hausa rulers in the early 16th century. A Songhai warrior conquered Zazzau c. 1512. By the end of the century it was renamed Zaria and was in decline. It became a tributary state (c. 1734–1804) of the Bornu kingdom. In 1804 it came under the Fulani Muslims. The Zaria emirate was created in 1835. It remains one of Nigeria's largest traditional emirates, and it is one of the nation's leading producers of cotton for export.

Zarlino \dzär-'lē-nō**, Gioseffo** (b. March 22, 1517, Chioggia, Rep. of Venice—d. Feb. 14, 1590, Venice) Italian music theorist and composer. In 1541 he was ordained a deacon and moved to Venice to study music with Adrian Willaert (c. 1490–1562). He later took over as chapel master at San Marco Basilica. His influential treatise *Le institutioni harmoniche* (1558) argued for more stringent control of dissonance (while accepting several previously dissonant intervals as consonances) and stricter adherence to unity of mode in a composition. In *Dimonstrationi harmoniche* (1571) he renumbered the church modes, starting with C instead of the traditional A, thus acknowledging the growing relevance of tonality.

zarzuela \ˌzär-'zwā-lə\ Spanish musical play consisting of spoken dialogue, songs, choruses, and dances. Zarzuela originated in the 1650s as an aristocratic entertainment, the first being performed at the royal residence of La Zarzuela near Madrid. The principal early composer was Juan Hidalgo (1614–85); early librettists included Lope de Vega and Pedro Calderón de la Barca. As Italian opera rose in popularity in the 18th century, the zarzuela adopted aspects of *opera seria* style but suffered a decline. It was revived c. 1840 as a satirical treatment of everyday life incorporating folk music, dance, and improvisation. Since 1940 few new works have been written.

Zátopek \'tsä-tō-ˌpek**, Emil** (b. Sept. 19, 1922, Kopřivnice, Czech.—d. Nov. 22, 2000, Prague, Cz.Rep.) Czech long-distance runner. He won his first Olympic gold medal in 1948 in the 10,000-m race. At the 1952 Olympics he won gold medals in the 5,000-m, 10,000-m, and marathon. From the mid-1940s to the mid-1950s he set 18 world records, and he held the record for the 10,000-m from 1949 to 1954.

zazen \'zä-'zen\ Sitting meditation as practiced in Zen Buddhism. The disciple sits in a quiet room, breathing rhythmically and easily, with legs fully or half crossed, spine and head erect, hands folded one palm above the other, and eyes open. Logical, analytic thinking is suspended, as are all desires, attachments, and judgments, leaving the mind in a state of relaxed attention. The practice was brought to prominence by Dogen, who considered it not only to be a method of moving toward enlightenment but also, if properly experienced, to constitute enlightenment itself. See also koan.

Zealand See Sjaelland

Zeami \zā-'ä-mē\ *or* **Seami** *or* **Kanze Motokiyo** (b. 1363, Japan—d. Sept. 1, 1443, Kyōto?) Japanese playwright and theorist of the nō theatre. Under the patronage of the shogun Ashikaga Yoshimitsu, Zeami joined with his father, Kan'ami (1333–84), to create the *nō* theatre in its present form. He is credited with about 90 (and most of the greatest) of the approximately 230 plays in the present repertoire. In treatises written as manuals for his pupils, notably *Fushi kaden* (1400–18; "The Transmission of the Flower of Acting Style"), he set forth principles of *nō* theatre that were followed for centuries.

zebra Any of three species of black-and-white-striped equines that subsist almost entirely on grass. Zebras stand 47–55 in. (120–140 cm) tall. The Burchell's zebra, or bonte quagga (*Equus quagga*), of eastern and southern African grasslands, has wide, widely spaced stripes. Grevy's zebra (*E. grevyi*), of arid areas in Kenya, Ethiopia, and Somalia, has narrow, closely spaced stripes and a white belly. The small mountain zebra (*E. zebra*), of dry upland plains in Namibia and western South Africa, has a gridlike pattern on the rump. Small zebra groups consisting of a stallion and several mares and foals may coalesce into large herds but retain their identity.

Burchell's zebra, or bonte quagga (*Equus quagga*)
LEONARD LEE RUE III

zebra fish Any member of two unrelated groups of fishes: freshwater species in the genus *Brachydanio* (family Cyprinidae) and saltwater species in the genus *Pterois* (family Scorpaenidae). The zebra danio (*Brachydanio rerio*), a popular freshwater aquarium fish originally from Asia, grows to about 1.5 in. (4 cm) long and has dark blue and silvery longitudinal stripes. The distinctive saltwater zebra fishes (*Pterois*), used in marine aquariums, have extremely large pectoral fins, numerous extremely poisonous spines, and colourful vertical stripes. Some species are more commonly known as lionfish and turkeyfish.

zebra mussel Either of two species of tiny mussels (genus *Dreissena*) that are prominent freshwater pests. They proliferate quickly and adhere in

© 2006 Encyclopædia Britannica, Inc.

great numbers to virtually any surface. The voracious mussels disrupt food webs by wiping out PHYTOPLANKTON, and their massive clustering on water-intake valves and pipes, bridge abutments, and other structures can cause severe commercial damage. They made their first known attack on Europe in the early 19th century and were carried (probably in ship water ballasts) to North America c. 1986; their invasion of all the Great Lakes has had devastating effects on the lakes' native mussel and fish populations.

zebu See BRAHMAN

Zechariah \ˌzek-ə-ˈrī-ə\ (fl. 6th century BC) One of the 12 Minor Prophets of the Hebrew scriptures, whose prophecies are recorded in the book of Zechariah. (The work is part of a larger book, The Twelve, in the Jewish canon.) His visions concern the return of the Jews to Jerusalem after the BABYLONIAN EXILE, the rebuilding of the Temple of JERUSALEM, and the world's recognition of Israel's God. The book also includes his apocalyptic visions of the end of time.

Zedillo \sā-ˈdē-yō\ **(Ponce de León), Ernesto** (b. Dec. 27, 1951, Mexico City, Mex.) President of Mexico (1994–2000). Raised in a working-class family, he joined Mexico's ruling party in 1971 and earned a Ph.D. in economics from Yale University. As secretary of the Ministry of Programming and Budget, he controlled Mexico's huge foreign debt, reduced inflation, and balanced the budget. Elected president after the assassination of the original PRI (Institutional Revolutionary Party) candidate, Luis Donaldo Colosio, he undertook reforms to reduce poverty, root out corruption, and continue democratizing the electoral system. His devaluation of the peso in 1994 led to an economic crisis that was turned around with massive U.S. aid. A rebellion in CHIAPAS plagued his administration, which was charged with human-rights abuses in that region.

Zee, James Van Der See James VAN DER ZEE

Zeeman \ˈzā-ˌmän\ **effect** Splitting of a spectral line (see SPECTRUM) into two or more lines of different FREQUENCIES. The effect occurs when the light source is placed in a MAGNETIC FIELD. It has helped identify the energy levels in atoms; it also provides a means of studying atomic nuclei and electron paramagnetic resonance (see MAGNETIC RESONANCE) and is used in measuring the magnetic field of the Sun and other stars. It was discovered in 1896 by Pieter Zeeman (1865–1943); he shared the second Nobel Prize for Physics (1902) with HENDRIK ANTOON LORENTZ, who had hypothesized that a magnetic field would affect the frequency of the light emitted.

Ẕefat \ˈtse-ˌfät\ City (pop., 2004 est.: 27,300), northern ISRAEL. Located near Lake TIBERIAS (Sea of Galilee), it is one of the four holy cities of JUDAISM. It was fortified in the 1st century AD by FLAVIUS JOSEPHUS and in the Middle Ages by the Crusaders (see CRUSADES). It was the seat of an important school of Jewish mysticism (see KABBALA) in the 16th century, and it became part of the modern State of Israel in 1948. It is now an artists' colony, with an economy based on light industry and tourism.

Zeffirelli \ˌze-fə-ˈre-lē**, Franco** *orig.* **Gianfranco Corsi** (b. Feb. 12, 1923, Florence, Italy) Italian director, producer, and stage designer. In 1946 he joined LUCHINO VISCONTI's Morelli-Stoppa Co. as an actor and stage director. After serving as Visconti's assistant on films such as *La terra trema* (1948), he turned to stage design. His major operatic productions, noted for their visual richness, began with *L'Italiana in Algeri* (1952–53) and include *Lucia di Lammermoor* (1959) and *La Bohème* (1963, 1981), among many others; he directed films of *La traviata* (1983) and *Otello* (1986). His other films include *The Taming of the Shrew* (1967), *Romeo and Juliet* (1968), *Endless Love* (1981), *Jane Eyre* (1996), and *Tea with Mussolini* (1999).

Zeiss \ˈtsīs,\ *English* \ˈzīs**, Carl** (b. Sept. 11, 1816, Weimar, Thuringian States—d. Dec. 3, 1888, Jena) German industrialist. In 1846 Zeiss opened a workshop for producing microscopes and other optical instruments. He later formed a partnership with the physicist and mathematician Ernst Abbe (1840–1905). The chemist Otto Schott developed about 100 new kinds of optical glass and numerous types of heat-resistant GLASS for the company. After Zeiss's death, Abbe donated the firm and his share in the glassworks to the Carl Zeiss Foundation; in 1923 Schott added his share in the glassworks.

Zemes māte \ˈze-mes-ˈmä-te\ In BALTIC RELIGION, the female aspect of nature and the source of all life. Together with DIEVS, she stimulates and protects the power of life. Libations of beer were offered to her at the opening of every festival, and bread, ale, and herbs were buried in the ground, thrown into rivers and lakes, or tied to trees in her honour. Her various functions were eventually assumed by demigoddesses of forests, fields, stones, animals, water, and, in the Christian era, by the Virgin MARY.

zemstvo \ˈzemst-və\ *plural* **zemstvos** Rural elected assembly in the Russian Empire. Established by Tsar ALEXANDER II in 1864 to provide social and economic services, the zemstvos became a liberal influence in imperial Russia. The assemblies, formed at the district and province levels, were composed of delegates representing the landed proprietors and the peasant village communes. They expanded education, improved roads, and provided health care. From the 1890s they agitated for constitutional reform, and they stimulated activity in the Russian Revolutions of 1905 and 1917 (see RUSSIAN REVOLUTION OF 1905; RUSSIAN REVOLUTION OF 1917). They were abolished after the BOLSHEVIKS came to power. The term *zemstvo* also refers to a 16th-century institution for tax collection.

Zen Important school of BUDDHISM that claims to transmit the experience of enlightenment achieved by the BUDDHA Gautama. Arising as Chan in China in the 6th century (introduced by BODHIDHARMA), it divided into two schools, the Southern school, which believed in sudden enlightenment, and the Northern school, which believed in gradual enlightenment. By the 8th century only the Northern school survived. Zen developed fully in Japan by the 12th century and had a significant following in the West by the later 20th century. Zen teaches that the potential to achieve enlightenment is inherent in everyone but lies dormant because of ignorance. It is best awakened not by the study of scripture, the practice of good deeds, rites and ceremonies, or worship of images, but by breaking through the boundaries of mundane logical thought. Methods employed vary among different schools and may emphasize the practice of ZAZEN (in the Soto school), the use of KOANS (in the Rinzai school), or the continual invocation of Amida (in the Obaku school; see AMITABHA).

Zend-Avesta See AVESTA

Zeng Guofan *or* **Tseng Kuo-fan** \ˈdzən-ˈgwō-ˈfän\ (b. Nov. 26, 1811, Xiangxiang, Hunan province, China—d. March 12, 1872, Nanjing) Chinese military leader most responsible for suppressing the TAIPING REBELLION, thus staving off the collapse of the QING DYNASTY. Having passed the highest examinations in the CHINESE EXAMINATION SYSTEM, Zeng entered the HANLIN ACADEMY and worked successfully as a bureaucrat. In 1852 he was asked to help combat the Taiping rebels, who had reached the Yangtze River (Chang Jiang) valley and were threatening the dynasty's survival. The imperial troops being weak, Zeng and other members of the scholar-gentry organized local militias. His army seized the rebels' supply areas along the upper Yangtze and besieged and captured their capital, Nanjing, in 1864. In 1865 he was called on to help suppress the NIAN REBELLION; a year later he asked that LI HONGZHANG take over the campaign. See also ZHANG ZHIDONG.

Zenger, John Peter (b. 1697, Germany—d. July 28, 1746, New York, N.Y.) German-born U.S. printer and journalist. He immigrated to New York at age 13 and was indentured to a printer before starting his own printing business (1726). In 1733 he began publishing the *New York Weekly Journal*. Arrested for libel in 1734 for his attacks on the policies of the colonial governor, he was acquitted on the grounds that his charges were based on fact (a key consideration in libel cases since that time). It was the first important victory for freedom of the press in Britain's North American colonies.

Zeno \ˈzē-nō\ *orig.* **Tarasicodissa** (b. Isauria, Diocese of the East—d. April 9, AD 491) Eastern Roman emperor (474–491). A military leader, he married the daughter of Emperor Leo I (c. 466), and their son reigned briefly as Leo II (474). On the boy's early death, Zeno became emperor. Obliged to flee to Isauria to escape a coup d'état, he returned to Constantinople in 476. He made peace with the VANDALS in Africa, put down a rebellion in Asia Minor (484), and persuaded the OSTROGOTHS to leave the Eastern Empire by making THEODORIC king of Italy (489). Seeking to reconcile orthodox Christians and MONOPHYSITES, he caused a schism with Rome (484–519).

Zeno of Citium \ˈzē-ˌnō...ˈsi-sh(ē-)əm\ (b. c. 335, Citium, Cyprus—d. c. 263 BC, Athens) Greek philosopher, founder of STOICISM. He went to Athens c. 312 BC and attended lectures by the Cynics Crates of Thebes (fl. late 4th century BC) and Stilpon of Megara (c. 380–300 BC), as well as lectures at the Academy. He began to teach in the Stoa Poikile ("Painted Colonnade"), whence the name of his philosophy. His system included logic, epistemology, physics, and ethics. He taught that happiness lies in conforming the will to the divine reason, which governs the universe. In

© 2006 Encyclopædia Britannica, Inc.

logic and epistemology he was influenced by Antisthenes (c. 445–365 BC) and Diodorus Cronus (fl. 4th century BC), in physics by HERACLEITUS. Only fragmentary quotations from his many treatises have survived.

Zeno of Elea \'ē-lē-ə\ (b. c. 495—d. c. 430 BC) Greek philosopher and mathematician. He was called by ARISTOTLE the inventor of dialectic. He is best known for his paradoxes (see PARADOXES OF ZENO). As a pupil and friend of PARMENIDES, he took it upon himself to reply to those who asserted that his master's doctrine of "the one" (i.e., indivisible reality) was inconsistent (see MONISM); he tried to show that the assumption of the existence of "the many" (i.e., a plurality of things in time and space) carried with it more serious inconsistencies.

Zenobia \zə-'nō-bē-ə\ *in full* **Septimia Zenobia** (d. AD after 274) Queen of the Roman colony of PALMYRA (267/268–272). Her husband, a Roman client ruler of Palmyra, was assassinated after recapturing several of Rome's eastern provinces from the Persians. She became her son's regent but called herself queen. In 269 she seized Egypt and much of Asia Minor and declared her independence from Rome. AURELIAN defeated her armies and besieged Palmyra; she and her son were captured and taken to Rome (272), where she was paraded in Aurelian's TRIUMPH.

zeolite \'zē-ə-ˌlīt\ Any member of a family of hydrated aluminosilicate minerals that have a framework structure enclosing interconnected cavities occupied by large metal cations (positively charged ions)—generally sodium, potassium, magnesium, calcium, and barium—and water molecules. The ease of movement of ions and water within the framework allows reversible dehydration and cation exchange, properties that are exploited in water softeners and molecular sieves for pollution control, among other uses.

zeolitic facies \ˌzē-ə-'li-tik-'fā-shēz\ One of the major divisions of the mineral facies classification of METAMORPHIC ROCKS, encompassing rocks that formed at the lowest temperatures and pressures associated with regional metamorphism. Typical minerals in these facies include the ZEOLITES, ALBITE, and QUARTZ.

Zephaniah (fl. 7th century BC) One of the 12 Minor Prophets of the Hebrew scriptures, traditional author of the book of Zephaniah. (The work is part of a larger book, The Twelve, in the Jewish canon.) He prophesied in the reign of JOSIAH, denouncing the worship of foreign gods, which suggests that he preached before the reforms instituted by Josiah. His dominant theme is the coming "day of the Lord," a time of divine judgment for Judah's sins.

zeppelin Rigid AIRSHIP of a type designed by the German builder Ferdinand, Graf (count) von Zeppelin (1838–1917). It was a cigar-shaped, trussed, and covered frame supported by internal gas cells, below which hung two external cars with an engine geared to two propellers. The first zeppelin flew in 1900. In World War I zeppelins were used as bombers by Germany. In 1928 the *Graf Zeppelin* inaugurated transatlantic flight service; it had completed 590 flights by 1937, when the *HINDENBURG* DISASTER halted such flights.

zero NUMBER and numeral of critical importance in mathematics. Zero is known as the additive identity because adding it to any number does not change the number's identity, or value. The product of zero and any number is zero; for most number systems the converse is true—that is, if the product of two numbers is zero, at least one of them must equal zero. The latter property is fundamental to the solution of nearly every problem in mathematics. Division by zero is undefined; efforts to deal with such divisions led to CALCULUS. Various punctuation marks were first used in Mesopotamia beginning about 700 BC to indicate an empty space in positional notation, but never at the end of a number—the difference between, say, 78 and 780 had to be understood from the context. PTOLEMY first used 0, or the Greek letter omicron "o," as an empty placeholder, including at the end of a number, to express data in the Babylonian sexagesimal system in his astronomical treatise *Almagest* (c. 130 AD). The HINDU-ARABIC NUMERALS and treatment of zero as a number developed between the 6th and 9th centuries in India. Zero soon followed trade routes to China, the Islamic world, and Europe.

Zero *in full* **Mitsubishi A6M Zero** Japanese FIGHTER AIRCRAFT of World War II. A single-seat, low-wing monoplane made by Mitsubishi, it was introduced in 1940, the 2,600th anniversary of the crowning of Japan's legendary first emperor, JIMMU, and named for the "zero-year" celebration. It had a top speed of 350 mph (565 kph) at nearly 20,000 ft (6,000 m). When it first appeared, it could outmaneuver every plane it encountered; Allied fighters could not defeat it until 1943. Many Zeros became KAMIKAZE craft in the war's closing months.

zero-point energy Vibrational energy retained by molecules even at a temperature of ABSOLUTE ZERO. Since temperature is a measure of the intensity of molecular motion, molecules would be expected to come to rest at absolute zero. However, if molecular motion were to cease altogether, the atoms would each have a precisely known location and VELOCITY (zero), and the UNCERTAINTY PRINCIPLE states that this cannot occur, since precise values of both position and velocity of an object cannot be known simultaneously. Thus, even molecules at absolute zero must have some zero-point energy.

Zeroual \zer-'wäl**, Liamine** (b. July 3, 1941, Batna, Alg.) President of Algeria (1994–99). After a military education, he rose through the ranks to become chief of land forces in 1989 and defense minister in 1993. In 1994 he was appointed transitional president by the military-dominated High Council of State, which had taken over the government after elections were canceled in 1992 and Pres. MOHAMED BOUDIAF was assassinated. Elected for a full term in 1995, he was replaced in 1999 by Abdelaziz Bouteflika.

Zetkin \'tset-kən**, Clara** *orig.* **Clara Eissner** (b. July 5, 1857, Wiederau, Saxony—d. June 20, 1933, Arkhangelskoye, Russia, U.S.S.R.) German communist leader. She joined the Social Democratic Party in 1881, and she later married a Russian revolutionary exile, Ossip Zetkin (1848–89). From 1892 she edited the Socialist women's newspaper *Die Gleichheit* ("Equality") in Stuttgart. A friend of VLADIMIR LENIN and ROSA LUXEMBURG, Zetkin was a cofounder of the SPARTACISTS (1916) and later joined the new Communist Party of Germany (1919). In 1921 she was elected to the presidium of the Third International (see COMINTERN). Her influence waned after Lenin's death in 1924.

Zeus \'züs\ In GREEK RELIGION, the chief deity of the pantheon, a sky and weather god. His Roman counterpart was JUPITER. Zeus was regarded as the bearer of thunder and lightning, rain, and winds, and his traditional weapon was the thunderbolt. The son of CRONUS and RHEA, he was fated to dethrone his father. He divided dominion over the world with his brothers POSEIDON and HADES. As ruler of heaven, Zeus led the gods to victory against the TITANS. From his home atop Mount OLYMPUS, he dispensed justice and served as protector. Known for his amorousness—a source of perpetual discord with his wife, HERA—he had many love affairs with mortal and immortal women, giving rise to numerous offspring, including APOLLO, ARES, ARTEMIS, ATHENA, DIONYSUS, HELEN, HEPHAESTUS, and PERSEPHONE. In art he was represented as a bearded, dignified, and mature man.

Zeuxis \'zük-səs\ (fl. late 5th century–early 4th century BC, Heraclea, Magna Graecia) Greek painter. Though none of his work survives, his style and subject matter were recorded by ancient writers. He advanced the trend toward illusionism through the use of shadow to produce a rudimentary form of CHIAROSCURO. Apparently he was a panel painter rather than a wall painter. He preferred small compositions, often a single figure; his subjects were gods and heroes and such genre figures as an old woman, an athlete, and a still life.

Zhang Daoling *or* **Chang Tao-ling** \'jäŋ-'daù-'liŋ\ (b. AD 34?, Pei, Jiangsu province, China—d. 156?, Hanzhong) Founder and first patriarch of organized religious Daoism. Zhang composed a Daoist work that attracted many followers among Chinese and indigenous groups in Sichuan. Like contemporary Daoists, he promised longevity and physical immortality, but, unlike others, he emphasized the importance of religious organization. He founded the FIVE PECKS OF RICE movement. Zhang, his son, and his grandson are known as the Three Zhangs. While the DAODEJING was the basic text, Zhang's *Xiang'er* commentary interpreted it to suit the organization's needs.

Zhang Daqian *or* **Chang Ta-ch'ien** (b. May 10, 1899, Neijiang, Sichuan province, China—d. April 2, 1983, Taipei, Taiwan) Chinese painter and collector. As a young man, he meticulously studied and copied the works of ancient masters; he gained notoriety in Shanghai for his forgeries. Zhang extended his career to the north in the late 1920s, when he became active in the cultural circles of Beijing. He began to collaborate with the well-known Beijing painter Pu Xinyu, and together they became known as "South Zhang and North Pu." In 1940 Zhang led a group of artists to the caves of Mogao and Yulin for the purpose of copying their Buddhist wall paintings. The group completed over 200 paintings, and the experience left Zhang with a repository of religious imagery. During this period he became particularly known for his lotus paintings, inspired by works from the Tang-Song era. In reaction to the political climate, Zhang left China in the early 1950s and traveled throughout the world. He developed eye problems in the late 1950s, and, as his eyesight deteriorated, he developed his mature splashed-colour (*pocai*) style. His work in this style fetched the highest market prices for contemporary Chinese paintings at international auctions of the time.

Zhang Juzheng *or* **Chang Chü-cheng** \'jäŋ-'jü-'jəŋ\ (b. 1525, Jiangling, Hubei province, China—d. 1582, Beijing) Powerful Chinese minister of the MING DYNASTY under the Longqing and Wanli emperors. His benevolent rule and strong foreign and economic policies are considered to have brought the Ming dynasty to its peak. He is credited with centralizing government, limiting special privileges, and reclaiming tax-exempt land.

Zhang Yimou \'jäŋ-'yē-'mō\ (b. Nov. 14, 1950, Xi'an, China) Chinese film director. He began his film career as a cinematographer, and his work for Chen Kaige's *The Yellow Earth* (1983) helped launch the "Fifth Generation," filmmakers who brought back sensuality and emotion to Chinese movies. Zhang made his directorial debut with *Red Sorghum* (1987), which starred Gong Li in the first of her acclaimed roles. Noted for his technical mastery, he also directed films such as *Ju Dou* (1990), *Raise the Red Lantern* (1991), *The Story of Qiu Ju* (1992), *To Live* (1994), and *Hero* (2002).

Zhang Zai *or* **Chang Tsai** \'jäŋ-'dzī\ (b. 1020, Chang'an, China—d. 1077, China) Realist philosopher of the SONG DYNASTY. The son of a magistrate, he studied Buddhism and Daoism before being inspired by the Confucian classics. In his *Cheng-meng*, he declared the universe a unity with myriad aspects and all existence an eternal integration and disintegration. REN (humaneness) is the basic virtue, and morality consists in doing one's duty as a member of society and of the universe.

Zhang Zhidong *or* **Chang Chih-tung** \'jäŋ-jir-'dòŋ\ (b. Sept. 2, 1837, Xingyi, Guizhou province, China—d. Oct. 4, 1909) Chinese classicist and one of the foremost reformers of his time. From 1862 to 1882 he was a scholar and educational director; from 1882 to 1907 he rose from a provincial to a national leader. He supported the dowager empress CIXI, who in turn favoured him with many promotions. Concerned with rejuvenating China, he searched for a way for China to survive in the modern world that could accommodate Western knowledge but preserve traditional ways. His attempt to launch China's first iron-and-steel works failed, but he later built a railway that extended from Hankou to near Beijing, and he founded a mint, tanneries, tile and silk factories, and paper, cotton, and wool mills. In response to China's defeat in the SINO-JAPANESE WAR, Zhang turned his attention to education, encouraging study abroad for Chinese students, establishment of a school system, translation of Western and Japanese books, and acquisition of knowledge from foreign newspapers. He also urged that civil service examinations be abolished, which occurred in 1905. See also ZENG GUOFAN.

Zhang Zuolin *or* **Chang Tso-lin** \'jäŋ-dzò-'lin\ (b. March 19, 1875, Haicheng, Liaoning province, China—d. June 4, 1928, Shengyang, Liaoning) Chinese warlord. After fighting in the SINO-JAPANESE WAR (1894–95), Zhang organized a self-defense militia in his native district. By 1912 he was in command of a division, and he set out to dominate MANCHURIA (northeastern China), relying on the tacit support of the Japanese, to whom he granted concessions in Manchuria. In 1918 he became inspector general of Manchuria's three provinces, which he ruled as a virtually autonomous state. In 1920 he pushed south into China proper and in 1924 took Beijing, but his troops had to abandon their position in the face of CHIANG KAI-SHEK's 1927 NORTHERN EXPEDITION. Zhang was killed by a bomb planted by Japanese extremists who hoped his death would provoke the Japanese into occupying Manchuria.

Zhao Youqin (b. July 26, 1271, Poyang, China—d. c. 1335, Longyou Mountains, Zhejiang province) Chinese astronomer, mathematician, and Daoist philosopher. He was one of the patriarchs of the northern branch of the Quanzhen ("Complete Perfection") sect of Daoism. His astronomical treatise *Gexiang xinshu* ("New Writing on the Symbol of Alteration") presents his cosmological theory featuring a flat Earth inside a spherical Heaven, his explanation of the lunar and solar eclipses, and his experiments with a camera obscura. The book also describes his methods of remote surveying with gnomons to measure the distance from the Earth to the Sun, the Moon, and the stars, as well as his procedure for calculating the value of π. His *Xian Fo tongyuan* ("On the Common Origins of [the Teachings of] Transcendentals and Buddhas") is devoted to the "Inner Alchemy," an esoteric discipline focusing on the attainment of immortality via respiratory and meditative practices.

Zhdanov \'shtä-nòf**, Andrey (Aleksandrovich)** (b. Feb. 26, 1896, Mariupol, Ukraine, Russian Empire—d. Aug. 31, 1948, Moscow, Russia, U.S.S.R.) Soviet politician. He joined the Bolsheviks in 1915 and became a leading member of the Politburo (1939) and Communist Party secretary in Leningrad. A close associate of JOSEPH STALIN, he formulated the extreme anti-Western cultural policy known as "Zhdanovism" (1946), which imposed strict government control on art and literature and soon affected all intellectual activity in the Soviet Union. In 1947 he founded the propaganda bureau COMINFORM.

Zhejiang \'jə-'jyäŋ\ *or* **Che-chiang** *conventional* **Chekiang** Province (pop., 2000 est.: 46,770,000), eastern China. With an area of 39,300 sq mi (101,800 sq km), it is bounded by the CHINA SEA, SHANGHAI municipality, and FUJIAN, JIANGXI, ANHUI, and JIANGSU provinces; its capital is HANGZHOU. It is one of China's smallest provinces and one of the most densely populated. Its northern part lies just south of the YANGTZE RIVER (Chang Jiang) delta. Occupying parts of various kingdoms until the 13th century AD, it was divided in the 1270s into eastern and western regions. Foreign penetration began in the 1840s. After the Chinese revolution (1911–12), it became a power base for the Nationalist Party of CHIANG KAI-SHEK, who was born in the province. Occupied by the Japanese during World War II, it was little affected by the 1946–49 civil war. In addition to its agricultural importance, it has a thriving fishing industry. Its hydroelectric power plants have spurred more growth.

Zheng Chenggong *or* **Cheng Ch'eng-kung** \'jəŋ-'chəŋ-'gùŋ\ *or* **Koxinga** \käk-'siŋ-ə\ (b. Aug. 28, 1624, Hirado, Japan—d. June 23, 1662, Taiwan) Chinese military leader of the late MING and early QING dynasties. After the Ming dynasty fell to the MANCHU, Zheng refused Manchu offers of rank and power and launched a military campaign against the new dynasty in 1659, taking a large force from his base in Fujian province up the Yangtze River (Chang Jiang). Initial success turned into failure, but, undaunted, Zheng took Taiwan from the Dutch in 1662 to use as a secure rear base area. Further glory was cut short by his death later that year. He became a popular deity and cultural hero to the Chinese on Taiwan, and even the Qing court honoured him as a paragon of loyalty. In Japan the playwright CHIKAMATSU MONZAEMON celebrated him on the stage (Zheng had a Japanese mother), and in the 20th century both Chinese communists and Nationalists embraced him as a national hero.

Zheng He *or* **Cheng Ho** \'jəŋ-'he\ *orig.* **Ma Sanbao** (b. c. 1371, Kunyang, Yunnan province, China—d. April 1433, Calicut, India) Eunuch admiral and diplomat who helped extend Chinese maritime and commercial influence throughout the region bordering on the Indian Ocean.The YONGLE EMPEROR named Zheng commander in chief of missions to the "Western Oceans." He first set sail in 1405 and on this mission visited Champa (southern Vietnam), Siam (Thailand), Malacca, and Java, traveled through the Indian Ocean as far as Sri Lanka, and returned to China in 1407. Subsequent voyages took him to Arabia, the eastern coast of Africa, Southeast Asia, and India. Chinese emigration increased in the

© 2006 Encyclopædia Britannica, Inc.

wake of these missions, resulting in Chinese colonization of Southeast Asia and consequent tributary trade that lasted into the 19th century.

Zhengzhou \'jəŋ-'jō\ *or* **Cheng-chou** *formerly (1913–49)* **Zhengxian** \'jəŋ-'shyen\ *or* **Cheng-hsien** City (pop., 1999 est.: 1,465,069), capital of Henan province, east-central China. Located south of the Huang He (Yellow River), it is an important rail centre. There were Neolithic settlements in the area, and the Shang Bronze Age culture (fl. c. 1500 BC) was centred there on a walled city. Zhou-dynasty tombs have also been discovered. The city was first called Zhengzhou in AD 605, and it has been known by that name virtually ever since. It achieved its greatest importance in the 6th–12th centuries, when it was the terminus of a canal that joined the Huang to the north. In the early 20th century it became a rail junction and a regional agricultural centre. Since 1950 its industrial base has greatly expanded, and its population has grown considerably.

Zhivkov \'zhiv-ˌkȯf**, Todor (Khristov)** (b. Sept. 7, 1911, Pravets, near Botevgrad, Bulg.—d. Aug. 5, 1998, Sofia) Bulgarian politician. The son of poor peasants, he drifted to the Bulgarian capital of Sofia in his youth and, in the late 1920s, joined the Komsomol, the youth league of the outlawed Communist Party. During World War II he organized a resistance movement, and after the war, he held posts in the Soviet-sponsored government, including head of the People's Militia. He became first secretary of the Bulgarian Communist Party in 1954, the youngest leader in the Soviet bloc, then served as premier (1962–71) and president (1971–89). He hewed closely to the Soviet line but encouraged industrialization and improved the country's living standard. When democratization reached Bulgaria, Zhivkov resigned (1989). Convicted of embezzlement, he was sentenced to house arrest in 1992.

Zhiyi *or* **Chih-i** \'jir-'ē\ (b. 538, Hunan province, China—d. 597, Mount Tiantai, Zhejiang province) Chinese Buddhist monk who founded the eclectic Tiantai sect. Orphaned at age 17, he studied with the Buddhist master Huisi for seven years. He was associated with the imperial governments of the Chen dynasty in southern China and the Sui dynasty, which reunified China. He reconciled the various strains of Buddhism by regarding all Buddhist doctrines as true and present in the mind of the enlightened Buddha, who unfolded his teachings in periods to accommodate his listeners' capacities. He considered the Lotus Sutra the highest teaching and helped establish it as the most popular scripture in East Asia.

Zhongyong *or* **Chung yung** \'jùŋ-'yùŋ\ *or* **Doctrine of the Mean** One of four ancient Confucian texts known as the Four Books, published together in 1190 by Zhu Xi. Its metaphysics had interested Buddhists and earlier Neo-Confucianists. Zhu Xi attributes the work to Confucius' grandson Zi Si, though it was actually part of *Liji* ("Book of Rites"), one of the Five Classics. *Zhongyong* expresses an ideal of moderation, rectitude, and lack of prejudice that should encompass virtually every relationship and activity in life.

Zhou dynasty *or* **Chou** \'jō\ **dynasty** (1046–256 BC) Ancient Chinese dynasty that gave China its historically identifying political and cultural characteristics. The period before 771 BC is known as the Western Zhou; the period from 771 BC on is called the Eastern Zhou and is further divided into the Spring and Autumn period (770–476) and the Warring States period (475–221). During the Zhou dynasty, iron, ox-drawn plows, crossbows, and horseback riding were introduced; large-scale irrigation projects were instituted; the Chinese writing system was further developed; and the great Chinese philosophers of antiquity, including Confucius, Mencius, and Zhuangzi, lived and taught. Pottery and bronzework expanded on the traditions of the earlier Shang dynasty, as did work in jade and lacquer.

Zhou Enlai *or* **Chou En-lai** \'jō-'en-'lī\ (b. March 5, 1898, Huai'an, Jiangsu province, China—d. Jan. 8, 1976, Beijing) Chinese communist leader, premier from the founding of the People's Republic of China until his death (1949–76). Zhou became a communist during his studies abroad in France and was an organizer for the Chinese Communist Party in Europe. Like other communists, he worked with the Nationalists in the early 1920s and escaped capture when Chiang Kai-shek purged his former allies in 1927. He joined Zhu De and Mao Zedong in Jiangxi province and became political commissar of the Red Army. In the 1930s he negotiated a tactical alliance with the Nationalists to resist Japanese aggression. When the communists prevailed over the Nationalists in 1949, Zhou became premier of the new People's Republic of China. During the Cultural Revolution, Zhou helped restrain extremists; as the revolution waned in the early 1970s, he sought to restore Deng Xiaoping and other moderates to power. He is credited with arranging the historic meeting between U.S. Pres. Richard Nixon and Mao that paved the way for U.S. recognition of the communist government.

Zhougong *or* **Chou-kung** \'jō-'gùŋ\ (fl. 11th century BC, China) Political figure who solidified the power of the Zhou dynasty. On the death of his brother Wuwang, founder of the Zhou, he resisted the temptation to seize the throne and chose instead to serve as counselor to his nephew, the second Zhou ruler. When Zhougong stepped down after seven years, the Zhou political and social system had been stabilized. Confucius so admired Zhougong's wisdom and virtue as a minister, that he proffered him as a model for rulers of his own time to emulate.

Zhoukoudian \'jō-kōd-yən\ *or* **Chou-k'ou-tien** Archaeological site some 26 mi (42 km) southwest of Beijing, China, where fossil remains of the extinct hominin *Homo erectus* have been found. So-called Peking man was identified as a new fossil human by Canadian anthropologist Davidson Black in 1927 and variously classified as *Pithecanthropus* and *Sinanthropus* before being assigned to *H. erectus*. Partial remains of about 40 individuals along with more than 100,000 artifacts have been uncovered, making Zhoukoudian one of the most important *H. erectus* sites in the world. Its strata date to 550,000–230,000 years ago. It was named a World Heritage site in 1987.

Zhu De *or* **Chu Teh** \'jü-'de\ (b. Dec. 1, 1886, Yilong, Sichuan province, China—d. July 6, 1976, Beijing) Founder of the Chinese communist force that became the People's Liberation Army. Educated at Yunnan Military Academy, Zhu began his military career in the armies of warlords in southern China. He became a communist in the early 1920s but hid his affiliation to become an officer in the Nationalist army. In 1927 he took part in the communist-led Nanchang Uprising, an event celebrated annually in China as the birth of the People's Liberation Army. When the uprising was defeated, Zhu led his troops south to join Mao Zedong's small guerrilla forces. He became commander in chief of the communist forces, a position he held through World War II and the civil war with the Nationalists, not stepping down until 1954. With Mao, Zhu is credited with elevating guerrilla warfare to a major strategic concept.

Zhu Rongji \'jü-rȯŋ-'jē\ *or* **Chu Jung-chi** (b. Oct. 23, 1928, Changsha, Hunan province, China) Premier of the State Council of China (1998–2003). In the 1950s he was denounced as a rightist, and he was purged again in the 1970s, but, once his Communist Party membership was restored, he rose rapidly. In 1988 he became mayor of Shanghai and in 1991 a deputy premier of the State Council. He was governor of the People's Bank of China (1993–95) and became director of the Institute for Economic Management at Qinghua University in 1994. He was appointed premier in 1998. In the face of the Asian economic crisis at the end of the 1990s, he worked to drastically cut back the size of the government bureaucracy. Zhu, whose economic policies have been both praised and criticized, stepped down as premier in 2003 and was replaced by Wen Jiabao.

Zhu Shijie (fl. 1300, China) Chinese mathematician who stood at the pinnacle of traditional Chinese mathematics. Zhu is known for having unified the southern and northern Chinese mathematical traditions. His fame rests on two publications, *Suanxue qimeng* (1299; "Introduction to Mathematical Science") and *Siyuan yujian* (1303; "Precious Mirror of Four Elements"). The former is an introductory mathematics textbook; following the southern Chinese tradition, it presents many rules and problems in the form of verses to facilitate their memorization. It played a central role in the development of the *wasan* ("Japanese calculation") tradition. "Precious Mirror" corresponds to the final stage in the generalization of the northern Chinese technique of *tian yuan* ("method of the celestial unknown"), a kind of algebraic computation performed with counting rods to solve problems.

Zhu Xi *or* **Chu Hsi** \'jü-'shē\ (b. Oct. 18, 1130, Yu-hsi, Fukien province, China—d. April 23, 1200, China) Chinese philosopher and proponent of Neo-Confucianism. The son of a minor government official, he was educated in the Confucian tradition and entered government service. Interested in history, he revised Sima Guang's famous history so that it would illustrate moral principles in government. In 1189 he began a commentary on the Daxue; he continued working on the *Daxue* all his life. Philosophically, his thought incorporated the ideas of Cheng Hao and Cheng Yi, Zhou Dunyi (1017–1073), and Zhang Zai, whose works he compiled. His commentaries on the Four Books, notably on the Lunyu (*Analects*) of Confucius and on *Mencius* (both 1177), were enormously influential. His philosophy emphasized logic, consistency, observance of classical authority, and the value of inquiry.

Zhu Yuanzhang See Hongwu emperor

Zhuangzi *or* **Chuang-tzu** \'jwäŋ-'dzə̀\ (b. c. 369, Meng, China—d. 286 BCE) Most significant early Chinese interpreter of Daoism and the purported author of the Daoist classic that bears his name. A minor official and a contemporary of Mencius, he drew on the sayings of Laozi but took a broader perspective. He taught that enlightenment comes from the realization that everything is one, the DAO, but that the *dao* has no limitations or demarcations and whatever can be known or said of the *dao* is not the *dao*. He held that things should be allowed to follow their own course and that no situation should be valued over any other.

Zhuge Liang *or* **Chu-ko Liang** \'jü-'gō-lē-'äŋ\ (b. AD 181, Yangdu, Shandong province, China—d. August 234, Wuzhangyuan, Shaanxi province, China) Celebrated adviser to Liu Bei, founder of the Shu-Han dynasty of the Six Dynasties period. Liu was so impressed with Zhuge that on his deathbed he urged Zhuge to take the throne himself if his own son proved incapable. A genius in mechanics and mathematics, Zhuge is credited with inventing a bow for shooting several arrows at once and with perfecting the Eight Dispositions, a series of military tactics. Supernatural powers were often ascribed to him, and he is a favourite character in Chinese plays and stories, notably *Sanguozhi yanyi* (*Romance of the Three Kingdoms*). In 1724 he was made a Confucian saint.

Zhukov \'zhü-ˌkȯf**, Georgy (Konstantinovich)** (b. Dec. 1, 1896, Kaluga province, Russia—d. June 18, 1974, Moscow, Russia, U.S.S.R.) Soviet army commander in World War II. He joined the Red Army in the Russian Civil War and rose to become head of Soviet forces in Manchuria (1938–39). In World War II he was chief of staff of the Red Army and organized the defense of Leningrad and Moscow (1941). He directed the offensive that broke the siege in the Battle of Stalingrad (1943) and was named a marshal of the Soviet Union. After helping win the Battle of Kursk, he directed the Soviet offensive through Belorussia (now Belarus) and commanded the final assault on Berlin (1945). After the war Zhukov's great popularity caused him to be regarded as a potential threat by Joseph Stalin, who assigned him to obscure regional commands. After Stalin's death he was appointed minister of defense (1955) and attempted to make the army more autonomous, but opposition from Nikita Khrushchev caused his dismissal in 1957. He remained in relative obscurity until Khrushchev fell from power in 1964, and he was subsequently awarded the Order of Lenin (1966).

Zia (ur-Rahman), Begum Khaleda *orig.* **Khaleda Majumdar** (b. Aug. 15, 1945, Dinājpur district, India) Politician who served as prime minister of Bangladesh. In 1959 she married Zia ur-Rahman, a leader in the fight for the independence of Bangladesh, then part of India. Her husband became president of Bangladesh in 1977, and after his assassination in 1981 she became politically active. In 1984 she assumed the leadership of the Bangladesh Nationalist Party. Zia was arrested repeatedly during the dictatorship of Hossain Mohammad Ershad in the 1980s, but in 1991 she led the opposition to victory and became prime minister. Her overwhelming reelection victory in February 1996 was tainted by an opposition-led boycott of the voting, and, after a wave of strikes and protests, she resigned the following month. In 2001 Zia was again elected prime minister.

Zia-ul-Haq \'zē-ə-əl-'häk**, Mohammad** (b. Aug. 12, 1924, Jullundur, Punjab, India—d. Aug. 17, 1988, near Bahawalpur, Pak.) President of Pakistan (1978–88). He served with the British in Southeast Asia at the end of World War II; after Pakistan's independence, he held various staff and command appointments for 19 years. He became a major general in 1972 and army chief of staff in 1976. The following year he seized power from Zulfikar Ali Bhutto, and in 1978 he assumed the presidency. After having the popular Bhutto executed in 1979, he tightened his grip on the government, suspending political parties and declaring martial law, and he worked for the Islamization of Pakistan's political and cultural life. He died in an airplane crash.

Ziegfeld \'zig-ˌfeld, 'zēg-ˌfeld**, Florenz** (b. March 21, 1869, Chicago, Ill., U.S.—d. July 22, 1932, Hollywood, Calif.) U.S. theatrical producer. He worked as a publicist for Sandow the strongman before turning to theatrical management in 1896. His press releases promoting the French beauty Anna Held set a pattern of star-making publicity. In 1907 in New York City he produced the first of his *Ziegfeld Follies*, revues that combined seminudity, pageantry, and comedy in a formula that he repeated successfully for 23 years. Under the slogan "Glorifying the American Girl," he made the revue an extravagant spectacle and developed stars such as Will Rogers and Fanny Brice. He also produced the hit musical *Show Boat* (1927).

Ziegler \'tsē-glər**, Karl** (b. Nov. 26, 1898, Helsa, near Kassel, Ger.—d. Aug. 12, 1973, Mülheim, W.Ger.) German chemist. He held academic appointments at the Universities of Frankfurt am Main, Heidelberg, and Halle, and in 1943 he became director of the Kaiser Wilhelm (later Max Planck) Institute. He was the first to explain the reactions involved in the synthesis of rubber (c. 1928). His most important work, in the 1950s, led to the discovery that certain catalysts permitted the fast polymerization of ethylene at atmospheric pressure to a linear polymer of high molecular weight having valuable plastic properties. His work formed the basis of nearly all later developments in the production of long-chain polymers of hydrocarbons from such olefins as ethylene and butadiene; the resulting products came into widespread use as plastics, fibres, rubbers, and films. He shared a 1963 Nobel Prize with Giulio Natta (1903–79).

ziggurat \'zi-gə-ˌrät\ Pyramidal, stepped temple tower characteristic of the major cities of Mesopotamia between 2200 and 500 BC. It was built with a core of mud brick and an exterior covered with baked brick. It had no internal chambers and was usually square or rectangular. Some 25 ziggurats are known, located in Sumer, Babylonia, and Assyria. The best-preserved ziggurat is at Ur, and the largest is at Elam. The legendary Tower of Babel has been associated with the ziggurat of the great temple of Marduk in Babylon.

Zimbabwe \zim-'bä-bwā, zim-'bä-bwē\ *officially* **Republic of Zimbabwe** *formerly* **Rhodesia** Landlocked country, southern Africa. Area: 150,872 sq mi (390,757 sq km). Population (2005 est.): 12,161,000. Capital: Harare. The Shona make up about two-thirds of the population; most of the rest are Ndebele, Chewa, and people of European ancestry. Languages: English (official); Bantu languages of the Shona and Ndebele are much more widely spoken. Religions: Christianity (other [mostly independent] Christians, Protestant, Roman Catholic), traditional beliefs. Currency: Zimbabwe dollar. A broad ridge running southwest-northeast, reaching elevations of 4,000–5,000 ft (1,200–1,500 m), dominates Zimbabwe's landscape. The Zambezi River forms the country's northwestern boundary and contains Victoria Falls as well as the Kariba Dam (completed 1959); Lake Kariba, created by the dam, covers some 2,000 sq mi (5,200 sq km). The Limpopo and Save river basins are in the southeast. Agricultural products, livestock, and mineral reserves, including gold, are all economically important. Zimbabwe is a republic with one legislative house; its head of state and government is the president. Remains of Stone Age cultures dating to 500,000 years ago have been found in the

© 2006 Encyclopædia Britannica, Inc.

area. The first Bantu-speaking peoples reached it during the 5th–10th centuries AD, driving the San inhabitants into the desert. A second migration of Bantu speakers began c. 1830. During that period the British and Afrikaners moved up from the south, and the area came under the administration of the British South Africa Company (1889–1923). Called Southern Rhodesia (1911–64), it became a self-governing British colony in 1923. The colony united in 1953 with Nyasaland (Malawi) and Northern Rhodesia (Zambia) to form the Central African Federation of Rhodesia and Nyasaland. The federation dissolved in 1963, and Southern Rhodesia reverted to its former colonial status. In 1965 it issued a unilateral declaration of independence considered illegal by the British government, which led to economic sanctions against it. The country, which proclaimed itself a republic in 1970, called itself Rhodesia from 1964 to 1979. In 1979 it instituted limited majority rule and changed its name to Zimbabwe Rhodesia. It was granted independence by Britain in 1980 and became Zimbabwe. A multiparty system was established in 1990. Since 2000 tension has increased between European farmers and government leaders as the government has pursued a program of confiscating farms.

Zimbabwe Fifteenth-century ruins, see GREAT ZIMBABWE

Zimmermann \'tsi-mər-ˌmän**, Arthur** (b. Oct. 5, 1864, Marggrabowa, East Prussia—d. June 6, 1940, Berlin, Ger.) German diplomat. He became foreign minister of Germany in 1916 during World War I. With Germany's decision to resume unrestricted submarine warfare, he planned to reduce the possible U.S. intervention in Europe by embroiling it in war with Mexico. On Jan. 16, 1917, he sent a coded telegram to the German ambassador in Mexico, proposing a German-Mexican alliance that would allow Mexico to "reconquer her lost territory in Texas, New Mexico, and Arizona." It was intercepted and decoded by British naval intelligence, then published in the U.S. on March 1, causing public outrage. The "Zimmermann telegram" became a key factor in the U.S. declaration of war against Germany on April 6. Zimmermann was forced to resign in 1917.

zinc Metallic chemical ELEMENT, chemical symbol Zn, atomic number 30. Zinc is a bluish silver METAL, ductile when very pure but brittle otherwise. It forms BRASS (with COPPER) and many other ALLOYS. Its major use is in GALVANIZING iron, steel, and other metals. Zinc is an essential trace element, particularly in red blood cells; in snails, it corresponds to iron in the blood of vertebrates. Zinc oxide is used as a PIGMENT, ultraviolet light absorber (to prevent sunburn), dietary supplement and seed treatment, and photoconductor. Zinc's many other compounds (in which it has VALENCE 2 or, rarely, 1) are used in industrial and consumer applications, including as pesticides, pigments, mordants (see DYE), fluxes, and wood preservatives.

zincblende See SPHALERITE

Zinder, Norton (David) (b. Nov. 7, 1928, New York, N.Y., U.S.) U.S. biologist. He received his Ph.D. from the University of Wisconsin. He discovered genetic transduction (the transfer of genes from one type of microorganism to another by an agent such as a bacteriophage) in *Salmonella* bacteria. Using this transduction, later researchers were able to show that bacterial genes affecting certain physiological processes were grouped together in what are now known as operons. His experiments also led to the discovery of the first bacteriophage that contained RNA as its genetic material.

Zinkernagel \'tsiŋ-kər-ˌnä-gəl,\ *English* \'ziŋ-kər-ˌnā-gəl**, Rolf M(artin)** (b. Jan. 6, 1944, Basel, Switz.) Swiss immunologist and pathologist. He received his Ph.D. from the Australian National University. Studying T CELLS in mice infected with a meningitis virus, he and PETER DOHERTY found that those from one infected mouse would destroy infected cells from another only if the mice belonged to the same genetic strain: no immune response occurs unless the T cells recognize two signals, those of the virus and those identifying the cell as "self." In 1992 he became head of the University of Zürich's Institute of Experimental Immunology. In 1996 he and Doherty shared a Nobel Prize.

Zinnemann \'zin-ə-mən**, Fred** (b. April 29, 1907, Vienna, Austria—d. March 14, 1997, London, Eng.) Austrian-born U.S. film director. After studying law in his native Vienna, he learned cinematography in Paris and worked in Berlin. In 1929 he moved to Hollywood, and in 1934 he codirected his first feature, *The Wave*, which was initially followed largely by documentaries and short subjects. His feature films, many of which focus on the crisis of moral courage, include *The Search* (1948), *The Men* (1950), the classic western *High Noon* (1952), *From Here to Eternity* (1953, Academy Award), *Oklahoma!* (1955), *The Nun's Story* (1959), *A Man for All Seasons* (1966, Academy Award), *The Day of the Jackal* (1973), and *Julia* (1977).

zinnia Any of about 22 species of herbaceous plants and shrubs that make up the genus *Zinnia* (COMPOSITE FAMILY), native mainly to North America. Where native, they are perennial; elsewhere they are annual. Zinnias have stiff, hairy stems and oval or lance-shaped leaves arranged opposite each other and often clasping the stem. The numerous garden varieties grown for their showy, solitary flowers come from the species *Z. elegans*. Garden zinnias range from dwarf compact plants (less than 1 ft, or 30 cm, tall), with flowers 1 in. (2.5 cm) in diameter, to giant forms (up to 3 ft, or 1 m, tall), with flowers up to 6 in. (15 cm) across.

KENNETH AND BRENDA FORMANEK/EB INC.

Zinovyev \zyi-'nȯf-yif**, Grigory (Yevseyevich)** *orig.* **Ovsel Gershon Aronov Radomyslsky** (b. Sept. 23, 1883, Yelizavetgrad, Ukraine, Russian Empire—d. Aug. 25, 1936, Moscow, Russia, U.S.S.R.) Soviet politician. Born to lower middle-class Jewish parents, he received no formal education, but during travels abroad in 1902–05 he attended lectures on law at Bern University. An early activist with the BOLSHEVIKS (1903), he became VLADIMIR LENIN's close collaborator in exile (1909–17) and in the RUSSIAN REVOLUTION OF 1917, helping win public support for the Bolshevik regime. By 1921 he was head of the Petrograd (St. Petersburg) soviet and a member of the Politburo. He was chairman of the Comintern (1919–26) and helped JOSEPH STALIN oust LEON TROTSKY. He was removed from power by Stalin in 1926. Although he was subsequently readmitted to the party, he never recovered his former prestige and was expelled again on two other occasions (1932 and 1934). In 1935 he was arrested for conspiracy and sentenced to prison. The following year he was retried in the first of the PURGE TRIALS, found guilty on the fabricated charge of forming a terrorist organization to assassinate various Soviet leaders, and executed. In 1988 the Soviet Supreme Court annulled the sentence posthumously.

Zinsser, Hans (b. Nov. 17, 1878, New York, N.Y., U.S.—d. 1940) U.S. bacteriologist and epidemiologist. He taught principally at the Columbia (1913–23) and Harvard (1923–40) medical schools. He isolated the bacterium that causes the European type of typhus, developed the first anti-typhus vaccine, and, with colleagues, found a way to mass-produce it. He recognized that cases of mild typhus-like symptoms in lice-free persons are recurrences after a latent period (Brill-Zinsser disease). His best-known book, *Rats, Lice and History* (1935), recounts the effects of typhus on humankind (he believed disease had destroyed more civilizations than war) and efforts to eradicate it.

Zion Easternmost of the two hills of ancient JERUSALEM, where DAVID established his royal capital. In the OLD TESTAMENT, the name Zion frequently refers to Jerusalem as a whole; it is overwhelmingly a poetic and prophetic designation. Mount Zion is the place where Yahweh (God) dwells and is the scene of his messianic salvation. The name came to mean the Jewish homeland, symbolic of Judaism or Jewish national aspirations, and thus was the source of the term ZIONISM. Though the name is rare in the NEW TESTAMENT, it has been frequently used in Christian literature and hymns as a designation for the heavenly city or for the earthly city of Christian faith and fraternity.

Zion National Park National park, southwestern Utah, U.S. It covers an area of 229 sq mi (593 sq km); its principal feature is Zion Canyon, which was named by the MORMONS who discovered it in 1858. Part of the area was first set aside as the Mukuntuweap National Monument in 1909. Enlarged and renamed Zion National Monument in 1918, it was established as a national park in 1919. Zion Canyon was carved by the Virgin River and is about 15 mi (24 km) long and 0.5 mi (0.8 km) deep. Rocky domes dot the canyon walls, which contain an abundant fossil record. Excavation has yielded evidence that prehistoric peoples once inhabited the area.

Zionism \'zī-ə-ˌni-zəm\ Jewish nationalism movement with the goal of establishing a Jewish state in Palestine. In the 16th–17th century, a number of "messiahs" tried to persuade the Jews to return to Palestine, but by the late 18th century interest had largely faded. POGROMS in Eastern Europe led

© 2006 Encyclopædia Britannica, Inc.

to formation of the "Lovers of Zion," which promoted the settlement of Jewish farmers and artisans in Palestine. In the face of persistent anti-Semitism, Theodor Herzl advocated a Jewish state in Palestine. He held the first Zionist Congress in Basel in 1897. After World War I the movement picked up momentum with the issuing of the Balfour Declaration. The Jewish population in Palestine increased from 90,000 in 1914 to 238,000 in 1933. The Arab population resisted Zionism, and the British tried unsuccessfully to reconcile Jewish and Arab demands. Zionism achieved its goal with the creation of Israel in 1948. See also Alliance Israélite Universelle, David Ben-Gurion, Hagana, Vladimir Jabotinsky, Irgun Zvai Leumi.

Zionist church Any of several prophet-healing groups in southern Africa that arose early in the 20th century from the fusion of African culture with the Christian message brought by U.S. Protestant missionaries. Their common features include: origination from a mandate received by a prophet in a dream or vision; a chieflike leader who is succeeded by his son and who is occasionally regarded as a messiah; healing through confession, repeated baptism, purification rites, and exorcism; revelation and power from the Holy Spirit through prophetic utterances and pentecostal phenomena; Africanized worship characterized by singing, dancing, clapping, and drumming; and repudiation of traditional magic, medicines, divination, and ancestor cults, though these are often replaced with Christianized equivalents.

zip code System of postal-zone codes (zip stands for "zone improvement plan") introduced in the U.S. in 1963 to improve mail delivery and exploit electronic reading and sorting capabilities. The original code, which corresponds to the postal codes used in most countries in the world, consists of five numbers. The first three identify the state and portion of the state, the last two a specific post office or zone. In 1983 a nine-digit code (created by adding a hyphen and four digits) was introduced to further speed delivery; the first two added digits specify a particular "sector," the last two an even smaller "segment" (e.g., one side of a city block, or a single floor in a large building).

zipper Device for binding the edges of an opening, as on a garment or a bag. A zipper consists of two strips of material with metal or plastic teeth along the edges, and a sliding piece that interlocks the teeth when moved in one direction and separates them again when moved in the opposite direction. The idea of a slide fastener was first exhibited by Whitcomb L. Judson (died 1909) at the World's Columbian Exposition of 1893. The modern form of the zipper began to appear on clothing in the late 1920s.

zircon Silicate mineral, zirconium silicate, $ZrSiO_4$, the principal source of zirconium. Zircon is widespread as an accessory mineral in acid igneous rocks; it also occurs in metamorphic rocks and, fairly often, in detrital deposits. It occurs in beach sands in many parts of the world, particularly Australia, India, Brazil, and Florida, and is a common heavy mineral in sedimentary rocks. Gem varieties occur in stream gravels and detrital deposits, particularly in Indochina and Sri Lanka, but also in Myanmar, Australia, and New Zealand. Zircon forms an important part of the syenite of southern Norway and occurs in large crystals in Quebec.

Zircon with quartz from Cheyenne Canyon, Colorado

zirconium Metallic chemical element, one of the transition elements, chemical symbol Zr, atomic number 40. The metal is hard and brittle when impure, soft and ductile when highly purified. It is relatively abundant, occurring as zircon (also marketed as a natural gemstone) and baddeleyite. Highly transparent to neutrons, zirconium became important in the 1940s in nuclear energy applications such as fuel cladding. Other uses are in alloys, fireworks, and flashbulbs and as a scavenger for oxygen and other gases. Its compounds, in most of which it has valence 4, are important industrial materials. Zirconia (the oxide) is used in piezoelectric crystals (see piezoelectricity), high-frequency induction coils, coloured glazes and glasses, and heat-resistant fibres; zirconium carbonate is employed in preparations to treat the rash of poison ivy.

zither Plucked or struck stringed instrument with a shallow soundbox. The common Austrian zither is roughly rectangular and has 30–40 strings; it is placed on the player's knees or on a table. Several melody strings pass over a fretted fingerboard; the player's left hand stops these strings, while the right hand plucks with the fingers and a thumb plectrum. Zither is also a generic term for stringed instruments, the strings of which are fastened across a frame that lacks any projecting neck or arms. The larger zither family thus includes instruments such as the Aeolian harp, autoharp, cimbalom, dulcimer, koto, and even the clavichord, harpsichord, and piano.

Zoan See Tanis

zodiac \'zō-dē-ˌak\ Belt around the heavens extending about 9° on either side of the ecliptic. The orbits of the Moon and the major planets (except Pluto) lie entirely within the zodiac. In astrology, each of 12 constellations along this circle is considered to occupy 1/12 (30°) of it. The positions of the Sun and planets when a person is born and their motion through these constellations are said to exert influence on his or her life, though precession of the equinoxes has shifted the constellations eastward and the Sun no longer passes through them on the traditional dates: Aries, the ram (March 21–April 19); Taurus, the bull (April 20–May 20); Gemini, the twins (May 21–June 21); Cancer, the crab (June 22–July 22); Leo, the lion (July 23–August 22); Virgo, the virgin (August 23–September 22); Libra, the balance (September 23–October 23); Scorpius (see Scorpio), the scorpion (October 24–November 21); Sagittarius, the archer (November 22–December 21); Capricornus (see Capricorn), the goat (December 22–January 19); Aquarius, the water bearer (January 20–February 18); Pisces, the fish (February 19–March 20).

The astrological images and symbols of the zodiac.

zodiacal light \zō-'dī-ə-kəl\ Band of very faint light in the night sky. It is thought to be sunlight reflected from interplanetary dust grains lying mostly in the plane of the zodiac, or ecliptic. Seen in the west after twilight and in the east before dawn, it is most clearly visible in the tropics, where the ecliptic is approximately perpendicular to the horizon. In mid-northern latitudes it is best seen evenings in February and March and mornings in September and October (vice versa in midsouthern latitudes). The light can be followed visually to a point about 90° from the Sun. It continues to the region opposite the Sun, where a slight enhancement, the Gegenschein, is visible.

Zoe \'zō-ē\ (b. c. 978, Constantinople—d. 1050, Constantinople) Byzantine empress. The daughter of Constantine VIII, she married Romanus III Argyrus in 1028. He died in 1034, perhaps poisoned by her, and she married her lover and chamberlain, who became Michael IV. After his death in 1041, his successor, Michael V, banished Zoe to a convent; she was recalled by public outcry, and Michael was deposed, blinded, and exiled (1042). Zoe and her sister became uneasy corulers, and she married Constantine IX Monomachus to secure her throne.

Zog I *Albanian* **Ahmed Bey Zogu** (b. Oct. 8, 1895, Castle Burgajet, Alb.—d. April 9, 1961, Suresnes, France) President (1925–28) and king of Albania (1928–39). After serving in the Austrian army in World War I, he became a leader of Albania's reformist Popular Party. He held ministerial posts in the government (1920–24) and was elected head of the Albanian republic in 1925. Proclaimed king in 1928, he pursued a policy of close collaboration with Italy. Unable to resist Benito Mussolini's increasing control of the country's finances and army, he was forced into exile when Italy invaded and made Albania a protectorate (1939). After World War II Albania became a communist republic, and Zog formally abdicated in 1946.

Zola \'zō-lə,\ *French* \zō-'lä**, Émile (-Édouard-Charles-Antoine)** (b. April 2, 1840, Paris, France—d. Sept. 28, 1902, Paris) French novelist and critic. Raised in straitened circumstances, Zola worked at a Paris publishing house for several years during the 1860s while establishing himself as a writer. In the gruesome novel *Thérèse Raquin* (1867), he put his "scientific" theories of the determination of character by heredity and environment into practice for the first time. These ideas established him as the founder of naturalism in literature. In 1870 he began the ambitious project for which he is best known, the *Rougon-Macquart Cycle* (1871–93), a sequence of 20 novels documenting French life through the lives of the violent Rougon family and the passive Macquarts. It includes *L'Assommoir* (1877), a study of alcoholism that is among his most successful and popular novels; *Nana* (1880); *Germinal* (1885), his masterpiece; and *La Bête humaine* (1890). Among his other works are two shorter novel cycles and treatises explaining his theories on art, including *The Experimental Novel* (1880). He is also notable for his involvement in the Alfred Dreyfus affair, especially for his open letter, "J'accuse" (1898), denouncing the French army general staff. He died under suspicious circumstances, overcome by carbon-monoxide fumes in his sleep.

Zollverein \'tsȯl-ver-ˌīn\ (German: "Customs Union") Free-trade area throughout much of Germany established in 1834 under Prussian leadership. The customs union developed from the 1818 Prussian tariff law that abolished internal customs dues and the customs union set up in 1828 in southern Germany by Bavaria and Württemberg. By 1834 other German states had joined, for a total of 18 members; more joined in subsequent years. The Zollverein represented an important step in German unification. See also Friedrich List.

zombi In Vodou, a dead person who is revived after burial and compelled to do the bidding of the reviver, including criminal acts and heavy manual labour. It is believed that actual zombis are living persons under the influence of powerful drugs, including burundanga (a drug reportedly used by Colombian criminals) and drugs derived from poisonous toads and puffer fish.

zone melting Any of a group of techniques used to purify an element or a compound or to control its composition by melting a short region (called a zone) and causing this liquid zone to travel slowly through a relatively long ingot, or charge, of the solid. In zone refining, the most important of the zone-melting techniques, a solid is refined by multiple molten zones being passed through it in one direction. Each zone carries a fraction of the impurities to the end of the solid charge, thereby purifying the remainder. Zone refining is particularly important as a method of purifying crystals, especially for use in semiconductor devices.

zone of avoidance See avoidance, zone of

zoning Legislative method of controlling land use by regulating considerations such as the type of buildings that may be erected and population density. German and Swedish cities first applied zoning regulations in the late 19th century to address the problems of urban congestion and building height. The earliest U.S. zoning ordinances, which date from the beginning of the 20th century, were motivated by the need to regulate the location of commercial and industrial activities. In 1916 New York City adopted the first comprehensive zoning law; it and other early regulations were designed to protect property values and preserve light and air. Modern zoning regulations divide land use into three types: residential, commercial, and industrial. Within each designation, more specific aspects of development (e.g., building proximity, height, and type) are also determined. Zoning is often used to maintain the distinctive character of a town or city; an adverse consequence of such zoning is economic segregation. The Supreme Court of the United States ruled against such laws in 1977 when it declared the zoning regulations of one Chicago suburb discriminatory.

zoo *or* **zoological garden** Place where wild and sometimes domesticated animals are exhibited in captivity. Aquatic zoological gardens are called aquariums. The first zoos were perhaps associated with domestication. Pigeons were kept in captivity as early as 4500 BC; other animals (e.g., elephants and antelopes) have also been kept in captivity since antiquity. Animal collections were kept by Charlemagne and other European monarchs. Hernán Cortés described a zoo in Mexico (1519) so large that it required a staff of 300. Modern zookeeping started in 1752 with the founding of the Imperial Menagerie at Vienna's Schönbrunn Palace. Open-range zoos were first established in the early 1930s, some so large that visitors drive through in cars, as on an African safari. There are now more than 1,000 animal collections open to the public throughout the world (e.g., in the U.S., the Bronx Zoo and San Diego Zoo).

zoology Branch of biology concerned with members of the animal kingdom and with animal life in general. The science originated in the works of Hippocrates, Aristotle, and Pliny. The contributions of individuals such as William Harvey (the circulation of blood), Carolus Linnaeus (system of nomenclature), Georges-Louis de Buffon (natural history), Georges Cuvier (comparative anatomy), and Claude Bernard (homeostasis) greatly advanced the field. The 1859 publication of Charles Darwin's *On the Origin of Species by Means of Natural Selection* was a major turning point. Since that time, the study of genetics has become essential in zoological studies.

zooplankton \ˌzō-ə-'plaŋk-tən\ Small floating or weakly swimming animals that drift with water currents and, with phytoplankton, make up the planktonic food supply on which almost all oceanic organisms ultimately depend (see plankton). Included are many animals, from single-celled radiolarians to the eggs or larvae of herrings, crabs, and lobsters. Permanent plankton (holoplankton), such as protozoans and copepods, spend their lives as plankton. Temporary plankton (meroplankton), such as young starfish, clams, worms, and other bottom-dwelling animals, live and feed as plankton until they become adults.

Zorn, John (b. Sept. 2, 1953, New York, N.Y., U.S.) U.S. saxophonist and composer. His music incorporates influences from the most diverse elements of music and culture: free jazz, klezmer music, punk rock, cartoon music, film scores, and contemporary classical music. His "game pieces," such as *Cobra* (1984), involve rules—understood by his musicians and cued by hand signals—that determine the flow of the music, placing emphasis on the process rather than the result of the performance.

Zoroaster \'zōr-ə-ˌwas-tər\ *or* **Zarathustra** \ˌzar-ə-'thüsh-trə\ (b. c. 628, probably Rhages, Iran—d. c. 551 BCE) Iranian religious reformer and prophet, founder of Zoroastrianism and Parsiism. He was a priest in his tribal religion, with which he eventually became disillusioned. Having received a vision, he began teaching that Ahura Mazdā was the highest god and alone was worthy of worship, a concept that went against the polytheism of Iranian religion. He forbade the orgiastic rites that accompanied animal sacrifice, common in his time, but preserved the ancient cult of fire worship. After converting a king called Vishtāspa to his teachings, Zoroaster remained at the royal court. He became the subject of legends and a model for various occupations.

Zoroastrianism and Parsiism Ancient religion that originated in Iran based on the teachings of Zoroaster. Founded in the 6th century BCE, it influenced the monotheistic religions Judaism, Christianity, and Islam. It rejects polytheism, accepting only one supreme God, Ahura Mazdā. In early Zoroastrianism, the struggle between good and evil was seen as an eternal rivalry between Ahura Mazdā's twin sons, Spenta Mainyu (good) and Angra Mainyu (evil). Later Zoroastrian cosmology made the rivalry between Ahura Mazdā himself (by then called Ormizd) and Angra Mainyu (Ahriman). This later cosmology identifies four periods of history; the last began with the birth of Zoroaster. Zoroastrian practice includes an initiation ceremony and various rituals of purification intended to ward off evil spirits. Fire worship, a carryover from an earlier religion, survives in the sacred fire that must be kept burning continually and be fed at least five times a day. The chief ceremony involves a sacrifice of haoma, a sacred liquor, accompanied by recitation of large parts of the Avesta, the primary

© 2006 Encyclopædia Britannica, Inc.

scripture. Zoroastrianism enjoyed status as an official religion at various times before the advent of Islam, but Zoroastrians were persecuted in the 8th–10th centuries, and some left Iran to settle in India. By the 19th century these Indian Zoroastrians, or Parsis, were noted for their wealth and education. The small group of Zoroastrians remaining in Iran are known as the Gabars.

Zorrilla \thōr-'rēl-yä\ **(y Moral), José** (b. Feb. 21, 1817, Valladolid, Spain—d. Jan. 23, 1893, Madrid) Spanish poet and dramatist. Zorrilla first gained notice in 1837 with his recitation of an elegy at the funeral of the satirist Mariano José de Larra. The major figure of the nationalist wing of the Spanish Romantic movement, he made his name with verse *leyendas* ("legends") about remote times and places, notably in *Cantos del trovador* (1841). His greatest success was *Don Juan Tenorio* (1844), the most popular play of 19th-century Spain. His works are considered quintessentially Spanish in style and tone. In 1889 he was crowned the national poet.

Zu Chongzhi (b. 429, Jiankang, China—d. 500, China) Chinese astronomer, mathematician, and engineer. About 462 he proposed a new calendar system that would provide a more precise number of lunations per year and take into consideration the precession of the equinoxes. His Daming calendar was finally adopted in 510 through the efforts of his son, Zu Gengzhi. Li Chunfeng called Zu Chongzhi the best mathematician ever and gave him credit for three approximations of π: $22/7$, $355/113$, and the interval $3.1415926 < \pi < 3.1415927$; the third result remained the best in the world until improved by the Arab mathematician al-Kashi (fl. c. 1400). He also worked on the mathematical theory of music and metrology, and he constructed several devices, such as a semilegendary "south-pointing carriage." The carriage was topped by a symbolic figure that, once properly aligned, would always point to the south.

Zu Gengzhi *also known as* **Zu Xuan** (b. c. 480, Jiankang, China—d. c. 525, China) Chinese government official, mathematician, astronomer, and son of Zu Chongzhi. Beginning in 504, he actively advocated his father's Daming calendar and finally succeeded in getting it officially adopted in 510. His astronomical observations with gnomons allowed him to measure the angular distance between Polaris and the celestial north pole. A mathematical fragment of his was appended by Li Chunfeng to the commentary on *Jiuzhang suanshu* (*Nine Chapters on the Mathematical Procedures*), a Chinese classic probably compiled in the 1st century AD. Fragments of his writings are also found in the astronomical chapter of *Suishu* ("History of the Sui Dynasty"). His fame as a mathematician rests primarily on his derivation and proof of the formula for the volume of a sphere.

Zuccaro \'tsü-kär-ō**, Federico** *or* **Federico Zuccari** \'tsü-kär-ē\ (b. c. 1540, Sant'Angelo in Vado, Duchy of Urbino—d. July 20, 1609, Ancona) Italian painter and art theorist. In 1565 he worked in Florence with Giorgio Vasari. He codified the theory of Mannerism in *The Idea of Painters, Sculptors, and Architects* (1607) and in a series of frescoes in his own house in Rome. In England in 1575 he drew or painted portraits of Elizabeth I and the earl of Leicester. He also painted the dome of the cathedral of Florence (1574), a large work in the Doges' Palace in Venice (1582), and much work for El Escorial in Spain (1585–88). At one time the central figure of the Roman Mannerist school, he lived to see Mannerism become extinct.

zucchini Subspecies of *Cucurbita pepo*, dark green elongate summer squash in the gourd family, of great abundance in U.S. home gardens and supermarkets. The creeping vine has five-lobed leaves, tendrils, and large yellow flowers.

Zuckerman \'tsůk-ər-ˌmän**, Yitzhak** *or* **Yitzhak Cukierman** \'tsůk-ər-ˌmän\ (b. 1915, Warsaw, Pol.—d. June 17, 1981, Tel Aviv, Israel) Hero of Jewish resistance to the Nazis in World War II. Active in Zionist organizations in his native Warsaw, he urged the creation and arming of a Jewish defense organization after the German takeover of Poland. He used his contacts outside the Warsaw Ghetto to smuggle in a few arms. He took command after the other leaders of the Warsaw Ghetto Uprising were killed, and eventually he led some 75 people through the sewers to safety. He continued leading Jewish resistance and alerting Jewish leaders elsewhere to the situation in Nazi Europe. At war's end he helped organize transportation for Jewish refugees to Palestine.

zuhd \'zù-həd\ Islamic asceticism. Though Islam permits unforbidden pleasure, it praises those who shun luxury in favour of a simple and pious life. *Zuhd* may have been influenced directly by the Christian hermits who had some contact with early Muslims. It was institutionalized in Islam as a result of Muslim conquests, which brought material wealth and widespread indulgence in luxurious living. Devout Muslims reacted by calling for a return to the way of life of Muhammad, who spent long periods in solitary vigil, fasting and praying. See also Sufism.

Zuiderzee \ˌzī-dər-'zā, ˌzī-dər-'zē\ *Dutch* **"Southern Sea"** Former inlet of the North Sea, northern coast of The Netherlands. From the 13th to the 20th century, it penetrated The Netherlands and occupied 2,000 sq mi (5,000 sq km), separated from the North Sea by an arc of former sand flats that are now the West Frisian Islands. Frisian peoples inhabited the sand flats from c. AD 400 and built the first sea works, considered engineering marvels, to stem rising sea levels. The control of water levels within the dikes developed into the reclamation of lowlands (polders) from the water. Between 1927 and 1932 a dam 19 mi (30 km) long was built across the Zuiderzee, separating it into the Waddenzee and the IJsselmeer. By the early 1980s four polders (of five proposed), largely agricultural land, had been created.

Zulu Nguni-speaking people living in KwaZulu-Natal province in South Africa. Numbering about 9.5 million, they are South Africa's largest ethnic group. Traditionally grain farmers, they also kept large herds of cattle. European settlers wrested grazing and water resources from the Zulu in prolonged warfare during the 19th century; with much of their wealth lost, modern Zulu depend largely on wage labour on farms owned by whites or work in the cities. The Zulu provide the main support for the Inkatha Freedom Party. Many Zulu belong to independent or separatist African churches, though the traditional religion, based on ancestor worship and belief in a creator-god, witches, and sorcerers, remains strong. See also Shaka.

Zululand Historical region, eastern South Africa. It was the home of the Zulu people when Chief Shaka established dominance over what is now KwaZulu-Natal. His state fought the Boers in the 1840s; it later lost parts of its territory to them. The British moved into nearby Natal and annexed it in 1843. The Zulu resisted British rule in 1878 but were overcome in 1879. The British made Zululand a crown colony in 1887 and annexed it to Natal in 1897. Under the apartheid system, a Bantu homeland named KwaZulu, composed of parts of the historical Zululand, was established for the Zulu in the 1970s. With the abolition of the apartheid system, KwaZulu in 1994 was reincorporated into Natal province, which was renamed KwaZulu-Natal.

Zuni \'zü-nē\ North American Pueblo Indian people living in west-central New Mexico, U.S. They call themselves Ashiwi. Their origin and early history are uncertain. When first encountered by 16th-century Spanish explorers, they were living in seven separate towns thought by the explorers to be the fabled Seven Cities of Cíbola; under the Spaniards they were crowded into a single pueblo. The traditional occupation was corn farming; basketry and pottery were also well developed. Religious life centred on gods or spirits called kachinas. Today the Zuni number about 12,000.

Zunz \'tsůnts**, Leopold** *Hebrew* **Yom-Tob Lippmann** (b. Aug. 10, 1794, Detmold, Lippe—d. March 18, 1886, Berlin) German historian of Jewish literature. After taking his doctorate at Halle, he spent much of his life in a precarious struggle with poverty. With the publication of his seminal work, *On Rabbinic Literature* (1818), he initiated (1819) the movement called Wissenschaft des Judentums ("Science of Judaism"), which stressed the analysis of Jewish literature and culture with the tools of modern scholarship. His *On History and Literature* (1845) places Jewish literary activity in the context of European literature and politics. Zunz is often considered the greatest Jewish scholar of the 19th century.

Zuo zhuan *or* **Tso chuan** \'dzwò-'jwän\ Ancient commentary on the Chunqiu ("Spring and Autumn Annals"). It provides extensive narrative accounts and background materials concerning events covered in the *Chunqiu*, as well as authentic historical documents and written evidence of the philosophical schools of the time. Finally, it provides a comprehensive account of the principal political, social, and military events of the period. It was once believed to have been written by Zuo, an ancient historian about whom virtually nothing is known, but modern scholarship attributes it to an anonymous author of the period 475–221 BCE.

Zurbarán \ˌzůr-bə-'rän**, Francisco de** (baptized Nov. 7, 1598, Fuente de Cantos, Spain—d. Aug. 27, 1664, Madrid) Spanish painter. He was apprenticed in 1614 to a painter in Sevilla (Seville), where he lived

© 2006 Encyclopædia Britannica, Inc.

until 1658 when he moved to Madrid. He had a few royal commissions but remained throughout his life a provincial painter of religious pictures. His apostles, saints, and monks are painted with almost sculptural modeling, and his emphasis on the minutiae of their dress lends verisimilitude to their miracles, visions, and ecstasies. This distinctive combination of naturalism with religious sensibility conforms to the guidelines for Counter-Reformation artists outlined by the Council of Trent. He had numerous commissions from monasteries and churches throughout southern Spain, and many of his works were sent to Lima, Peru. His late devotional paintings show the influence of Bartolomé Esteban Murillo.

Zürich \'tsu̇̄-rik̲\ *or* **Zurich** \'zu̇r-ik\ City (pop., 2000: city, 363,273; 1998 est.: metro. area, 935,118), Switzerland. Located at the northwestern end of Lake Zürich, the site was occupied first by prehistoric lake dwellers and later by the Celtic Helvetii before the Romans conquered the area c. 58 BC. It subsequently was held by the Alamanni and the Franks. Zürich grew as a trade centre, and in 1218 it became a free imperial city. In 1351 it joined the Swiss Confederation. Under the leadership of Huldrych Zwingli, Zürich became the centre of the Swiss Reformation in the 16th century. Attracting refugees from the Counter-Reformation, it established a liberal democratic order during the 1830s. Long an industrial centre and Switzerland's largest city, Zürich is also an important financial centre and a major tourist destination. The city's cultural treasures include the National Museum (1833) and the Zürich Opera (1891).

Zürich, Lake *German* **Zürichsee** \'tsu̇̄-rik̲-ˌzā\ Lake, north-central Switzerland. Extending southeast from the city of Zürich, it lies at an altitude of 1,332 ft (406 m) and has an area of about 34 sq mi (88 sq km). It is 18 mi (29 km) long and has a maximum depth of 469 ft (143 m). The Linth River flows into it and emerges as the Limmat.

Zuse \'tsü-zə**, Konrad** (b. June 22, 1910, Berlin, Ger.—d. Dec. 18, 1995, Hünfeld) German engineer. In 1941 he constructed the first fully operational program-controlled electromechanical binary calculating machine, or digital computer, called the Z3. The machine predated Howard H. Aiken's Harvard Mark I but was destroyed by bombing during World War II. In 1945 he designed Plankalkül, one of the first attempts at a high-level programming language, which later influenced the development of ALGOL.

Zweig \'tsvīk**, Arnold** (b. Nov. 10, 1887, Glogau, Silesia, Ger.—d. Nov. 26, 1968, East Berlin, E.Ger.) German writer. Zweig, who was Jewish, was exiled from Germany by the Nazis in 1933. He lived as an émigré in Palestine until 1948, when he moved to East Germany. He is best known for the novel *The Case of Sergeant Grischa* (1927), which depicts the German army in World War I through a Russian prisoner's tragic encounter with the Prussian military bureaucracy. Later works, including *Education Before Verdun* (1935) and *The Crowning of a King* (1937), follow the fortunes of characters he introduced in *Sergeant Grischa*.

Zweig, Stefan (b. Nov. 28, 1881, Vienna, Austro-Hungarian Empire—d. Feb. 22, 1942, Petrópolis, near Rio de Janeiro, Braz.) Austrian writer. He was deeply influenced by Sigmund Freud, whose theories on psychology informed Zweig's analyses of historical figures and his subtle portrayal of fictional characters. His essays include studies of Honoré de Balzac, Charles Dickens, and Fyodor Dostoyevsky, in *Three Masters* (1920); and Friedrich Hölderlin, Heinrich Kleist, and Friedrich Nietzsche, in *Master Builders* (1925). He achieved popularity with *The Tide of Fortune* (1928), five historical portraits in miniature. He also wrote biographies, poetry, short stories, dramas, and a novel. Driven into exile by the Nazis in 1934, Zweig and his second wife went to England and then Brazil, where, lonely and disillusioned, they committed suicide.

Zwicky \'tsvik-ē**, Fritz** (b. Feb. 14, 1898, Varna, Bulg.—d. Feb. 8, 1974, Pasadena, Calif., U.S.) Swiss astronomer and physicist. He received his Ph.D. from the Swiss Federal Institute of Technology and moved to the U.S. in 1925 to work at Caltech, where he remained until 1972. In 1934, with Walter Baade (1893–1960), he proposed that supernovas are a class of stellar explosions completely different from novas. He conducted an extensive search of neighbouring galaxies for supernovas and discovered 18; only about 12 had been recorded previously in the entire history of astronomy. In the years 1943–46, with Theodore von Kármán and others, he helped develop early jet-propulsion systems.

Zwilich \'zwi-lik**, Ellen Taaffe** (b. April 30, 1939, Miami, Fla., U.S.) U.S. composer. She was trained as a violinist, studying with Ivan Galamian (1903–81). She studied composition with Elliott Carter and Roger Sessions at Juilliard. Her straightforward and expressive music won wide recognition; her *Symphony No. 1* (1983) was the first composition by a woman to win a Pulitzer Prize. Her orchestral work *Symbolon* premiered in Russia in 1988. She is noted for writing music that is both substantive and accessible.

Zwinger \'tsviŋ-ər\ Rococo-style building complex (1709–32), on the southern bank of the Elbe in Dresden, Germany, designed by Matthäus Daniel Pöppelmann (1662–1736). Originally planned as the forecourt for a castle, it is considered one of the finest works of its style in the world. It comprises one- and two-story buildings surrounding an immense square court. Its festive air is accented by bold, richly sculpted and ornamented facades and gates and by dramatic contrasts between its low arcades and high pavilions.

Zwingli \'zwiŋ-lē,\ *German* \'tsviŋ-lē**, Huldrych** (b. Jan. 1, 1484, Wildhaus in the Toggenburg, Sankt Gallen, Switz.—d. Oct. 11, 1531, near Kappel) Major reformer in the Protestant Reformation in Switzerland. Educated in Vienna and Basel, he was ordained a priest in 1506. An admirer of Erasmus, he began preaching reformist ideas in Zürich in 1518, shortly after Martin Luther made his break with the church in Rome, and became increasingly active in challenging the ritualism, decadence, and hierarchy of the Roman Catholic church. The main contentions of his *67 Articles* (1523) were adopted by most priests in Zürich. As his movement spread, he rejected a number of the basic teachings of the church, declaring that Jesus alone is head of the church, that the mass is an affront to Christ, and that there is no biblical foundation for the intercession of the dead or for purgatory. He also rejected the notions of priestly celibacy, and his teachings on the sacrament of communion brought him into conflict with both Luther and the Catholic church. He was killed in a battle between Protestants and Catholics while serving as an army chaplain.

Zwingli, detail of an oil portrait by Hans Asper, 1531; in the Kunstmuseum Winterthur, Switz.

COURTESY OF THE KUNSTMUSEUM WINTERTHUR, SWITZ.; PHOTOGRAPH, SCHWEIZERISCHES INSTITUT FUR KUNSTWISSENSCHAFT

Zworykin \'zvȯr^{y}-kyin,\ *English* \'zwȯr-i-kən**, Vladimir (Kosma)** (b. July 30, 1889, Murom, Russia—d. July 29, 1982, Princeton, N.J., U.S.) Russian-born U.S. electronic engineer and inventor. He immigrated to the U.S. in 1919. While with Westinghouse Electric Corp. (1920–29), he filed patent applications for his inventions of the iconoscope (a TV transmission tube, 1923) and the kinescope (TV receiver, 1924), which formed the first all-electronic TV system. He patented a colour TV system in 1928. In 1929 he became director of electronic research at RCA. His electron image tube, sensitive to infrared light, was the basis for devices first used in World War II for seeing in the dark.

zydeco \'zī-də-ˌkō\ Form of dance music from southwestern Louisiana, U.S., with roots in French, African American, and Afro-Caribbean styles. Similar to the music of the Cajuns (displaced French Canadians who settled in Louisiana), zydeco was created by the Creoles (those of African heritage in Louisianan French culture). Its name is thought to come from a modified pronunciation of the French phrase *les haricots* ("the beans") heard in a popular song. The music usually features guitar, accordion, fiddle (violin), and washboard played to a driving beat, but it may also include electric guitar, electric bass, saxophone, and keyboards. It became widely popular in the 1980s through the performances of Clifton Chenier, Queen Ida, Buckwheat Zydeco, Boozoo Chavis, and others.

zymogen \'zī-mə-jən\ *or* **proenzyme** Any of a class of proteins that are secreted by cells and are inactive precursors of enzymes. Transformation into active enzymes occurs as one or more peptide bonds in the zymogen are cleaved. Examples include trypsinogen and chymotrypsinogen, secreted by the pancreas and converted by proteolysis in the small intestine into the active enzymes trypsin and chymotrypsin; and numerous coagulation factors.

Merriam-Webster

The following is the editorial staff of Merriam-Webster that contributed to *Merriam-Webster's Collegiate Encyclopedia:*

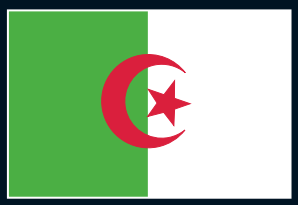
Editor: Mark A. Stevens; ***Associate Editors:*** Jocelyn White Franklin, Francesca M. Forrest, Kathleen M. Doherty; ***Art Coordinator:*** Lynn Stowe Tomb; ***Pronunciation Editor:*** David B. Justice

Merriam-Webster Consultants: Anne Agur (University of Toronto), Robert Audi (University of Nebraska), Carol Berkin (Baruch College, City University of New York), Paul Bottino (University of Maryland), Brian Burrell (University of Massachusetts), Louis P. Cain (Loyola University Chicago, Northwestern University), Francis D. K. Ching (University of Washington), Dale F. Eickelman (Dartmouth College), John A. Garraty (Columbia University [emeritus]), Robert B. Gordon (Yale University), James J. Jenkins (University of South Florida), John W. Johnson (University of Northern Iowa), Daniel Kaiser (Sarah Lawrence College), Cornelis Klein (University of New Mexico), Joel Krieger (Wellesley College), James M. Powell (Syracuse University [emeritus]), Edwin D. Reilly, Jr. (SUNY-Albany [emeritus]), Conrad Schirokauer (Columbia University), Stephen L. Schneider (University of Massachusetts), Thomas E. Skidmore (Brown University), Fredric P. Smoler (Sarah Lawrence College), Graham Speake (Oxford University), William C. Summers (Yale University), Christine Sutton (Oxford University), Birdsall S. Viault (Winthrop University [emeritus]), David K. Wyatt (Cornell University), Mark J. Zucker (Louisiana State University)

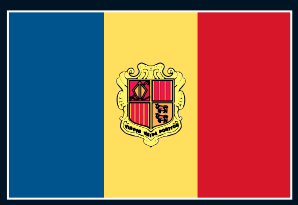
Merriam-Webster Editorial Staff: Michael G. Belanger, Susan L. Brady, Deanna Chiasson, Jennifer N. Cislo, Robert D. Copeland, Joanne M. Despres, Florence A. Fowler, Daniel J. Hopkins, Joan I. Narmontas, Kara L. Noble, Madeline L. Novak, Seán O'Mannion-Espejo, Roger J. Pease, Stephen J. Perrault, Thomas F. Pitoniak, James L. Rader, Donna L. Rickerby, Michael D. Roundy, Maria A. Sansalone, Adrienne M. Scholz, Michael Shally-Jensen, Peter A. Sokolowski, Karen L. Wilkinson

Particular acknowledgment is due to Jennifer Cislo, who fact-checked the great majority of the encyclopedia's entries; Mike Roundy, who advised on a range of scientific and technical subject areas; Deanna Chiasson, who coordinated the provision of pronunciations; Jim Rader, who served as language consultant; Steve Perrault, who served as sports consultant; Dan Hopkins, who acted as in-house cartography coordinator; Roger Pease, who drew up the botany and zoology entry lists; Joan Narmontas, who oversaw creation of the biological diagrams; Seán O'Mannion-Espejo and Peter Sokolowski, who wrote many of the music articles; Karen Wilkinson, who prepared many of the tables; Robert Copeland, who handled the file conversions; and Adrienne Scholz, who proofread virtually the entire volume. Mike Shally-Jensen contributed valuable analyses and many hundreds of articles in the project's early stages.

Merriam-Webster Freelance Staff: Michael J. Anderson, Cynthia Susan Ashby, Arlene Bensam, Frank Calvillo, May K. Chapman, Mary Wood Cornog, Lori Dirks, Jennifer Goss Duby, Elizabeth Morris Ewell, Amy Fass, Sharon Goldstein, Mary Catherine Hager, Helen Downs Haller, Orin K. Hargraves, Stephanie Hiebert, Betty B. Hoskins, Patricia Hurley Jarden, Anthony P. Johnson, Frances Kianka, Mark L. Koontz, Polly Kummel, Lynne Lackenbach, Ellen S. Leach, Arthur Maisel, Danny Marcus, Marvin Martin, Doris Maxfield, Wayne F. Moquin, Caroline Power, Margo Quinto, Mary H. Russell, Barbara H. Salazar, Fran Shonfeld Sherman, Elizabeth Stevens, Jeri Stolk, Barbara R. Tepperman, Deborah J. Untener, Helen M. Webber, Holly Isabella Webber



The project owes special thanks to Mike Anderson, Susan Ashby, Amy Fass, Mary Catherine Hager, Helen Haller, Stephanie Hiebert, Polly Kummel, Lynne Lackenbach, Barbara Salazar, and Holly Webber for their unusually extensive work.



Other Contributors: Tech-Graphics Corporation of Atlantic Highlands, N.J., produced the encyclopedia's diagrams. John Nelson provided its maps. Susana Darwin and Amor Montes de Oca selected and prepared the photographs from the Encyclopædia Britannica collection. Mark Diller drew up the religion entry list. Ellen Sullivan Farley and Loree Hany assisted in technical preparation of the art. Dale Good served as consultant on project management. Ted Atanowski provided computer assistance. The text was typeset by the Clarinda Co. of Clarinda, Iowa, under the exemplary direction of Dee Hughes. Finally, John M. Morse, publisher of Merriam-Webster, conceived the encyclopedia more than 20 years before its publication and offered indispensable support and encouragement throughout its development.

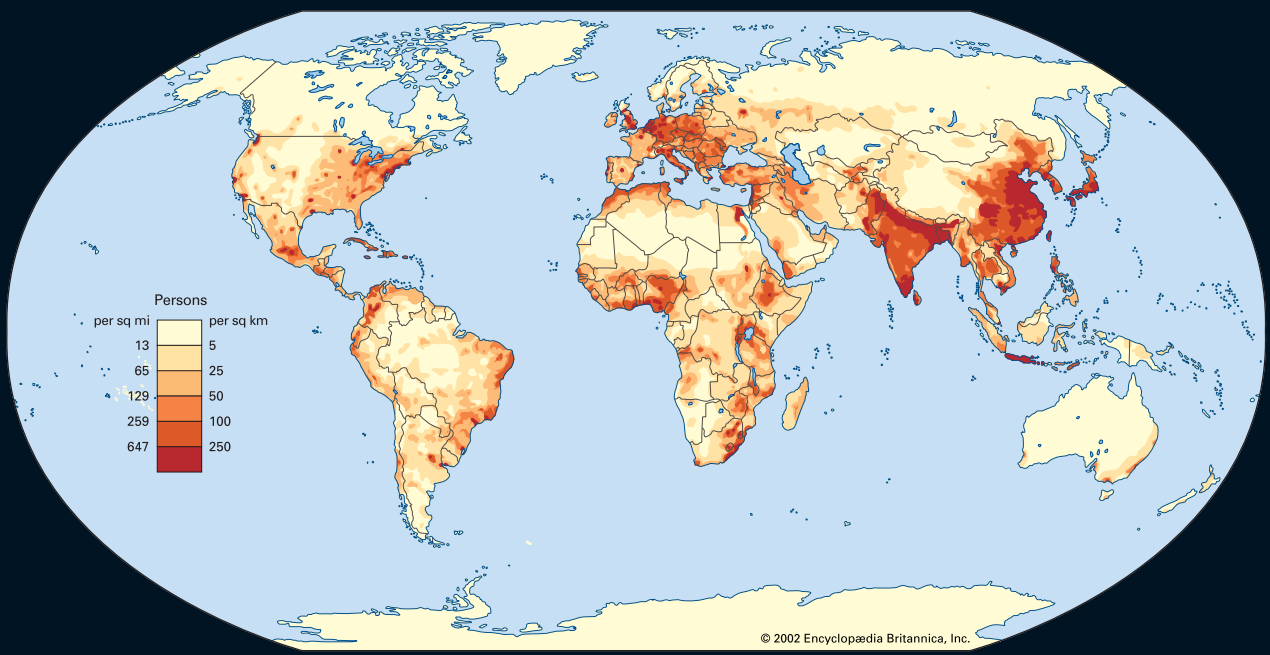
- Buddhism
- Ch Chinese religions[1]
- C Christianity, undifferentiated by branch[2]
- E Eastern Orthodoxy[3]
- H Hinduism
- N Independent churches of Eastern Christianity[4]
- T Indigenous (tribal) religions
- I Islam, predominantly Sunni
- Islam, predominantly Shi'ite
- Ja Japanese religions[1]
- J Judaism
- K Korean religions[1]
- Mormonism
- Sikhism
- P Protestantism
- R Roman Catholicism
- X Nonreligious
- No dominant religion
- Uninhabited

Footnotes:

[1] In certain eastern Asian areas, many of the people have plural religious affiliations. Chinese and Korean religions include Buddhism, Taoism, Confucianism, and folk cults. The Japanese religions include Shintō and Buddhism.

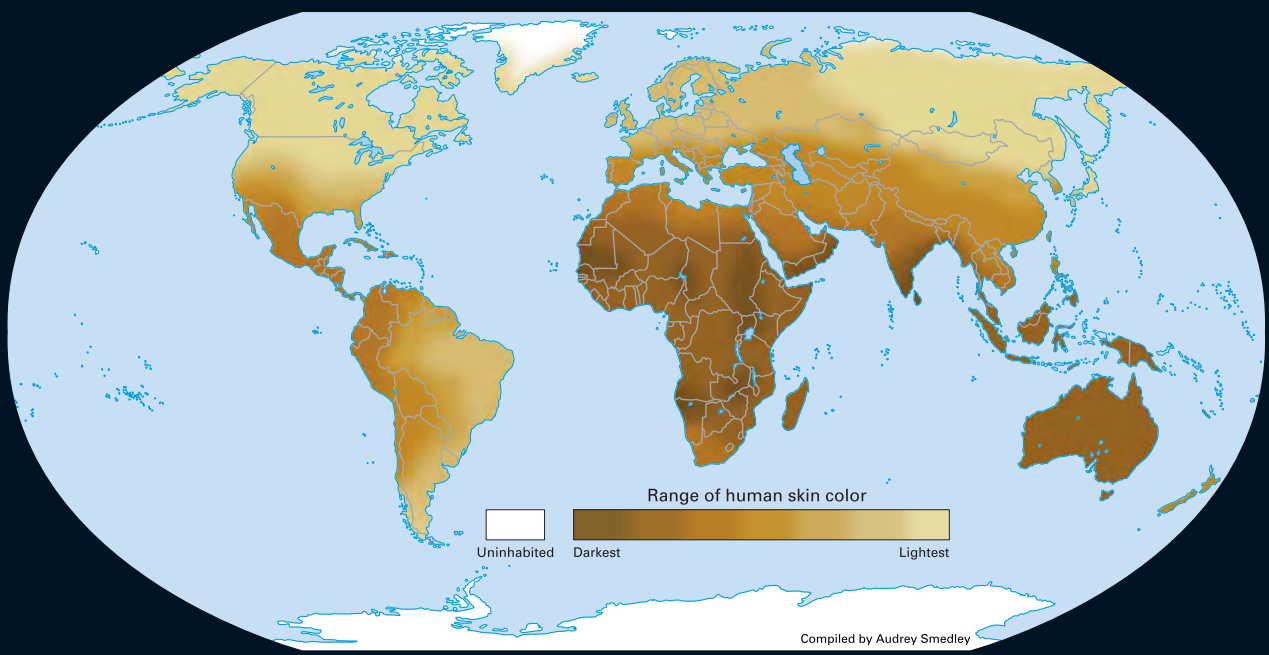
[2] Chiefly mingled Protestantism and Roman Catholicism, neither predominant.

[3] Including Greek and Russian Orthodox Christianity.



[4] Including Armenian, Coptic, Ethiopian, East and West Syrian.

Note:



The majority of the inhabitants in each of the areas colored on the map share the religious tradition indicated. Letter symbols show religious traditions shared by at least 25 percent of the inhabitants within areas no smaller than 1,000 square miles. Therefore minority religions of city dwellers have generally not been represented.

World Population Density

Indigenous Skin Color

The distribution of skin color variations of indigenous populations before colonization by Europeans.
This map represents a reconstruction of populations based on a number of sources. In some cases, areal characteristics have been estimated from descriptions (or drawings) of first contact by the earliest Europeans. In other cases, where there was little European contact or where there is scant information about native populations (as, for example, the populations of Inner Asia), skin color was estimated from surrounding populations and geographic and climatological information. On a map of this scale, it is difficult to give more than a representation of current understanding. It must also be noted that many populations, even before the modern era, were quite heterogeneous in skin color, and this heterogeneity is difficult to depict accurately on any scale. In areas of the world where the indigenous population was sparse and widely scattered (such as Australia), the map's color density can be misleading. Further, some populations, such as the Tasmanians (who are virtually extinct) and Maoris (who have been widely mixed with Europeans), present only a few examples of "unmixed" individuals in historical records.

Time is calculated from the meridian of Greenwich, England. The middle of the zero time zone passes through Greenwich with its east and west limits 7°30′ on each side. Each 15° zone east and west of the initial zone represents one hour of time. The number of hours (h) and minutes (m) that must be added to or subtracted from local time to give Greenwich time is indicated on the map for each zone and for area units that have a different time from the zone in which they are located.
